AC 4000	Revenue and Expense	8301
AC 5100	Assets	9301
AC 5300	Liabilities and Deferred Credits	9621
AC 5500	Capital	9901
AC 6000	Special Industry Applications	10,401
AC 9000	International Accounting Standards	11,001
AC	AICPA Accounting Interpretations	12,501
AC	Cross-Reference Tables	15,001
AC	Topical Index	15,201

The materials in this volume have been prepared and compiled by the staff of the American Institute of Certified Public Accountants, and have not been reviewed or approved by the Financial Accounting Standards Board.

HOW TO USE THIS VOLUME

Scope of the Volume . . .

This volume, which is a reprint of volumes 3 & 4, looseleaf editions of *AICPA Professional Standards,* includes the currently effective Accounting Research Bulletins, the Opinions and Statements of the Accounting Principles Board, the Accounting Interpretations issued by the AICPA, the Statements and Interpretations of the Financial Accounting Standards Board, the successor to the Accounting Principles Board, and the Statements of the International Accounting Standards Committee.

How this Volume is arranged . . .

The contents of this volume are arranged as follows:

Preface, Introduction
Financial Accounting—General
Financial Statement Presentation
Revenue and Expense
Assets
Liabilities and Deferred Credits
Capital
Special Industry Applications
International Accounting Standards
AICPA Accounting Interpretations

How to use this Volume . . .

The arrangement of material in this volume is indicated in the general table of contents at the front of the volume. There is a detailed table of contents covering the material within each major division.

The major divisions are divided into sections, each with its own section number. Each paragraph within a section is decimally numbered. For example, AC section 2012.20 refers to the twentieth paragraph of section 2012, *Reporting the Results of Operations.* AICPA Accounting Interpretations have the same section number as the section to which they relate, but the number is always preceded by a "U". For example, AC section U1091 refers to AICPA Accounting Interpretations of section 1091, *Accounting for Business Combinations.*

FASB Statements are located in the major divisions related to their subject matter. FASB Interpretations are assigned the same section numbers as the pronouncements to which they relate except

that a hyphenated number in serial order is added. For example, section 4211-1 is the first interpretation of section 4211.

Statements of International Accounting Standards are included in section 9000 in chronological order.

Appendix A is a cross-reference index which lists the Accounting Research Bulletins, Opinions and Statements of the Accounting Principles Board, Statements and Interpretations of the Financial Accounting Standards Board, and Statements of International Accounting Standards in numerical order cross-referenced to the section numbers in this volume in which material from the pronouncements still in effect may be found.

Appendix B is a cross-reference index which is arranged by section numbers in this volume and which indicates the Accounting Research Bulletins, Opinions and Statements of the Accounting Principles Board, Statements and Interpretations of the Financial Accounting Standards Board, and Statements of International Accounting Standards from which the material in the section was derived.

Appendix C is a schedule of the major changes which have taken place in Accounting Research Bulletins 43 through 51, in the Opinions and Statements of the Accounting Principles Board, and pronouncements of the Financial Accounting Standards Board since June 1953 when ARB No. 43 was issued. The dates of change are also indicated.

Appendix D is a cross-reference index which is arranged by section numbers and which indicates the AICPA Accounting Interpretations and FASB Interpretations relating to the official pronouncements. By reference to this appendix, it is possible to determine whether an Interpretation has been issued on any official pronouncement.

Appendix E lists the American Institute of Certified Public Accountants Industry Audit/Accounting Guides and Statements of Position. Accounting principles applicable to specialized situations are discussed in these publications.

The topical index uses the key word method to facilitate reference to the pronouncements. This index is arranged alphabetically by subject, with references to section and paragraph numbers.

AC Section 100

Preface

(This preface represents a combination of the preface prepared by the committee on accounting procedure in 1953 for Accounting Research Bulletin Number 43, *Restatement and Revision of Accounting Research Bulletins,* and a statement of subsequent developments.)

.01 Since its organization the American Institute of Certified Public Accountants, aware of divergences in accounting procedures and of an increasing interest by the public in financial reporting, has given consideration to problems raised by these divergences. Its studies led it, in 1932, to make certain recommendations to the New York Stock Exchange which were adopted by the Institute in 1934. Further consideration developed into a program of research and the publication of opinions, beginning in 1938, in a series of Accounting Research Bulletins.

.02 Forty-two bulletins were issued during the period from 1939 to 1953. Eight of these were reports of the committee on terminology. The other 34 were the result of research by the committee on accounting procedure directed to those segments of accounting practice where problems were most demanding and with which business and the accounting profession were most concerned at the time.

.03 Some of these studies were undertaken to meet new business or economic developments. Some arose out of the war which ended in 1945 and the problems following in its wake. Certain of the bulletins were amended, superseded, or withdrawn as changing conditions affected their usefulness.

.04 Although the committee has approved the objective of finding a better term than the word *surplus* for use in published financial statements, it has used *surplus* herein as being a technical term well understood among accountants, to whom its pronouncements are primarily directed.

.05 The committee on accounting procedure and the committee on terminology of the American Institute of Certified Public Accountants were superseded on Septem-

ber 1, 1959, by the Accounting Principles Board. At its first meeting, on September 11, 1959, the Board approved the following resolution:

> The Accounting Principles Board of the American Institute of Certified Public Accountants on September 1, 1959, assumed the responsibilities of the former committees on accounting procedure and on terminology.
>
> During its existence, the committee on accounting procedure issued a series of accounting research bulletins and the committee on terminology issued a series of accounting terminology bulletins. In 1953, the first forty-two of the accounting research bulletins were revised, restated, or withdrawn and appeared as Accounting Research Bulletin No. 43 and Accounting Terminology Bulletin No. 1. Since 1953, other bulletins have been issued, the last accounting research bulletin being No. 51 and the last terminology bulletin being No. 4.
>
> The Accounting Principles Board has the authority, as did the predecessor committees, to review and revise any of these bulletins and it plans to take such action from time to time.
>
> Pending such action and in order to prevent any misunderstanding meanwhile as to the status of the existing accounting research and terminology bulletins, the Accounting Principles Board now makes public announcement that these bulletins should be considered as continuing in force with the same degree of authority as before.

.06 The Accounting Principles Board has issued a number of "Opinions" and "Statements." Certain of the Opinions modify Accounting Research Bulletins or other Opinions. With these revisions, all currently existing Bulletins, Opinions and Statements continue in full force and effect.

.07 The Institute staff has been authorized to issue Accounting Interpretations of accounting questions having general interest to the profession. The purpose of the Interpretations is to provide guidance on a timely basis

 © 1974, American Institute of Certified Public Accountants, Inc.

without the formal procedures required for an Accounting Principles Board Opinion. These Interpretations, which are reviewed with informed members of the profession, are not pronouncements of the Board.

.08 This looseleaf edition has been instituted to facilitate reference to the Bulletins, Opinions, Statements and Accounting Interpretations and to provide an effective means of reflecting modifications of them on a timely basis. Due to the fact that it is a compilation of pronouncements of the predecessor committee and the Board, the composition of which has changed during the periods of their existence, it has been considered desirable to maintain the language of the pronouncements in their original form and context to the extent feasible. Accordingly, such terms as *committee* and *Board* appear unchanged from the original pronouncements.

.09 The Council of the Institute passed the following resolution[1] at its May 7, 1973 meeting:

> Whereas in 1959 the Council designated the Accounting Principles Board to establish accounting principles, and
>
> Whereas the Council is advised that the Financial Accounting Standards Board has become operational, it is
>
> Resolved, that as of April 1, 1973, all authority of the Accounting Principles Board shall terminate, except in respect of action taken on pronouncements of such Board approved prior to April 1, 1973 for exposure, and action of the APB Chairman in respect of pronouncements not issued by such Board; and that on June 30, 1973 or upon approval for final issuance for all such APB pronouncements, whichever first occurs, the Accounting Principles Board shall be dissolved.
>
> Resolved, that the Accounting Standards Executive Committee is hereby designated as the Senior Technical Committee of the Institute with respect to

[1] See section 510.08 for the Council Resolution establishing the Financial Accounting Standards Board as the body to establish accounting principles pursuant to Rule 203 of the Rules of Conduct of the American Institute of Certified Public Accountants.

financial accounting and reporting, and cost accounting, as defined in the statement of its responsibilities, authority and structure approved by the Board of Directors, except as hereinabove provided with respect to the authority of the Accounting Principles Board and its Chairman until the dissolution of such Board.

AC Section 510

Introduction—General

(This section of the introduction was prepared, except as otherwise indicated herein, by the committee on accounting procedure and was issued in June 1953 as a part of Accounting Research Bulletin No. 43, *Restatement and Revision of Accounting Research Bulletins.*)

ACCOUNTING AND THE CORPORATE SYSTEM

.01 Accounting is essential to the effective functioning of any business organization, particularly the corporate form. The test of the corporate system and of the special phase of it represented by corporate accounting ultimately lies in the results which are produced. These results must be judged from the standpoint of society as a whole—not merely from that of any one group of interested persons.

.02 The uses to which the corporate system is put and the controls to which it is subject change from time to time, and all parts of the machinery must be adapted to meet changes as they occur. In the past fifty years there has been an increasing use of the corporate system for the purpose of converting into readily transferable form the ownership of large, complex, and more or less permanent business enterprises. This evolution has brought in its train certain uses of the processes of law and accounting which have led to the creation of new controls, revisions of the laws, and reconsideration of accounting procedures.

.03 As a result of this development, the problems in the field of accounting have increasingly come to be considered from the standpoint of the buyer or seller of an interest in an enterprise, with consequent increased recognition of the significance of the income statement and a tendency to restrict narrowly charges and credits to surplus. The fairest possible presentation of periodic net income, with neither material overstatement nor understatement, is important, since the results of operations are significant not only to prospective buyers of an interest in the enterprise but also to prospective sellers. With the increasing importance of the income statement there has been a tendency to regard the balance sheet as the connecting link

between successive income statements; however this concept should not obscure the fact that the balance sheet has significant uses of its own.

.04 This evolution has also led to a demand for a larger degree of uniformity in accounting. *Uniformity* has usually connoted similar treatment of the same item occurring in many cases, in which sense it runs the risk of concealing important differences among cases. Another sense of the word would require that different authorities working independently on the same case should reach the same conclusions. Although uniformity is a worthwhile goal, it should not be pursued to the exclusion of other benefits. Changes of emphasis and objective as well as changes in conditions under which business operates have led, and doubtless will continue to lead, to the adoption of new accounting procedures. Consequently, diversity of practice may continue as new practices are adopted before old ones are completely discarded.

APPLICABILITY OF COMMITTEE OPINIONS

.05 The principal objective of the committee has been to narrow areas of difference and inconsistency in accounting practices, and to further the development and recognition of generally accepted accounting principles, through the issuance of opinions and recommendations that would serve as criteria for determining the suitability of accounting practices reflected in financial statements and representations of commercial and industrial companies. In this endeavor, the committee has considered the interpretation and application of such principles as appeared to it to be pertinent to particular accounting problems. The committee has not directed its attention to accounting problems or procedures of religious, charitable, scientific, educational, and similar non-profit institutions, municipalities, professional firms, and the like. Accordingly, except where there is a specific statement of a different intent by the committee, its opinions and recommendations are directed primarily to business enterprises organized for profit.

VOTING PROCEDURE IN ADOPTING OPINIONS

.06 The committee regards the representative character and general acceptability of its opinions as of the

© 1974, American Institute of Certified Public Accountants, Inc.

highest importance, and to that end has adopted the following procedures:

(a) Any opinion or recommendation before issuance is submitted in final form to all members of the committee either at a meeting or by mail.

(b) No such opinion or recommendation is issued unless it has received the approval of two-thirds of the entire committee.

(c) Any member of the committee dissenting from an opinion or recommendation issued under the preceding rule is entitled to have the fact of his dissent and his reasons therefor recorded in the document in which the opinion or recommendation is presented.

.07 Before reaching its conclusions, the committee gives careful consideration to prior opinions, to prevailing practices, and to the views of professional and other bodies concerned with accounting procedures.

AUTHORITY OF OPINIONS

.08 The Council of the American Institute passed the following resolution [1] at its May 7, 1973 meeting:

Whereas in 1959 the Council designated the Accounting Principles Board to establish accounting principles, and

Whereas the Council is advised that the Financial Accounting Standards Board has become operational, it is

Resolved, that as of the date hereof the Financial Accounting Standards Board, in respect of Statements of Financial Accounting Standards finally adopted by such Board in accordance with its Rules of Procedure and the bylaws of the Financial Accounting Foundation, be, and hereby is, designated by this Council as the body to establish accounting principles pursuant to Rule 203 of the Rules of Conduct of the American Institute of Certified Public Accountants; provided, however, any Accounting Research Bulletins, or Opinions of the Accounting Principles Board presently issued or approved for exposure by the Accounting Principles Board prior to April 1, 1973 and finally adopted by such Board on or before June 30, 1973, shall constitute statements of accounting principles promulgated by a body

[1] See section 100.09 for the Council Resolution which relates to the internal AICPA adjustment to the designation of the FASB as the body to establish accounting principles pursuant to Rule 203 of the Rules of Conduct of the American Institute of Certified Public Accountants.

designated by Council as contemplated in Rule 203 of the Rules of Conduct[2] unless and until such time as they are expressly superseded by action of the FASB.

.09 The committee contemplates that its opinions need not be applied to immaterial items. It considers that items of little or no consequence may be dealt with as expediency may suggest. However, freedom to deal expediently with immaterial items should not extend to a group of items whose cumulative effect in any one financial statement may be material and significant. [As amended, effective after August, 1970 by the revision of notes to APB Opinions starting with APB Opinion No. 16.]

OPINIONS NOT RETROACTIVE

.10 No opinion issued by the committee or by the Board is required to have a retroactive effect unless it contains a statement of such requirement. Thus an opinion will ordinarily have no application to a transaction arising prior to its publication (or stated effective date), nor to transactions in process of completion at the time of publication. But while the committee considers it inequitable to make its statements retroactive, it does not wish to discourage the revision of past accounts in an individual case if it appears to be desirable in the circumstances. [As amended to reflect Board policy—beginning with APB Opinion No. 6, October 1965—of stating the effective date of each Opinion.]

THE COMPANY AND ITS AUDITORS

.11 Underlying all committee opinions is the fact that the accounts of a company are primarily the responsibility of management. The responsibility of the auditor is to express his opinion concerning the financial statements and to state clearly such explanations, amplifications, disagreement, or disapproval as he deems appropriate. While opinions of the committee are addressed particularly to certified public accountants whose problem it is to decide what they may properly report, the committee recommends similar application of the procedures mentioned herein by those who prepare the accounts and financial statements.

AC Section 520

Excerpts from the AICPA Code of Professional Ethics

Effective March 1, 1973

RULES OF CONDUCT

.01 *Rule 203—Accounting Principles.* A member shall not express an opinion that financial statements are presented in conformity with generally accepted accounting principles if such statements contain any departure from an accounting principle promulgated by the body designated by Council to establish such principles which has a material effect on the statements taken as a whole, unless the member can demonstrate that due to unusual circumstances the financial statements would otherwise have been misleading. In such cases his report must describe the departure, the approximate effects thereof, if practicable, and the reasons why compliance with the principle would result in a misleading statement.

Interpretations of Rules of Conduct

Interpretation under Rule 203—Accounting Principles

.02 *203-1—Departures from established accounting principles.* Rule 203 was adopted to require compliance with accounting principles promulgated by the body designated by Council to establish such principles. There is a strong presumption that adherence to officially established accounting principles would in nearly all instances result in financial statements that are not misleading.

.03 However, in the establishment of accounting principles it is difficult to anticipate all of the circumstances to which such principles might be applied. The rule therefore recognizes that upon occasion there may be unusual circumstances where the literal application of pronouncements on accounting principles would have the effect of rendering financial statements misleading. In such cases, the proper accounting treatment is that which will render the financial statements not misleading.

.04 The question of what constitutes unusual circumstances as referred to in Rule 203 is a matter of professional judgment involving the ability to support the position that adherence to a promulgated principle would be regarded generally by reasonable men as producing a misleading result.

.05 Examples of events which may justify departures from a principle are new legislation or the evolution of a new form of business transaction. An unusual degree of materiality or the existence of conflicting industry practices are examples of circumstances which would not ordinarily be regarded as unusual in the context of Rule 203.

.06 *203-2—Status of FASB Interpretations.* Council is authorized under Rule 203 to designate a body to establish accounting principles and has designated the Financial Accounting Standards Board as such body. Council also has resolved that FASB Statements on Financial Accounting Standards, together with those Accounting Research Bulletins and APB Opinions which are not superseded by action of the FASB, constitute accounting principles as contemplated in Rule 203.

.07 In determining the existence of a departure from an accounting principle established by a Statement of Financial Accounting Standards, Accounting Research Bulletin or APB Opinion encompassed by Rule 203, the Division of Professional Ethics will construe such Statement, Bulletin or Opinion in the light of any Interpretations thereof issued by the FASB.

AC Section 1010

Fundamentals of Financial Accounting

[Source: APB Statement No. 1.]

Issue date, unless otherwise indicated: April 13, 1962

STATEMENT BY THE ACCOUNTING PRINCIPLES BOARD

.01 The Accounting Principles Board has received *Accounting Research Study No. 3,* "A Tentative Set of Broad Accounting Principles for Business Enterprises," by Robert T. Sprouse and Maurice Moonitz. The Board previously had received *Accounting Research Study No. 1,* "The Basic Postulates of Accounting," by Maurice Moonitz. Study No. 1 was published in September 1961 and Study No. 3 is scheduled for publication toward the end of April 1962.

.02 In the opinion of the Director of Accounting Research, these two studies comply with the instructions to the Accounting Research Division to make a study of the basic postulates and broad principles of accounting. Prior to its publication, Study No. 3 has been read and commented upon by a limited number of people in the field of accounting. Their reactions range from endorsement of the ideas set forth in the study of "Broad Principles" to misgivings that compliance with the recommendations set forth by the authors would lead to misleading financial statements. The Board is therefore treating these two studies (the one on "Postulates" and the other on "Principles") as conscientious attempts by the accounting research staff to resolve major accounting issues which, however, contain inferences and recommendations in part of a speculative and tentative nature.

.03 The Board feels that there is ample room for improvement in present generally accepted accounting principles and a need to narrow or eliminate areas of difference which now exist. It hopes the studies will stimulate constructive comment and discussion in the areas of the basic postulates and the broad principles of accounting. Ac-

counting principles and practices should be adapted to meet changing times and conditions, and, therefore, there should be experimentation with new principles and new forms of reporting to meet these conditions. The Board believes, however, that while these studies are a valuable contribution to accounting thinking, they are too radically different from present generally accepted accounting principles for acceptance at this time.

.04 After a period of exposure and consideration, some of the specific recommendations in these studies may prove acceptable to the Board while others may not. The Board therefore will await the results of this exposure and consideration before taking further action on these studies.

AC Section 1021

Purpose and Nature of the Statement

[Source: APB Statement No. 4, Chap. 1, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

PURPOSE OF THE STATEMENT

.01 The American Institute of Certified Public Accountants through its Accounting Principles Board is engaged in a program of advancing the written expression of financial accounting principles for the purpose of increasing the usefulness of financial statements. The Board has been directed to devote its attention to the broad fundamentals of financial accounting as well as to specific accounting problems.[1] This Statement of basic concepts[2] and accounting principles underlying financial statements of business enterprises[3] (sections 1021-1029) states the Board's views in response to that directive.[4]

.02 Sections 1021-1029 have two broad purposes, one educational and the other developmental. They are intended to provide a basis for enhanced understanding of the broad fundamentals of financial accounting. They are also intended to provide a basis for guiding the future

[1] See "Report to Council of the Special Committee on Research Program," *The Journal of Accountancy,* December 1958, pp. 62-68 and *Report of Special Committee on Opinions of Accounting Principles Board,* 1965, summarized in *The Journal of Accountancy,* June 1965, pp. 12, 14, and 16.

[2] The term *basic concepts* is used to refer to the observations concerning the environment, the objectives of financial accounting and financial statements, and the basic features and basic elements of financial accounting discussed in sections 1023-1025.

[3] See section 1023.12 for a discussion of business enterprises. Although sections 1021-1029 apply to business enterprises, some of the contents may also apply to not-for-profit organizations.

[4] Three accounting research studies were among the sources used in preparing sections 1021-1029: Accounting Research Study No. 1, *The Basic Postulates of Accounting,* by Maurice Moonitz; Accounting Research Study No. 3, *A Tentative Set of Broad Accounting Principles for Business Enterprises,* by Robert T. Sprouse and Maurice Moonitz; and Accounting Research Study No. 7, *Inventory of Generally Accepted Accounting Principles for Business Enterprises,* by Paul Grady. (Accounting research studies are not pronouncements of this Board or of the Institute, but are published for the purpose of stimulating discussion on important accounting issues.)

development of financial accounting. To achieve these purposes sections 1021-1029 (1) discuss the nature of financial accounting, the environmental forces that influence it, and the potential and limitations of financial accounting in providing useful information, (2) set forth the objectives of financial accounting and financial statements, and (3) present a description of present generally accepted accounting principles.

NATURE OF THE STATEMENT

.03 Sections 1021-1029 are primarily descriptive, not prescriptive. They identify and organize ideas that for the most part are already accepted. In addition to the summary in section 1022, sections 1021-1029 contain two main parts that are essentially distinct—(a) sections 1023 to 1025 on the environment, objectives, and basic features of financial accounting and (b) sections 1026 to 1028 on present generally accepted accounting principles. The description of present generally accepted accounting principles is based primarily on observation of accounting practice. Present generally accepted accounting principles have not been formally derived from the environment, objectives, and basic features of financial accounting.

.04 The aspects of the environment selected for discussion are those that appear to influence the financial accounting process directly. The objectives of financial accounting and financial statements discussed are goals toward which efforts are presently directed. The accounting principles described are those that the Board believes are generally accepted *today. The Board has not evaluated or approved present generally accepted accounting principles except to the extent that principles have been adopted in Board Opinions. Publication of sections 1021-1029 does not constitute approval by the Board of accounting principles that are not covered in its Opinions.*

.05 Section 1029 describes the dynamic nature of financial accounting and the need for continual reexamination of generally accepted accounting principles. The section describes how present generally accepted accounting principles may be evaluated on the basis of the material in sections 1023 to 1025. The section also indicates some of the proposals that have been made for improving financial

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

accounting information. These proposals, which the Board has not evaluated, may also be evaluated on the basis of the material in sections 1023 to 1025.

.06 Sections 1021-1029 are a step toward development of a more consistent and comprehensive structure of financial accounting and of more useful financial information. They are intended to provide a framework within which the problems of financial accounting may be solved, although they do not propose solutions to those problems and do not attempt to indicate what generally accepted accounting principles should be. Evaluation of present accounting principles and determination of changes that may be desirable are left to future pronouncements of the Board.

.07 The status of Statements of the Board is defined in section 1029.14. Sections 1021-1029 do not change, supersede, or interpret Accounting Research Bulletins or Opinions of the Accounting Principles Board currently in effect. The normal procedures established to maintain the effectiveness of these pronouncements and to interpret them continue in effect unchanged. Sections 1021-1029 do, however, modify some of the definitions of technical accounting terms in the Accounting Terminology Bulletins.[5] The following sections are superseded:

Accounting Terminology Bulletin No. 1, paragraphs:

9—*accounting*
21—*balance sheet*
26—*assets*
27—*liabilities*

Accounting Terminology Bulletin No. 4, paragraph 2, *cost*.

The following sections are amended:

Accounting Terminology Bulletin No. 2, paragraphs:

5—*revenue*
8—*income*

Accounting Terminology Bulletin No. 4, paragraph 3, *expense*.

These changes are noted by footnotes at appropriate places in sections 1021-1029.

[5] The Accounting Terminology Bulletins do not have the same authoritative status as the Accounting Research Bulletins and the Opinions of the Accounting Principles Board but are useful guides to financial accounting terminology.

TERMINOLOGY

.08 Technical language is used in financial accounting. Many technical terms used in financial accounting are words that have wide common usage but that are given special meanings by accountants. Many important technical terms are defined or discussed in sections 1021-1029. The meaning of these terms is best understood in the context of the discussions in which they appear. The terms and the sections in which they are defined or discussed are:

AC Section 1022

Summary of the Statement

[Source: APB Statement No. 4, Chap. 2, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

.01 Accounting is a service activity. Its function is to provide quantitative information, primarily financial in nature, about economic entities that is intended to be useful in making economic decisions. Sections 1021-1029 deal with financial accounting for business enterprises, the branch of accounting that focuses on the general-purpose reports on financial position and results of operations known as financial statements.

FINANCIAL STATEMENTS

.02 Financial statements are the means by which the information accumulated and processed in financial accounting is periodically communicated to those who use it. They are designed to serve the needs of a variety of users, particularly owners and creditors. Through the financial accounting process, the myriad and complex effects of the economic activities of an enterprise are accumulated, analyzed, quantified, classified, recorded, summarized, and reported as information of two basic types: (1) financial position, which relates to a point in time, and (2) changes in financial position, which relate to a period of time. Notes to the statements, which may explain headings, captions or amounts in the statements or present information that cannot be expressed in money terms, and descriptions of accounting policies are an integral part of the statements. [As amended by APB Opinion No. 22, December 31, 1971.]

Financial Position—The Balance Sheet

.03 A balance sheet (or statement of financial position) presents three major categories: (a) assets, (b) liabilities, and (c) owners' equity, the difference between total assets and total liabilities. A balance sheet at any date

presents an indication in conformity with generally accepted accounting principles of the financial status of the enterprise at a particular point of time.

Changes in Financial Position—The Income Statement

.04 The income statement for a period presents the revenue, expenses, gains, losses, and net income (net loss) recognized during the period and thereby presents an indication in conformity with generally accepted accounting principles of the results of the enterprise's profit-directed activities during the period. The information presented in an income statement is usually considered the most important information provided by financial accounting because profitability is a paramount concern to those interested in the economic activities of the enterprise.

Changes in Financial Position—Changes in Owners' Equity

.05 An income statement is usually not sufficient to describe the total change in owners' equity during a period because changes arise from sources other than profit-directed activities. The total change in owners' equity is described by three statements: an income statement, a statement of retained earnings, and a statement of other changes in owners' equity. A statement of retained earnings presents net income (as shown in the income statement) and items such as dividends and adjustments of the net income of prior periods. A statement of other changes in owners' equity presents additional investments by owners, retirements of owners' interests (except for the part considered to be a distribution of earnings), and similar events. If these other changes are simple and few in number, they are often presented in notes to the other financial statements rather than in a separate statement.

Changes in Financial Position—Other Statements

.06 A statement of changes in financial position shows the major sources of increases in an enterprise's assets for a period in addition to net income, for example, from borrowing, owners' investments, and disposal of assets other than through normal operations. It also shows how the

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

enterprise used its assets during the period, for example, in acquiring other assets, in paying debt, and in distributions to owners. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

.07 Other statements that analyze specific changes in financial position are occasionally presented, for example, changes in plant and equipment, changes in long-term liabilities, and cash receipts and disbursements. Statements that analyze changes in each asset, each liability, and each item of owners' equity could be prepared, but statements of changes in financial position in addition to those already discussed are seldom presented. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

The Source of Financial Statements

.08 Financial statements are the end product of the financial accounting process. This process is governed by generally accepted accounting principles, which determine the information that is included, how it is organized, measured, combined, and adjusted, and finally how it is presented in the financial statements. The principles reflect the objectives and the basic features of financial accounting (discussed below). All of financial accounting—principles, objectives, and basic features—is grounded in the environment of business enterprises.

THE ENVIRONMENT OF FINANCIAL ACCOUNTING

.09 An understanding of financial accounting and an ability to evaluate the information it produces depend not only on delineation of accounting principles and the features and objectives of accounting, but also on an understanding of the environment within which financial accounting operates and which it is intended to reflect (section 1023). The users of financial accounting information and economic activity in society and in individual business enterprises are aspects of the environment important to an analysis of the problems of financial accounting.

Users

.10 Needs and expectations of users of financial statements are a part of the environment that determines the type of information required of financial accounting. A

knowledge of important classes of users, of their common and special needs for information, and of their decision processes is helpful in improving financial accounting information.

Economic Activity

.11 Economic activity can be described in terms of (1) its general nature in highly developed economies, (2) the economic resources, obligations, and residual interest of a business enterprise and the economic activities that change them, and (3) the ways of measuring economic activity.

.12 Describing economic resources, economic obligations, and residual interest and the economic activities that change them is important because the basic elements of financial accounting—assets, liabilities, owners' equity, revenue, expenses, and net income—are related to these economic elements. A discussion of the measurement of economic activity is also relevant because measurement difficulties underlie many of the problems of financial accounting.

OBJECTIVES OF FINANCIAL ACCOUNTING AND FINANCIAL STATEMENTS

.13 The basic purpose of financial accounting and financial statements is to provide financial information about individual business enterprises that is useful in making economic decisions (section 1024). General and qualitative objectives aid in fulfilling this basic purpose and provide means for evaluating present and proposed accounting principles.

.14 General objectives determine the appropriate content of financial accounting information. These objectives are to present reliable financial information about enterprise resources and obligations, economic progress and other changes in resources and obligations, to present information helpful in estimating earnings potential, and to present other financial information needed by users, particularly owners and creditors.

.15 Certain qualities or characteristics make financial information useful. Providing information that has each of these qualities is an objective of financial accounting.

 © 1974, American Institute of Certified Public Accountants, Inc.

These qualitative objectives are relevance, understandability, verifiability, neutrality, timeliness, comparability, and completeness.

.16 The objectives of financial accounting and financial statements are at least partially achieved at present, although improvement is probably possible in connection with each of them. Constraints on full achievement of the objectives arise from (1) conflicts of objectives, (2) environmental influences, and (3) lack of complete understanding of the objectives.

BASIC FEATURES AND BASIC ELEMENTS OF FINANCIAL ACCOUNTING

Basic Features

.17 The basic features of financial accounting (section 1025) are determined by the characteristics of the environment in which financial accounting operates. The features are:

(1) *Accounting entity*—economic activities of individual entities are the focus of financial accounting.

(2) *Going concern*—continuation of entity operations is usually assumed in financial accounting in the absence of evidence to the contrary.

(3) *Measurement of economic resources and obligations*—financial accounting is primarily concerned with measurement of economic resources and obligations and changes in them.

(4) *Time periods*—financial accounting presents information about activities for relatively short time periods.

(5) *Measurement in terms of money*—financial accounting measures in terms of money.

(6) *Accrual*—determining periodic income and financial position depends on measurement of noncash resources and obligations.

(7) *Exchange price*—financial accounting measurements are primarily based on exchange prices.

(8) *Approximation*—approximations are inevitable in the allocations required in financial accounting.

(9) *Judgment*—financial accounting requires informed judgment.

(10) *General-purpose financial information*—financial accounting presents general-purpose financial information.

(11) *Fundamentally related financial statements*—statements of financial position and changes in financial position are fundamentally related.

(12) *Substance over form*—financial accounting emphasizes the economic substance of events even though the legal form may differ from the economic substance and suggest different treatment.

(13) *Materiality*—financial reporting is only concerned with significant information.

Basic Elements

.18 The basic elements of financial accounting are assets, liabilities, owners' equity, revenue, expenses, and net income (section 1025). These elements are defined in terms of (a) economic resources, economic obligations, and residual interest and changes in resources, obligations, and residual interest and (b) generally accepted accounting principles.

GENERALLY ACCEPTED ACCOUNTING PRINCIPLES

.19 Generally accepted accounting principles (sections 1026 to 1028) incorporate the consensus[1] at any time as to which economic resources and obligations should be recorded as assets and liabilities, which changes in them should be recorded, when these changes should be recorded, how the recorded assets and liabilities and changes in them should be measured, what information should be disclosed and how it should be disclosed, and which financial statements should be prepared. In this Statement, generally accepted accounting principles are divided into three levels: pervasive principles, broad operating principles, and detailed principles.

.20 Pervasive principles (section 1026) form the basis for much of the accounting process. They include pervasive measurement principles and modifying conventions. The

[1] See section 1026.01, footnote 1.

 © 1974, American Institute of Certified Public Accountants, Inc.

pervasive measurement principles—for example, realization—broadly determine the events recognized in financial accounting, the basis of measurement used in financial accounting, and the way net income is determined. The modifying conventions—for example, conservatism—affect the application of the pervasive measurement principles.

.21 Broad operating principles (section 1027) are general rules, derived from the pervasive principles, that govern the application of the detailed principles. They are described in this Statement in two groups, principles of selection and measurement and principles of financial statement presentation. The principles of selection and measurement include principles that guide selection of events to be accounted for and assignment of dollar amounts and principles that determine the effects of recorded events on assets, liabilities, owners' equity, revenue, and expenses of the enterprise.

.22 Detailed principles are the numerous rules and procedures that are based on the broad principles and specify the way data are processed and presented in specific situations. Detailed principles are discussed but not listed in section 1028.

.23 The three types of principles determine the operation of the financial accounting process. All three levels of principles are conventional. They have developed on the basis of experience, reason, and custom; they become generally accepted by agreement (often tacit agreement) and are not formally derived from a set of postulates.

DYNAMIC NATURE OF FINANCIAL ACCOUNTING

.24 Present generally accepted accounting principles are the result of an evolutionary process that can be expected to continue (section 1029). Principles change in response to changes in economic and social conditions, to new knowledge and technology, and to demands by users for more serviceable financial information. Change is more pronounced in the detailed principles than in the broad operating principles; the pervasive principles tend to be the most stable. Nevertheless, because the principles are conventional and have been developed in relation to a specific environment and with assumptions about needed financial

information, they are all subject to review, evaluation, and possible change.

CHARACTERISTICS AND LIMITATIONS OF FINANCIAL ACCOUNTING AND FINANCIAL STATEMENTS

.25 The environment, objectives, and basic features of financial accounting determine the structure of financial accounting and provide constraints and conditions on its operations. The accounting principles that are generally accepted at a particular time as the basis of reporting represent a response to these influences, constraints, and conditions as they exist at that time and determine not only the scope of financial accounting information at the time but also its relevance. These principles are the result of the historical development of financial accounting, the way in which needs of users of financial accounting information are perceived, and the way accountants interact with the environment.

.26 The complexity of the economic activity that forms the subject matter of accounting gives financial accounting some definite limits. Taking one approach in financial accounting requires rejection of other approaches and limits the scope of accounting. The approach taken is reflected in certain characteristics of the financial accounting process and its product, the financial statements. In the midst of the continuous and complex interactions found in the economic environment of enterprises, periodic measurements are made based on a relatively simple classification system. Faced with the uncertainty and joint effects that characterize economic activity, accountants adopt conventional procedures that emphasize verifiable measures and are based on assumptions that certain causal relationships exist and can be traced.

.27 Some of the more important present characteristics and limitations of financial accounting and financial statements are briefly described.

Historical Report. Financial accounting and financial statements are primarily historical in that information about events that have taken place provides the basic data of financial accounting and financial statements.

General-Purpose Financial Statements. Financial accounting presents information designed to serve the

 © 1974, American Institute of Certified Public Accountants, Inc.

common needs of a variety of user groups with primary emphasis on the needs of present and potential owners and creditors.

Fundamentally Related Financial Statements. Financial statements are fundamentally related. Aspects of financial position presented in the balance sheet are related to changes in financial position presented in the income statement and the statement of changes in financial position.

Classification. Information about financial position and results of operations is classified based on the presumed needs of owners, creditors, and other users.

Summarization. Transactions and other events of a business enterprise that have similar characteristics are grouped and presented in summary form.

Measurement in Terms of Money. Financial statements in the United States are expressed in terms of numbers of U. S. dollars. Changes in the general purchasing power of the dollar are not reflected in the basic financial statements.

Measurement Bases. Several measurement bases are used in financial accounting, for example, net realizable value (receivables), lower of acquisition cost and present market price (inventories), and acquisition cost less accumulated depreciation (plant and equipment). Financial statements in general do not purport to reflect the current value of the assets of the enterprise or their potential proceeds on liquidation under present generally accepted accounting principles.

Accrual. The effects of transactions and other events on the assets and liabilities of a business enterprise are recognized and reported in the time periods to which they relate rather than only when cash is received or paid.

Estimates and Judgment. The complexity and uncertainty of economic activity seldom permit exact measurement. Estimates and informed judgment must often be used to assign dollar amounts to the effects of transactions and other events that affect a business enterprise.

Verifiability. Although estimates are unavoidable in financial accounting, an attempt is made to keep the effects of estimates to a minimum by basing financial accounting measurements primarily on enterprise transactions and requiring corroboration by outside evidence before increases in value are recognized. Estimates included in financial accounting are usually related in some way to data derived from verifiable events and the estimates are accounted for in a consistent and systematic manner.

Conservatism. The uncertainties that surround the preparation of financial statements are reflected in a general tendency toward early recognition of unfavorable events and minimization of the amount of net assets and net income.

Substance Over Form. Although financial accounting is concerned with both the legal and economic effects of transactions and other events and many of its conventions are based on legal rules, the economic substance of transactions and other events are usually emphasized when economic substance differs from legal form.

Technical Terminology. Many of the terms used in financial statements are common words to which accountants have given technical meanings.

Audience. Financial statement users are presumed to be generally familiar with business practices, the technical language of accounting, and the nature of the information reported.

[As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

USE OF FINANCIAL ACCOUNTING INFORMATION

.28 Appropriate use of financial accounting information requires a knowledge of the characteristics and limitations of financial accounting. Financial accounting information is produced for certain purposes by the use of conventional principles. Use of the information for other purposes or without a general knowledge of its characteristics and limitations may lead to misinterpretation and errors.

.29 An important characteristic of financial statements, for example, is that the information they contain de-

© 1974, American Institute of Certified Public Accountants, Inc.

scribes the past, while decision making is oriented toward the future. A record of past events and a knowledge of past position and changes in position, however, help users evaluate prior decisions and this information is also a starting point for users in predicting the future. Decision makers should not assume, however, that the conditions that produced past results will necessarily continue in the future.

.30 Financial statements are designed to provide an important part of the information that users need for many of their decisions. The information contained in the statements should not be relied on exclusively, however, and should be supplemented by other information about the specific prospects of the company, the industry in which it operates, and the economy in general.

.31 A knowledge of the characteristics and limitations of financial statements also helps users avoid putting undue reliance on single measures or the results of a single year. Net income or earnings per share of a single year, for example, should not be overemphasized since these amounts are derived from complex computations, are based on estimates and judgments, and often have their meaning modified by information in the notes to the financial statements. In reaching decisions users should consider movements in the components of net income, the effects of estimates and judgments, the possible effects of information disclosed in notes, and similar factors.

AC Section 1023

The Environment of Financial Accounting

[Source: APB Statement No. 4, Chap. 3, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

.01 Accounting is a service activity. Its function is to provide quantitative information, primarily financial in nature, about economic entities that is intended to be useful in making economic decisions—in making reasoned choices among alternative courses of action. Accounting includes several branches, for example, financial accounting, managerial accounting, and governmental accounting.

.02 Financial accounting for business enterprises is one branch of accounting. It provides, within limitations described below, a continual history quantified in money terms of economic resources and obligations of a business enterprise and of economic activities that change those resources and obligations.

.03 Financial accounting is shaped to a significant extent by the environment, especially by:

1. The many uses and users which it serves,
2. The overall organization of economic activity in society,
3. The nature of economic activity in individual business enterprises, and
4. The means of measuring economic activity.

Environmental conditions, restraints, and influences are generally beyond the direct control of businessmen, accountants, and statement users. Understanding and evaluating financial accounting requires knowledge of this environment and of its impact on the financial accounting process. Aspects of the environment are reflected in the basic features and basic elements of financial accounting (see Section 1025) and in generally accepted accounting principles (see Sections 1026 to 1028).

USES AND USERS OF FINANCIAL ACCOUNTING INFORMATION

.04 Financial accounting information[1] is used by a variety of groups and for diverse purposes. The needs and expectations of users determine the type of information required. User groups may be broadly classified into (1) those with direct interests in business enterprises and (2) those with indirect interests.

Users with Direct Interests

.05 Some users have or contemplate having a direct economic interest in business enterprises. Examples of these users and of the types of evaluations and decisions for which they use financial accounting information are:

Owners—retain, increase, or decrease proportionate ownership; evaluate the use and stewardship of resources by management.

Creditors and suppliers—extend credit; determine terms of credit; require security or restrictive covenants in terms; enter suit or force bankruptcy or receivership; increase or decrease reliance on the enterprise as a customer.

Potential owners, creditors, and suppliers—commit resources to the enterprise; determine amount of commitment; evaluate the use and stewardship of resources by management.

Management (including directors and officers)—assess nature and extent of financing needs; evaluate results of past economic decisions; set dividend policy; project future financial position and income; assess merger and acquisition possibilities; recommend reorganization or dissolution.

Taxing authorities—evaluate tax returns; assess taxes or penalties; make investigations and audits.

Employees—negotiate wages; terminate employment; or, for prospective employees, apply for employment.

Customers—anticipate price changes; seek alternative sources or broader bases of supply.

---

[1] The term *information* is sometimes applied only to relevant data. Sections 1021-1029 do not distinguish between the terms *information* and *data*.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Users with Indirect Interests

.06 Some users of financial accounting information derive an interest because their function is to assist or protect those who have or contemplate having a direct interest. Examples are:

Financial analysts and advisors—advise investors and potential investors to retain, increase, decrease, or acquire an investment in the enterprise; evaluate prospects of investment in the enterprise relative to alternative investments.[2]

Stock exchanges—accept or cancel listings; suspend trading; encourage changes in accounting practices or additional disclosure of information.

Lawyers—determine whether covenants and contractual provisions are fulfilled; advise on legality of dividends and profit sharing and deferred compensation agreements; draft pension plan terms.

Regulatory or registration authorities—assess reasonableness of rate of return; allow or require increases or decreases in prices or rates; require or recommend changes in accounting or disclosure practices; issue cease-and-desist or stock-trading-suspension orders.

Financial press and reporting agencies—prepare descriptive analyses; combine, summarize, or select information to present in descriptions; conform information to uniform presentation arrangements; compute trends and ratios.

Trade associations—compile industry statistics and make comparisons; analyze industry results.

Labor unions—formulate wage and contract demands; assess enterprise and industry prospects and strengths.

Common and Special Needs

.07 Financial accounting information may be directed toward the common needs of one or more of the user groups cited above or may be directed toward specialized needs. Examples of information directed toward common needs are the general-purpose reports on enterprise financial posi-

---

[2] Investment bankers are users with derived interests when they act as analysts and advisors to issuers of securities and investors in securities. They are users with direct interests when they purchase and sell securities on their own account.

tion and progress known as the balance sheet, the income statement and the statement of changes in financial position. The emphasis in financial accounting on general-purpose information (see section 1025.12) is based on the presumption that a significant number of users need similar information. General-purpose information is not intended to satisfy specialized needs of individual users. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

.08 Examples of information that is derived from financial accounting records and directed toward specialized needs are some financial reports submitted to regulatory authorities, special financial reports prepared to obtain credit or loans, many reports to management, tax returns, and statistical financial information given to trade and industry associations. Information prepared for a particular purpose cannot be expected to serve other needs well. Furthermore, the problem of ascertaining specialized needs of a large number of users, the cost of attempting to serve these needs on an individual basis, and the confusion that might result from disseminating more than one set of information about the financial results of an enterprise's operations militate against attempting to serve all needs of users with special-purpose reports.

.09 Improving financial accounting requires continuing research on the nature of user needs, on the decision processes of users, and on the information that most effectively serves user needs.

THE ORGANIZATION OF ECONOMIC ACTIVITY IN SOCIETY

.10 All societies engage in certain fundamental economic activities:

Production—the process of converting economic resources into outputs of goods and services that are intended to have greater utility than the required inputs. In sections 1021-1029 the term *production* is used in this broad sense and encompasses the provision of services and the movement and storage of goods as well as changes in physical form of goods. The term *production* therefore is not used in sections 1021-1029 synonymously with the term *manufacturing*.[3]

[3] See paragraph .23 for further discussion of production.

© 1974, American Institute of Certified Public Accountants, Inc.

Income distribution—the process of allocating rights to the use of output among individuals and groups in society.

Exchange—the process of trading resources or obligations for other resources or obligations.

Consumption—the process of using the final output of the production process.

Saving—the process by which individuals and groups set aside rights to present consumption in exchange for rights to future consumption.

Investment—the process of using current inputs to increase the stock of resources available for future output as opposed to immediately consumable output.

.11 In less developed economies each form of economic activity is relatively simple and many of the processes are merged into one another. Individuals or groups produce for their own consumption; the distribution of claims to output and income is direct and obvious; exchange is the exception rather than the rule; and saving and investment occur together as some individuals or groups set aside part of the product of their current effort for future rather than present consumption.

.12 In contrast, economic activity is specialized and complex in highly developed economies like the United States. Goods and services are produced by specialized units. These units may be government owned, but in the United States most productive activity is carried on through investor owned business enterprises. Business enterprises are individuals or associations of individuals that control and use resources for a variety of purposes including the purpose of yielding a return to the owners of the enterprise. They produce for sale rather than their own consumption and generally engage in market exchanges to acquire inputs for the production process and to dispose of goods and services produced.

.13 Within producing units, the production process itself is often specialized and complex. Modern organization permits and modern technology requires long, continuous, and intricate processes in which products and services are often the joint result of several productive re-

sources. Rapid changes in technology change patterns of inputs and of outputs and contribute to changes in their relative prices. Likewise, shifts in consumer demands and preferances affect the prices of outputs and through these the prices of inputs used in the production process.

.14 Savings and investment are also separate, specialized activities. Savings are invested through a complex set of intermediaries which offer the saver diverse types of ownership or creditor claims, most of which can be freely traded.

.15 The complexity and diversity of modern economic organization have implications for financial accounting:

(1) Since economic activity of business enterprises tends to be continuous, relationships associated with intervals of time like a year or a quarter of a year can be measured only on the basis of assumptions or conventional allocations.

(2) Because of the complexity of modern production and the joint nature of economic results, the relative effects of the various productive resources are intertwined, not only with each other but with external market events. Computing the precise effects of a particular input unit or a particular external event is therefore impossible except on an arbitrary basis.

(3) In a dynamic economy, the outcome of economic activity is uncertain at the time decisions are made and financial results often do not correspond to original expectations.

.16 On the other hand, certain elements of modern economic organization help to provide an underlying continuity and stability to some aspects of economic activity and hence to the task of measuring that activity. In particular:

(1) Several forms of enterprise, especially the corporate form, continue to exist as legal entities for extended periods of time.

(2) The framework of law, custom, and traditional patterns of action provides a significant degree of stability to many aspects of the economic environ-

 © 1974, American Institute of Certified Public Accountants, Inc.

ment. In a society in which property rights are protected, contracts fulfilled, debts paid, and credit banking and transfer operations efficiently performed, the degree of uncertainty is reduced and the predicability of the outcome of many types of economic activities is correspondingly increased.

ECONOMIC ACTIVITY IN INDIVIDUAL BUSINESS ENTERPRISES

.17 The economic activities of a business enterprise increase or decrease (1) its economic resources, (2) its economic obligations, and (3) the residual interest in its resources.

Economic Resources

.18 Economic resources are the scarce means (limited in supply relative to desired uses) available for carrying on economic activities. The economic resources of a business enterprise include:

1. *Productive resources*

   These resources are the means used by the enterprise to produce its product:

   a. Productive resources of the enterprise—

      These include raw materials, plant, equipment, natural resource deposits, patents and similar intangibles, goodwill, services, and other resources used in production.

   b. Contractual rights to productive resources—

      These include contractual rights to the use of resources of other entities (including individuals) as well as rights to delivery of materials, plant, and equipment from other entities. Contractual rights to resources of other entities often arise in mutual commitments in which payment is to be made as, or shortly after, the goods or services are used or received.

2. *Products*

   These resources are outputs of the enterprise, consisting of (a) goods awaiting exchange, and (b)

partially completed goods still in the process of production.[4]

3. *Money*
4. *Claims to receive money*
5. *Ownership interests in other enterprises.*

Economic Obligations

.19 The economic obligations of an enterprise at any time are its present responsibilities to transfer economic resources or provide services to other entities in the future. Obligations usually arise because the enterprise has received resources from other entities through purchases or borrowings. Some obligations, however, arise by other means, for example, through the imposition of taxes or through legal action. Obligations are general claims against the enterprise rather than claims to specific resources of the enterprise unless the terms of the obligation or applicable legal rules provide otherwise. Economic obligations include:

1. *Obligations to pay money*
2. *Obligations to provide goods or services*

   These are normally contractual obligations calling for the transfer of resources other than money according to specified conditions. The obligations may arise because payment for the goods or services to be provided has already been received or as the result of a mutual commitment.

Residual Interest

.20 The residual or owners' interest is the interest in the economic resources of an enterprise that remains after deducting economic obligations. It is the interest of those who bear the ultimate risks and uncertainties and receive the ultimate benefits of enterprise operations. At the start of the enterprise the residual interest equals the owners' initial investment of resources. Increases or decreases in enterprise resources that are not offset by equal changes in enterprise obligations change the residual interest.

[4] The products of an enterprise also include services provided to other entities. Services provided to others cannot be inventoried, however, and therefore are not resources of the enterprise.

 © 1974, American Institute of Certified Public Accountants, Inc.

Relationship Among Economic Resources, Economic Obligations, and Residual Interest

.21 The relationship among the resources of an enterprise and the claims and interests in those resources implicit in the definition of residual interest is:

Economic Resources — Economic Obligations = Residual Interest [5]

The resources, obligations, and residual interest of an enterprise are the basis for the basic elements of financial position—assets, liabilities, and owners' equity—dealt with in financial accounting (see section 1025.19-.20).

Changes in Economic Resources, Economic Obligations, and Residual Interest

.22 Resources, obligations, and residual interest of an enterprise change over time. Changes in resources and obligations include acquisitions and dispositions of resources, incurrence and discharge of obligations, and changes in the utility or prices of resources held. Because resources, obligations, and residual interest are related, changes in them are also related and a change in total resources is always accompanied by a change in obligations or residual interest. Events that change resources, obligations, and residual interest are the basis for the basic elements of results of operations—revenue, expenses, and net income (see section 1025.21-.22)—and other changes in financial position with which financial accounting is concerned.

.23 Events that change the resources, obligations, or residual interest of an enterprise may be classified in many ways. The following classification is intended to be complete, to avoid overlapping, and to highlight differences that are important to financial accounting. This classification of events is used in section 1027 as the basis for presenting the principles of selection and measurement.

I. External events: events that affect the enterprise and in which other entities participate.

  A. Transfers of resources or obligations to or from other entities.

[5] Expressing the relationship in a mathematical equation goes beyond descriptions of terms and assumes appropriate measurement. Measurement of economic activity is discussed in paragraphs .27-.33.

1. Exchanges—

   These events are reciprocal transfers of resources or obligations between the enterprise and other entities in which the enterprise either sacrifices resources or incurs obligations in order to obtain other resources or satisfy other obligations. Exchanges occur if each party to the transaction values that which he will receive more than that which he must give up and if the particular exchange is evaluated as preferable to alternative actions. Exchanges encompass many of the economic interactions of entities; they include contractual commitments as well as transfers of goods, services, money, and the exchange of one obligation for another. Some exchanges take place on a continuous basis over time instead of being consummated at a moment of time—for example, accumulations of interest and rent.

2. Nonreciprocal transfers—

   These events are transfers in one direction of resources or obligations, either from the enterprise to other entities or from other entities to the enterprise.

   a. Transfers between the enterprise and its owners—

      These are events in which the enterprise receives resources from owners and the enterprise acknowledges an increased ownership interest, or the enterprise transfers resources to owners and their interest decreases.[6] These transfers are not exchanges from the point of view of the enterprise. The enterprise sacrifices none of its resources and incurs no obligations in exchange for owners' investments, and it receives

[6] Interactions of enterprises with owners acting as customers, suppliers, employees, debtors, creditors, donors, etc., rather than as owners are excluded from this category.

 © 1974, American Institute of Certified Public Accountants, Inc.

nothing of value to itself in exchange for the resources it distributes.[7] Transfers of this type also include declaration of dividends and substituting ownership interest for obligations.

b. Nonreciprocal transfers between the enterprise and entities other than owners—

In these transfers one of the two entities is often passive, a mere beneficiary or victim of the other's actions. Examples are gifts, dividends received, taxes, loss of a negligence lawsuit, imposition of fines, and theft.

B. External events other than transfers of resources or obligations to or from other entities.

Enterprise resources may be changed by actions of other entities that do not involve transfers of enterprise resources or obligations. Examples are changes in specific prices of enterprise resources, changes in interest rates, general price-level changes, technological changes caused by outside entities, and vandalism. In addition to their direct effects on the enterprise, these types of events also introduce an element of uncertainty into production and exchange activities. Unfavorable effects of these events may at best be insured or hedged against or provided for through policies that promote orderly adaptation to changed conditions.

II. Internal events: events in which only the enterprise participates.

---

[7] The distinction between exchanges and transfers between an enterprise and its owners is important in financial accounting today because resources are normally recorded at the cost (see section 1026.28) in an exchange; owners' investments have no cost to the enterprise and are recorded at the fair value of the assets received (see section 1027.08, M-2). Furthermore, revenue and expenses can result from exchanges but not from transfers between an enterprise and its owners.

A. Production.

Production in a broad sense is the process by which resources are combined or transformed into products (goods or services). Production does not necessarily alter the physical form of the items produced; it may involve simply a change in location or the holding of items over a period of time. Production encompasses a broad range of activities, including manufacturing, exploration, research and development, mining, agriculture, transportation, storage, marketing and distribution, merchandising, and provision of services. Each of these activities is intended to result in a product with an exchange price greater than the cost of the resources used in its production. Production includes all the internal events of an enterprise except casualties. (The term *production* therefore is *not* used in sections 1021-1029 synonymously with the term *manufacturing*.)

B. Casualties.

Casualties are sudden,[8] substantial, unanticipated reductions in enterprise resources not caused by other entities.[9] Examples are fires, floods, and other events ordinarily termed acts of God. Some events in this category are similar to those in category IB in that they introduce an element of uncertainty and may be insured against.

.24 Net income or loss can result from each of the types of events listed except transfers between an enterprise and its owners.

.25 *Discussion of Classification of Events.* Classifying events involves problems regardless of the system of classification chosen. First, the distinctions between classes probably cannot be made clear enough to make the class

[8] Casualties also include concealed progressive changes in assets that are discovered after substantial change has taken place, for example, damage from settling of a building foundation.

[9] This definition of casualties differs from that in the Internal Revenue Code, which includes some external events as casualties.

 © 1974, American Institute of Certified Public Accountants, Inc.

in which every event belongs obvious. For example, the distinctions between external and internal events and between production and casualties involve borderline situations which require judgment in assigning events to classes. Second, more than one event can occur at the same time and place. For example, when employees are at work, exchanges are taking place between the enterprise and the employees (wages and salaries are accruing) and production is taking place at the same time. Single occurrences must sometimes be analyzed into component events that fit into separate classes. Finally, the economic substance of some events may differ from their legal form. Classification of this kind of event may differ depending on whether its form or its substance is considered to govern (see section 1025.14).

.26 *Cost.* Changes in resources, obligations, and residual interest often involve economic cost to the enterprise. Economic cost is the sacrifice (that which is given up or foregone) incurred in economic activities (see section 1026.28 for treatment of cost under generally accepted accounting principles).

MEASURING ECONOMIC ACTIVITY

.27 Comparison and evaluation of diverse economic activities are facilitated by measurement[10] of enterprises' resources and obligations and the events that change them.

Measurement Problems

.28 The complexity, continuity, and joint nature of economic activity (see paragraphs .12 to .15) present problems in measuring the effects of enterprise activities and associating them with specific products and services and with relatively short time periods. The need to relate measurements to each other also presents problems because it requires selecting like quantitative attributes and ignoring others. Attributes are selected on the basis of concepts that specify the attribute to be measured and how and when measurements are to be made. Disagreements over meas-

[10] The terms *measurement* and *valuation* are often used interchangeably in accounting to mean simply the quantification of resources, obligations, and changes in them in money terms. An accounting research study on measurement and valuation in financial accounting is now in progress. The technicalities of differences between measurement and valuation, if any, will be examined in that study.

urement concepts are the source of many of the differences of opinion about how to achieve the objectives of financial accounting and financial statements. (The objectives are discussed in section 1024.)

.29 Because the resources and obligations of an enterprise and changes in them are inseparably connected, measuring the resources and obligations and measuring changes in them (including those changes that are the source of net income for a period) are two aspects of the same problem.

Exchange Prices

.30 The effects of economic activities are measured in terms of money in a monetary economy. Money measurements are used to relate economic activities that use diverse types of resources to produce diverse types of products and services. Fluctuations in the general purchasing power of money cause problems in using money as a unit of measure (see sections 1026.30 to 1026.32).

.31 Resources are measured in terms of money through money prices, which are ratios at which money and other resources are or may be exchanged. Several types of money prices can be distinguished based on types of markets (purchase prices and sales prices) and based on time (past prices, present prices, and expected future prices). Four types of money prices are used in measuring resources in financial accounting.

1. *Price in past purchase exchanges of the enterprise*
   This price is usually identified as *historical cost* or *acquisition cost* because the amount ascribed to the resource is its cost, measured by the money or other resources exchanged by the enterprise to obtain it.
2. *Price in a current purchase exchange*
   This price is usually identified as *replacement cost* because the amount ascribed to the resource is measured by the current purchase price of similar resources that would now have to be paid to acquire it if it were not already held or the price that would now have to be paid to replace assets held.
3. *Price in a current sale exchange*
   This price is usually identified as *current selling price* because the amount ascribed to the resource

© 1974, American Institute of Certified Public Accountants, Inc.

is measured by the current selling price of the resource that would be received in a current exchange.

4. *Price based on future exchanges*

   This price is used in several related concepts—*present value of future net money receipts, discounted cash flow, (discounted) net realizable value,* and *value in use.* Each indicates that the amount ascribed to the resource is measured by the expected net future money flow related to the resource in its present or expected use by the enterprise, discounted for an interest factor.[11]

.32 Each of these concepts has at least some current application in financial accounting. Their application is discussed in connection with present generally accepted accounting principles in section 1027.05.

.33 Measuring economic activities in terms of exchange prices has certain limitations because some important changes that affect these activities are not changes in monetary attributes of resources. Examples are (1) physical changes in resources during production, (2) certain external events, such as technological changes and changes in consumer tastes, and (3) certain broad forces in the economy, such as changes in governmental attitudes toward business operations. Reporting these changes in terms of exchange prices when they occur requires certain assumptions, for example, assumptions concerning the presumed effect of these changes on prices of enterprise resources. The alternative is to wait to report these changes until they affect aspects of resources that are directly related to exchange prices or until exchanges occur.

→ *The next page is 7221.* ←

[11] *Current selling price* and *net realizable value* differ conceptually, although they may give the same amount under certain conditions: (1) future sales price is expected to be the same as current sales price (or no better estimate of future sales price than current price is available), (2) no future costs are expected, and (3) discounting is ignored.

AC Section 1024

Objectives of Financial Accounting and Financial Statements

[Source: APB Statement No. 4, Chap. 4, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

.01 The basic purpose of financial accounting and financial statements is to provide quantitative financial information about a business enterprise that is useful to statement users, particularly owners and creditors, in making economic decisions. This purpose includes providing information that can be used in evaluating management's effectiveness in fulfilling its stewardship and other managerial responsibilities. Within the framework of these purposes financial accounting and financial statements have a number of objectives that (1) determine the appropriate content of financial accounting information (general objectives) and (2) indicate the qualities that make financial accounting information useful (qualitative objectives). The objectives provide means to evaluate and improve generally accepted accounting principles (see section 1029.07).

.02 The content of financial accounting information can be examined on two levels. First, the appropriate content of particular financial statements prepared at a given date may be examined. Second, the appropriate content of financial accounting information in general, without regard for the conventions at any particular date, may be examined.

OBJECTIVES OF PARTICULAR FINANCIAL STATEMENTS

.03 The objectives of particular financial statements are to present fairly in conformity with generally accepted accounting principles[1] (1) financial position, (2) results

[1] See section 1026.01-.04 for a discussion of the nature of generally accepted accounting principles. See section 1027.15 for a discussion of fair presentation in conformity with generally accepted accounting principles.

of operations, and (3) other changes in financial position. Financial position and changes in financial position of an enterprise are defined in terms of its economic resources and obligations and changes in them that are identified and measured in conformity with accounting principles that are generally accepted at the time the statements are prepared.[2]

GENERAL OBJECTIVES

.04 The objectives of particular financial statements are stated in terms of the accounting principles that are generally accepted at the time the financial statements are prepared. These principles may change in response to a variety of forces.[3] General objectives that give direction to the development of accounting principles are therefore required. These general objectives are broader or longer range than those for particular financial statements and indicate the appropriate content of financial accounting information in general. They are independent of generally accepted accounting principles at any particular time. Improving financial accounting to better achieve the general objectives involves difficulties, which are discussed in paragraphs .38 to .41.

Statement of the General Objectives

.05 A general objective of financial accounting and financial statements is to provide reliable financial information about economic resources and obligations of a business enterprise. This information is important in evaluating the enterprise's strengths and weaknesses. It indicates how enterprise resources are financed and the pattern of its holdings of resources. It aids in evaluating the enterprise's ability to meet its commitments. The information indicates the present resource base available to exploit opportunities and make future progress. In short, information about economic resources and obligations of a business enterprise is needed to form judgments about the ability of the enterprise to survive, to adapt, to grow, and to prosper amid changing economic conditions.

.06 Another general objective, of prime importance, is to provide reliable information about changes in net re-

---

sources (resources less obligations) of an enterprise that result from its profit-directed activities.[4] Almost all who are directly concerned with the economic activities of an enterprise are interested in its ability to operate successfully. Investors expect a dividend return or increases in the price of ownership shares or both. An enterprise that operates successfully is more likely to be able to pay creditors and suppliers, provide jobs for employees, pay taxes, and generate funds for expansion. Management of the enterprise also needs information about economic progress to plan operations and evaluate progress in comparison with previously established goals. To survive, the enterprise needs some minimum level of success in its profit-directed activities over the long run.

.07 A related general objective is to provide financial information that assists in estimating the earning potential of the enterprise. Information about the past and present may help users of the information in making predictions. Trend figures usually (though not invariably) are better aids to prediction than the results of a single year. Extrapolations of financial data, however, should be made only in conjunction with the best additional information available about the enterprise, its circumstances, and its prospects.

.08 Another general objective is to provide other needed information about changes in economic resources and obligations. Examples are information about changes in residual interest from sources other than profit-directed activities and information about financing and investing activities. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

.09 A further general objective is to disclose, to the extent possible, other information related to the financial statements that is relevant to statement users' needs. Examples of disclosures of this type are descriptions of the accounting policies adopted by the reporting entity. [As amended by APB Opinion No. 22, December 31, 1971.]

---

[4] The term *profit-directed activities* is used in sections 1021-1029 to refer to all activities of an enterprise except transfers between the enterprise and its owners.

.10 Underlying the preceding discussion is the recognition that decisions of financial statement users involve the process of choosing among alternative courses of action. Owners make choices on whether to increase, retain, or dispose of holdings in various enterprises. Creditors often must choose between enterprises in deciding whether to extend credit. Management makes choices, for example, between alternative business activities and between alternative investments. Generally, statement users compare performance both between enterprises and over two or more reporting periods for the same enterprise. (See paragraphs .21 and .23-.33 for a discussion of comparability in financial accounting.)

Discussion of General Objectives

.11 The general objectives aid in improving accounting principles by relating the content of the information to the underlying activities of business enterprises and to the interests and needs of users of the information.

.12 The general objectives do not specify which resources and obligations and changes should be measured and reported as assets, liabilities, revenue, and expenses in financial accounting. They contain no implication that assets and liabilities ideally should include *all* resources and obligations or that *all* changes in assets and liabilities ideally should be reported.[5] Furthermore, they do not specify how the resources and obligations to be recorded should be measured. A complementary set of objectives, the qualitative objectives, aids in determining which resources and obligations and changes should be measured and reported and how they should be measured and reported to make the information most useful.

QUALITATIVE OBJECTIVES

.13 Certain qualities or characteristics make financial information useful. Providing information that has each of these qualities is an objective of financial accounting.

[5] Not all resources and obligations and changes in them are presently reported. For example, rights under executory contracts, obligations whose amounts are indeterminate, and changes in market price of productive resources are generally not recorded as assets, liabilities, revenue, and expenses, although they may be disclosed. (See sections 1026-1028 on generally accepted accounting principles.)

 © 1974, American Institute of Certified Public Accountants, Inc.

These qualitative objectives are at least partially achieved at present, although improvement is probably possible in connection with each of them. Constraints on full achievement of the qualitative objectives are caused by conflicts of objectives, by environmental influences, and by lack of complete understanding of the objectives (see paragraphs .38 to .41).

.14 The qualitative objectives are related to the broad ethical goals of truth, justice, and fairness that are accepted as desirable goals by society as a whole. To the extent that the objectives are met, progress is made toward achieving the broad ethical goals as well as toward making financial information more useful. The qualitative objectives are less abstract than the ethical goals of truth, justice, and fairness and can therefore be applied more directly to financial accounting. Nevertheless, they are also generalizations that require judgment in using them to evaluate and improve accounting principles.

Statement of the Qualitative Objectives

.15 The Board believes that financial accounting has seven qualitative objectives (0-1 to 0-7). The primary qualitative objective is relevance.

.16 0-1. *Relevance.* Relevant financial accounting inmation bears on the economic decisions for which it is used.

The objective of relevance helps in selecting methods of measuring and reporting in financial accounting that are most likely to aid users in making the types of economic decisions for which they use financial accounting data.[6] In judging relevance of general-purpose information attention is focused on the common needs of users and not on specific needs of particular users. A vital task is to determine these common needs and the information that is relevant to them (see sections 1023.07 and 1023.09). Relevance is the primary qualitative objective because information that does not bear on the decisions for which it is used is useless, regardless of the extent to which it satisfies the other objectives.

[6] See discussion on uses and users in section 1023.04-.09.

.17 0-2. *Understandability.* Understandable financial accounting information presents data that can be understood by users of the information and is expressed in a form and with terminology adapted to the users' range of understanding.

Understandability is important because accounting information must be intelligible if it is to be useful. Users of financial statements can understand the information only if the data presented and their method of presentation are meaningful to them. Understandability also requires that the users have some understanding of the complex economic activities of enterprises, the financial accounting process, and the technical terminology used in financial statements.

.18 0-3. *Verifiability.* Verifiable financial accounting information provides results that would be substantially duplicated by independent measurers using the same measurement methods.

Measurements cannot be completely free from subjective opinions and judgments. The process of measuring and presenting information must use human agents and human reasoning and therefore is not founded solely on an "objective reality." Nevertheless, the usefulness of information is enhanced if it is verifiable, that is, if the attribute or attributes selected for measurement and the measurement methods used provide results that can be corroborated by independent measurers.

.19 0-4. *Neutrality.* Neutral financial accounting information is directed toward the common needs of users and is independent of presumptions about particular needs and desires of specific users of the information.

Measurements not based on presumptions about the particular needs of specific users enhance the relevance of the information to common needs of users. Preparers of financial accounting information should not try to increase the helpfulness of the information to a few users to the detriment of others who may have opposing interests.

.20 0-5. *Timeliness.* Timely financial accounting information is communicated early enough to

 © 1974, American Institute of Certified Public Accountants, Inc.

be used for the economic decisions which it might influence and to avoid delays in making those decisions.

.21 0-6. *Comparability.* Comparable financial accounting information presents similarities and differences that arise from basic similarities and differences in the enterprise or enterprises and their transactions and not merely from differences in financial accounting treatments.

Problems in achieving comparability are discussed in paragraphs .23 to .33.

.22 0-7. *Completeness.* Complete financial accounting information includes all financial accounting data that reasonably fulfill the requirements of the other qualitative objectives (0-1 to 0-6).

The first six qualitative objectives specify qualities that are desirable in reported financial information. The objective of completeness specifies that all information that has the six qualities in reasonable degree should be reported.

Comparability

.23 Comparability means the ability to bring together for the purpose of noting points of likeness and difference. Comparability of financial information generally depends on like events being accounted for in the same manner. Comparable financial accounting information facilitates conclusions concerning relative financial strengths and weaknesses and relative success, both between periods for a single enterprise and between two or more enterprises.

.24 *Comparability Within a Single Enterprise.* A comparison of the financial statements of one enterprise at one date or for one period of time with those of the same enterprise at other dates or for other periods of the same length is more informative if the following conditions exist:

(1) The presentations are in the same form—that is, the arrangement within the statements is identical.

(2) The content of the statements is identical—that is, the same items from the underlying accounting records are classified under the same captions.

(3) Accounting principles are not changed or, if they are changed, the financial effects of the changes are disclosed.

(4) Changes in circumstances or in the nature of the underlying transactions are disclosed.

.25 If these four conditions are satisfied, a comparison of the financial statements furnishes useful information about differences in the results of operations for the periods involved or in the financial positions at the dates specified. To the extent, however, that any one of the conditions is not met, comparisons may be misleading.

.26 *Consistency*—Consistency is an important factor in comparability within a single enterprise. Although financial accounting practices and procedures are largely conventional, consistency in their use permits comparisons over time. If a change of practice or procedure is made, disclosure of the change and its effect permits some comparability, although users can rarely make adjustments that make the data completely comparable.

.27 *Regular reporting periods*—Regular reporting periods are also an important factor in comparability within a single enterprise. Periods of equal length facilitate comparisons between periods. Comparing the results of periods shorter than a year, even though the periods are of equal length, however, may require consideration of seasonal factors. (See section 2071, *Interim Financial Reporting*.)

.28 *Comparability Between Enterprises.* Comparability between enterprises is more difficult to attain than comparability within a single enterprise. Widespread public interest in investment opportunities in recent years has focused attention on the desirability of achieving greater comparability of financial statements.

.29 To make comparisons between enterprises as meaningful as possible, the four conditions outlined in paragraph .24 as well as other conditions should be satisfied. The most important of the other conditions is that, ideally, differences between enterprises' financial statements should arise from basic differences in the enterprises themselves or from the nature of their transactions and not merely from differences in financial accounting practices and pro-

© 1974, American Institute of Certified Public Accountants, Inc.

cedures. One of the most important unsolved problems at present, therefore, is the general acceptance of alternative accounting practices under circumstances which themselves do not appear to be sufficiently different to justify different practices.

.30 Achieving comparability between enterprises depends on accomplishing two difficult tasks: (1) identifying and describing the circumstances that justify or require the use of a particular accounting practice or method, (2) eliminating the use of alternative practices under these circumstances. If these tasks can be accomplished, basic differences under which enterprises operate can be reflected by appropriate, and possibly different, practices.

.31 Pending accomplishment of these tasks, users of financial statements should recognize that financial statements of different enterprises may not be fully comparable; that is, they may to an unknown extent reflect differences unrelated to basic differences in the enterprises and in their transactions. Evaluation of differences is not completely effective in the absence of criteria governing the applicability of various practices and methods.

.32 Supplemental disclosures are sometimes directed toward overcoming this present weakness in financial reporting, but disclosure does not necessarily make financial statements comparable. For example, a statement user may not safely assume that he has made comparable the financial statements of two enterprises which use different accounting methods even though he has been able to put them on the same inventory or depreciation method through the use of disclosed information, because the circumstances may differ to such an extent that similar methods may not be appropriate.

.33 The Accounting Principles Board and others in the accounting profession are continuing to work on problems of comparability between enterprises. The Board has, for example, developed criteria for application of practices and procedures in some problem areas and expects to deal with others in the future. The great variety of business enterprises and the large number of different circumstances in which enterprises operate, even within the same industry, make the task a difficult one. The Board ranks compara-

bility among the most important of the objectives of financial accounting, however, and is attempting to narrow areas of difference in accounting practices that are not justified by differences in circumstances.

Adequate Disclosure

.34 Financial information that meets the qualitative objectives of financial accounting also meets the reporting standard of adequate disclosure.[7] Adequate disclosure relates particularly to objectives of relevance, neutrality, completeness, and understandability. Information should be presented in a way that facilitates understanding and avoids erroneous implications. The headings, captions, and amounts must be supplemented by enough additional data so that their meaning is clear but not by so much information that important matters are buried in a mass of trivia.

Reliability of Financial Statements

.35 Achievement of the qualitative objectives of financial accounting enhances the reliability of financial statements. Reliability of information is important to users because decisions based on the information may affect their economic well-being. Reliability does not imply precision of the information in financial statements because financial accounting involves approximation and judgment (see sections 1025.10 and 1025.11).

.36 The responsibility for the reliability of an enterprise's financial statements rests with its management. This responsibility is discharged by applying generally accepted accounting principles that are appropriate to the enterprise's circumstances, by maintaining effective systems of accounts and internal control, and by preparing adequate financial statements.

.37 The users of financial statements also look to the reports of independent auditors to ascertain that the financial statements have been examined by independent experts who have expressed their opinion as to whether or not the information is presented fairly in conformity with generally accepted accounting principles consistently applied.

ACHIEVING THE OBJECTIVES

.38 The objectives of financial accounting and financial statements are at least partially achieved at present, although improvement is probably possible in connection with each of them. The objectives are often difficult to achieve, however, and are usually not equally capable of attainment. Constraints on full achievement of the objectives arise from (1) conflicts of objectives, (2) environmental influences, and (3) lack of complete understanding of the objectives.

.39 The pursuit of one objective or one set of objectives may conflict with the pursuit of others. It is not always possible, for example, to have financial statements that are highly relevant on the one hand and also timely on the other. Nor is it always possible to have financial accounting information that is both as verifiable and as relevant as desired. Only if all other objectives are not affected will a change in information that increases compliance with one objective be certain to be beneficial. Conflicts between qualitative objectives might be resolved by arranging the objectives in order of relative importance and determining desirable trade-offs, but, except for the primacy of relevance, neither accountants nor users now agree as to their relative importance. Determining the trade-offs that are desirable requires judgment.

.40 Constraints on achieving the objectives may stem from influences of the environment on accounting. First, the objectives, which are based largely on the needs of users of financial information, are not necessarily compatible with environmental influences. The inherent difficulties of measurement in terms of money, for example, mean that information produced by accounting will necessarily fall short to some extent of objectives of verifiability and comparability. Second, financial accounting costs money. Anticipated benefits from proposed changes in financial accounting information that are intended to better achieve the objectives must be weighed against the additional cost involved. Finally, changing financial accounting practices to better achieve the objectives involves user costs and dislocations that may tend to offset the advantages to be obtained. For example, changing practices may affect business arrangements that were initiated on the basis of

practices before the change. Also, the costs of learning how to use new types of information and the reluctance to change ways of using information may reduce the benefits otherwise obtainable from improvements.

.41 The Board believes that the objectives discussed in this section are helpful in evaluating and improving financial accounting information even though they are stated in general terms. Obtaining clearer understanding of the nature and implications of the objectives is an important prerequisite to further improvement of financial accounting and financial statements.

AC Section 1025

Basic Features and Basic Elements of Financial Accounting

[Source: APB Statement No. 4, Chap. 5.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

BASIC FEATURES OF FINANCIAL ACCOUNTING

.01 The basic features of financial accounting are a distillation of the effects of environmental characteristics (described in section 1023) on the financial accounting process. These features underlie present generally accepted accounting principles, discussed in sections 1026 to 1028, but they could also serve as a foundation for other accounting principles that are based on the same environmental characteristics.

Statement of the Basic Features of Financial Accounting

.02 The following thirteen statements (F-1 to F-13) describe the basic features of financial accounting. Each statement contains a parenthetical reference to environmental characteristics from which it is, at least in part, derived.

.03 F-1. *Accounting entity.* Accounting information pertains to entities, which are circumscribed areas of interest. In financial accounting the entity is the specific business enterprise. The enterprise is identified in its financial statements. (sections 1023.12, 1023.17)

Attention in financial accounting is focused on the economic activities of individual business enterprises. The boundaries of the accounting entity may not be the same as those of the legal entity, for example, a parent corporation and its subsidiaries treated as a single business enterprise.

.04 F-2. *Going concern.* An accounting entity is viewed as continuing in operation in the absence of evidence to the contrary.[1] (section 1023.16)

Because of the relative permanence of enterprises, financial accounting is formulated basically for going concerns. Past experience indicates that continuation of operations is highly probable for most enterprises although continuation cannot be known with certainty. An enterprise is not viewed as a *going concern* if liquidation appears imminent.

.05 F-3. *Measurement of economic resources and obligations.* Financial accounting is primarily concerned with measurement of economic resources and obligations and changes in them. (sections 1023.10, 1023.17-.19, 1023.22-.24, 1023.27)

The subject matter of financial accounting is economic activity and financial accounting therefore involves measuring and reporting on the creation, accumulation, and use of economic resources. Economic activities that can be quantified are emphasized in financial accounting. Accounting does not deal directly with subjective concepts of welfare or satisfactions; its focus is not sociological or psychological.

.06 F-4. *Time periods.* The financial accounting process provides information about the economic activities of an enterprise for specified time periods that are shorter than the life of the enterprise. Normally the time periods are of equal length to facilitate comparisons. The time period is identified in the financial statements. (sections 1023.13, 1023.15-.16, 1023.28)

Interested parties make evaluations and decisions at many points in the lives of enterprises. The continuous activities of enterprises are therefore segmented into relatively short periods of time so that information can be prepared that will be useful in decisions.

---

[1] The corollary observation is that if liquidation appears imminent, financial information may be prepared on the assumption that liquidation will occur.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.07 F-5. *Measurement in terms of money.* Financial accounting measures monetary attributes of economic resources and obligations and changes in them. The unit of measure is identified in the financial statements. (sections 1023.12, 1023.17, 1023.27, 1023.30-.31)

Measurement in terms of money focuses attention on monetary attributes of resources and obligations; other aspects, such as physical attributes, are not emphasized. Money measurement entails significant problems (see sections 1023.28, 1023.29 and 1023.33).

.08 F-6. *Accrual.* Determination of periodic income and financial position depends on measurement of economic resources and obligations and changes in them as the changes occur rather than simply on recording receipts and payments of money. (sections 1023.17, 1023.20-.22, 1023.24, 1023.27, 1023.29, 1023.31)

Enterprise economic activity in a short period seldom follows the simple form of a cycle from money to productive resources to product to money. Instead, continuous production, extensive use of credit and long-lived resources, and overlapping cycles of activity complicate the evaluation of periodic activities. As a result, noncash resources and obligations change in time periods other than those in which money is received or paid. Recording these changes is necessary to determine periodic income and to measure financial position. This is the essence of accrual accounting.

.09 F-7. *Exchange price.* Financial accounting measurements are primarily based on prices at which economic resources and obligations are exchanged. (sections 1023.12, 1023.28, 1023.30-.33)

Measurement in terms of money is based primarily on exchange prices. Changes in resources from other than exchanges (for example, production) are measured by allocating prices in prior exchanges or by reference to current prices for similar resources. The multiple concepts of exchange price (section 1023.31) require decisions about the prices relevant to the uses of financial accounting information.

.10 F-8. *Approximation.* Financial accounting measurements that involve allocations among relatively short periods of time and among complex and joint activities are necessarily made on the basis of estimates. (sections 1023.12-.13, 1023.15-.16, 1023.28, 1023.33)

The continuity, complexity, uncertainty, and joint nature of results inherent in economic activity often preclude definitive measurements and make estimates necessary.

.11 F-9. *Judgment.* Financial accounting necessarily involves informed judgment. (sections 1023.04, 1023.07-.08, 1023.15-.16, 1023.28-.29, 1023.32-.33)

The estimates necessarily used in financial accounting (F-8) involve a substantial area of informed judgment. This precludes reducing all of the financial accounting process to a set of inflexible rules.

.12 F-10. *General-purpose financial information.* Financial accounting presents general-purpose financial information that is designed to serve the common needs of owners, creditors, managers, and other users, with primary emphasis on the needs of present and potential owners and creditors. (sections 1023.05-.08, 1023.24)

General-purpose financial statements are prepared by an enterprise under the presumption that users have common needs for information (see section 1023.07). Although special-purpose information may be prepared from financial accounting records, it is not the primary product of financial accounting and is not discussed in sections 1021-1029.

.13 F-11. *Fundamentally related financial statements.* The results of the accounting process are expressed in statements of financial position and changes in financial position, which are based on the same underlying data and are fundamentally related. (sections 1023.22, 1023.24, 1023.29)

The basic interrelationships between economic resources and economic obligations and changes in them make

 © 1974, American Institute of Certified Public Accountants, Inc.

measurement of periodic net income and of assets and liabilities part of the same process and require that the financial statements be fundamentally related. The measurement bases used to quantify changes in financial position are necessarily related to the measurement bases of the resources and obligations used in representations of financial position.

.14 F-12. *Substance over form.* Financial accounting emphasizes the economic substance of events even though the legal form may differ from the economic substance and suggest different treatment. (sections 1023.02, 1023.25, 1023.27)

Usually the economic substance of events to be accounted for agrees with the legal form. Sometimes, however, substance and form differ. Accountants emphasize the substance of events rather than their form so that the information provided better reflects the economic activities represented.

.15 F-13. *Materiality.* Financial reporting is only concerned with information that is significant enough to affect evaluations or decisions. (section 1023.04-.06)

Basic Features and the Environment

.16 The basic features of financial accounting described above are the result of environmental factors and influence the financial accounting process. The relationships between the features and the environment and among the features themselves are complex. The relationships between environmental conditions and the basic features of financial accounting can be illustrated with examples. The importance of money in a highly developed economy is the basis for the feature of measurement in terms of money (F-5). The complexity and continuity of economic activity, the joint nature of economic results, and the uncertain outcome of economic activity are important factors in the features of approximation (F-8) and judgment (F-9).

BASIC ELEMENTS OF FINANCIAL ACCOUNTING

.17 The basic elements of financial accounting—assets, liabilities, owners' equity, revenue, expenses, and net income (net loss)—are related to the economic resources, economic obligations, residual interest, and changes in them which are discussed in section 1023. Not all economic resources and obligations and changes in them are recognized and measured in financial accounting. The objectives of financial accounting (section 1024) provide broad criteria that aid in selecting economic resources, obligations, and changes in them for recognition and measurement. The basic features are additional factors in determining which economic elements and changes in them are recognized and measured. The particular economic elements and changes to be recognized and measured at any time as the basic elements of financial accounting are determined by generally accepted accounting principles in effect at that time. The basic elements of financial accounting therefore are defined in terms of both (1) economic resources and obligations of enterprises, and (2) generally accepted accounting principles.

.18 Because generally accepted accounting principles change, the concepts of assets, liabilities, owners' equity, revenue, expenses, and net income also change, subject to the constraints of the economic elements referred to in their definitions. The definitions themselves, therefore, provide criteria for determining those economic resources, economic obligations, and changes in them that *are* included in the basic elements at any particular time but do not provide criteria for determining from a broader or longer-range perspective those economic elements that *should be* included in the basic elements. Under the definitions given, determining the items that should be included in the basic elements is part of the overall problem of determining what generally accepted accounting principles should be. Criteria intended to help solve that problem are provided by the general and qualitative objectives of financial accounting and financial statements (section 1024).

Financial Position

.19 The basic elements of the financial position of an enterprise are assets, liabilities, and owners' equity:

 © 1974, American Institute of Certified Public Accountants, Inc.

Assets—economic resources of an enterprise that are recognized and measured in conformity with generally accepted accounting principles. Assets also include certain deferred charges that are not resources [2] but that are recognized and measured in conformity with generally accepted accounting principles.[3]

Liabilities—economic obligations of an enterprise that are recognized and measured in conformity with generally accepted accounting principles. Liabilities also include certain deferred credits that are not obligations [4] but that are recognized and measured in conformity with generally accepted accounting principles.[5]

Owners' equity—the interest of owners in an enterprise, which is the excess of an enterprise's assets over its liabilities.[6]

Owners' equity is defined in terms of assets and liabilities, just as residual interest is defined in terms of economic resources and obligations (see section 1023.20). The relationship among assets, liabilities, and owners' equity implicit in the definition of owners' equity is:

Assets — Liabilities = Owners' Equity [7]

.20 The *financial position* of an enterprise at a particular time comprises its assets, liabilities, and owners' equity

---

[2] Deferred charges from income tax allocation are an example of deferred charges that are not resources. The term *deferred charges* is also sometimes used to refer to certain resources, for example, prepaid insurance.

[3] This definition differs from that in Accounting Terminology Bulletin No. 1, paragraph 26, which defines assets as debit balances carried forward upon a closing of books of account that represent property values or rights acquired.

[4] Deferred credits from income tax allocation are an example of deferred credits that are not obligations. The term *deferred credits* is also sometimes used to refer to certain obligations, for example, subscriptions collected in advance.

[5] This definition differs from that in Accounting Terminology Bulletin No. 1, paragraph 27, in that (1) it defines liabilities primarily in terms of obligations rather than as credit balances carried forward upon closing the books, and (2) it excludes capital stock and other elements of owners' equity.

[6] This definition isolates owners' equity as a separate element. Owners' equity is included in the definition of liabilities in Accounting Terminology Bulletin No. 1, paragraph 27. Owners' equity is conventionally classified into several categories (see section 1027.24).

[7] Expressing the relationship in a mathematical equation goes beyond descriptions of terms and assumes appropriate measurement. Measurement of economic activity is discussed in section 1023.27-.33.

and the relationship among them, plus those contingencies, commitments, and other financial matters that pertain to the enterprise at that time and are required to be disclosed under generally accepted accounting principles. The financial position of an enterprise is presented in the *balance sheet*[8] and in notes to the financial statements.

Results of Operations

.21 The basic elements of the results of operations of an enterprise are revenue, expenses, and net income:

Revenue—gross increases in assets or gross decreases in liabilities recognized and measured in conformity with generally accepted accounting principles that result from those types of profit-directed activities[9] of an enterprise that can change owners' equity.[10]

Increases in assets and decreases in liabilities designated as revenue are related to changes in resources and obligations discussed in section 1023.22. Revenue does not, however, include all recognized increases in assets or decreases in liabilities. Revenue results only from those types of profit-directed activities that can change owners' equity under generally accepted accounting principles. Receipt of the proceeds of a cash sale is revenue under present generally accepted accounting principles, for example, because the net result of the sale is a change in owners' equity.[11] On the other hand, receipt of the proceeds of a loan or receipt of an asset purchased for cash, for example, is not revenue under present generally ac-

[8] The definition of balance sheet in this paragraph differs from that in Accounting Terminology Bulletin No. 1, paragraph 21, in that it defines the content in terms of assets, liabilities, and owners' equity, rather than balances carried forward after closing books kept according to principles of accounting.

[9] See section 1024.06, fn. 4, for the definition of profit-directed activities.

[10] The definition of revenue in this paragraph differs from that in Accounting Terminology Bulletin No. 2, paragraphs 5-7, in that (1) it emphasizes the nature of revenue rather than the usual point of recognition—the sale, (2) it includes the proceeds rather than only the gain from sale or exchange of assets "other than stock in trade." Gain is defined in sections 1021-1029 as a net concept, the result of deducting expenses from revenue. See section 1027.24 for a discussion of gains in financial accounting.

[11] If by coincidence the proceeds of a sale are equal to the cost and owners' equity does not change, receipt of the proceeds is nevertheless revenue because a sale is a type of event in which owners' equity can change under present generally accepted accounting principles.

 © 1974, American Institute of Certified Public Accountants, Inc.

cepted accounting principles because owners' equity can not change at the time of the loan or purchase.

Expenses—gross decreases in assets or gross increases in liabilities recognized and measured in conformity with generally accepted accounting principles that result from those types of profit-directed activities of an enterprise that can change owners' equity.[12]

Decreases in assets and increases in liabilities designated as expenses are related to changes in resources and obligations discussed in section 1023.22. Expenses, like revenue, result only from those types of profit-directed activities that can change owners' equity under generally accepted accounting principles. Delivery of product in a sale is an expense under present generally accepted accounting principles, for example, because the net result of the sale is a change in owners' equity. On the other hand, incurring a liability for the purchase of an asset is not an expense under present generally accepted accounting principles because owners' equity can not change at the time of the purchase.

Net income (*net loss*)—the excess (deficit) of revenue over expenses for an accounting period, which is the net increase (net decrease) in owners' equity (assets minus liabilities) of an enterprise for an accounting period from profit-directed activities that is recognized and measured in conformity with generally accepted accounting principles.

The relationship among revenue, expenses, and net income (net loss) implicit in the definition of net income (net loss) is:

Revenue — Expenses = Net Income (Net Loss) [13]

[12] This definition of expenses differs from that given in Accounting Terminology Bulletin No. 4, paragraphs 3-4, and 6. It is similar to the "broad" definition in the Terminology Bulletin except that it includes the cost of assets "other than stock in trade" disposed of rather than only the loss (see section 1027.24 for a discussion of losses in financial accounting). The "narrow" definition of expenses recommended in the Terminology Bulletin for use in financial statements excludes "cost of goods or services sold" from expenses and is incompatible with the definition in sections 1021-1029. Expense in this "narrow" sense should always be modified by appropriate qualifying adjectives, for example, *selling and administrative expenses* or *interest expense*.

[13] Expressing the relationship in a mathematical equation goes beyond descriptions of terms and assumes appropriate measurement. Measurement of economic activity is discussed in section 1023.27-.33.

.22 The *results of operations* of an enterprise for a period of time comprises the revenue, expenses, and net income (net loss) of the enterprise for the period. The results of operations of an enterprise are presented in the *income statement.*

Interrelationship of Financial Position and Results of Operations

.23 The financial position and results of operations of an enterprise are fundamentally related. Net income (net loss) for an accounting period, adjustments of income of prior periods, and investments and withdrawals by owners during the period constitute the change during the period in owners' equity, an element of financial position. Other relationships between the income statement and the balance sheet, for example, the relationship of cost of goods sold to inventory and of depreciation to fixed assets, are further indications of the interrelatedness of the statements.

AC Section 1026

Generally Accepted Accounting Principles—Pervasive Principles

[Source: APB Statement No. 4, Chap. 6, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

GENERALLY ACCEPTED ACCOUNTING PRINCIPLES

.01 Financial statements are the product of a process in which a large volume of data about aspects of the economic activities of an enterprise are accumulated, analyzed, and reported. This process should be carried out in accordance with generally accepted accounting principles. Generally accepted accounting principles incorporate the consensus[1] at a particular time as to which economic resources and obligations should be recorded as assets and liabilities by financial accounting, which changes in assets and liabilities should be recorded, when these changes should be recorded, how the assets and liabilities and changes in them should be measured, what information should be disclosed and how it should be disclosed, and which financial statements should be prepared.

.02 *Generally accepted accounting principles* therefore is a technical term in financial accounting. Generally accepted accounting principles encompass the conventions,

---

[1] Inasmuch as generally accepted accounting principles embody a consensus, they depend on notions such as *general acceptance* and *substantial authoritative support,* which are not precisely defined. The Securities and Exchange Commission indicated in Accounting Series Release No. 4 that when financial statements are "prepared in accordance with accounting principles for which there is no substantial authoritative support, such financial statements will be presumed to be misleading or inaccurate . . . ." The AICPA Special Committee on Opinions of the Accounting Principles Board defines *generally accepted accounting principles* as those "having substantial authoritative support." Problems in defining substantial authoritative support are discussed in Marshall Armstrong, "Some Thoughts on Substantial Authoritative Support," *The Journal of Accountancy,* April 1969, pp. 44-50.

rules, and procedures necessary to define accepted accounting practice at a particular time. The standard[2] of "generally accepted accounting principles" includes not only broad guidelines of general application, but also detailed practices and procedures.[3]

.03 Generally accepted accounting principles are conventional—that is, they become generally accepted by agreement (often tacit agreement) rather than by formal derivation from a set of postulates or basic concepts. The principles have developed on the basis of experience, reason, custom, usage, and, to a significant extent, practical necessity.

.04 In recent years Opinions of the Accounting Principles Board have received considerable emphasis as a major determinant of the composition of generally accepted accounting principles. All of the Accounting Research Bulletins and the early Opinions of the Accounting Principles Board include the statement that ". . . the authority of the bulletins [or Opinions] rests upon their general acceptability. . . ." Beginning with Opinion No. 6 (October 1965), however, Opinions of the Accounting Principles Board include a statement to reflect the adoption in October 1964 by Council of the American Institute of Certified Public Accountants of a resolution that provides in essence that accounting principles accepted in Opinions of the Accounting Principles Board constitute, per se, generally accepted accounting principles for Institute members. [Effective March 1, 1973 members are governed by Rule 203 of the AICPA Code of Professional Ethics in reporting departures from generally accepted accounting principles.] (See section 520.)

.05 In sections 1021-1029 the discussion of present generally accepted accounting principles is divided into three sections: (1) pervasive principles, which relate to financial accounting as a whole and provide a basis for the other

[2] The independent auditor's report gives the auditor's opinion as to whether the financial statements "present fairly the financial position . . . and the results of . . . operations, in conformity with generally accepted accounting principles. . . ."

[3] "The term 'principles of accounting' as used in reporting standards is construed to include not only accounting principles and practices but also the methods of applying them." AU section 410.02 (volume 1, AICPA PROFESSIONAL STANDARDS).

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

principles, (2) broad operating principles, which guide the recording, measuring, and communicating processes of financial accounting, and (3) detailed principles, which indicate the practical application of the pervasive and broad operating principles. This classification provides a useful framework for analysis, although the distinctions between the types of principles, especially between the broad operating and detailed principles, are somewhat arbitrary. This section discusses the pervasive principles. The broad operating and detailed principles are discussed in sections 1027 and 1028, respectively.

.06 The three types of principles form a hierarchy. The pervasive principles are few in number and fundamental in nature. The broad operating principles derived from the pervasive principles are more numerous and more specific, and guide the application of a series of detailed principles. The detailed principles are numerous and specific. Detailed principles are generally based on one or more broad operating principles and the broad operating principles are generally based on the pervasive principles. No attempt is made in sections 1021-1029 to indicate specific relationships between principles.

PERVASIVE PRINCIPLES

.07 The pervasive principles specify the general approach accountants take to recognition and measurement of events that affect the financial position and results of operations of enterprises. The pervasive principles are divided into (1) pervasive measurement principles and (2) modifying conventions.

Pervasive Measurement Principles

.08 The pervasive measurement principles (P-1 to P-6) establish the basis for implementing accrual accounting. They include the initial recording principle, the realization principle, three pervasive expense recognition principles, and the unit of measure principle. These principles broadly determine (1) the types of events to be recognized by financial accounting, (2) the bases on which to measure the events, (3) the time periods with which to identify the events, and (4) the common denominator of measurement.

.09 *Initial Recording.* The principle for initial recording of assets and liabilities is important in financial accounting because it determines (1) the data that enter the accounting process, (2) the time of entry, and (3) generally the amounts at which assets, liabilities, revenue, and expenses are recorded.

> P-1. *Initial recording of assets and liabilities.* Assets and liabilities generally are initially recorded on the basis of events in which the enterprise acquires resources from other entities or incurs obligations to other entities.[4] The assets and liabilities are measured by the exchange prices[5] at which the transfers take place.

.10 The initial recording of assets and liabilities may also reflect the elimination of other assets or liabilities, for example, the payment of cash in acquiring equipment. The amounts at which assets and liabilities are initially recorded may be carried without change, may be changed, for example, by amortization or write off, or may be shifted to other categories. The effects of transactions or other events to which the entity is not a party are usually not recognized in the accounting records until transactions of the enterprise occur, although there are significant exceptions to this general principle (see section 1027.09). The effects of executory contracts also are generally not recognized until one of the parties at least partially fulfills his commitment.

.11 *Income Determination.*[6] Income determination in accounting is the process of identifying, measuring, and relating revenue and expenses of an enterprise for an

---

[4] This principle does not cover the first recording of assets produced or constructed by the enterprise from other assets that previously have been initially recorded. Accounting for produced or self-constructed assets is discussed in paragraph .23.

[5] In transfers that involve deferred payments of money, the determination of exchange prices requires a realistic rate of interest (refer to section 4111.) [As amended, effective October 1, 1971, by APB Opinion No. 21.]

In transfers that do not involve money prices, such as barter transactions or investments by owners, assets are usually measured at "fair value," that is, at the amount of money that would be involved if the assets were received in exchanges that involved money prices. For exceptions to this general rule see section 1027.08, M-2B and M-2C.

[6] The term *matching* is often used in the accounting literature to describe the entire process of income determination. The term is also often

 © 1974, American Institute of Certified Public Accountants, Inc.

accounting period. Revenue for a period is generally determined independently by applying the realization principle. Expenses are determined by applying the expense recognition principles on the basis of relationships between acquisition costs[7] and either the independently determined revenue or accounting periods. Since the point in time at which revenue and expenses are recognized is also the time at which changes in amounts of net assets are recognized, income determination is interrelated with asset valuation. From the perspective of income determination, costs are divided into (1) those that have "expired" and become expenses and (2) those that are related to later periods and are carried forward as assets in the balance sheet. From the perspective of asset valuation, those costs that no longer meet the criteria of assets become expenses and are deducted from revenue in determining net income.

.12 *Revenue and Realization.* Revenue is a gross increase in assets or a gross decrease in liabilities recognized and measured in conformity with generally accepted accounting principles that results from those types of profit-directed activities of an enterprise that can change owners' equity (see section 1025.21). Revenue under present generally accepted accounting principles is derived from three general activities: (a) selling products, (b) rendering services and permitting others to use enterprise resources, which result in interest, rent, royalties, fees, and the like, and (c) disposing of resources other than products—for example, plant and equipment or investments in other entities. Revenue does not include receipt of assets purchased, proceeds of borrowing, investments by owners, or adjustments of revenue of prior periods.

.13 Most types of revenue are the joint result of many profit-directed activities of an enterprise and revenue is

---

applied in accounting, however, in a more limited sense to the process of expense recognition or in an even more limited sense to the recognition of expenses by associating costs with revenue on a cause and effect basis (see paragraph .21). Because of the variety of its meanings, the term *matching* is not used in sections 1021-1029.

[7] See section 1023.26 for a general discussion of the term *cost* and paragraph .28 for a discussion of the meaning of the term *cost* under present generally accepted accounting principles.

often described as being "earned" gradually and continuously by the whole of enterprise activities. *Earning* in this sense is a technical term that refers to the activities that give rise to the revenue—purchasing, manufacturing, selling, rendering service, delivering goods, allowing other entities to use enterprise assets, the occurrence of an event specified in a contract, and so forth. All of the profit-directed activities of an enterprise that comprise the process by which revenue is earned may be called the *earning process.*

.14 Revenue is conventionally recognized at a specific point in the earning process of a business enterprise, usually when assets are sold or services are rendered. This conventional recognition is the basis of the pervasive measurement principle known as realization.

> P-2. *Realization.* Revenue is generally recognized when both of the following conditions are met: (1) the earning process is complete or virtually complete, and (2) an exchange has taken place.

.15 The exchange required by the realization principle determines both the time at which to recognize revenue and the amount at which to record it. Revenue from sales of products is recognized under this principle at the date of sale, usually interpreted to mean the date of delivery to customers. Revenue from services rendered is recognized under this principle when services have been performed and are billable. Revenue from permitting others to use enterprise resources, such as interest, rent, and royalties is also governed by the realization principle. Revenue of this type is recognized as time passes or as the resources are used. Revenue from sales of assets other than products is recognized at the date of sale. Revenue recognized under the realization principle is recorded at the amount received or expected to be received.

.16 Revenue is sometimes recognized on bases other than the realization rule. For example, on long-term construction contracts revenue may be recognized as construction progresses. This exception to the realization principle is based on the availability of evidence of the ultimate proceeds and the consensus that a better measure of

© 1974, American Institute of Certified Public Accountants, Inc.

periodic income results. Sometimes revenue is recognized at the completion of production and before a sale is made. Examples include certain precious metals and farm products with assured sales prices.[8] The assured price, the difficulty in some situations of determining costs of products on hand, and the characteristic of unit interchangeability are reasons given to support this exception.

.17 The realization principle requires that revenue be earned before it is recorded. This requirement usually causes no problems because the earning process is usually complete or nearly complete by the time of the required exchange. The requirement that revenue be earned becomes important, however, if money is received or amounts are billed in advance of the delivery of goods or rendering of services. For example, amounts for rent or magazine subscriptions received in advance are not treated as revenue of the period in which they are received but as revenue of the future period or periods in which they are "earned." These amounts are carried as "unearned revenue"—that is, liabilities to transfer goods or render services in the future—until the earning process is complete. The recognition of this revenue in the future period results in recording a decrease in a liability rather than an increase in an asset.

.18 *Expense Recognition.* Expenses are gross decreases in assets or gross increases in liabilities recognized and measured in conformity with generally accepted accounting principles that result from those types of profit-directed activities of an enterprise that can change owners' equity (see section 1025.21). Important classes of expenses are (1) costs of assets used to produce revenue (for example, cost of goods sold, selling and administrative expenses, and interest expense), (2) expenses from nonreciprocal transfers and casualties (for example, taxes, fires, and theft), (3) costs of assets other than products (for example, plant and equipment or investments in other companies) disposed of, (4) costs incurred in unsuccessful efforts, and (5) declines in market prices of inventories held for sale. Expenses do not include repayments of

[8] This increase in assets is often reported in the income statement as a reduction of cost of goods sold rather than as sales revenue.

borrowing, expenditures to acquire assets, distributions to owners (including acquisition of treasury stock), or adjustments of expenses of prior periods.

.19 Expenses are the costs that are associated with the revenue of the period, often directly but, frequently indirectly through association with the period to which the revenue has been assigned. Costs to be associated with future revenue or otherwise to be associated with future accounting periods are deferred to future periods as assets. Costs associated with past revenue or otherwise associated with prior periods are adjustments of the expenses of those prior periods.[9] The expenses of a period are (a) costs directly associated with the revenue of the period, (b) costs associated with the period on some basis other than a direct relationship with revenue, and (c) costs that cannot, as a practical matter, be associated with any other period.

.20 Three pervasive expense recognition principles specify the bases for recognizing the expenses that are deducted from revenue to determine the net income or loss of a period. They are "associating cause and effect," "systematic and rational allocation," and "immediate recognition."

.21 P-3. *Associating cause and effect.*[10] Some costs are recognized as expenses on the basis of a presumed direct association with specific revenue.

Although direct cause and effect relationships can seldom be conclusively demonstrated, many costs appear to be related to particular revenue and recognizing them as expenses accompanies recognition of the revenue. Examples of expenses that are recognized by associating cause and effect are sales commissions and costs of products sold or services provided.

.22 Several assumptions regarding relationships must be made to accumulate the costs of products sold or services provided. For example, manufacturing costs

---

[9] See paragraph .38.

[10] The term *matching* is often applied to this process (see paragraph .11, footnote 6).

 © 1974, American Institute of Certified Public Accountants, Inc.

are considered to "attach" to products on bases of association such as labor hours, area or volume of facilities used, machine hours, or other bases presumed to indicate the relationship involved. "Attaching" costs to products often requires several allocations and reallocations of costs. Also, assumptions regarding the "flow" of costs or of physical goods (LIFO, FIFO, average) are often made to determine which costs relate to products sold and which remain in inventory as assets.

.23 P-4. *Systematic and rational allocation.* In the absence of a direct means of associating cause and effect, some costs are associated with specific accounting periods as expenses on the basis of an attempt to allocate costs in a systematic and rational manner among the periods in which benefits are provided.

If an asset provides benefits for several periods its cost is allocated to the periods in a systematic and rational manner in the absence of a more direct basis for associating cause and effect. The cost of an asset that provides benefits for only one period is recognized as an expense of that period (also a systematic and rational allocation). This form of expense recognition always involves assumptions about the pattern of benefits and the relationship between costs and benefits because neither of these two factors can be conclusively demonstrated. The allocation method used should appear reasonable to an unbiased observer and should be followed systematically. Examples of items that are recognized in a systematic and rational manner are depreciation of fixed assets, amortization of intangible assets, and allocation of rent and insurance. Systematic and rational allocation of costs may increase assets as product costs or as other asset costs rather than increase expenses immediately, for example, depreciation charged to inventory and costs of self-constructed assets. These costs are later recognized as expenses under the expense recognition principles.

.24 P-5. *Immediate recognition.* Some costs are associated with the current accounting period as expenses because (1) costs in-

> curred during the period provide no discernible future benefits, (2) costs recorded as assets in prior periods no longer provide discernible benefits or (3) allocating costs either on the basis of association with revenue or among several accounting periods is considered to serve no useful purpose.

Application of this principle of expense recognition results in charging many costs to expense in the period in which they are paid or liabilities to pay them accrue. Examples include officers' salaries, most selling costs, amounts paid to settle lawsuits, and costs of resources used in unsuccessful efforts. The principle of immediate recognition also requires that items carried as assets in prior periods that are discovered to have no discernible future benefit be charged to expense, for example, a patent that is determined to be worthless.

.25 *Application of Expense Recognition Principles.* To apply expense recognition principles, costs are analyzed to see whether they can be associated with revenue on the basis of cause and effect. If not, systematic and rational allocation is attempted. If neither cause and effect associations nor systematic and rational allocations can be made, costs are recognized as expenses in the period incurred or in which a loss is discerned. Practical measurement difficulties and consistency of treatment over time are important factors in determining the appropriate expense recognition principle.

.26 *Effect of the Initial Recording, Realization, and Expense Recognition Principles.* The essential effect of these principles as they now exist is that measurement of the assets, liabilities, revenue, and expenses of a business enterprise is based primarily on its own exchanges. Resources and obligations that result from executory contracts are generally not recorded as assets and liabilities until one of the parties at least partially fulfills his commitment. Furthermore, not all changes in the utility or price of assets are recognized. Increases in assets and the related revenue are usually not recorded if they result

© 1974, American Institute of Certified Public Accountants, Inc.

from events wholly internal to the enterprise. For example, revenue that is earned during the production process is generally not recorded until the goods and services produced are exchanged. Also, increases or decreases in assets and related revenue and expenses that result from events in which the enterprise does not participate directly are usually not recorded.[11] For example, most changes in prices of productive resources are not recognized until enterprise transactions take place.

.27 Under the initial recording, realization, and expense recognition principles assets are generally carried in the accounting records and presented in financial statements at acquisition cost or some unexpired or unamortized portion of it. When assets are sold, the difference between the proceeds realized and the unamortized portion of acquisition cost is recognized as an increase (or decrease) in the enterprise's net assets.

.28 The initial recording and realization conventions are the basis for the "cost principle" (which is more accurately described as the acquisition-price or historical-cost rule). Cost can be defined in several ways—for example, as the amount of money that would be required to acquire assets currently (replacement cost) or as the return from alternative uses of assets, such as selling them (opportunity cost). However, "cost" at which assets are carried and expenses are measured in financial accounting today usually means historical or acquisition cost because of the conventions of initially recording assets at acquisition cost and of ignoring increases in assets until they are exchanged (the realization convention).[12] The term *cost* is also commonly used in financial accounting to refer to the amount at which assets are initially recorded, regardless of how the amount is determined.

.29 *Unit of Measure.* In the United States, the U. S. dollar fulfills the functions of medium of exchange, unit of account, and store of value. It provides the unit of meas-

---

[11] Exceptions include the cost or market rule for inventories (see section 1027.09).

[12] See section 1023.26 for a general discussion of the term *cost.* The discussions of cost in section 1023.26 and paragraph .28 are broader than that in Accounting Terminology Bulletin No. 4, paragraph 2, which defines only historical or acquisition cost.

ure for financial accounting. Stating assets and liabilities and changes in them in terms of a common financial denominator is prerequisite to performing the operations—for example, addition and subtraction—necessary to measure financial position and periodic net income.

.30 Defining the unit of measure in terms of money presents problems because of decreases (inflation) or increases (deflation) in the general purchasing power of money over time. The effects of inflation in the United States are not considered sufficiently important at this time to require recognition in financial accounting measurements.

> P-6. *Unit of measure.* The U. S. dollar is the unit of measure in financial accounting in the United States. Changes in its general purchasing power are not recognized in the basic financial statements.

.31 *Effect of the Unit of Measure Principle.* The basic effect of this principle is that financial accounting measures are in terms of numbers of dollars, without regard to changes in the general purchasing power of those dollars.

.32 The unit of measure principle is applied together with the other pervasive measurement principles. Costs are therefore measured in terms of the number of dollars initially invested in assets. If moderate inflation or deflation persists for several years or if substantial inflation or deflation occurs over short periods, the general purchasing power of the dollars in which expenses are measured may differ significantly from the general purchasing power of the dollars in which revenue is measured. Methods of accounting which tend to minimize this effect in the determination of periodic income—most notably the last-in, first-out method of inventory pricing and accelerated depreciation of plant and equipment—have become generally accepted and widely used in the United States. Methods of restating financial statements for general price-level changes have been used in some countries that have experi-

© 1974, American Institute of Certified Public Accountants, Inc.

enced extreme inflation but are not now used in the basic financial statements in the United States.[13]

Modifying Conventions

.33 The pervasive measurement principles are largely practical responses to problems of measurement in financial accounting and do not provide results that are considered satisfactory in all circumstances. Certain widely adopted conventions modify the application of the pervasive measurement principles. These modifying conventions, discussed in the following paragraphs, have evolved to deal with some of the most difficult and controversial problem areas in financial accounting. They are applied because rigid adherence to the pervasive measurement principles (1) sometimes produces results that are not considered to be desirable, (2) may exclude from financial statements some events that are considered to be important, or (3) may be impractical in certain circumstances.

.34 The modifying conventions are applied through generally accepted rules that are expressed either in the broad operating principles or in the detailed principles. The modifying conventions are a means of substituting the collective judgment of the profession for that of the individual accountant.

.35 *Conservatism.* Frequently, assets and liabilities are measured in a context of significant uncertainties. Historically, managers, investors, and accountants have generally preferred that possible errors in measurement be in the direction of understatement rather than overstatement of net income and net assets. This has led to the convention of conservatism, which is expressed in rules adopted by the profession as a whole such as the rules that inventory should be measured at the lower of cost and market and that accrued net losses should be recognized on firm purchase commitments for goods for inventory. These rules may result in stating net income and net assets at amounts lower than would otherwise result from applying the pervasive measurement principles.

---

[13] Section 1071, *Financial Statements Restated for General Price-Level Changes,* issued in June 1969, recommends supplementary disclosure of general price-level information.

.36 *Emphasis on Income.* Over the past century businessmen, financial statement users, and accountants have increasingly tended to emphasize the importance of net income and that trend has affected the emphasis in financial accounting. Although balance sheets formerly were presented without income statements, the income statement has in recent years come to be regarded as the most important of the financial statements. Accounting principles that are deemed to increase the usefulness of the income statement are therefore sometimes adopted by the profession as a whole regardless of their effect on the balance sheet or other financial statements. For example, the last-in, first-out (LIFO) method of inventory pricing may result in balance sheet amounts for inventories that become further removed from current prices with the passage of time. LIFO, however, is often supported on the grounds that it usually produces an amount for cost of goods sold in determining net income that more closely reflects current prices. This result is believed to compensate for the effect under the LIFO method of presenting inventories in the balance sheet at prices substantially different from current prices.

.37 *Application of Judgment by the Accounting Profession as a Whole.* Sometimes strict adherence to the pervasive measurement principles produces results that are considered by the accounting profession as a whole to be unreasonable in the circumstances or possibly misleading. Accountants approach their task with a background of knowledge and experience. The perspective provided by this background is used as the basis for modifying accounting treatments when strict application of the pervasive measurement principles yields results that do not appear reasonable to the profession as a whole.

.38 The exception to the usual revenue realization rule for long-term construction-type contracts, for example, is justified in part because strict adherence to realization at the time of sale would produce results that are considered to be unreasonable. The judgment of the profession is that revenue should be recognized in this situation as construction progresses. Similarly, the most meaningful concept of net income in the judgment of the pro-

© 1974, American Institute of Certified Public Accountants, Inc.

fession is one that includes all items of revenue and expense recorded during the period except for certain items that can be clearly identified with prior periods under carefully specified conditions. Extraordinary items are segregated in the current income statement so that their effects can be distinguished. Also, avoiding undue effects on the net income of a single period is judged by the profession to be important in certain circumstances. For example, actuarial gains and losses recognized in accounting for pension cost may be spread over the current year and future years.

AC Section 1027

Generally Accepted Accounting Principles— Broad Operating Principles

[Source: APB Statement No. 4, Chap. 7, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

.01 The broad operating principles guide in selecting, measuring, and reporting events in financial accounting. They are grounded in the pervasive principles discussed in section 1026 and are applied to specific situations through the detailed principles discussed in section 1028. The broad operating principles are broader and less specific than the detailed principles. For example, the detailed principle of first-in, first-out inventory pricing is one application of the broad operating principles of product cost determination and asset measurement, and straight-line depreciation is one of the detailed principles through which the broad operating principles that deal with systematic and rational expense allocation are applied. Although the broad operating principles are more specific than the pervasive principles, they are also generalizations. Consequently, exceptions to the broad operating principles may exist in the detailed principles through which they are applied.

.02 The financial accounting process consists of a series of operations that are carried out systematically in each accounting period. The broad operating principles guide these operations. The operations are listed separately although they overlap conceptually and some of them may be performed simultaneously:

(1) *Selecting* the events. Events to be accounted for are identified. Not all events that affect the economic resources and obligations of an enterprise are, or can be, accounted for when they occur.

(2) *Analyzing* the events. Events are analyzed to determine their effects on the financial position of an enterprise.

(3) *Measuring* the effects. Effects of the events on the financial position of the enterprise are measured and represented by money amounts.

(4) *Classifying* the measured effects. The effects are classified according to the individual assets, liabilities, owners' equity items, revenue, or expenses affected.

(5) *Recording* the measured effects. The effects are recorded according to the assets, liabilities, owners' equity items, revenue, and expenses affected.

(6) *Summarizing* the recorded effects. The amounts of changes recorded for each asset, liability, owners' equity item, revenue, and expense are summed and related data are grouped.

(7) *Adjusting* the records. Remeasurements, new data, corrections, or other adjustments are often required after the events have been initially recorded, classified, and summarized.

(8) *Communicating* the processed information. The information is communicated to users in the form of financial statements.

The broad operating principles, which guide these eight operations, are divided into (1) principles of selection and measurement and (2) principles of financial statement presentation.

PRINCIPLES OF SELECTION AND MEASUREMENT

.03 The principles of selection and measurement are conventions that (1) guide selection of events to be accounted for by an enterprise, (2) determine how selected events affect the assets, liabilities, owners' equity, revenue, and expenses of the enterprise, and (3) guide assignment of dollar amounts to the effects of these events. They are classified in this section according to the types of economic events that affect the economic resources, economic obligations, and residual interests of enterprises, as discussed in section 1023 (see section 1023.23). The types of events are

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

I. External Events
  A. Transfers of resources or obligations to or from other entities:
    1. Exchanges (reciprocal transfers)
    2. Nonreciprocal transfers
      a. Transfers between an enterprise and its owners
      b. Nonreciprocal transfers between an enterprise and entities other than owners
  B. External events other than transfers

II. Internal Events
  A. Production
  B. Casualties

Each type of event is explained briefly in the list of principles in paragraphs .07 to .11 and more fully in section 1023.23.

.04 Additional principles other than those that guide recognition of events govern accounting for those assets and liabilities that are not resources and obligations (see section 1025.19) and the related revenue and expenses and govern reporting of accounting changes and corrections of errors in previously issued financial statements (See section 1051). [As amended, effective for fiscal periods beginning after July 31, 1971, by APB Opinion No. 20.]

Measurement Bases

.05 Four measurement bases are currently used in financial accounting: (1) price in a past exchange of the enterprise (historical cost), which is the primary basis of measurement in financial accounting and is usually used in measuring inventory, plant and equipment, and many other assets, (2) price in a current purchase exchange, used, for example, in applying the lower of cost and market rule to inventories, (3) price in a current sale exchange, which may be used, for example, in measuring precious metals that have a fixed monetary price with no substantial cost of marketing, and (4) price based on future exchanges, used, for example, to estimate future costs when revenue is recognized on the percentage-of-completion basis. The

measurement bases are described more fully in section 1023.31.

STATEMENT OF THE PRINCIPLES OF SELECTION AND MEASUREMENT

.06 The principles of selection and measurement are presented in three sections:

1. The principles of selection of events and the principles of measurement (assignment of dollar amounts) are presented together for each type of event in paragraphs .07 to .11. Principles of selection (S-1 to S-7) and measurement (M-1 to M-7) that deal with the same items are identified by the same number (e. g., S-4 and M-4). Other important principles that constitute amplifications of or exceptions to the general rule are listed under it and identified with the general principle (e. g., S-4A). The statement of a principle is followed by a short discussion if further clarification is needed.
2. Principles that govern accounting for those assets and liabilities that are *not* resources or obligations are discussed in paragraph .12.
3. The principles (E-1 to E-10) of determination of the effects of events on the basic elements are presented in paragraph .13.

Principles That Guide Selection of Events and Assignment of Dollar Amounts

I. *External Events*

A. *Transfers of Resources or Obligations to or from Other Entities*

.07 1. *Exchanges* are reciprocal transfers between the enterprise and other entities that involve obtaining resources or satisfying obligations by giving up other resources or incurring other obligations. Exchanges may take place over time rather than at points of time (for example, accumulations of interest and rent).

S-1. *Exchanges recorded.* Exchanges between the enterprise and other entities (enterprises or indi-

 © 1974, American Institute of Certified Public Accountants, Inc.

viduals) are generally recorded in financial accounting when the transfer of resources or obligations takes place or services are provided.

M-1. *Exchange prices.* The effects of exchanges on assets, liabilities, revenue, and expenses are measured at the prices established in the exchanges.

S-1A. *Acquisitions of assets.* Resources acquired in exchanges are recorded as assets of the enterprise. Some assets that are not carried forward to future periods are immediately charged to expense (see S-6C).

M-1A. *Acquisition cost of assets.* Assets acquired in exchanges are measured at the exchange price, that is, at acquisition cost. Money and money claims acquired are measured at their face amount or sometimes at their discounted amount.

Discussion. Cash, accounts receivable, and other short-term money claims are usually measured at their face amount. Long-term notes receivable are measured at their discounted amounts when the notes nominally bear no interest or an interest rate clearly below a reasonable rate. (See section 4111.) [As amended, effective October 1, 1971, by APB Opinion No. 21.]

M-1A(1). *Fair value.* In exchanges in which neither money nor promises to pay money are exchanged, the assets acquired are generally measured at the fair value of the assets given up. However, if the fair value of the assets received is more clearly evident, the assets acquired are measured at that amount.

Discussion. Fair value is the approximation of exchange price in transfers in which money or money claims are not

involved. Similar exchanges are used to approximate what the exchange price would have been if an exchange for money had taken place. The recorded amount (as distinguished from the fair value) of assets given up in a trade is generally not used to measure assets acquired.

M-1A(2). *Acquisition of a group of assets in one exchange.* A group of assets acquired in a single ex-exchange is measured at the exchange price. The total price is allocated to the individual assets based on their relative fair values.

Discussion. Fair value of assets acquired is used primarily as a device for allocating total cost, not as the measurement basis of the assets acquired.

M-1A(3). *Acquisition of a business in an exchange.* A business acquired in an exchange is measured at the exchange price. Each individual asset acquired (other than goodwill) is measured at its fair value. If the total exchange price exceeds the amounts assigned to the individual assets, the excess is recorded as goodwill. If the total amount assigned to individual assets exceeds the exchange price, the difference is recorded as a reduction of the amounts assigned to the assets (also see S-2A and S-2B).

 © 1974, American Institute of Certified Public Accountants, Inc.

S-1B. *Dispositions of assets.* Decreases in assets are recorded when assets are disposed of in exchanges.

M-1B. *Asset dispositions measured.* Decreases in assets are measured by the recorded amounts that relate to the assets. The amounts are usually the historical or acquisition costs of the assets (as adjusted for amortization and other changes).

Discussion. In partial dispositions, measurement of the amount removed is governed by detailed principles (e. g., first-in, first-out; last-in, first-out; and average cost for inventories) that are based on the presumed "flow" of goods or the presumed "flow" of costs.

S-1C. *Liabilities recorded.* Liabilities are recorded when obligations to transfer assets or provide services in the future are incurred in exchanges.

M-1C. *Amount of liabilities.* Liabilities are measured at amounts established in the exchanges, usually the amounts to be paid, sometimes discounted.

Discussion. Conceptually, a liability is measured at the amount of cash to be paid discounted to the time the liability is incurred. Most short-term liabilities are simply measured at the amount to be paid. Discounted present values are often used if the obligations require payments at dates that are relatively far in the future. Pension obligations and liabilities under capitalized long-term leases are measured at discounted amounts. Bonds and other long-term liabilities are in effect measured at the discounted amount of the future cash payments for interest and principal. Long-term liabilities are discounted when the notes nominally bear no interest or an interest rate clearly below a

reasonable rate. (See section 4111.) [As amended, effective October 1, 1971, by APB Opinion No. 21.] The difference between the recorded amount of a liability and the amounts to be paid is amortized over the periods to maturity.

S-1D. *Liability decreases.* Decreases in liabilities are recorded when they are discharged through payments, through substitution of other liabilities, or otherwise.

M-1D. *Liability decrease measured.* Decreases in liabilities are measured by the recorded amounts that relate to the liabilities. A partial discharge of liabilities is measured at a proportionate part of the recorded amount of the liabilities.

S-1E. *Commitments.* Agreements for the exchange of resources in the future that at present are unfulfilled commitments on both sides are not recorded until one of the parties at least partially fulfills its commitment, except that (1) some leases and (2) losses on firm commitments are recorded.

Discussion. An exception to the general rule for recording exchanges is made for most executory contracts. An exchange of promises between the contracting parties is an exchange of something of value, but the usual view in accounting is that the promises are off-setting and nothing need be recorded until one or both parties at least partially perform(s) under the contract. The effects of some executory contracts, however, are recorded, for example, long-term leases that are recorded as assets by the lessee with a corresponding liability (see discussion after M-1C).

S-1F. *Revenue from exchanges.* Revenue is recorded when products are sold, services

© 1974, American Institute of Certified Public Accountants, Inc.

are provided, or enterprise resources are used by others. Revenue is also recorded when an enterprise sells assets other than products (usually presented as part of a gain or loss—see paragraph .24).

M-1F. *Revenue measurement.* Revenue from exchanges is initially measured at prices established in the exchanges. The revenue amounts are reduced (or expenses recorded) for discounts, returns, and allowances.

Discussion. Revenue is usually recognized at the time of exchanges in which cash is received or new claims arise against other entities. However, exceptions are made, for example, for certain products that have an assured selling price (see S-6D) and long-term construction-type contracts (see S-6E). Revenue is not recognized on purchases.

S-1F(1). *Recognizing revenue and expenses if proceeds are collectible over a long period without reasonable assurance of collection.* The terms of an exchange transaction or other conditions related to receivables collectible over a long period may preclude a reasonable estimate of the collectibility of the receivables. Either an installment method or a cost recovery method of recognizing revenue and expenses may be used as long as collectibility is not reasonably assured.

M-1F(1). *Measuring revenue and expenses on installment or cost recovery methods.* Under both installment and cost recovery methods the proceeds collected

measure revenue. Under an installment method expenses are measured at an amount determined by multiplying the cost of the asset sold by the ratio of the proceeds collected to the total selling price. Under a cost recovery method, expenses are measured at the amounts of the proceeds collected until all costs have been recovered.

S-1G. *Expenses directly associated with revenue from exchanges.* Costs of assets sold or services provided are recognized as expenses when the related revenue is recognized (see S-1F).

M-1G. *Expense measurement.* Measurement of expenses directly associated with revenue recognized in exchanges is based on the recorded amount (usually acquisition cost) of the assets that leave the enterprise or the costs of the services provided (see S-6A(1) for a discussion of product and service costs).

Discussion. Revenue is usually accompanied by related expenses. For example, sale of a product leads to recording of revenue from the sale and an expense for the cost of the product sold. If an asset other than normal product, such as a building, is sold, the undepreciated cost of the asset is an expense to be subtracted from the revenue on the sale.

.08 2. *Nonreciprocal transfers* are transfers in one direction of resources or obligations, either from the enterprise to other entities or from other entities to the enterprise.

a. *Transfers between an enterprise and its owners.* Examples are investments of resources by owners, declaration of cash or property dividends, acqui-

 © 1974, American Institute of Certified Public Accountants, Inc.

sition of treasury stock, and conversion of convertible debt.

S-2. *Owners' investments and withdrawals recorded.* Transfers of assets or liabilities between an enterprise and its owners are recorded when they occur.

M-2. *Owners' investments and withdrawals measured.* Increases in owners' equity are usually measured by (a) the amount of cash received, (b) the discounted present value of money claims received or liabilities cancelled, or (c) the fair value of noncash assets received.[1] Decreases in owners' equity are usually measured by (a) the amount of cash paid, (b) the recorded amount of noncash assets transferred, or (c) the discounted present value of liabilities incurred.

Discussion. Measurement of owners' investments is generally based on the fair value of the assets or the discounted present value of liabilities that are transferred. The market value of stock issued may be used to establish an amount at which to record owners' investments but this amount is only an approximation when the fair value of the assets transferred cannot be measured directly.

S-2A. *Acquisition of a business as a whole through issuance of stock.* The acquisition of a business as a whole by an enterprise through the issuance of stock is recorded when it occurs. (See S-2B for a discussion of poolings of interests.)

M-2A. *Acquisition of a business through issuance of stock measured.* A business acquired through issuance of stock is measured at the fair value of the business acquired. Each individual asset acquired (other than goodwill) is measured at its fair value. If the fair value of the whole business exceeds the amounts assigned to the

[1] The fair value of assets received is often measured by the fair value of the shares of stock issued.

individual assets, the excess is recorded as goodwill. If the total assigned to individual assets exceeds the fair value of the whole business, the difference is recorded as a reduction of the amounts assigned to the assets.

S-2B. *Poolings of interests.* Business combinations effected by issuance of voting common stock that also meet other specified criteria are accounted for as poolings of interests and not as acquisitions of one business by another. A business combination accounted for as a pooling of interests is accounted for when it occurs.

M-2B. *Poolings of interests measured.* The assets, liabilities, and elements of owners' equity of the separate companies generally become the assets, liabilities, and elements of owners' equity of the combined corporation. They generally are measured at the time of combination by the combined corporation at the amounts at which they were then carried by the separate companies. The revenue and expenses of the combined corporation for the period in which the companies are combined include the revenue and expenses of the separate companies from the beginning of the period to the date of combination. Financial statements for prior periods presented in reports of the combined corporation combine the financial statements of the separate companies.

S-2C. *Investments of noncash assets by founders or principal stockholders of a corporation.* Transfers of noncash assets to a corporation by its founders or principal stockholders are recorded when they occur.

M-2C. *Founders' or principal stockholders' investments of noncash assets measured.*

© 1974, American Institute of Certified Public Accountants, Inc.

Transfers of noncash assets to a corporation by its founders or principal stockholders are sometimes measured at their costs to the founders or principal stockholders rather than at their fair value at the date of transfer.

b. *Nonreciprocal transfers between an enterprise and entities other than owners.* Examples are gifts and donations, taxes, loss of a negligence lawsuit, imposition of fines, and theft.

S-3. *Nonreciprocal transfers recorded.* Nonreciprocal transfers with other than owners are recorded when assets are acquired, when assets are disposed of or their loss is discovered, or when liabilities come into existence or are discovered. [As amended, effective for transactions entered into after September 30, 1973, by APB Opinion No. 29.] (See section 1041.)

M-3. *Nonreciprocal transfers measured.* Those noncash assets received in nonreciprocal transfers with other than owners that are recorded are measured at their fair value on the date received. Noncash assets given are usually accounted for at fair value. Liabilities imposed are measured at the amount to be paid, sometimes discounted. [As amended, effective for transactions entered into after September 30, 1973, by APB Opinion No. 29.] (See section 1041.)

.09 B. *External events other than transfers of resources or obligations to or from other entities.* Examples are changes in specific prices of enterprise assets, changes in interest rates, general price-level changes, technological changes caused by outside entities, and damage to enterprise assets caused by others.

S-4. *Favorable external events other than transfers generally not recorded.* External events other than transfers that increase market prices or utility of assets or decrease amounts required to discharge liabilities are generally not recorded when they occur. Instead their effects are usually reflected at the time of later exchanges.

M-4. *Retention of recorded amounts.* Assets whose prices or utility are increased by external events other than transfers are normally retained in the accounting records at their recorded amounts until they are exchanged. Liabilities that can be satisfied for less than their recorded amounts because of external events generally are retained in the records at their recorded amounts until they are satisfied.

S-4A. *Some favorable events recorded.* Examples of the few exceptions to principle S-4 are (1) earnings of companies whose voting stock is owned by minority or 50% shareholders who have the ability to exercise significant influence over investees, (2) increases in market prices of marketable securities held by investment companies and (3) decreases in the amounts required currently to satisfy liabilities to provide services or deliver resources other than U. S. dollars, for example, foreign currency obligations and obligations under warranties. [As amended, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 18.]

M-4A. *Measuring favorable events.* Recorded increases in market prices are measured by the difference between the recorded amount of the securities and the higher market price. Recorded decreases in liabilities are measured by the difference between the recorded amounts of the liabilities and the lower amounts estimated to be required to satisfy them.

S-5. *Unfavorable external events other than transfers recorded.* Certain unfavorable external events, other than transfers, that decrease market prices or utility of assets or increase liabilities are recorded.

 © 1974, American Institute of Certified Public Accountants, Inc.

M-5. *Measuring unfavorable events.* The amounts of those assets whose decreased market price or utility is recorded are adjusted to the lower market price or recoverable cost resulting from the external event.

Discussion. Recording unfavorable external events other than transfers varies depending on the type of asset or liability and is governed by specific rules. The major rules are described below.

S-5A. *Cost or market rule for inventories.* A loss is recognized by application of the rule of lower of cost and market to inventories when their utility is no longer as great as their cost.

M-5A. *Measuring inventory losses under the cost or market rule.* Replacement price is used in measuring the decline in price of inventory except that the recorded decline should not result in carrying the inventory at an amount that (1) exceeds net realizable value or (2) is lower than net realizable value reduced by an allowance for an approximately normal profit margin.

S-5B. *Decline in market price of certain marketable securities.* If market price of marketable securities classified as current assets is less than cost and it is evident that the decline is not due to a temporary condition a loss is recorded when the price declines.*

M-5B. *Measuring losses from decline in price of marketable securities.* The loss on a price decline of marketable securities is measured by the difference between the recorded amount and the lower market price.*

---

* Modified by section 5132, *Accounting for Certain Marketable Securities.*

S-5C. *Obsolescence.* Reductions in the utility of productive facilities caused by obsolescence due to technological, economic, or other change are usually recognized over the remaining productive lives of the assets. If the productive facilities have become worthless the entire loss is then recognized.

M-5C. *Measuring obsolescence.* Obsolescence of productive facilities is usually measured by adjusting rates of depreciation, depletion, or amortization for the remaining life (if any) of the assets. If productive facilities have become worthless, unamortized cost is recognized as a current loss.

Discussion. In unusual circumstances persuasive evidence may exist of impairment of the utility of productive facilities indicative of an inability to recover cost although the facilities have not become worthless. The amount at which those facilities are carried is sometimes reduced to recoverable cost and a loss recorded prior to disposition or expiration of the useful life of the facilities.

S-5D. *Damage caused by others.* The effects of damage to enterprise assets caused by others are recorded when they occur or are discovered.

M-5D. *Measuring damage caused by others.* When enterprise assets are damaged by others, asset amounts are written down to recoverable costs and a loss is recorded.

S-5E. ***Decline in market prices of noncurrent assets generally not recorded.*** Reductions in the market prices of noncurrent assets

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

are generally not recorded until the assets are disposed of or are determined to be worthless.

M-5E. *Retention of recorded amount.* Noncurrent assets whose market prices have declined are generally retained in accounting records at their recorded amounts until they are disposed of or have become worthless.

Discussion. In unusual circumstances a reduction in the market price of securities classified as noncurrent assets may provide persuasive evidence of an inability to recover cost although the securities have not become worthless. The amount at which those securities are carried is sometimes reduced and a loss recognized prior to disposition of the securities.

S-5F. *Increases in amounts required to liquidate liabilities other than those payable in U. S. dollars recorded.* Increases in the amounts required currently to satisfy liabilities to provide services or deliver resources other than U. S. dollars, for example, foreign currency obligations and obligations under warranties, are often recorded. Increases in amounts required currently to liquidate liabilities payable in U. S. dollars because of changes in interest rates or other external factors are generally not recorded until the liabilities are liquidated, converted, or otherwise disposed of.

M-5F. *Liability increases measured.* Recorded increases in liabilities from external events other than transfers are measured at the difference between the recorded amount of the liabilities and the higher amounts estimated to be required to satisfy them.

II. *Internal Events*

.10 A. *Production.* Production in a broad sense is the economic process by which inputs of goods and services are combined to produce an output of product which may be either goods or services. Production in this sense is therefore *not* restricted to manufacturing operations, but includes activities such as merchandising, transporting, and holding goods.

S-6. *Production recorded.* Utility added to assets by the internal profit-directed activities of the enterprise is generally not recorded at the time of production. Instead, historical or acquisition costs, including costs of the production process, are shifted to different categories of assets or to expenses as events in the enterprise indicate that goods and services have been used (either partially or completely) in production operations of the period. The costs that continue to appear in asset categories are deducted from revenue when the products or services to which they have been related are sold at a later date (see S-1G).

M-6. *Production measurement.* Utility created by production is generally not measured at the time of production. Instead, previously recorded amounts (usually acquisition costs) are shifted or allocated between asset categories or between activities or periods in a systematic and rational manner.

Discussion. Accounting for production encompasses much of the internal accounting for the enterprise. Accounting to determine costs of manufacturing products and providing services (cost accounting) is a part of production accounting in general. The purpose of production accounting is to relate costs to revenue when the product is sold or services provided or to relate costs to particular accounting periods.

S-6A. *Costs of manufacturing products and providing services.* Costs of manufacturing

 © 1974, American Institute of Certified Public Accountants, Inc.

products and providing services during a period include (1) costs of assets that are completely used during the period in manufacturing products and providing services and (2) allocated portions of the costs of assets that are partially used during the period in manufacturing products and providing services, assigned in a systematic and rational manner to those activities.

M-6A. *Measuring costs of manufacturing products and providing services.* Costs of manufacturing products and providing services are measured at the recorded amounts (usually acquisition costs) of assets used directly and by allocations in a systematic and rational manner of recorded amounts of assets used indirectly.

Discussion. Cost accounting often involves shifts and allocations of acquisition costs. The shifts and allocations are based on observed or assumed relationships between the assets used and the activities of manufacturing products or providing services. An example of a shift to a different category is the shift of costs from raw materials inventory to work in process inventory. Examples of allocated costs are overhead costs such as power, indirect labor, repair costs, and depreciation of plant and equipment.

S-6A(1). *Product and service costs.* Costs assigned to products and services provided are those costs of manufacturing products and providing services that are considered productive, including direct costs and indirect costs (absorbed overhead). Costs of manufacturing products and providing services for a period that are not

assigned to product or service costs are charged to expense during the period, for example, unabsorbed overhead.

M-6A(1). *Measuring product and service costs.* Product and service costs are measured by the sum of productive costs of manufacturing products and providing services assigned to units of product or service in a rational and systematic manner.

S-6B. *Expenses from systematic and rational allocation.* Some expenses are associated with accounting periods by allocating costs of assets over their useful lives.

M-6B. *Determination of expenses by systematic and rational allocation.* These expenses are allocations of the recorded amount of assets in a systematic and rational manner to the period or periods of the assets' lives.

Discussion. If all the benefits of an asset are related to one period, the recorded amount of the asset is charged as expense in that period. If the asset will benefit several periods, the recorded amount is charged to expense in a systematic and rational manner over the periods involved. Depreciation, depletion, and amortization of long-lived assets are examples of amounts allocated to periods as expenses (excluding amounts allocated to costs of manufacturing products and providing services, see S-6A).

S-6C. *Expenses recognized immediately.* The costs of some assets are charged to expense immediately on acquisition.

© 1974, American Institute of Certified Public Accountants, Inc.

M-6C. *Measurement of expenses recognized immediately.* Expenses from immediate recognition are measured at the acquisition prices of the assets acquired.

Discussion. Enterprises never acquire expenses per se; they always acquire assets. Costs may be charged to expenses in the period goods or services are acquired either under this principle of immediate recognition or, if they only benefit the period in which they are acquired, under the principle of systematic and rational allocation (see S-6B). Examples of costs that often are charged to expense immediately are salaries paid to officers and payments for advertising.

S-6D. *Revenue at completion of production.* Revenue may be recorded at the completion of production of precious metals that have a fixed selling price and insignificant marketing costs. Similar treatment may also be accorded certain agricultural, mineral, and other products characterized by inability to determine unit acquisition costs, immediate marketability at quoted prices that cannot be influenced by the producer, and unit interchangeability.

M-6D. *Revenue measured by net realizable value of product.* Revenue recorded at completion of production is measured by the net realizable value of the product.

Discussion. Recognition of revenue at completion of production is an exception to principles S-1F and S-6. The net realizable value of product is its selling price less expected costs to sell.[2]

S-6E. *Revenue as production progresses.* Revenue from cost-plus-fixed-fee and long-term

[2] See section 1026.16, footnote 8, for a discussion of income statement treatment of revenue recognized at completion of production.

construction-type contracts is recognized as production progresses using the percentage-of-completion method if the total cost and the ratio of performance to date to full performance can be reasonably estimated and collection of the contract price is reasonably assured. When the current estimate of total contract costs indicates a loss on long-term construction-type contracts, in most circumstances provision is made for the loss on the entire contract.

M-6E. *Measuring revenue as production progresses.* Under cost-plus-fixed-fee contracts, revenue recognized as production progresses includes either reimbursable costs and an allocated portion of the fee or an allocated portion of the fee alone. Under long-term construction-type contracts, revenue recognized as production progresses is measured at an allocated portion of the predetermined selling price. Product or service cost is subtracted from revenue as an expense as production progresses for long-term construction-type contracts and for those cost-plus-fixed-fee contracts for which recorded revenue includes reimbursable costs.

Discussion. Recognition of revenue as production progresses is another exception to principles S-1F and S-6.

.11 B. *Casualties.* Casualties are sudden, substantial, unanticipated reductions in enterprise assets not caused by other entities. Examples are fires, floods, and abnormal spoilage.

S-7. *Casualties.* Effects of casualties are recorded when they occur or when they are discovered.

M-7. *Measuring casualties.* When casualties occur or are discovered, asset amounts are written down to recoverable costs and a loss is recorded.

© 1974, American Institute of Certified Public Accountants, Inc.

Accounting for Those Assets and Liabilities That Are Not Resources or Obligations

.12 Accounting for those assets and liabilities that are not resources or obligations (see section 1025.19) and the related revenue and expenses is governed by detailed principles, for example, principles for accounting for deferred federal income taxes in section 4091. The principles are generally related to the modifying conventions, especially emphasis on income (see sections 1026.33 to 1026.38).

Principles That Determine Effects on Assets, Liabilities, Owners' Equity, Revenue, and Expenses of an Enterprise

.13 Principles (E-1 to E-10) that summarize the effects of selection and measurement on the basic elements of financial accounting are related to changes in assets, liabilities, owners' equity, revenue, and expenses rather than to types of events. The first of these principles recognizes the interrelated effects of events.

E-1. *Dual effects.* Each recorded event affects at least two items in the financial accounting records. The double entry system of recording is based on this principle.

In the following principles, the changes in assets, liabilities, owners' equity, revenue, and expenses that are recognized in conformity with generally accepted accounting principles are listed, together with some indication of the dual effect. Recognized changes are derived from the preceding principles of selection of events and assignment of dollar amounts.

E-2. *Increases in assets* arise from (1) exchanges in which assets are acquired, (2) investments of assets in the enterprise by owners, (3) nonreciprocal transfers of assets to an enterprise by other than owners, (4) shifts of costs to different asset categories in production, and, occasionally, (5) increases in amounts ascribed to produced assets. Increases in assets sometimes arise from external events other than transfers.

In exchanges, asset increases may be accompanied by decreases in other assets (e. g., a purchase for cash), increases

in liabilities (e. g., a purchase on account), or recognition of revenue (e. g., a sale for cash). In production, costs may be shifted from one asset classification to another with no change in total assets. If production increases are recorded (e. g., at the completion of production of precious metals), the increase is recognized as revenue or reduction of expenses. Earnings of companies whose voting stock is owned by minority or 50% shareholders who have the ability to exercise significant influence over investees, and increases in the market prices of securities held by investment companies are examples of asset increases recognized on external events other than transfers. [As amended, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 18.]

E-3. *Decreases in assets* arise from (1) exchanges in which assets are disposed of, (2) withdrawals of assets from the enterprise by owners, (3) nonreciprocal transfers of assets from the enterprise other than to owners, (4) certain external events other than transfers that reduce the market price or utility of assets, (5) shifts or allocations of costs to different asset categories or to expense in production, and (6) casualties.

In exchanges, asset decreases may be accompanied by increases in other assets (e. g., a purchase for cash or a sale for cash or on account), decreases in liabilities (e. g., payment of a debt), or increases in expenses. An increase of expenses in an exchange may result if an asset acquired is used up almost immediately or if future benefits of an expenditure cannot be determined and it is therefore written off to expense immediately. The sale of products results in a decrease in product held by the enterprise and reduces an asset and increases an expense.

E-4. *Increases in liabilities* arise from (1) exchanges in which liabilities are incurred, (2) transfers between an enterprise and its owners (dividend declaration), and (3) nonreciprocal transfers with other than owners in which liabilities arise.

In exchanges, liability increases may be accompanied by decreases in other liabilities (e. g., a note given on an account payable), increases in assets (e. g., a purchase on

 © 1974, American Institute of Certified Public Accountants, Inc.

account), or an expense (e. g., office salaries incurred but unpaid).

E-5. *Decreases in liabilities* arise from (1) exchanges in which liabilities are reduced, (2) transfers between an enterprise and its owners (debt converted into capital stock), and (3) nonreciprocal transfers with other than owners in which liabilities are reduced (forgiveness of indebtedness).

In exchanges, liability decreases may be accompanied by increases in other liabilities (e. g., a note given on an account payable), decreases in assets (e. g., payment of an account), or revenue (e. g., goods delivered or services rendered to satisfy a customer prepayment).

E-6. *Increases in owners' equity* arise from (1) investments in an enterprise by its owners, (2) the net result of all revenue and expenses recognized during a period (net income), and (3) nonreciprocal transfers to an enterprise from other than owners (gifts and donations). Owners' equity may also be increased by prior period adjustments.

E-7. *Decreases in owners' equity* arise from (1) transfers from an enterprise to its owners (dividends, treasury stock acquisitions), and (2) net losses for a period. Owners' equity may also be decreased by prior period adjustments.

E-8. *Revenue* arises primarily from exchanges. Occasionally revenue arises from production, and rarely from nonreciprocal transfers and from external events other than transfers.

Revenue from exchanges is usually accompanied by asset increases but may be accompanied by decreases in liabilities ("unearned revenue").

E-9. *Expenses* arise from (1) exchanges, (2) nonreciprocal transfers with other than owners, (3) external events other than transfers, (4) production, and (5) casualties.

Expenses that arise in exchanges are costs associated directly with revenue recognized when assets are sold or

services are provided [including product and service costs, see S-6A(1)]. Expenses that arise in production are (1) costs of manufacturing products and providing services not included in product or service costs (for example, unabsorbed overhead), (2) expenses from systematic and rational allocation of the cost of assets over their useful lives (excluding amounts allocated to costs of manufacturing products and providing services, see S-6A), (3) expenses recognized immediately on the acquisition of goods and services, and (4) costs of products for which revenue is recognized at the completion of production or as production progresses (see S-6D and S-6E).

E-10. *Effects of accounting for assets and liabilities that are not resources or obligations* (see section 1025.19 and paragraph .12). Accounting for these assets and liabilities results in increases and decreases in assets and increases and decreases in liabilities. The income statement effects are usually confined to increases and decreases in expenses.

PRINCIPLES OF FINANCIAL STATEMENT PRESENTATION

.14 The principles of financial statement presentation guide the communication of the information provided by the financial accounting process. They are related to the principles of selection and measurement and the pervasive principles but are not derived directly from them. The presentation principles are more closely related to the objectives of financial accounting and financial statements. The general objectives that deal with the type of information to be provided (for example, reliable information about economic resources and obligations and economic progress) and the qualitative objectives based on characteristics of useful information (such as comparability, completeness, and understandability) directly influence the content of some of the presentation principles. The basic features of financial accounting, particularly accounting entity, approximation, and fundamentally related financial statements, also influence these principles.

 © 1974, American Institute of Certified Public Accountants, Inc.

Fair Presentation in Conformity with Generally Accepted Accounting Principles

.15 The qualitative standard of *fair presentation in conformity with generally accepted accounting principles* of financial position and results of operations is particularly important in evaluating financial presentations. This standard guides preparers of financial statements and is the subjective benchmark against which independent public accountants judge the propriety of the financial accounting information communicated. Financial statements "present fairly in conformity with generally accepted accounting principles" if a number of conditions are met: (1) generally accepted accounting principles applicable in the circumstances have been applied in accumulating and processing the financial accounting information, (2) changes from period to period in generally accepted accounting principles have been appropriately disclosed, (3) the information in the underlying records is properly reflected and described in the financial statements in conformity with generally accepted accounting principles, and (4) a proper balance has been achieved between the conflicting needs to disclose important aspects of financial position and results of operations in accordance with conventional concepts and to summarize the voluminous underlying data into a limited number of financial statement captions and supporting notes.

STATEMENT OF THE PRINCIPLES OF FINANCIAL STATEMENT PRESENTATION

.16 The principles of financial statement presentation guide reporting of financial accounting information. They are conventional and subject to change in the same manner as the principles of selection and measurement. Twelve principles (R-1 to R-12) of financial statement presentation are stated; two are amplified by related principles; several are followed by explanations of their characteristics or applications. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

.17 R-1. *Basic financial statements.* A balance sheet, a statement of income, a statement of changes in retained earnings, a statement of changes in financial position, disclosure of

changes in other categories of stockholders' equity, descriptions of accounting policies, and related notes is the minimum presentation required to present fairly the financial position and results of operations of an enterprise in conformity with generally accepted accounting principles. [As amended, effective for fiscal years beginning after December 31, 1971, by APB Opinion No. 22.]

The basic financial statements are usually presented for two or more periods to enhance their usefulness. Historical summaries are also often presented. Other information may be provided as supplementary to the basic statements, for example, data as to revenue and net income by lines of business, information regarding physical output, and financial statements restated for changes in the general price level. These kinds of information, however, are not now considered necessary for a fair presentation of financial position and results of operations in conformity with generally accepted accounting principles. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

.18 R-2. *Complete balance sheet.* The balance sheet or statement of financial position should include and properly describe all assets, liabilities, and classes of owners' equity as defined by generally accepted accounting principles.

.19 R-3. *Complete income statement.* The income statement of a period should include and properly describe all revenue and expenses as defined by generally accepted accounting principles.

Under narrowly specified conditions an income statement should exclude a few items that represent adjustments of prior periods' net income.

.20 R-4. *Complete statement of changes in financial position.* The statement of changes in financial position of a period should include and properly describe all important aspects of

 © 1974, American Institute of Certified Public Accountants, Inc.

the company's financing and investing activities. [As amended, effective for fiscal periods ending after September 30, 1971 by APB Opinion No. 19.]

.21 R-5. *Accounting period.* The basic time period for which financial statements are presented is one year; "interim" financial statements are commonly presented for periods of less than a year. (See section 2071, *Interim Financial Reporting.*)

.22 R-6. *Consolidated financial statements.* Consolidated financial statements are presumed to be more meaningful than the separate statements of the component legal entities. Consolidated statements are usually necessary for fair presentation in conformity with generally accepted accounting principles if one of the enterprises in a group directly or indirectly owns over 50% of the outstanding voting stock of the other enterprises.

Consolidated financial statements present the financial position and results of operations of a parent company and its subsidiaries essentially as if the group were a single enterprise comprised of branches or divisions. The resulting accounting entity is an economic rather than a legal unit, and its financial statements are considered to reflect the substance of the combined economic relationships to an extent not possible by merely providing the separate financial statements of the corporate entities comprising the group.

.23 R-7. *Equity basis.* Unconsolidated subsidiaries and investments in 50% or less of the voting stock of companies in which the investors have the ability to exercise significant influence over investees should be presented on the equity basis.

Under the equity basis, net income during a period includes the investor company's proportionate share of the net income reported by the investee for the period (subsequent to acquisition in the period of acquisition). The effect is that

net income for the period and owners' equity at the end of the period are the same as if the companies presented on the equity basis had been consolidated. Dividends received are treated as adjustments of the amount of the investment under the equity basis. [As amended, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 18.]

.24 R-8. *Translation of foreign balances.* Financial information about the foreign operations of U. S. enterprises should be "translated" into U. S. dollars by the use of conventional translation procedures that involve foreign exchange rates.

.25 R-9. *Classification and segregation.* Separate disclosure of the important components of the financial statements is presumed to make the information more useful. Examples in the income statement are sales or other source of revenue, cost of sales, depreciation, selling and administrative expenses, interest expense, and income taxes. Examples in the balance sheet are cash, receivables, inventories, plant and equipment, payables, and categories of owners' equity.

Owners' equity of corporations is conventionally classified into categories including par or stated amount of capital stock, additional paid-in capital, and retained earnings. Net income or net loss, prior period adjustments, dividends, and certain transfers to other categories of owners' equity are among the changes in owners' equity that affect retained earnings.

R-9A. *Working capital.* Disclosure of components of working capital (current assets less current liabilities)[3] is presumed to be useful in manufacturing, trading, and some service enterprises. Current assets and current liabilities are distinguished from other assets and liabilities.

[3] Because the term *working capital* is sometimes used to describe current assets alone, the difference between current assets and current liabilities is sometimes described as *net working capital.*

© 1974, American Institute of Certified Public Accountants, Inc.

Disclosure of working capital is normally accomplished by classifying current assets and liabilities separately. Current assets include cash and other assets that are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business or within one year if the operating cycle is shorter than one year. Current liabilities include those expected to be satisfied by either the use of assets classified as current in the same balance sheet or the creation of other current liabilities, or those expected to be satisfied within a relatively short period of time, usually one year. (See section 2031.)

R-9B. *Offsetting.* Assets and liabilities in the balance sheet should not be offset unless a legal right of setoff exists.

R-9C. *Gains and losses.* Revenue and expenses from other than sales of products, merchandise, or services may be separated from other revenue and expenses and the net effects disclosed as gains or losses.[4]

Revenue and expense result from dispositions of assets other than products of the enterprise as well as from sales of products or services. For disclosure purposes, revenue (proceeds received) and expenses (cost of assets relinquished) on dispositions of assets other than products are separated from other revenue and expenses and the net amounts (revenue less expense) are shown as gains or losses. If these gains or losses are not material in amount they may be combined with other income statement amounts. Other examples of gains and losses are sizable write-downs of inventories and receivables, sizable gains and losses on sale of temporary investments, gains and losses recognized in nonmonetary transactions, and gains and losses on foreign currency devaluations. Gains and losses include items that are of a character typical of the customary business activities of the entity, which may be disclosed separately if their effects are material, and extraordinary gains and losses, which should be presented separately (see the following principle). [As amended, effective for

[4] Losses are sometimes defined in the accounting literature as expired costs that produce no revenue. "Losses" of that type are a subclassification of expenses in sections 1021-1029.

transactions entered into after September 30, 1973, by APB Opinion No. 29 (See section 1041); as modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2. (See section 4211.)]

R-9D. *Extraordinary items.* Extraordinary gains and losses should be presented separately from other revenue and expenses in the income statement.

Extraordinary items are events and transactions that are distinguished by their unusual nature *and* by the infrequency of their occurrence. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

R-9E. *Net income.* The net income of an enterprise for a period should be separately disclosed and clearly identified in the income statement.

Identifying the amount of the net income is considered necessary for fair presentation in conformity with generally accepted accounting principles.

.26 R-10. *Other disclosures.* In addition to informative classifications and segregation of data, financial statements should disclose all additional information that is necessary for fair presentation in conformity with generally accepted accounting principles. Descriptions of accounting policies and notes that are necessary for adequate disclosure are an integral part of the financial statements.

Financial statements cannot provide all of the information available about an enterprise. They are essentially summaries of a large quantity of detailed information. Furthermore, the information given on the face of the statements is largely restricted to that which can be represented by a number described by a very few words. Normally information of that type needs amplification to make it most useful, and the financial statements, descriptions of accounting policies, and notes are necessary for adequate disclosure. In addition to the four types of disclosure specified below that are considered necessary, additional disclosures are commonly made, for example, disclosure of nonarm's-length

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

and nonmonetary transactions. [As amended, effective for transactions entered into after September 30, 1973, by APB Opinion No. 29.] (See section 1041.)

In general, information that might affect the conclusions formed by a reasonably informed reader of the financial statements should be disclosed. Disclosure principles carry an implied responsibility to present information so that its significance is apparent to a reasonably informed reader. A mass of detailed information, overly compressed information, and language that may be a barrier to communication are unsatisfactory. Financial statements should inform the reader of matters that may affect his interpretation of them, and may provide additional information that will facilitate his understanding and use of the statements. [As amended by APB Opinion No. 22, December 31, 1971.]

R-10A. *Customary or routine disclosure.* Information about measurement bases of important assets, restrictions on assets and of owners' equity, contingent liabilities, contingent assets, important long-term commitments not recognized in the body of the statements, information on terms of owners' equity and long-term debt, and certain other disclosures required by pronouncements of the Accounting Principles Board and the Committee on Auditing Procedure of the American Institute of Certified Public Accountants and regulatory bodies that have jurisdiction are necessary for full disclosure.

R-10B. *Disclosure of changes in accounting principles.* Disclosure of changes in accounting principles, practices, or the methods of applying them, together with the financial effect, is required in accordance with section 1051, *Accounting Changes.* [As amended, effective for fiscal periods

beginning after July 31, 1971 by APB Opinion No. 20.]

R-10C. *Disclosure of subsequent events.* Disclosure of events that affect the enterprise directly and that occur between the date of, or end of the period covered by, the financial statements and the date of completion of the statements is necessary if knowledge of the events might affect the interpretation of the statements, even though the events do not affect the propriety of the statements themselves.

R-10D. *Disclosure of accounting policies.* Description of the accounting policies adopted by the reporting entity is required as an integral part of the financial statements. [As amended, effective for fiscal years beginning after December 31, 1971, by APB Opinion No. 22.] (See section 2045.)

.27 R-11. *Form of financial statement presentation.* No particular form of financial statements is presumed better than all others for all purposes, and several forms are used.

.28 R-12. *Earnings per share.* Earnings per share information is most useful when furnished in conjunction with net income and its components and should be disclosed on the face of the income statement.

A single figure for earnings per share involves the same limitations of usefulness as does a single figure for net income. Unless earnings per share statistics are presented in conjunction with financial statements and with other historical information, their usefulness in evaluating past performance of an enterprise and attempting to formulate an opinion as to its future potential is limited. Furthermore, earnings per share should be disclosed for (a) income before extraordinary items, and (b) net income. Earnings

© 1974, American Institute of Certified Public Accountants, Inc.

per share disclosure should take into consideration matters such as changes in the number of shares outstanding, contingent changes, and possible dilution from potential conversions of convertible debentures, preferred stock, options, or warrants.

AC Section 1028

Generally Accepted Accounting Principles— Detailed Operating Principles

[Source: APB Statement No. 4, Chap. 8, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

.01 The detailed principles of accounting are the large body of practices and procedures that prescribe definitively how transactions and other events should be recorded, classified, summarized, and presented. They are the means of implementing the pervasive and broad operating principles discussed in sections 1026 and 1027.

.02 The detailed accounting principles are not enumerated in sections 1021-1029 for several reasons:

1. Many detailed accounting principles are already found in Opinions of the Accounting Principles Board and in the Accounting Research Bulletins.
2. The pervasive principles and the broad operating principles that underlie the detailed accounting principles tend to evolve slowly. The detailed principles, on the other hand, change relatively frequently. A comprehensive statement of detailed principles therefore would need continual revision to avoid becoming obsolete.
3. A comprehensive statement of detailed accounting principles would include material that the Board cannot, as practical matter, consider at this time.

.03 Opinions of the Accounting Principles Board and Accounting Research Bulletins are the most authoritative sources of generally accepted accounting principles for members of the American Institute of Certified Public Accountants.[1] Opinions of the Accounting Principles Board and Accounting Research Bulletins deal with specific subjects

[1] See sections 100.09 and 520.

but do not constitute a comprehensive list of detailed accounting principles. No comprehensive authoritative list of detailed accounting principles is presently available.[2] [As amended, effective May 7, 1973 by Council Resolution.] (See section 510.08.)

.04 Securities and Exchange Commission pronouncements are an important source of detailed principles in some areas. These pronouncements specify requirements for Securities and Exchange Commission reports and influence financial accounting and reporting practices. Actual accounting and reporting practices are another important source of detailed accounting principles in areas not covered by Accounting Principles Board Opinions or the Accounting Research Bulletins. Publications of professional organizations, for example Industry Audit Guides published by the American Institute of CPAs, and surveys that disclose predominant or preferred accounting practices may also provide evidence of authoritative support. On the other hand, isolated instances of actual practice cannot be regarded as authoritative.

.05 Accounting textbooks and other accounting writings may also be referred to as sources of detailed accounting principles in areas that are not covered by Accounting Principles Board Opinions or the Accounting Research Bulletins. The information from these sources must be regarded as tentative. No one textbook or other writing may be regarded as authoritative in itself. The consensus of a number of writers, however, may be a good indication of existing detailed principles not covered by Accounting Principles Board pronouncements.

The next page is 7331.

---

[2] Accounting Research Study No. 7, *Inventory of Generally Accepted Accounting Principles for Business Enterprises*, by Paul Grady, is a valuable source of those detailed accounting principles that existed at the time of its publication in 1965. This is an "unofficial" source, however, because Accounting Research Studies are not pronouncements of the Accounting Principles Board or of the Institute, and the fact that the study quotes extensively from the Board Opinions and the Accounting Research Bulletins in no way changes the status of either the pronouncements or the study.

AC Section 1029

Financial Accounting in the Future

[Source: APB Statement No. 4, Chap. 9, as amended.]

Issue date, unless otherwise indicated: October, 1970

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

.01 Description of the environment, objectives, and basic features of financial accounting and financial statements and of broad generally accepted accounting principles has been an important objective of the Accounting Principles Board since its inception. Issuance of sections 1021-1029 is a basic step in the Board's program of determining appropriate practice and narrowing areas of difference and inconsistency.

DYNAMIC NATURE OF FINANCIAL ACCOUNTING

.02 Present generally accepted accounting principles are the result of an evolutionary process that can be expected to continue in the future. Changes may occur at any level of generally accepted accounting principles. The pervasive and broad operating principles are relatively stable but may change over time. Changes occur more frequently in the detailed principles used to apply broad principles to specific situations.

.03 Generally accepted accounting principles change in response to changes in economic and social conditions, to new knowledge and technology, and to demands of users for more serviceable financial information. The dynamic nature of financial accounting—its ability to change in response to changed conditions—enables it to maintain and increase the usefulness of the information it provides.

BASIS FOR EVALUATION

.04 Although sections 1021-1029 do not specify what generally accepted accounting principles should be in the future, they are intended to provide a basis for evaluating principles and guiding changes in financial accounting.

Orderly change in financial accounting is promoted by evaluation of present and proposed principles in terms of their internal consistency and practical operation and in the light of observations concerning the environment and objectives of financial accounting and financial statements.

Practical Operation and Internal Consistency of Generally Accepted Accounting Principles

.05 Present generally accepted accounting principles can be analyzed to determine if they are operational and internally consistent.[1] Analysis can focus on individual principles and on their implications for and consistency with other principles. Evaluations of this type can aid in narrowing areas of difference and promoting the usefulness of financial accounting information.

The Environment

.06 Generally accepted accounting principles can also be evaluated by relating the financial accounting information they produce to the economic activities that the information attempts to represent. The significant constraints placed on accounting measurement by the complexity, continuity, and joint nature of economic activities are important in this evaluation.

Objectives of Financial Accounting and Financial Statements

.07 Understanding the objectives of financial accounting and financial statements (section 1024) is vital in evaluating and improving generally accepted accounting principles. The general objectives relate the content of financial accounting information to the interests and needs of users. The content of financial accounting information can therefore be appraised by determining the extent to which it serves these interests and needs. The qualitative objectives indicate the characteristics of useful information and thus provide criteria for appraising the usefulness of financial accounting information. The objectives are now achieved with varying degrees of success but improvement is probably possible in achieving each of them. Some objectives may conflict, however, so that improvement in one

---

[1] Although consistency of principles is desirable, improving financial accounting may require changes that temporarily increase inconsistency among principles.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

area may be at the expense of another area. Generally accepted accounting principles should therefore be evaluated to determine the degree to which the objectives are met and the extent to which present principles represent an optimum practical solution to the problem of resolving conflicts between objectives.

PROPOSALS FOR CHANGE

.08 Suggestions have been made that present generally accepted accounting principles be changed (1) to eliminate differences in accounting practices that are not justified by differences in circumstances, (2) to make them more internally consistent, (3) to improve their effectiveness in accomplishing the objectives of financial accounting, and (4) to reflect more adequately the economic activities represented. These suggestions have resulted in a number of proposals in recent years which have not been fully evaluated but which, if accepted, would result in significant changes in generally accepted accounting principles and the resulting financial statements. Brief mention of some of these proposals in the following paragraphs does not, of course, imply a degree of present acceptance nor constitute a forecast of future acceptance. Reference to them in sections 1021-1029 does not give them substantial authoritative support.

.09 Some proposals contemplate change within the basic historical-cost-based accounting described in sections 1021-1029 in connection with present generally accepted accounting principles. The proposed changes, for example, would broaden the measurement and recognition criteria so that some items, such as contracts, commitments, and leases, that are not now recorded as assets and liabilities would be included in financial statements; also, criteria would be established for associating inventory costs and the costs of long-lived productive assets (plant and equipment) with the related revenue, both to narrow the range of acceptable procedures and to reduce the necessity of making essentially arbitrary choices among procedures. Although adopting these kinds of proposals would introduce significant changes, financial accounting for the most part would still rely on relating acquisition costs with revenue

to determine income and on acquisition prices as the basic recorded amount of assets.

.10 Other proposals contemplate more sweeping changes in the financial accounting structure or the content of financial statements. For example, they would revise the realization principle to permit accrual of increases in value of resources during production, substitute current replacement prices, current selling prices, estimated future selling prices, or discounted present-value concepts for acquisition prices as the basis of measurement, recognize changes in the general level of prices, and incorporate budgets as part of the basic financial statements.

.11 Still other proposals would change the presentation of financial accounting information rather than its accumulation and processing. New financial statements and new forms of existing financial statements have been proposed. The use of ratios instead of money amounts has been suggested, pointing to an emphasis on information such as trends, relationships, rates of return, and statements expressed in terms of percentages, rather than on absolute dollar amounts. Development of ways of disclosing information more effectively than in narrative notes has been proposed, including more use of graphs, charts, and other visual aids.

.12 Considerable interest has been shown in international accounting standards or "international generally accepted accounting principles." Prerequisite to the development of accounting standards on an international scale is not only knowledge of accounting practices and principles in various countries but also some attempts on the part of the accounting profession of each country to formalize and codify the accounting practices used in the country.*

.13 These proposals are mentioned in sections 1021-1029 not to give them recognition or support but to indicate the general nature of potential changes in ideas and conditions in the future. Financial accounting promises to be as dynamic in the future as it has been in the past. The Accounting Principles Board will be involved in guiding future changes in generally accepted accounting principles.

AC Section 1041

Accounting For Nonmonetary Transactions

[Source: APB Opinion No. 29.]

Effective for transactions entered into after September 30, 1973, unless otherwise indicated

INTRODUCTION

.01 Most business transactions involve exchanges of cash or other monetary assets or liabilities[1] for goods or services. The amount of monetary assets or liabilities exchanged generally provides an objective basis for measuring the cost of nonmonetary assets or services received by an enterprise as well as for measuring gain or loss on nonmonetary assets transferred from an enterprise. Some transactions, however, involve either (a) an exchange with another entity (reciprocal transfer[1]) that involves principally nonmonetary assets or liabilities[1] or (b) a transfer of nonmonetary assets for which no assets are received or relinquished in exchange (nonreciprocal transfer[1]). Both exchanges and nonreciprocal transfers that involve little or no monetary assets or liabilities are referred to in this section as nonmonetary transactions.

.02 Questions have been raised concerning the determination of the amount to assign to a nonmonetary asset transferred to or from an enterprise in a nonmonetary transaction and also concerning the recognition of a gain or loss on a nonmonetary asset transferred from an enterprise in a nonmonetary transaction. Practice has varied; some nonmonetary transactions have been accounted for at the estimated fair value of the assets transferred and some at the amounts at which the assets transferred were previously recorded. This section sets forth the views of the Board on accounting for nonmonetary transactions.

Definitions

.03 The meanings of certain terms used in this section are:

[1] See paragraph .03 of this section for definitions of these terms.

a. *Monetary assets and liabilities* are assets and liabilities whose amounts are fixed in terms of units of currency by contract or otherwise. Examples are cash, short- or long-term accounts and notes receivable in cash, and short- or long-term accounts and notes payable in cash.[2]

b. *Nonmonetary assets and liabilities* are assets and liabilities other than monetary ones. Examples are inventories; investments in common stocks; property, plant and equipment; and liabilities for rent collected in advance.[2]

c. *Exchange* (*or exchange transaction*) is a reciprocal transfer between an enterprise and another entity that results in the enterprise's acquiring assets or services or satisfying liabilities by surrendering other assets or services or incurring other obligations.[3]

d. *Nonreciprocal transfer*[3] is a transfer of assets or services in one direction, either from an enterprise to its owners (whether or not in exchange for their ownership interests) or another entity or from owners or another entity to the enterprise. An entity's reacquisition of its outstanding stock is an example of a nonreciprocal transfer.

e. *Productive assets* are assets held for or used in the production of goods or services by the enterprise. Productive assets include an investment in another entity if the investment is accounted for by the equity method but exclude an investment not accounted for by that method. *Similar productive assets* are productive assets that are of the same general type, that perform the same function or that are employed in the same line of business.

Applicability

.04 This section does not apply to the following transactions:

---

[2] Section 1071.17-.19, *Financial Statements Restated for General Price-Level Changes,* and section 1071B, contains a more complete explanation of monetary and nonmonetary items.

[3] Section 1027.06-.09, *Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises,* contains a more complete explanation of exchanges and nonreciprocal transfers.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

a. A business combination accounted for by an enterprise according to the provisions of section 1091, *Business Combinations,*

b. A transfer of nonmonetary assets solely between companies or persons under common control, such as between a parent company and its subsidiaries or between two subsidiary corporations of the same parent, or between a corporate joint venture and its owners,

c. Acquisition of nonmonetary assets or services on issuance of the capital stock of an enterprise,[4] and

d. Stock issued or received in stock dividends and stock splits which are accounted for in accordance with section 5561.

This section applies to regulated companies in accordance with section 6011, *Accounting Principles for Regulated Industries,* and it amends section 1027, *Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises,* to the extent it relates to measuring transfers of certain nonmonetary assets. Some exchanges of nonmonetary assets involve a small monetary consideration, referred to as "boot," even though the exchange is essentially nonmonetary. This section also applies to those transactions. For purposes of applying this section, events and transactions in which nonmonetary assets are involuntarily converted (for example, as a result of total or partial destruction, theft, seizure, or condemnation) to monetary assets that are then reinvested in other nonmonetary assets —are monetary transactions since the recipient is not obligated to reinvest the monetary consideration in other nonmonetary assets.

DISCUSSION

Present Accounting for Nonmonetary Transactions

.05 *Nonreciprocal Transfers with Owners.* Some nonmonetary transactions are nonreciprocal transfers between an enterprise and its owners. Examples include (a) distribution of nonmonetary assets, such as marketable equity

[4] The Board has deferred consideration of accounting for those transactions pending completion and consideration of Accounting Research Studies on intercorporate investments and stockholders' equity except to the extent they are covered in section 4062, *Accounting for Stock Issued to Employees.*

securities, to stockholders as dividends, (b) distribution of nonmonetary assets, such as marketable equity securities, to stockholders to redeem or acquire outstanding capital stock of the enterprise, (c) distribution of nonmonetary assets, such as capital stock of subsidiaries, to stockholders in corporate liquidations or plans of reorganization that involve disposing of all or a significant segment of the business (the plans are variously referred to as spin-offs, split-ups, and split-offs), and (d) distribution of nonmonetary assets to groups of stockholders, pursuant to plans of rescission or other settlements relating to a prior business combination, to redeem or acquire shares of capital stock previously issued in a business combination. Accounting for decreases in owners' equity that result from nonreciprocal nonmonetary transactions with owners has usually been based on the recorded amount of the nonmonetary assets distributed.

.06 *Nonreciprocal Transfers with Other Than Owners.* Other nonmonetary transactions are nonreciprocal transfers between an enterprise and entities other than its owners. Examples are the contribution of nonmonetary assets by an enterprise to a charitable organization and the contribution of land by a governmental unit for construction of productive facilities by an enterprise. Accounting for nonmonetary assets received in a nonreciprocal transfer from an entity other than an owner has usually been based on fair value of the assets received while accounting for nonmonetary assets transferred to another entity has usually been based on the recorded amount of the assets relinquished.

.07 *Nonmonetary Exchanges.* Many nonmonetary transactions are exchanges of nonmonetary assets or services with another entity. Examples include (a) exchange of product held for sale in the ordinary course of business (inventory) for dissimilar property as a means of selling the product to a customer, (b) exchange of product held for sale in the ordinary course of business (inventory) for similar product as an accommodation—that is, at least one party to the exchange reduces transportation costs, meets immediate inventory needs, or otherwise reduces costs or facilitates ultimate sale of the product—and not as a means of selling the product to a customer, and (c) exchange of

 © 1974, American Institute of Certified Public Accountants, Inc.

productive assets—assets employed in production rather than held for sale in the ordinary course of business—for similar productive assets or for an equivalent interest in similar productive assets. Examples of exchanges in category (c) include the trade of player contracts by professional sports organizations, exchange of leases on mineral properties, exchange of one form of interest in an oil producing property for another form of interest, exchange of real estate for real estate. Accounting for nonmonetary assets acquired in a nonmonetary exchange has sometimes been based on the fair value of the assets relinquished and sometimes on the recorded amount of the assets relinquished.

Differing Views

.08 Views of accountants differ as to appropriate accounting for all of the types of nonmonetary transactions described in paragraphs .05 to .07.

.09 *Nonreciprocal Transfers of Nonmonetary Assets to Owners.* Some believe that accounting for nonreciprocal transfers of nonmonetary assets to owners should be based on the carrying amount of the nonmonetary assets transferred because only that method is consistent with the historical cost basis of accounting.

.10 Others believe that accounting for transfers of nonmonetary assets to reduce certain owners' interests other than through a reorganization, liquidation, or rescission of a prior business combination should be based on the fair value of the nonmonetary assets distributed or the fair value of the stock representing the owners' equity eliminated, whichever is more clearly evident. In their view, disposing of the value represented by a nonmonetary asset is a significant economic event, and the unrecorded increase or decrease that has resulted in the value of the nonmonetary asset since its acquisition should be recognized.

.11 Many who agree with accounting based on fair value for a nonreciprocal transfer of a nonmonetary asset that reduces certain owners' interests also believe that distributing a nonmonetary asset as an ordinary dividend (but not distributing a nonmonetary asset as a liquidating dividend or in a spin-off, reorganization or similar distributions)

may be regarded as equivalent to an exchange with owners and therefore recorded at the fair value of the nonmonetary asset distributed, particularly if the dividend is distributable as either cash or the nonmonetary asset at the election of the owner. They believe that failure to recognize the fair value of nonmonetary assets transferred may both misstate the dividend and fail to recognize gains and losses on nonmonetary assets that have already been earned or incurred by the enterprise and should be recognized on distributing the assets for dividend purposes.

.12 Others generally agree with the view that nonreciprocal transfers of nonmonetary assets to certain owners should be accounted for at fair value but believe that dividends and other prorata distributions to owners are essentially similar to liquidating dividends or distributions in spin-offs and reorganizations and should be accounted for at the recorded amount of the asset transferred.

.13 *Nonreciprocal Receipts of Nonmonetary Assets.* Many believe that a nonmonetary asset received in a nonreciprocal transfer from other than owners should be recorded at fair value because fair value is the only value revelant to the recipient enterprise. Others believe that such nonmonetary assets should be recorded at a nominal value since fair value cannot be reasonably determined in view of performance obligations usually agreed to by the recipient as a consideration for the transfer.

.14 *Nonreciprocal Transfers of Nonmonetary Assets to Other Than Owners.* Some believe that accounting for a nonreciprocal transfer of a nonmonetary asset to an entity other than an owner should be based on the carrying amount of the asset transferred because only that method is consistent with the historical cost basis of accounting. Others believe that failure to recognize the fair value of a nonmonetary asset transferred may both understate (or overstate) expenses incurred and fail to recognize gains or losses on nonmonetary assets that have already been earned or incurred by the enterprise and should be recognized when the transfer of the asset is recognized as an expense.

.15 *Exchange Transactions.* Some believe that accounting for an exchange of nonmonetary assets between an enterprise and another entity (an enterprise or indi-

 © 1974, American Institute of Certified Public Accountants, Inc.

vidual acting in a capacity other than a stockholder of the enterprise) should be based on the fair values of the assets involved, while others believe that accounting for the exchange should be based on the carrying amount of the asset transferred from the enterprise. Those who advocate the former view believe it to be the only method consistent with the accounting principle that an asset acquired should be recorded at its cost as measured by the fair value of the asset relinquished to acquire it. Those advocating the latter view believe that revenue should be recognized only if an exchange involves monetary assets; therefore recognizing fair value is inappropriate unless a monetary asset is received in an exchange.

.16 Many accountants who accept the concept that accounting for an exchange of nonmonetary assets should be based on fair value believe that problems of measurement and questions about the conditions for recognizing revenue require modification of the concept in two types of exchanges. They therefore conclude that:

a. Fair values should not be recognized if an enterprise exchanges product or property held for sale in the ordinary course of business for product or property to be sold in the same line of business. The emphasis in that exchange, in their view, is on developing economical ways to acquire inventory for resale to customers rather than on marketing inventory to obtain revenue from customers. Therefore, "swapping" inventories between enterprises that are essentially competitors and not customers of each other is merely an incidental early stage of an earning process, and revenue should not be recognized until the time of sale of the exchanged products (in the same or another form) to a customer of the enterprise.

b. Fair value should not be recognized if an enterprise exchanges a productive asset for a similar productive asset or an equivalent interest in the same or similar productive asset. Therefore, revenue should not be recognized merely because one productive asset is substituted for a similar productive asset but rather should be considered to flow from the

production and sale of the goods or services to which the substituted productive asset is committed.

.17 *Fair Value Not Determinable.* General agreement exists that a nonmonetary transaction, regardless of form, should not be recorded at fair value if fair value is not determinable within reasonable limits. Major uncertainties concerning realizability of the fair value proposed to be assigned to a nonmonetary asset received in a nonmonetary transaction are indicative of an inability to determine fair value within reasonable limits. Some believe that only an exchange transaction between parties with essentially opposing interests provides an independent test of fair value to be used in measuring the transaction; therefore fair value is determinable within reasonable limits only in a negotiated exchange transaction. Others believe that fair value in a nonreciprocal transfer is also often determinable within reasonable limits and should be recognized in certain types of transactions.

OPINION

Basic Principle

.18 The Board concludes that in general accounting for nonmonetary transactions should be based on the fair values [5] of the assets (or services) involved which is the same basis as that used in monetary transactions. Thus, the cost of a nonmonetary asset acquired in exchange for another nonmonetary asset is the fair value of the asset surrendered to obtain it, and a gain or loss should be recognized on the exchange. The fair value of the asset received should be used to measure the cost if it is more clearly evident than the fair value of the asset surrendered. Similarly, a nonmonetary asset received in a nonreciprocal transfer should be recorded at the fair value of the asset received. A transfer of a nonmonetary asset to a stockholder or to another entity in a nonreciprocal transfer should be recorded at the fair value of the asset transferred, and a gain or loss should be recognized on the disposition of the asset. The fair value of an entity's own stock reacquired may be a more clearly evident measure of the fair value of the asset distributed in a nonreciprocal transfer if the transaction involves distribution of a nonmonetary asset

[5] See paragraph .25 for determination of fair value.

 © 1974, American Institute of Certified Public Accountants, Inc.

to eliminate a disproportionate part of owners' interests (that is, to acquire stock for the treasury or for retirement).

.19 The Board believes that certain modifications of the basic principle are required to accommodate problems of measurement and questions about the conditions for recognizing revenue. These modifications are specified in paragraphs .20 to .23.

Modifications of the Basic Principle

.20 *Fair Value Not Determinable.* Accounting for a nonmonetary transaction should not be based on the fair values of the assets transferred unless those fair values are determinable within reasonable limits (paragraph .25).

.21 *Exchanges.* If the exchange is not essentially the culmination of an earning process, accounting for an exchange of a nonmonetary asset between an enterprise and another entity should be based on the recorded amount (after reduction, if appropriate, for an indicated impairment of value) of the nonmonetary asset relinquished. The Board believes that the following two types of nonmonetary exchange transactions do not culminate an earning process:

a. An exchange of a product or property held for sale in the ordinary course of business for a product or property to be sold in the same line of business to facilitate sales to customers other than the parties to the exchange, and

b. An exchange of a productive asset not held for sale in the ordinary course of business for a similar productive asset or an equivalent interest in the same or similar productive asset (similar productive asset is defined in paragraph .03 and examples are given in paragraph .07).[6]

.22 The exchanges of nonmonetary assets that would otherwise be based on recorded amounts (paragraph .21) may include an amount of monetary consideration. The Board believes that the recipient of the monetary consideration has realized gain on the exchange to the extent that the amount of the monetary receipt exceeds a proportionate

---

[6] The fact that an exchange of productive assets is not a taxable transaction for tax purposes may be evidence that the assets exchanged are similar for purposes of applying this section.

share of the recorded amount of the asset surrendered. The portion of the cost applicable to the realized amount should be based on the ratio of the monetary consideration to the total consideration received (monetary consideration plus the estimated fair value of the nonmonetary asset received) or, if more clearly evident, the fair value of the nonmonetary asset transferred. The Board further believes that the entity paying the monetary consideration should not recognize any gain on a transaction covered in paragraph .21 but should record the asset received at the amount of the monetary consideration paid plus the recorded amount of the nonmonetary asset surrendered. If a loss is indicated by the terms of a transaction described in this paragraph or in paragraph .21, the entire indicated loss on the exchange should be recognized.

.23 *Nonreciprocal Transfers to Owners.* Accounting for the distribution of nonmonetary assets to owners of an enterprise in a spin-off or other form of reorganization or liquidation or in a plan that is in substance the rescission of a prior business combination should be based on the recorded amount (after reduction, if appropriate, for an indicated impairment of value) of the nonmonetary assets distributed. A prorata distribution to owners of an enterprise of shares of a subsidiary or other investee company that has been or is being consolidated or that has been or is being accounted for under the equity method is to be considered to be equivalent to a spin-off. Other nonreciprocal transfers of nonmonetary assets to owners should be accounted for at fair value if the fair value of the nonmonetary asset distributed is objectively measurable and would be clearly realizable to the distributing entity in an outright sale at or near the time of the distribution.

Applying the Basic Principle

.24 The Board's conclusions modify to some extent existing practices as described in paragraphs .05 to .07. The conclusions are based on supporting reasons given in paragraphs .08 to .17.

.25 Fair value of a nonmonetary asset transferred to or from an enterprise in a nonmonetary transaction should be determined by referring to estimated realizable values in cash transactions of the same or similar assets, quoted

 © 1974, American Institute of Certified Public Accountants, Inc.

market prices, independent appraisals, estimated fair values of assets or services received in exchange, and other available evidence. If one of the parties in a nonmonetary transaction could have elected to receive cash instead of the nonmonetary asset, the amount of cash that could have been received may be evidence of the fair value of the nonmonetary assets exchanged.

.26 Fair value should be regarded as not determinable within reasonable limits if major uncertainties exist about the realizability of the value that would be assigned to an asset received in a nonmonetary transaction accounted for at fair value. An exchange involving parties with essentially opposing interests is not considered a prerequisite to determining a fair value of a nonmonetary asset transferred; nor does an exchange insure that a fair value for accounting purposes can be ascertained within reasonable limits. If neither the fair value of a nonmonetary asset transferred nor the fair value of a nonmonetary asset received in exchange is determinable within reasonable limits, the recorded amount of the nonmonetary asset transferred from the enterprise may be the only available measure of the transaction.

.27 A difference between the amount of gain or loss recognized for tax purposes and that recognized for accounting purposes may constitute a timing difference to be accounted for according to section 4091, *Income Taxes.*

Disclosure

.28 An enterprise that engages in one or more nonmonetary transactions during a period should disclose in financial statements for the period the nature of the transactions, the basis of accounting for the assets transferred, and gains or losses recognized on transfers.[7]

EFFECTIVE DATE

.29 This section shall be effective for transactions entered into after September 30, 1973. Transactions recorded previously for a fiscal year ending before October 1, 1973 should not be adjusted. However, transactions re-

---

[7] Section 2051.11, *Consolidated Financial Statements,* includes additional disclosures that are preferred if a parent company disposes of a subsidiary during the year.

corded previously for a fiscal year that includes October 1, 1973 may be adjusted to comply with the provisions of this section.

AC Section 1051

Accounting Changes

[Source: APB Opinion No. 20, as amended.]

Effective for fiscal years beginning after July 31, 1971, unless otherwise indicated

INTRODUCTION

.01 A change in accounting by a reporting entity may significantly affect the presentation of both financial position and results of operations for an accounting period and the trends shown in comparative financial statements and historical summaries. The change should therefore be reported in a manner which will facilitate analysis and understanding of the financial statements.

Scope of Section

.02 This section defines various types of accounting changes and establishes guides for determining the manner of reporting each type. It also covers reporting a correction of an error in previously issued financial statements.

.03 This section applies to financial statements which purport to present financial position, changes in financial position, and results of operations in conformity with generally accepted accounting principles. The guides in this section also may be appropriate in presenting financial information in other forms or for special purposes. Companies in regulated industries may apply generally accepted accounting principles differently from nonregulated companies because of the effect of the rate-making process. This section should therefore be applied to regulated companies in accordance with the provisions of section 6011.

.04 This section does not change the policy of the Board that its Opinions, unless otherwise stated, are not intended to be retroactive. Each published section specifies its effective date and the manner of reporting a change to conform with the conclusions of each section. An industry audit guide prepared by a committee of the American Institute of Certified Public Accountants may also prescribe the manner of reporting a change in accounting principle.[1] Accordingly, the provisions of this section do not apply to changes made in conformity with such pronouncements issued in the past or in the future.

---

[1] See AC section 6000 Appendix for a list of AICPA Industry Audit/Accounting Guides.

.05 This section reaffirms the provisions of previous Board Opinions that prescribe the manner of reporting a change in accounting principle, an accounting estimate, or reporting entity except for the following sections: [2]

a. Section 2041.03, *Comparative Financial Statements,* has been amended to insert a cross reference to this section. This section identifies numerous accounting changes and specifies the manner of reporting each change.

b. Section 2010.19, *Reporting the Results of Operations,* has been superseded, and section 2011.13, *Earnings per Share,* amended by APB Opinion No. 30. This section specifies an additional element in the presentation of the income statement. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

c. Section 2010.24 has been superseded. Although the conclusion of that paragraph is not modified, this section deals more completely with accounting changes.

TYPES OF ACCOUNTING CHANGES

.06 The term *accounting change* in this section means a change in (a) an accounting principle, (b) an accounting estimate, or (c) the reporting entity (which is a special type of change in accounting principle classified separately for purposes of this section). The correction of an error in previously issued financial statements is not deemed to be an accounting change.

Change in Accounting Principle

.07 A change in accounting principle results from adoption of a generally accepted accounting principle different from the one used previously for reporting purposes. The term *accounting principle* includes "not only accounting principles and practices but also the methods of applying them." [3]

.08 A characteristic of a change in accounting principle is that it concerns a choice from among two or more generally accepted accounting principles. However, neither

---

[2] Sections 1021-1029, *Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises,* have been amended to the extent that they relate to reporting accounting changes.

[3] AU section 410.02 (volume 1, AICPA PROFESSIONAL STANDARDS).

(a) initial adoption of an accounting principle in recognition of events or transactions occurring for the first time or that previously were immaterial in their effect nor (b) adoption or modification of an accounting principle necessitated by transactions or events that are clearly different in substance from those previously occurring is a change in accounting principle.

.09 Changes in accounting principle are numerous and varied. They include, for example, a change in the method of inventory pricing, such as from the last in, first out (LIFO) method to the first in, first out (FIFO) method; a change in depreciation method for previously recorded assets, such as from the double declining balance method to the straight line method;[4] a change in the method of accounting for long-term construction-type contracts, such as from the completed contract method to the percentage of completion method; and a change from recording costs as expense when incurred to deferring and amortizing them. (Paragraph .11 covers a change in accounting principle to effect a change in estimate.) [As modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2.] (See section 4211.)

Change in Accounting Estimate

.10 Changes in estimates used in accounting are necessary consequences of periodic presentations of financial statements. Preparing financial statements requires estimating the effects of future events. Examples of items for which estimates are necessary are uncollectible receivables, inventory obsolescence, service lives and salvage values of depreciable assets, warranty costs, periods benefited by a deferred cost, and recoverable mineral reserves. Future events and their effects cannot be perceived with certainty; estimating, therefore, requires the exercise of judgment. Thus accounting estimates change as new events occur, as more experience is acquired, or as additional information is obtained.

.11 *Change in estimate effected by a change in accounting principle.* Distinguishing between a change in an accounting principle and a change in an accounting estimate

---

[4] A change to the straight line method at a specific point in the service life of an asset may be planned at the time the accelerated depreciation method is adopted to fully depreciate the cost over the estimated life of the asset. Consistent application of such a policy does not constitute a change in accounting principle for purposes of applying this section. (Section 2043.02d covers disclosure of methods of depreciation.)

is sometimes difficult. For example, a company may change from deferring and amortizing a cost to recording it as an expense when incurred because future benefits of the cost have become doubtful. The new accounting method is adopted, therefore, in partial or complete recognition of the change in estimated future benefits. The effect of the change in accounting principle is inseparable from the effect of the change in accounting estimate. Changes of this type are often related to the continuing process of obtaining additional information and revising estimates and are therefore considered as changes in estimates for purposes of applying this section.

Change in the Reporting Entity

.12 One special type of change in accounting principle results in financial statements which, in effect, are those of a different reporting entity. This type is limited mainly to (a) presenting consolidated or combined statements in place of statements of individual companies, (b) changing specific subsidiaries comprising the group of companies for which consolidated financial statements are presented, and (c) changing the companies included in combined financial statements. A different group of companies comprise the reporting entity after each change. A business combination accounted for by the pooling of interests method also results in a different reporting entity.

Correction of an Error in Previously Issued Financial Statements

.13 Reporting a correction of an error in previously issued financial statements concerns factors similar to those relating to reporting an accounting change and is therefore discussed in this section.[5] Errors in financial statements result from mathematical mistakes, mistakes in the application of accounting principles, or oversight or misuse of facts that existed at the time the financial statements were prepared. In contrast, a change in accounting estimate results from new information or subsequent developments and accordingly from better insight or improved judgment. Thus, an error is distinguishable from a change in estimate. A change from an accounting principle that is not generally accepted to one that is generally accepted is a correction of an error for purposes of applying this section.

[5] AU section 561, *Subsequent Discovery of Facts Existing at the Date of the Auditor's Report,* discusses other aspects of errors in previously issued financial statements.

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

VIEWS ON REPORTING CHANGES IN ACCOUNTING PRINCIPLES

.14 An essential question in reporting a change in accounting principle is whether to restate the financial statements currently presented for prior periods to show the new accounting principle applied retroactively. A summary of differing views bearing on that question is:

a. Accounting principles should be applied consistently for all periods presented in comparative financial statements. Using different accounting principles for similar items in financial statements presented for various periods may result in misinterpretations of earnings trends and other analytical data that are based on comparisons. The same accounting principle therefore should be used in presenting financial statements of current and past periods. Accordingly, financial statements presented for prior periods in current reports should be restated if a reporting entity changes an accounting principle.

b. Restating financial statements of prior periods may dilute public confidence in financial statements and may confuse those who use them. Financial statements previously prepared on the basis of accounting principles generally accepted at the time the statements were issued should therefore be considered final except for changes in the reporting entity or corrections of errors.

c. Restating financial statements of prior periods for some types of changes requires considerable effort and is sometimes impossible. For example, adequate information may not be available to restate financial statements of prior periods if the method of recording revenue from long-term contracts is changed from the completed contract method to the percentage of completion method.

d. Restating financial statements of prior periods for some changes requires assumptions that may furnish results different from what they would have been had the newly adopted principle been used in prior periods. For example, if the method of pricing inventory is changed from the FIFO method to the

LIFO method, it may be assumed that the ending inventory of the immediately preceding period is also the beginning inventory of the current period for the LIFO method. The retroactive effects under that assumption may be different from the effects of assuming that the LIFO method was adopted at an earlier date.

OPINION

Justification for a Change in Accounting Principle

.15 The Board concludes that in the preparation of financial statements there is a presumption that an accounting principle once adopted should not be changed in accounting for events and transactions of a similar type. Consistent use of accounting principles from one accounting period to another enhances the utility of financial statements to users by facilitating analysis and understanding of comparative accounting data.

.16 The presumption that an entity should not change an accounting principle may be overcome only if the enterprise justifies the use of an alternative acceptable accounting principle on the basis that it is preferable. However, a method of accounting that was previously adopted for a type of transaction or event which is being terminated or which was a single, nonrecurring event in the past should not be changed. For example, the method of accounting should not be changed for a tax or tax credit which is being discontinued or for preoperating costs relating to a specific plant. The Board does not intend to imply, however, that a change in the estimated period to be benefited for a deferred cost (if justified by the facts) should not be recognized as a change in accounting estimate. The issuance of an Opinion of the Accounting Principles Board that creates a new accounting principle, that expresses a preference for an accounting principle, or that rejects a specific accounting principle is sufficient support for a change in accounting principle. The burden of justifying other changes rests with the entity proposing the change.[6]

[6] The issuance of an industry audit guide by a committee of the American Institute of Certified Public Accountants also constitutes sufficient support for a change in accounting principle (paragraph .04).

 © 1974, American Institute of Certified Public Accountants, Inc.

General Disclosure—A Change in Accounting Principle

.17 The nature of and justification for a change in accounting principle and its effect on income should be disclosed in the financial statements of the period in which the change is made. The justification for the change should explain clearly why the newly adopted accounting principle is preferable.

Reporting A Change in Accounting Principle

.18 The Board believes that, although they conflict, both (a) the potential dilution of public confidence in financial statements resulting from restating financial statements of prior periods and (b) consistent application of accounting principles in comparative statements are important factors in reporting a change in accounting principles. The Board concludes that most changes in accounting should be recognized by including the cumulative effect, based on a retroactive computation, of changing to a new accounting principle in net income of the period of the change (paragraphs .19 to .26) but that a few specific changes in accounting principles should be reported by restating the financial statements of prior periods (paragraphs .27 to .30 and .34 to .35).

.19 For all changes in accounting principle except those described in paragraphs .27 to .30 and .34 to .35, the Board therefore concludes that:

a. Financial statements for prior periods included for comparative purposes should be presented as previously reported.

b. The cumulative effect of changing to a new accounting principle on the amount of retained earnings at the beginning of the period in which the change is made should be included in net income of the period of the change (paragraph .20).

c. The effect of adopting the new accounting principle on income before extraordinary items and on net income (and on the related per share amounts) of the period of the change should be disclosed.

d. Income before extraordinary items and net income computed on a pro forma basis[7] should be shown

---

[7] The pro forma amounts include both (a) the direct effects of a change

on the face of the income statements for all periods presented as if the newly adopted accounting principle had been applied during all periods affected (paragraph .21).

Thus, income before extraordinary items and net income (exclusive of the cumulative adjustment) for the period of the change should be reported on the basis of the newly adopted accounting principle. The conclusions in this paragraph are modified for various special situations which are described in paragraphs .23 to .30.

.20 *Cumulative effect of a change in accounting principle.* The amount shown in the income statement for the cumulative effect of changing to a new accounting principle is the difference between (a) the amount of retained earnings at the beginning of the period of a change and (b) the amount of retained earnings that would have been reported at that date if the new accounting principle had been applied retroactively for all prior periods which would have been affected and by recognizing only the direct effects of the change and related income tax effect.[8] The amount of the cumulative effect should be shown in the income statement between the captions "extraordinary items" and "net income." The cumulative effect is not an extraordinary item but should be reported in a manner similar to an extraordinary item. The per share information shown on the face of the income statement should include the per share amount of the cumulative effect of the accounting change.

.21 *Pro forma effects of retroactive application.* Pro forma effects of retroactive application (paragraph .19-d including footnote 7) should be shown on the face of the income statement for income before extraordinary items and net income. The earnings per share amounts (primary and fully diluted, as appropriate under section 2011, *Earnings per Share*) for income before extraordinary items and

---

and (b) nondiscretionary adjustments in items based on income before taxes or net income, such as profit sharing expense and certain royalties, that would have been recognized if the newly adopted accounting principle had been followed in prior periods: related income tax effects should be recognized for both (a) and (b). Direct effects are limited to those adjustments that would have been recorded to restate the financial statements of prior periods to apply retroactively the change. The nondiscretionary adjustments described in (b) should not therefore be recognized in computing the adjustment for the cumulative effect of the change described in paragraph .20 unless nondiscretionary adjustments of the prior periods are actually recorded.

[8] See footnote 7.

 © 1974, American Institute of Certified Public Accountants, Inc.

net income computed on a pro forma basis should be shown on the face of the income statement. If space does not permit, such per share amounts may be disclosed prominently in a separate schedule or in tabular form in the notes to the financial statements with appropriate cross reference; when this is done the actual per share amounts should be repeated for comparative purposes. Pro forma amounts should be shown in both current and future reports for all periods presented which are prior to the change and which would have been affected. Section 1051A illustrates the manner of reporting a change in accounting principle. If an income statement is presented for the current period only, the actual and the pro forma amounts (and related per share data) for the immediately preceding period should be disclosed.

.22 The principal steps in computing and reporting the cumulative effect and the pro forma amounts of a change in accounting principle may be illustrated by a change in depreciation method for previously recorded assets as follows:

a. The class or classes of depreciable assets to which the change applies should be identified. (A ''class of assets'' relates to general physical characteristics.)

b. The amount of accumulated depreciation on recorded assets at the beginning of the period of the change should be recomputed on the basis of applying retroactively the new depreciation method. Accumulated depreciation should be adjusted for the difference between the recomputed amount and the recorded amount. Deferred taxes should be adjusted for the related income tax effects.

c. The cumulative effect on the amount of retained earnings at the beginning of the period of the change resulting from the adjustments referred to in (b) above should be shown in the income statement of the period of the change.

d. The pro forma amounts should give effect to the pro forma provisions for depreciation of each prior period presented and to the pro forma adjustments of nondiscretionary items,[9] computed on the assumption of retroactive application of the newly adopted method

[9] See footnote 7.

to all prior periods and adjusted for the related income tax effects.

.23 *Change in method of amortization and related disclosure.* Accounting for the costs of long-lived assets requires adopting a systematic pattern of charging those costs to expense. These patterns are referred to as depreciation, depletion, or amortization methods (all of which are referred to in this section as methods of amortization). Various patterns of charging costs to expenses are acceptable for depreciable assets; fewer patterns are acceptable for other long-lived assets.

.24 Various factors are considered in selecting an amortization method for identifiable assets, and those factors may change, even for similar assets. For example, a company may adopt a new method of amortization for newly acquired, identifiable, long-lived assets and use that method for all additional new assets of the same class but continue to use the previous method for existing balances of previously recorded assets of that class. For that type of change in accounting principle, there is no adjustment of the type outlined in paragraphs .19-.22, but a description of the nature of the change in method and its effect on income before extraordinary items and net income of the period of the change, together with the related per share amounts, should be disclosed. If the new method of amortization is however applied to previously recorded assets of that class, the change in accounting principle requires an adjustment for the cumulative effect of the change and the provisions of paragraphs .15 to .22 should be applied.

.25 *Pro forma amounts not determinable.* In rare situations the pro forma amounts described in paragraph .21 cannot be computed or reasonably estimated for individual prior periods, although the cumulative effect on retained earnings at the beginning of the period of change can be determined. The cumulative effect should then be reported in the income statement of the period of change in the manner described in paragraph .20. The reason for not showing the pro forma amounts by periods should be explained because disclosing those amounts is otherwise required and is expected by users of financial statements.

.26 *Cumulative effect not determinable.* Computing the effect on retained earnings at the beginning of the period

© 1974, American Institute of Certified Public Accountants, Inc.

in which a change in accounting principle is made may sometimes be impossible. In those rare situations, disclosure will be limited to showing the effect of the change on the results of operations of the period of change (including per share data) and to explaining the reason for omitting accounting for the cumulative effect and disclosure of pro forma amounts for prior years. The principal example of this type of accounting change is a change in inventory pricing method from FIFO to LIFO for which the difficulties in computing the effects of that change are described in paragraph .14-d.

.27 *Special changes in accounting principle reported by applying retroactively the new method in restatements of prior periods.* Certain changes in accounting principle are such that the advantages of retroactive treatment in prior period reports outweigh the disadvantages. Accordingly, for those few changes, the Board concludes that the financial statements of all prior periods presented should be restated. The changes that should be accorded this treatment are: (a) a change from the LIFO method of inventory pricing to another method, (b) a change in the method of accounting for long-term construction-type contracts, and (c) a change to or from the "full cost" method of accounting which is used in the extractive industries.

.28 The nature of and justification for a change in accounting principle described in paragraph .27 should be disclosed in the financial statements for the period the change was adopted. In addition, the effect of the change on income before extraordinary items, net income, and the related per share amounts should be disclosed for all periods presented. This disclosure may be on the face of the income statement or in the notes. Section 1051B illustrates the manner of reporting a change in accounting principle retroactively by restating the statements of those prior periods affected. Financial statements of subsequent periods need not repeat the disclosures.

.29 *Special exemption for an initial public distribution.* The Board concludes that in one specific situation the application of the foregoing provisions of this section may result in financial statement presentations of results of operations that are not of maximum usefulness to intended users. For example, a company owned by a few individuals may decide

to change from one acceptable accounting principle to another acceptable principle in connection with a forthcoming public offering of shares of its equity securities. The potential investors may be better served by statements of income for a period of years reflecting the use of the newly adopted accounting principles because they will be the same as those expected to be used in future periods. In recognition of this situation, the Board concludes that financial statements for all prior periods presented may be restated retroactively when a company first issues its financial statements for any one of the following purposes: (a) obtaining additional equity capital from investors, (b) effecting a business combination, or (c) registering securities. This exemption is available only once for changes made at the time a company's financial statements are first used for any of those purposes and is not available to companies whose securities currently are widely held.

.30 The company should disclose in financial statements issued under the circumstances described in paragraph .29 the nature of the change in accounting principle and the justification for it (paragraph .17).

Reporting a Change in Accounting Estimate

.31 The Board concludes that the effect of a change in accounting estimate should be accounted for in (a) the period of change if the change affects that period only or (b) the period of change and future periods if the change affects both. A change in an estimate should not be accounted for by restating amounts reported in financial statements of prior periods or by reporting pro forma amounts for prior periods.[10]

.32 A change in accounting estimate that is recognized in whole or in part by a change in accounting principle should be reported as a change in an estimate because the cumulative effect attributable to the change in accounting principle cannot be separated from the current or future effects of the change in estimate (paragraph .11). Although

[10] [Superseded, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

that type of accounting change is somewhat similar to a change in method of amortization (paragraphs .23 and .24), the accounting effect of a change in a method of amortization can be separated from the effect of a change in the estimate of periods of benefit or service and residual values of assets. A change in method of amortization for previously recorded assets therefore should be treated as a change in accounting principle, whereas a change in the estimated period of benefit or residual value should be treated as a change in accounting estimate.

.33 *Disclosure.* The effect on income before extraordinary items, net income and related per share amounts of the current period should be disclosed for a change in estimate that affects several future periods, such as a change in service lives of depreciable assets or actuarial assumptions affecting pension costs. Disclosure of the effect on those income statement amounts is not necessary for estimates made each period in the ordinary course of accounting for items such as uncollectible accounts or inventory obsolescence; however, disclosure is recommended if the effect of a change in the estimate is material.

Reporting a Change in the Entity

.34 The Board concludes that accounting changes which result in financial statements that are in effect the statements of a different reporting entity (paragraph .12) should be reported by restating the financial statements of all prior periods presented in order to show financial information for the new reporting entity for all periods.

.35 *Disclosure.* The financial statements of the period of a change in the reporting entity should describe the nature of the change and the reason for it. In addition, the effect of the change on income before extraordinary items, net income, and related per share amounts should be disclosed for all periods presented. Financial statements of subsequent periods need not repeat the disclosures. (Sections 1091.56-.65 and 1091.93-.96, *Business Combinations,* describe the manner of reporting and the disclosures required for a change in reporting entity that occurs because of a business combination.)

Reporting a Correction of an Error in Previously Issued Financial Statements

.36 The Board concludes that correction of an error in the financial statements of a prior period discovered subsequent to their issuance (paragraph .13) should be reported as a prior period adjustment. (Section 2010.17 covers the manner of reporting prior period adjustments.)

.37 *Disclosure.* The nature of an error in previously issued financial statements and the effect of its correction on income before extraordinary items, net income, and the related per share amounts should be disclosed in the period in which the error was discovered and corrected. Financial statements of subsequent periods need not repeat the disclosures.

Materiality

.38 The Board concludes that a number of factors are relevant to the materiality of (a) accounting changes contemplated in this section and (b) corrections of errors, in determining both the accounting treatment of these items and the necessity for disclosure. Materiality should be considered in relation to both the effects of each change separately and the combined effect of all changes. If a change or correction has a material effect on income before extraordinary items or on net income of the current period before the effect of the change, the treatments and disclosures described in this section should be followed. Furthermore, if a change or correction has a material effect on the trend of earnings, the same treatments and disclosures are required. A change which does not have a material effect in the period of change but is reasonably certain to have a material effect in later periods should be disclosed whenever the financial statements of the period of change are presented.

Historical Summaries of Financial Information

.39 Summaries of financial information for a number of periods are commonly included in financial reports. The summaries often show condensed income statements, including related earnings per share amounts, for five years or more. In many annual reports to stockholders, the financial highlights present similar information in capsule form. The Board concludes that all such information should be pre-

 © 1974, American Institute of Certified Public Accountants, Inc.

pared in the same manner (including the presentation of pro forma amounts) as that prescribed in this section for primary financial statements (paragraphs .15 to .38) because the summaries include financial data based on the primary financial statements. In a summary of financial information that includes an accounting period in which a change in accounting principle was made, the amount of the cumulative effect of the change that was included in net income of the period of the change should be shown separately along with the net income and related per share amounts of that period and should not be disclosed only by a note or parenthetical notation.

EFFECTIVE DATE

.40 The provisions of this section are effective for fiscal years beginning after July 31, 1971. However, the Board encourages application of the provisions of this section in reporting any accounting changes included in fiscal years beginning before August 1, 1971 but not yet reported in financial statements issued for the year of the change.

AC Section 1051A

Accounting Changes—Appendix A

An Illustration of Reporting a Change in Accounting Principle (Pursuant to Sections 1051.19-.22)

.01 ABC Company decides in 1971 to adopt the straight line method of depreciation for plant equipment. The straight line method will be used for new acquisitions as well as for previously acquired plant equipment for which depreciation had been provided on an accelerated method.

.02 This illustration assumes that the direct effects are limited to the effect on depreciation and related income tax provisions and that the direct effect on inventories is not material. The pro forma amounts have been adjusted for the hypothetical effects of the change in the provisions for incentive compensation. The per share amounts are computed assuming that 1,000,000 shares of common stock are issued and outstanding, that 100,000 additional shares would be issued if all outstanding bonds (which are not common stock equivalents) are converted, and that the annual interest expense, less taxes, for the convertible bonds is $25,000. Other data assumed for this illustration are—

		Effects of Change	
Year	*Excess of Accelerated Depreciation Over Straight Line Depreciation*	*Direct, Less Tax Effect*	*Pro forma (Note A)*
Prior to 1967	$ 20,000	$ 10,000	$ 9,000
1967	80,000	40,000	36,000
1968	70,000	35,000	31,500
1969	50,000	25,000	22,500
1970	30,000	15,000	13,500
Total at beginning of 1971	$250,000	$125,000	$112,500

.03 The manner of reporting the change in two-year comparative statements is—

	1971	*1970*
Income before extraordinary item and cumulative effect of a change in accounting principle	$1,200,000	$1,100,000
Extraordinary item (description)	(35,000)	100,000
Cumulative effect on prior years (to December 31, 1970) of changing to a different depreciation method (Note A)	125,000	
Net Income	$1,290,000	$1,200,000
Per share amounts—		
Earnings per common share—assuming no dilution:		
Income before extraordinary item and cumulative effect of a change in accounting principle	$1.20	$1.10
Extraordinary item	(0.04)	0.10
Cumulative effect on prior years (to December 31, 1970) of changing to a different depreciation method	0.13	......
Net income	$1.29	$1.20
Earnings per common share—assuming full dilution:		
Income before extraordinary item and cumulative effect of a change in accounting principle	$1.11	$1.02
Extraordinary item	(0.03)	0.09
Cumulative effect on prior years (to December 31, 1970) of changing to a different depreciation method	0.11	......
Net income	$1.19	$1.11

 © 1974, American Institute of Certified Public Accountants, Inc.

	1971	*1970*
Pro forma amounts assuming the new depreciation method is applied retroactively—		
Income before extraordinary item	$1,200,000	$1,113,500
Earnings per common share—assuming no dilution	$1.20	$1.11
Earnings per common share—assuming full dilution	$1.11	$1.04
Net income	$1,165,000	$1,213,500
Earnings per common share—assuming no dilution	$1.17	$1.21
Earnings per common share—assuming full dilution	$1.08	$1.13

(See accompanying note to the financial statements)

NOTE A:

Change in Depreciation Method for Plant Equipment

Depreciation of plant equipment has been computed by the straight line method in 1971. Depreciation of plant equipment in prior years, beginning in 1954, was computed by the sum of the years digits method. The new method of depreciation was adopted to recognize . . . (state justification for change of depreciation method) . . . and has been applied retroactively to equipment acquisitions of prior years. The effect of the change in 1971 was to increase income before extraordinary item by approximately $10,000 (or one cent per share). The adjustment of $125,000 (after reduction for income taxes of $125,000) to apply retroactively the new method is included in income of 1971. The pro forma amounts shown on the income statement have been adjusted for the effect of retroactive application on depreciation, the change in provisions for incentive compensation which would have been made had the new method been in effect, and related income taxes.

.04 The manner of reporting the change in five-year comparative statements is—

	1971	*1970*	*1969*	*1968*	*1967*
Income before extraordinary item and cumulative effect of a change in accounting principle	$1,200,000	$1,100,000	$1,300,000	$1,000,000	$800,000
Extraordinary item	(35,000)	100,000	....	40,000	....
Cumulative effect on prior years (to December 31, 1970) of changing to a different depreciation method (Note A)	125,000	....	....	....	....
Net income	$1,290,000	$1,200,000	$1,300,000	$1,040,000	$800,000
Earnings per common share—assuming no dilution:					
Income before extraordinary item and cumulative effect of change in accounting principle	$1.20	$1.10	$1.30	$1.00	$0.80
Extraordinary item	(0.04)	0.10	....	0.04	....
Cumulative effect on prior years (to December 31, 1970) of changing to a different depreciation method	0.13	....	....	....	....
Net income	$1.29	$1.20	$1.30	$1.04	$0.80

© 1974, American Institute of Certified Public Accountants, Inc.

	1971	*1970*	*1969*	*1968*	*1967*
Earnings per common share—assuming full dilution:					
Income before extraordinary item and cumulative effect of change in accounting principle	$1.11	$1.02	$1.20	$0.93	$0.75
Extraordinary item	(0.03)	0.09	....	0.04	....
Cumulative effect on prior years (to December 31, 1970) of changing to a different depreciation method	0.11				
Net income	$1.19	$1.11	$1.20	$0.97	$0.75
Pro forma amounts assuming the new depreciation method is applied retroactively:					
Income before extraordinary item	$1,200,000	$1,113,500	$1,322,500	$1,031,500	$836,000
Earnings per common share—assuming no dilution	$1.20	$1.11	$1.32	$1.03	$0.84
Earnings per common share—assuming full dilution	$1.11	$1.04	$1.23	$0.96	$0.78
Net income	$1,165,000	$1,213,500	$1,322,500	$1,071,500	$836,000
Earnings per common share—assuming no dilution	$1.17	$1.21	$1.32	$1.07	$0.84
Earnings per common share—assuming full dilution	$1.08	$1.13	$1.23	$1.00	$0.78

A note similar to Note A of this Appendix should accompany the five-year comparative income statement.

The next page is 7461.

AC Section 1051B

Accounting Changes—Appendix B

An Illustration of Reporting a Special Change in Accounting Principle By Restating Prior Period Financial Statements (Pursuant to Sections 1051.27 and 1051.28)

.01 XYZ Company decides in 1971 to adopt the percentage of completion method in accounting for all of its long-term construction contracts. The company had used in prior years the completed contract method and had maintained records which are adequate to apply retroactively the percentage of completion method. The change in accounting principle is to be reported in the manner described in sections 1051.27 and 1051.28.

.02 The direct effect of the change in accounting principle and other data assumed for this illustration are—

	Pre-tax Income Reported by		*Difference in Income*	
Year	*Percentage of Completion Method*	*Completed Contract Method*	*Direct*	*Less Tax Effect*
Prior to 1967	$1,800,000	$1,300,000	$500,000	$250,000
1967	900,000	800,000	100,000	50,000
1968	700,000	1,000,000	(300,000)	(150,000)
1969	800,000	600,000	200,000	100,000
1970	1,000,000	1,100,000	(100,000)	(50,000)
Total at beginning of 1971	5,200,000	4,800,000	400,000	200,000
1971	1,100,000	900,000	200,000	100,000
Total	$6,300,000	$5,700,000	$600,000	$300,000

The per share amounts are computed assuming that 1,000,000 shares of common stock are issued and outstanding, that 100,000 additional shares would be issued if all outstanding bonds (which are not common stock equivalents) are converted, and that the annual interest expense, less taxes, for the convertible bonds is $25,000.

.03 The manner of reporting the change in two-year comparative statements is—

Income Statement:

	1971	1970 *as adjusted (Note A)*
Income before extraordinary item	$ 550,000	$ 500,000
Extraordinary item (description)		(80,000)
Net Income	$ 550,000	$ 420,000
Per share amounts:		
Earnings per common share—assuming no dilution:		
Income before extraordinary item	$0.55	$0.50
Extraordinary item		(.08)
Net Income	$0.55	$0.42
Earnings per common share assuming full dilution:		
Income before extraordinary item	$0.52	$0.47
Extraordinary item		(.07)
Net Income	$0.52	$0.40

Statement of Retained Earnings:

	1971	1970 *as adjusted (Note A)*
Balance at beginning of year, as previously reported	$17,800,000	$17,330,000

© 1974, American Institute of Certified Public Accountants, Inc.

	1971	1970
Add adjustment for the cumulative effect on prior years of applying retroactively the new method of accounting or long-term contracts (Note A)	200,000	250,000
Balance at beginning of year, as adjusted	$18,000,000	$17,580,000
Net income	550,000	420,000
Balance at end of year	$18,550,000	$18,000,000

(See accompanying note to the financial statements)

NOTE A:

Change in Method of Accounting for Long-Term Contracts

The company has accounted for revenue and costs for long-term construction contracts by the percentage of completion method in 1971, whereas in all prior years revenue and costs were determined by the completed contract method. The new method of accounting for long-term contracts was adopted to recognize . . . (state justification for change in accounting principle) . . . and financial statements of prior years have been restated to apply the new method retroactively. For income tax purposes, the completed contract method has been continued. The effect of the accounting change on income of 1971 and on income as previously reported for 1970 is—

	Increase (Decrease)	
Effect on—	*1971*	*1970*
Income before extraordinary item and net income	$100,000	$(50,000)
Earnings per common share—assuming no dilution	$0.10	($0.05)
Earnings per common share—assuming full dilution	$0.09	($0.05)

The balances of retained earnings for 1970 and 1971 have been adjusted for the effect (net of income taxes) of applying retroactively the new method of accounting.

.04 A note to a five-year summary of financial statements should disclose the effect of the change on net income and related per share amounts for the periods affected in the following manner:

NOTE A:

Change in Method of Accounting for Long-Term Contracts

The company has accounted for revenue and costs for long-term construction contracts by the percentage of completion method in 1971, whereas in all prior years revenue and costs were determined by the completed contract method. The new method of accounting for long-term contracts was adopted to recognize . . . (state justification for change in accounting principle) . . . and financial statements of prior years have been restated to apply the new method retroactively. For income tax purposes, the completed contract method has been continued. The effect of the accounting change on net income as previously reported for 1970 and prior years is—

	1970	*1969*	*1968*	*1967*
Net income as previously reported	$470,000	$300,000	$500,000	$400,000
Adjustment for effect of a change in accounting principle that is applied retroactively	(50,000)	100,000	(150,000)	50,000
Net income as adjusted	$420,000	$400,000	$350,000	$450,000
Per share amounts:				
Earnings per common share—assuming no dilution:				
Net income as previously reported	$0.47	$0.30	$0.50	$0.40
Adjustment for effect of a change in accounting principle that is applied retroactively	(0.05)	0.10	(0.15)	0.05
Net income as adjusted	$0.42	$0.40	$0.35	$0.45
Earnings per common share—assuming full dilution:				
Net income as previously reported	$0.45	$0.30	$0.47	$0.38
Adjustment for effect of a change in accounting principle that is applied retroactively	(0.05)	0.09	(0.13)	0.05
Net income as adjusted	$0.40	$0.39	$0.34	$0.43

AC Section 1051-1

Accounting Changes Related to the Cost of Inventory: An Interpretation of Section 1051

[Source: FASB Interpretation No. 1.]

June 1974

INTRODUCTION

.01 *Accounting Principles Board (APB) Opinion No. 20* [section 1051] specifies how changes in accounting principles should be reported in financial statements and what is required to justify such changes. Under that Opinion, the term *accounting principle* includes "not only accounting principles and practices but also the methods of applying them."

.02 Paragraph 5 of Chapter 4 of *Accounting Research Bulletin No. 43* [section 5121.05] states "there is a presumption that inventories should be stated at cost," which is "understood to mean acquisition and production cost." It further states that "the exclusion of all overheads from inventory cost does not constitute an accepted accounting procedure."

.03 Internal Revenue Service (IRS) Regulation 1.471—11, adopted in September 1973, specifies how certain costs should be treated in determining inventory costs for income tax reporting. Under IRS Reg. 1.471—11, some costs must be included in inventory or excluded from inventory for income tax reporting *regardless* of their treatment for financial reporting. Other costs must be included in inventory or excluded from inventory for income tax reporting *depending upon* their treatment for financial reporting, "but only if such treatment is not inconsistent with generally accepted accounting principles." Among the costs listed in IRS Reg. 1.471—11 in this last category are taxes other than income taxes, depreciation, cost depletion, factory administrative expenses, and certain insurance costs.

.04 Taxable income and accounting income are based on common information about transactions of an enterprise. However, the objectives of income determination for Federal income taxation and the objectives of income determination for financial statements of business enterprises are not always the same.

INTERPRETATION

.05 A change in composition of the elements of cost included in inventory is an accounting change. A company which makes such a change for financial reporting shall conform to the requirements of *APB Opinion No. 20* [section 1051], including justifying the change on the basis of preferability as specified by paragraph 16 of *APB Opinion No. 20* [section 1051.16]. In applying *APB Opinion No. 20* [section 1051], preferability among accounting principles shall be determined on the basis of whether the new principle constitutes an improvement in financial reporting and not on the basis of the income tax effect alone.

EFFECTIVE DATE

.06 This Interpretation shall be effective on July 1, 1974.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

AC Section 1051-2

Reporting Accounting Changes under AICPA Statements of Position: An Interpretation of Section 1051

[Source: FASB Interpretation No. 20.]

November 1977

INTRODUCTION AND BACKGROUND INFORMATION

.01 The Accounting Standards Division of the AICPA has asked the FASB to either reconsider certain provisions of *APB Opinion No. 20* [section 1051], "Accounting Changes," or to clarify whether statements of position issued by the AICPA may specify how to report a change to adopt its recommendations for purposes of applying that Opinion.

.02 Paragraph 4 of *APB Opinion No. 20* [section 1051.04] indicates that each APB Opinion specifies how to report a change to conform with the conclusions of the Opinion and further states:

> An industry audit guide prepared by a committee of the American Institute of Certified Public Accountants may also prescribe the manner of reporting a change in accounting principle. Accordingly, the provisions of this Opinion do not apply to changes made in conformity with such pronouncements issued in the past or in the future.

.03 At the time *APB Opinion No. 20* [section 1051] was issued in July 1971, the Accounting Principles Board issued Opinions on financial accounting and reporting and various AICPA industry committees issued industry audit guides that dealt with both the specialized auditing procedures and the specialized accounting practices applicable to enterprises in those industries. Subsequently, specialized industry accounting practices were dealt with in a new series of industry accounting guides issued by the AICPA, each of which specified how to report a change in accounting to conform with the conclusions of the guide. In July 1973, the FASB replaced the APB; the AICPA discontinued the industry accounting guides and its Accounting Standards Division began issuing statements of position[1] covering specialized industry accounting practices.

[1] In the introduction to previously issued statements of position, the AICPA indicates that "Statements of Position of the Accounting Standards Division are issued for the general information of those interested in the subject. They present the conclusions of at least a majority of the Account-

.04 The FASB believes that in due course *APB Opinion No. 20* [section 1051] should be reconsidered. The FASB believes further, however, that pending that reconsideration, issuance of this Interpretation will result in improvements in financial accounting and reporting.

INTERPRETATION

.05 For purposes of applying *APB Opinion No. 20* [section 1051], an enterprise making a change in accounting principle to conform with the recommendations of an AICPA statement of position shall report the change as specified in the statement. If an AICPA statement of position does not specify the manner of reporting a change in accounting principle to conform with its recommendations, an enterprise making a change in accounting principle to conform with the recommendations of the statement shall report the change as specified by Opinion No. 20 [section 1051].

EFFECTIVE DATE

.06 This Interpretation shall be effective December 1, 1977.

The next page is 7491.

ing Standards Executive Committee, which is the senior technical body of the [AICPA] authorized to speak for the [AICPA] in the areas of financial accounting and reporting and cost accounting.

"The objective of Statements of Position is to influence the development of accounting and reporting standards in directions the Divison believes are in the public interest. It is intended that they should be considered, as deemed appropriate, by bodies having authority to issue pronouncements on the subject. However, Statements of Position do not establish standards enforceable under the [AICPA's] Code of Professional Ethics."

AC Section 1071

Financial Statements Restated for General Price-Level Changes

[Source: APB Statement No. 3, as amended.]

Issue date, unless otherwise indicated: June, 1969

STATEMENT OF THE ACCOUNTING PRINCIPLES BOARD

FOREWORD

This Statement sets forth the conclusions and recommendations of the Accounting Principles Board concerning general price-level information. Presentation of such information is not mandatory. The principles and procedures on which general price-level information is based have been tested (see paragraph .16 of this section) and have been discussed with representatives of organizations that have responsibilities which involve financial reporting.

INTRODUCTION

.01 This section explains the effects on business enterprises and their financial statements of changes in the general purchasing power of money, describes the basic nature of financial statements restated for general price-level changes ("general price-level financial statements"), and gives general guidance on how to prepare and present these financial statements.[1]

.02 In Section 4071 (issued in 1953), the committee on accounting procedure stated that it ". . . gives its full support to the use of supplementary financial schedules, explanations or footnotes by which management may ex-

[1] A more detailed discussion of general price-level financial statements is found in *Accounting Research Study No. 6,* "Reporting the Financial Effects of Price-Level Changes," by the Staff of the Accounting Research Division, American Institute of Certified Public Accountants, 1963. (Accounting research studies are not statements of this Board or of the Institute but are published for the purpose of stimulating discussion on important accounting matters.)

plain the need for retention of earnings [in the face of rising general price levels]." Section 4071 continues in "full force and effect without change" according to *APB Opinion 6*. The present section is an expansion of the ideas in section 4071; it provides recommendations on how to prepare and present supplementary information restated for general price-level changes.

.03 General price-level financial statements take into account changes in the general purchasing power of money. These changes are now ignored in preparing financial statements in the United States. In conventional financial statements the individual asset, liability, stockholders' equity, revenue, expense, gain, and loss items are stated in terms of dollars of the period in which these items originated. Conventional financial statements may be referred to as "historical-dollar financial statements."

.04 The basic difference between general price-level and historical-dollar financial statements is the unit of measure used in the statements. In general price-level statements the unit of measure is defined in terms of a single specified amount of purchasing power—the general purchasing power of the dollar at a specified date. Thus, dollars which represent the same amount of general purchasing power are used in general price-level statements whereas dollars which represent diverse amounts of general purchasing power are used in historical-dollar statements.

.05 The cost principle on which historical-dollar statements are based is also the basis of general price-level statements. In general, amounts shown at historical cost in historical-dollar statements are shown at historical cost restated for changes in the general purchasing power of the dollar in general price-level statements. The amount may be restated, but it still represents cost and not a current value. The process of restating historical costs in terms of a specified amount of general purchasing power does not introduce any factors other than general price-level changes. The amounts shown in general price-level financial statements are not intended to represent appraisal values, replacement costs, or any other measure of current value. (See section 1071D for further discussion.)

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

.06 Changes in the general purchasing power of money have an impact on almost every aspect of economic affairs, including such diverse matters as investment, wage negotiation, pricing policy, international trade, and government fiscal policy. The effects of changes in the general purchasing power of money on economic data expressed in monetary terms are widely recognized, and economic data for the economy as a whole are commonly restated to eliminate these effects. General price-level financial statements should prove useful to investors, creditors, management, employees, government officials, and others who are concerned with the economic affairs of business enterprises.

BACKGROUND INFORMATION

Changes in the General Purchasing Power of Money

.07 The general purchasing power of the dollar—its command over goods and services in general—varies, often significantly, from time to time. Changes in the general purchasing power of money are known as inflation or deflation. During inflation, the general purchasing power of money declines as the general level of prices of goods and services rises. During deflation, the general purchasing power of money increases as the general level of prices falls. The general purchasing power of money and the general price level are reciprocals.

.08 A change in the general price level is a composite effect of changes in the prices of individual goods and services. The prices of all goods and services do not change at the same rate or in the same direction. Some rise while others fall, some rise or fall more rapidly than others, and some remain unchanged. This section is concerned with changes in the general purchasing power of money and therefore with changes in the *general* price level, not with changes in the relationships between *specific* prices of individual goods and services. (See section 1071D.)

Measuring General Price-Level Changes

.09 Changes in the general price level are measured by the use of index numbers. The most comprehensive indicator of the general price level in the United States is the Gross National Product Implicit Price Deflator (GNP De-

flator), issued quarterly by the Office of Business Economics of the Department of Commerce. The Consumer Price Index which is issued monthly by the Bureau of Labor Statistics of the Department of Labor is less inclusive than the GNP Deflator. Because of differences in coverage and in the system of weights used, the two indexes may change at different rates in the short run. Over the long run, however, the two indexes have changed at approximately the same rate.

.10 Published general price-level indexes in the United States are stated in terms of a base year (currently 1958 for the GNP Deflator). Index numbers for current periods are expressed as percentages of the base year general price level. Through the use of indexes, amounts stated in terms of dollars at any point in time can be restated in terms of dollars of the base year of the index, dollars of the current year, or dollars of any year that is chosen. For example, the cost of land purchased for $10,000 in 1964 (GNP Deflator index = 108.9) can be restated as 9,183 dollars of 1958 general purchasing power (index = 100.0) by multiplying the cost by 100.0/108.9, or as 11,185 dollars of 1968 general purchasing power (index = 121.8) by multiplying the cost by 121.8/108.9. In all three cases the cost is the same but the units in which it is expressed are different. Similarly, the general level of prices in 1968 may be stated as 121.8% of the general level of prices in 1958, or the general level of prices in 1958 may be stated as

$\frac{100}{121.8} = 82.1\%$ of the general level of prices in 1968.

.11 General price levels seldom remain stable for long periods. For example, 35 of the 39 year to year changes in the United States GNP Deflator from 1929 to 1968 exceeded 1%. Ten of these changes were more than 5% and four were more than 10%. (See section 1071A.)

.12 Although general price levels can and have moved both up and down, inflation has been the general rule throughout the world for the last 30 years. Some countries have experienced slowly rising prices while others have experienced rapidly rising prices. The rise in the general price level in the United States, as measured by the GNP

 © 1974, American Institute of Certified Public Accountants, Inc.

Deflator, was approximately 22% during the period 1958-1968 or a compound annual rate of 2% in contrast to approximately 130% in the preceding 20 years or a compound annual rate of about 4%. Price indexes in Brazil rose about 3,000% from 1958 to 1966. Inflation in China, Greece, and Hungary just before and after World War II was even more spectacular. General price-level increases of 25% to 50% per year have occurred recently in several countries.

Effects of General Price-Level Changes

.13 The effects of inflation or deflation on a business enterprise and on its financial statements depend on (1) the amount of change in the general price level and (2) the composition of the assets and liabilities of the enterprise.

.14 *Effects of Rate of Inflation.* Large changes in the general price level obviously have a greater effect than small changes. It is perhaps less obvious that moderate changes in the general price level may also significantly affect business enterprises and their financial statements. The nature of the income statement and the cumulative effect over time of moderate changes in the general price level tend to magnify the effects of changes in the general price level. Thus, in the income statement, differences which represent relatively small percentage changes in comparatively large revenue and expense items may be substantial in relation to net income. Also, if assets are held for a number of years the effect of inflation or deflation depends on the cumulative inflation or deflation since acquisition of the assets. The general price-level change in any one year is only a part of the total effect. Thus, the 3.8% inflation experienced in 1968 is only a small part of the total inflation effect on fixed assets appearing in 1968 statements. For fixed assets purchased in 1950, for example, there is a cumulative inflation effect of 54% (total inflation measured by the GNP Deflator from 1950 to 1968) on undepreciated cost and depreciation expense in 1968 general price-level financial statements. Furthermore, the effects of inflation compound over a period of years (for example, a constant 2% rate of inflation results in a 22% cumulative general price-level change in ten years and a 49% cumulative general price-level change in 20 years). Nonrecognition

of the effects of inflation may therefore have a substantial effect on financial statement representations of assets held over long periods (such as investments, and property, plant, and equipment), even though the amount of inflation each year has been relatively small.

.15 *Effects of Different Kinds of Assets and Liabilities.* The holders of some types of assets and liabilities are affected differently by inflation and deflation than are the holders of other types of assets and liabilities. For example, holders of cash and similar assets always lose general purchasing power during a period of inflation, but holders of other assets may or may not lose general purchasing power during inflation. The effects on holders of different types of assets and liabilities are discussed more fully in paragraphs .17 to .23.

.16 *Determining Combined Effects.* The effects of general price-level changes on a business enterprise and its financial statements therefore cannot be approximated by a simple adjustment. If users attempt to adjust for general price-level changes on an uninformed basis, they are likely to draw misleading inferences. The effects of general price-level changes can only be determined by comprehensive restatement of the items which comprise its financial statements. The need for comprehensive restatement was illustrated by a field test of general price-level restatement procedures.[2] For many companies in the test, net income was a smaller numerical amount on the general price-level basis than on the historical-dollar basis for the same period; for other companies it was a larger amount. The percentage differences between the amounts of net income for each company on the two bases varied widely, even with the relatively mild inflation in the United States in recent years.

Monetary and Nonmonetary Assets and Liabilities and General Price-Level Gains and Losses

.17 During inflation, a given amount of money can be used to buy progressively fewer goods and services in general. Consequently, holders of money lose general purchasing power as a result of inflation. This loss may be

[2] See Paul Rosenfield, "Accounting for Inflation—A Field Test," *The Journal of Accountancy,* June 1969, pp. 45 to 50.

© 1974, American Institute of Certified Public Accountants, Inc.

called a "general price-level loss."[3] General price-level losses also occur when certain other assets, mainly contractual claims to fixed amounts of money, are held during a period of inflation. The amount of money expected to be received represents a diminishing amount of general purchasing power simply as a result of the inflation. Similarly, a fixed amount of money payable in the future becomes less burdensome in a time of inflation because it is payable in dollars of reduced general purchasing power; those who owe money during inflation therefore have "general price-level gains." The effects of deflation are the opposite of the effects of inflation on holders of assets and liabilities of the type described in this paragraph.

.18 Assets and liabilities are called "monetary" for purposes of general price-level accounting if their amounts are fixed by contract or otherwise in terms of numbers of dollars regardless of changes in specific prices or in the general price level. Examples of monetary assets and liabilities are cash, accounts and notes receivable in cash, and accounts and notes payable in cash. Holders of monetary assets and liabilities gain or lose general purchasing power during inflation or deflation simply as a result of general price-level changes.[4] General price-level gains and losses on monetary items cannot be measured in historical-dollar financial statements and are not now reported.

.19 Assets and liabilities other than monetary items are called "nonmonetary" for general price-level accounting purposes. Examples of nonmonetary items are inventories, investments in common stocks, property, plant, and equipment, deferred charges which represent costs expended in the past, advances received on sales contracts, liabilities

---

[3] Gains and losses of this type are often called "purchasing power gains and losses" in discussions of general price-level accounting (for example, see *Accounting Research Study No. 6*, page 137), but the Board prefers the term "general price-level gains and losses" to distinguish them from other gains and losses of general purchasing power experienced by business enterprises, such as those discussed in paragraph .19 of this section.

[4] See *Accounting Research Study No. 6*, page 137, for discussion of monetary and nonmonetary items in general price-level accounting. Assets and liabilities may be classified as "monetary" for purposes other than general price-level accounting. Classification of assets and liabilities as monetary for general price-level accounting purposes should be based on the fact that holders gain or lose general purchasing power simply as a result of general price-level changes rather than on criteria developed for other purposes.

for rent collected in advance, deferred credits which represent reductions of prior expense, and common stock. Holders of nonmonetary items do not gain or lose general purchasing power simply as a result of general price-level changes. If the price of a nonmonetary item changes at the same rate as the general price level, no gain or loss of general purchasing power results. Holders of nonmonetary assets and liabilities gain or lose general purchasing power if the specific price of the item owned or owed rises or falls faster or slower than the change in the general price level. Holders of nonmonetary assets and liabilities also gain or lose general purchasing power if the specific price of a nonmonetary item remains constant while the general price level changes. Gains and losses on nonmonetary items differ from general price-level gains and losses on monetary items because they are the joint result of changes in the structure of prices (the relationships between specific prices) and changes in the general level of prices, and not the result simply of changes in the general price level. (See section 1071B for additional examples of monetary and nonmonetary items.)

.20 Historical-dollar financial statements report gains and losses on nonmonetary items, usually when the items are sold, and corresponding gains and losses should also be reported in general price-level financial statements in the same time period as in the historical-dollar statements. The amounts reported as gains or losses may differ, however, because the costs and proceeds in the general price-level statements are restated for changes in the general price level. Thus, if the market price of an asset increases more than the increase in the general price level and the asset is sold, in historical-dollar statements the entire market price increase is shown as a gain in the period of sale but only the excess of the market price increase over the cost restated for the increase in the general price level is shown as a gain in the general price-level statements. The timing of reporting these gains and losses is the same in historical-dollar and general price-level financial statements but the amounts differ because of the effect of the change in the general price level. Similarly, if the asset is used instead of sold, depreciation or amortization deducted from the related revenue is reported in the same time periods in

 © 1974, American Institute of Certified Public Accountants, Inc.

both historical-dollar and general price-level statements, although the amounts differ because of the restatement made in the general price-level statements. The Internal Revenue Code does not recognize general price-level restatements for tax purposes and income taxes are therefore assessed on the basis of historical-dollar amounts rather than amounts restated for general price-level changes. The income tax expense presented in general price-level statements is not computed in direct relationship to specific amounts of gains or losses on the statements or to the amount of net income before taxes. A few members of the Board believe that federal income tax should be allocated in general price-level statements to achieve a more direct relationship between the tax and various elements presented in these statements.

.21 The fact that the market price of an item does not change over long periods of time does not in itself indicate that the item is monetary. Thus gold is nonmonetary because its price can fluctuate. The fact that the price did not fluctuate for over 30 years does not make gold a monetary item. When general price levels moved upward, the holder of gold lost general purchasing power because the price of his asset did not move as much as other prices, and not simply as a result of general price-level changes. Foreign currency, accounts receivable and payable in foreign currency, and similar items are also nonmonetary. The price of foreign currency, that is, the foreign exchange rate, can change. Therefore, the holder of foreign currency items does not gain or lose general purchasing power simply as a result of general price-level changes. If the exchange rate does not change when the general price level changes because of international controls or other factors, the price of foreign currency is rising or falling at a different rate than the general price level. The effect on the holder is the joint result of a change in the structure of prices and a change in the general level of prices, and therefore the items are nonmonetary. Even though foreign currency items are nonmonetary, they may be stated at the current foreign exchange rate in general price-level financial statements. Under these circumstances they would be treated as nonmonetary items carried at current market value.

.22 A different viewpoint than that expressed in paragraph .21, held by a few Board members, is that foreign currency, accounts receivable and payable in foreign currency, and similar foreign currency items are similar to domestic monetary items. Foreign currency items should therefore be stated directly at the current (closing) foreign exchange rate in the general price-level balance sheet. The effect on the income of the holder of foreign currency items is the joint result of both the change in the foreign exchange rate and the change in the domestic general price level, and the items are therefore complex. Both effects are measurable, however, and should be disclosed separately. In the general price-level income statement, the effect of the general price-level change should be reported as a general price-level gain or loss on monetary items and the effect of the change in the exchange rate should be reported as a foreign exchange gain or loss. If the foreign exchange rate does not change, only a general price-level gain or loss should be reported.

.23 A few assets and liabilities have characteristics of both monetary and nonmonetary items. For example, debentures held as an investment may have both a market price and fixed interest and principal payments. The fixed interest and principal payments do not change when prices change and therefore holders have general price-level gains or losses during inflation or deflation with respect to this characteristic. On the other hand, the market price of the debentures can and does change, and this feature does not yield general price-level gains or losses. Similarly, convertible debt owed is fixed in amount when considered as debt, but may be converted into capital stock. The fixed amount of debt owed is a monetary liability, which gives rise to general price-level gains or losses when general price levels change. The conversion feature is nonmonetary in nature, and does not give rise to gains or losses of general purchasing power simply as a result of general price-level changes. (See paragraph .34.)

General Price-Level Restatements

.24 Economic data are commonly restated to eliminate the effects of changes in the general purchasing power of money. In the President's Economic Reports, National

 © 1974, American Institute of Certified Public Accountants, Inc.

Income data of the United States, for example, have been restated in "constant" 1947-1949 dollars and "constant" 1954 dollars and are now expressed in "constant" 1958 dollars. The restatement procedures necessary for preparing general price-level financial statements are similar to those employed in restating other economic data. Some companies now use general price-level statements to report on their operations in countries in which the currency has suffered severe loss of general purchasing power.

RECOMMENDATIONS

.25 The Board believes that general price-level financial statements or pertinent information extracted from them present useful information not available from basic historical-dollar financial statements. General price-level information may be presented in addition to the basic historical-dollar financial statements, but general price-level financial statements should not be presented as the basic statements. The Board believes that general price-level information is not required at this time for fair presentation of financial position and results of operations in conformity with generally accepted accounting principles in the United States.

.26 The Board recognizes that the degree of inflation or deflation in an economy may become so great that conventional statements lose much of their significance and general price-level statements clearly become more meaningful, and that some countries have experienced this degree of inflation in recent years.[5] The Board concludes that general price-level statements reported in the local currency of those countries are in that respect in conformity with accounting principles generally accepted in the United States, and that they preferably should be presented as the basic foreign currency financial statements of companies operating in those countries when the statements are intended for readers in the United States.[6]

---

[5] Although the Board believes that this conclusion is obvious with respect to some countries, it has not determined the degree of inflation or deflation at which general price-level statements clearly become more meaningful.

[6] This paragraph applies only to statements prepared in the currency of the country in which the operations reported on are conducted. Only conventional statements of foreign subsidiaries should be used to prepare historical-dollar consolidated statements.

Restatement of Financial Statements

.27 General guidelines for preparing general price-level statements, with explanatory comments, are set forth in paragraphs .28 to .46. More specific procedures are illustrated in section 1071C.

.28 *The same accounting principles used in preparing historical-dollar financial statements should be used in preparing general price-level financial statements except that changes in the general purchasing power of the dollar are recognized in general price-level financial statements.* General price-level financial statements are an extension of and not a departure from the "historical cost" basis of accounting. Many amounts in general price-level statements, however, are different from amounts in the historical-dollar statements because of the effects of changing the unit of measure.

.29 *An index of the general price level, not an index of the price of a specific type of goods or services, should be used to prepare general price-level financial statements.* Price indexes vary widely in their scope; some measure changes in the prices of a relatively limited group of goods and services, such as construction costs or retail food prices in a specific city, while others measure changes in the prices of a broad group of goods and services in a whole economy. The purpose of the general price-level restatement procedures is to restate historical-dollar financial statements for changes in the general purchasing power of the dollar, and this purpose can only be accomplished by using a general price-level index.

.30 Indexes which approximate changes in the general price level are now available for most countries. As noted in paragraph .09, the GNP Deflator is the most comprehensive indicator of the general price level in the United States. Consequently, it should normally be used to prepare general price-level statements in U. S. dollars.

.31 The GNP Deflator is issued on a quarterly basis. The deflator for the last quarter of a year can ordinarily be used to approximate the index as of the end of the year. The Bureau of Labor Statistics Consumer Price Index has the practical advantage of being issued on a monthly basis.

 © 1974, American Institute of Certified Public Accountants, Inc.

The consumer price index may therefore be used to approximate the GNP Deflator unless the two indexes deviate significantly.

.32 *General price-level financial statements should be presented in terms of the general purchasing power of the dollar at the latest balance sheet date.* The Board has selected current general purchasing power as the basis for presentation because it believes that financial statements in "current dollars" are more relevant and more easily understood than those employing the general purchasing power of any other period. Current economic actions must take place in terms of current dollars, and restating items in current dollars expresses them in the context of current action.

.33 *Monetary and nonmonetary items should be distinguished for the purpose of preparing general price-level financial statements.* Monetary items are stated in terms of current general purchasing power in historical-dollar statements. General price-level gains and losses arise from holding monetary items. On the other hand, nonmonetary items are generally stated in terms of the general purchasing power of the dollar at the time they were acquired. Holding nonmonetary items does not give rise to general price-level gains and losses. Distinguishing monetary and nonmonetary items therefore permits (1) restatement of nonmonetary items in terms of current general purchasing power and (2) recognition of general price-level gains and losses on monetary items which are not recognized under historical-dollar accounting. Paragraphs .17 to .23 give criteria for distinguishing monetary and nonmonetary items for general price-level accounting purposes.

.34 Assets and liabilities that have both monetary and nonmonetary characteristics (see paragraph .23) should be classified as monetary or nonmonetary based on the purpose for which they are held, usually evidenced by their treatment in historical-dollar accounting. Thus, carrying debentures at acquisition cost (perhaps adjusted to lower of cost and market) and classifying them as marketable securities provides evidence that market price may be important and the debentures may be nonmonetary. On the other hand, classifying debentures held as a long-

term investment and amortizing premium or discount is evidence that the debentures are held for the fixed principal and interest and therefore are monetary assets. Similarly, convertible debt is usually treated as straight debt and therefore is usually a monetary liability.

.35 *The amounts of nonmonetary items should be restated to dollars of current general purchasing power at the end of the period.* Nonmonetary items are typically stated in historical-dollar financial statements in terms of the general purchasing power of the dollar at the dates of the originating transactions. They should be restated by means of the general price index to dollars of current general purchasing power at the end of the period. Restatement of nonmonetary items does not introduce current values or replacement costs. For example, restatement of the cost of land that cost $100,000 in 1958 to $123,500 in 1968 statements does not imply that the market price of the land is $123,500 in 1968. Restatement merely presents the *cost* in a unit which represents the general purchasing power of the dollar at the end of 1968.

.36 Nonmonetary items are sometimes already stated in historical-dollar financial statements in dollars of current general purchasing power, for example, inventory purchased near the end of the fiscal period or assets carried at current market price. The fact that the amount of an item is not changed in restatement does not necessarily identify it as a monetary item on which general price-level gains and losses should be computed.

.37 Some nonmonetary items such as inventories are stated at the lower of cost and market in historical-dollar financial statements. These items should also be stated at the lower of cost and market in general price-level financial statements. Market may sometimes be below restated cost even though it is not below historical-dollar cost, and application of the cost or market rule will therefore sometimes result in a write-down to market in general price-level statements even though no write-down was required in the historical-dollar statements.

.38 *Monetary assets and liabilities in the historical-dollar balance sheet are stated in dollars of current general*

 © 1974, American Institute of Certified Public Accountants, Inc.

purchasing power; consequently, they should appear in current general price-level statements at the same amounts. The fact that the amounts of monetary assets and liabilities are the same in general price-level and historical-dollar statements should not obscure the fact that general price-level gains and losses result from holding them during a period of general price-level change (see paragraphs .17 and .18). Monetary assets and liabilities which appear in financial statements of prior periods presented for comparative purposes are updated to dollars of current general purchasing power by the "roll-forward" procedure described in paragraph .44.

.39 *The amounts of income statement items should be restated to dollars of current general purchasing power at the end of the period.* Revenue and expenses are typically stated in historical-dollar statements in terms of the general purchasing power of the dollar at the dates of the originating transactions and should be restated by means of the general price index to dollars of current general purchasing power at the end of the period. The components of gains and losses (costs and proceeds) are also stated in terms of historical dollars and should be restated. All revenue, expenses, gains, and losses recognized under historical-dollar accounting are recognized in the same time period under general price-level accounting, but their amounts are different in the case of items that are recorded in noncurrent dollars, such as depreciation, amortization, and cost of goods sold. Transactions that give rise to gains in historical-dollar financial statements may even give rise to losses in general price-level financial statements and vice versa. Income tax amounts in general price-level statements are based on income taxes reflected in historical-dollar statements and are not computed in direct relationship to the income before taxes on the general price-level statements.

.40 *General price-level gains and losses should be calculated by means of the general price index and included in current net income.* General price-level gains and losses on monetary items described in paragraphs .17 and .18 should be calculated by restating the opening bal-

ances and transactions in the accounts for monetary assets and liabilities to dollars of general purchasing power at the end of the period and comparing the resulting restated balances at the end of the period with the actual balances at the end of the period. (See section 1071C.)

.41 General price-level gains and losses on monetary items arise from changes in the general price level, and are not related to subsequent events such as the receipt or payment of money. Consequently, the Board has concluded that these gains and losses should be recognized as part of the net income of the period in which the general price level changes.

.42 A different viewpoint than that expressed in paragraph .41, held by a Board member, is that all of a monetary gain should not be recognized in the period of general price-level increase. Under this view, a portion of the gain on net monetary liabilities in a period of general price-level increase should be deferred to future periods as a reduction of the cost of nonmonetary assets, since the liabilities represent a source of funds for the financing of these assets. The proponent of this view believes that the gain from holding net monetary liabilities during inflation is not realized until the assets acquired from the funds borrowed are sold or consumed in operations.[7] The Board does not agree with this view, however, because it believes that the gain accrues during the period of the general price-level increase and is unrelated to the cost of nonmonetary assets.

.43 *General price-level gains and losses should be reported as a separate item in general price-level income statements.* General price-level gains and losses on monetary items are not part of the revenue and expenses reported in historical-dollar financial statements. They should be separately identified in the general price-level statements. General price-level gains may, however, be offset against general price-level losses and only a single figure representing net general price-level gain or loss for the period need be reported.

---

[7] For further discussion of this view see Marvin M. Deupree, "Accounting for Gains and Losses in Purchasing Power of Monetary Items" in *Accounting Research Study No. 6*, pp. 153-165.

© 1974, American Institute of Certified Public Accountants, Inc.

.44 *General price-level financial statements of earlier periods should be updated to dollars of the general purchasing power at the end of each subsequent period for which they are presented as comparative information.* Statements of an earlier period are updated by multiplying each item by the ratio of the current general price level to the general price level of the earlier period. This "rolling forward" of earlier statements could cause confusion and convey the erroneous impression that previously reported information has been changed in substance rather than merely updated in terms of a later unit of measure.[8] Consequently, comparative general price-level financial statements and related financial information should be described in a way that makes clear that the general price-level statements of prior periods represent previously reported information updated to dollars of current general purchasing power to provide comparability with the current general price-level statements. (See paragraph .48, point f.)

.45 *Restatement of financial statements of foreign branches or subsidiaries of U. S. companies for inclusion in combined or consolidated financial statements stated in terms of U. S. dollars should be based on an index of the general level of prices in the United States.* General price-level financial statements stated in terms of U. S. dollars use a unit of measure that represents the general purchasing power of the U. S. dollar at a specified date. An index of changes in the general purchasing power of the U. S. dollar should therefore be used to restate the financial statements of a company and its combined or consolidated foreign branches and subsidiaries. Financial statements of foreign branches or subsidiaries to be combined or consolidated with the financial statements of their United States parent company should first be translated into U. S. dollars using presently accepted methods and then restated for changes in the general purchasing power of the U. S. dollar.

---

[8] The "roll-forward" process results in stating financial statement items at different amounts than they were stated before being "rolled forward." The differences are not gains or losses but are merely differences between the same items measured in two different units of measure. If a cost stated at 100 dollars of general purchasing power current at the beginning of the year is "rolled forward" to 105 dollars of general purchasing power current at the end of the year, the difference of 5 is not a gain. It is similar, for example, to the difference of 2 between 1 yard and 3 feet.

.46 *All general price-level information presented should be based on complete general price-level calculations.* Financial statements in which only some of the items, such as depreciation, have been restated disclose only part of the effects of changing general price levels on an enterprise. Partially restated financial statements and information based on them are likely to be misleading and should not be presented. General price-level information should therefore be based on complete calculations, although it need not be presented in the same detail as the historical-dollar financial statements. If any general price-level information is given, at least sales, net general price-level gains and losses on monetary items, extraordinary items, net income, and common stockholders' equity should be disclosed.

Presentation of General Price-Level Financial Information

.47 Presentation of general price-level financial information as a supplement to the basic historical-dollar financial statements should be designed to promote clarity and minimize possible confusion. Because the two types of data are prepared on different bases, presentations of general price-level financial information should generally encourage comparisons with other general price-level data rather than with historical-dollar data. If general price-level financial statements are presented in their entirety, they preferably should be presented in separate schedules, not in columns parallel to the historical-dollar statements. Financial information extracted from general price-level statements (see paragraph .46) may be presented in either chart or narrative form, and may emphasize ratios and percentages instead of or in addition to dollar amounts.

.48 The basis of preparation of general price-level information and what it purports to show should be clearly explained in the notes to the general price-level financial statements or other appropriate places. The explanation should include the following points:

a. The general price-level statements (or information) are supplementary to the basic historical-dollar financial statements [except as provided in paragraph .26].

 © 1974, American Institute of Certified Public Accountants, Inc.

b. All amounts shown in general price-level statements are stated in terms of units of the same general purchasing power by use of an index of changes in the general purchasing power of the dollar.

c. The general price-level gain or loss in the general price-level statements indicates the effects of inflation (or deflation) on the company's net holdings of monetary assets and liabilities. The company gains or loses general purchasing power as a result of holding these assets and liabilities during a period of inflation (deflation).

d. In all other respects, the same generally accepted accounting principles used in the preparation of historical-dollar statements are used in the preparation of general price-level statements (or information).

e. The amounts shown in the general price-level statements do not purport to represent appraised value, replacement cost, or any other measure of the current value of assets or the prices at which transactions would take place currently.

f. The general price-level statements (or information) of prior years presented for comparative purposes have been updated to current dollars. This restatement of prior years' general price-level statements is required to make them comparable with current information. It does not change the prior periods' statements in any way except to update the amounts to dollars of current general purchasing power.

.49 Disclosure involving the following items should also be made:

a. The difference between the balance of retained earnings at the end of the preceding year in beginning-of-the-year dollars and at the beginning of the year in end-of-the-year dollars, which arises in the roll-forward process discussed in paragraph .44, should be explained somewhat as follows:

Retained earnings at the beginning of the year:

Restated to general purchasing power at the beginning of the year	xxx
Amount required to update to general purchasing power at the end of the year	xxx
Restated to general purchasing power at the end of the year	xxx

b. The fact should be disclosed that when assets are used or sold, federal income taxes are based on cost before restatement for general price-level changes because inflation is not recognized in the Internal Revenue Code.

NOTE

.50 *Statements of the Accounting Principles Board present the conclusions of at least two-thirds of the members of the Board, which is the senior technical body of the Institute authorized to issue pronouncements on accounting principles. This Statement is not an "Opinion of the Accounting Principles Board" covered by action of the Council of the Institute in its May 7, 1973 Resolution designating the Financial Accounting Standards Board as the body to establish accounting principles pursuant to Rule 203 of the Rules of Conduct of the American Institute of Certified Public Accountants.* [*As amended, effective May 7, 1973 by Council Resolution.*] *(See section 510.08.)*

Financial Statements Restated for General Price-Level Changes—Appendix B

MONETARY AND NONMONETARY ITEMS

.01 Section 1071.17-.23 presents criteria for distinguishing between monetary and nonmonetary items for general price-level accounting purposes and gives examples of each kind of item. This section provides additional examples, with an explanation of the reason for classification when needed.

.02 **Assets**	Monetary	Non-monetary
Cash on hand and demand bank deposits (domestic currency)	X	
Time deposits (domestic currency)	X	
Foreign currency on hand and claims to foreign currency		X
See discussion in section 1071.21.		
Marketable securities		
Stocks		X
Bonds	(see discussion)	
Bonds held as a short-term investment may be held for price speculation. If so, they are nonmonetary. If the bonds are held primarily for the fixed income characteristic, they are monetary.		
Accounts and notes receivable	X	
Allowance for doubtful accounts and notes receivable	X	
Inventories produced under fixed price contracts accounted for at the contract price	X	
These items are in effect receivables of a fixed amount.		

	Monetary	Non-monetary
Other inventories		X
Advances to employees	X	
Prepaid insurance, taxes, advertising, rent These represent an amount of services for which expenditures have been made and which will be amortized to expense in the future. In financial statements they are substantially the same kind of item as fixed assets.		X
Prepaid interest Related to notes payable, a monetary item.	X	
Receivables under capitalized financing leases	X	
Long-term receivables	X	
Refundable deposits	X	
Advances to unconsolidated subsidiaries If there is no expectation that the advances will ever be collected, they are in effect additional investments and are nonmonetary.	X	
Investments in unconsolidated subsidiaries If an investment is carried at cost, it is nonmonetary. If an investment is carried on the equity basis, the statements of the subsidiary should be restated for general price-level changes (in accordance with section 1071.45 for foreign affiliates) and the equity method should then be applied.	(see discussion)	
Pension, sinking, and other funds Depends on composition of the fund—bonds are generally monetary and stocks nonmonetary.	(see discussion)	
Investments in convertible bonds If the bond is held for price speculation or with expectation of converting	(see discussion)	

© 1974, American Institute of Certified Public Accountants, Inc.

	Monetary	Non-monetary
into common stock the investment is nonmonetary. If the bond is held for the fixed principal and interest, it is monetary.		
Property, plant, and equipment		X
Allowance for depreciation		X
Cash surrender value of life insurance	X	
Advances paid on purchase contracts		X
The items to be received are nonmonetary.		
Deferred charges for income taxes—deferred method		X
A cost deferred as an expense of future periods is nonmonetary.		
Other deferred charges which represent costs incurred to be charged against future income		X
Patents, trademarks, licenses, formulas		X
Goodwill		X
Other intangible assets		X

[As amended, effective October 1, 1971, by APB Opinion No. 21.]

.03 Liabilities

	Monetary	Non-monetary
Accounts and notes payable	X	
Accrued expenses payable (salaries, wages, etc.)	X	
Similar to accounts payable, amount is fixed.		
Cash dividends payable	X	
Debts payable in foreign currency		X
See section 1071.21.		
Refundable deposits	X	
Advances received on sales contracts		X
The obligation will be satisfied by delivery of goods that are nonmonetary.		
Accrued losses on firm purchase commitments	X	
Bonds payable	X	

	Monetary	Non-monetary
Unamortized discount on bonds payable	X	
[As amended, effective October 1, 1971, by APB Opinion No. 21.]		
Convertible bonds payable	X	
Treated as monetary debt until converted.		
Obligations under capitalized leases	X	
Other long-term debt	X	
Deferred taxes—deferred method		X
Cost savings deferred as a reduction of expenses of future periods.		
Deferred investment credits		X
Accrued pension cost	X	
Reserve for self-insurance		X
Although reserve for self-insurance is nonmonetary, it may be stated in the same amount in both the historical-dollar and general price-level statements if the adequacy of the reserve in terms of current costs has been determined at year end for the historical-dollar statements.		
Deferred income		X
Provision for guarantees		X
Provision for guarantees is nonmonetary because it is a liability to provide goods or services. It may be stated in the same amount in both the historical-dollar and general price-level statements if the adequacy of the provision in terms of current costs has been determined at year end for the historical-dollar statements.		
Accrued vacation pay	(see discussion)	
Accrued vacation pay is monetary if it is based on a fixed contract. It is nonmonetary if it is payable based on wage or salary rates that may change after the balance sheet date.		

© 1974, American Institute of Certified Public Accountants, Inc.

	Monetary	Non-monetary
.04 Owners' Equity		
Minority interest		X
Preferred stock		X

Classifying preferred stock as nonmonetary is based on the fact that the amount accounted for is the proceeds received when the stock was issued. The proceeds must be restated to present them in terms of the general purchasing power of the dollar at the balance sheet date.

The amount of a nonconvertible callable preferred stock should not exceed the call price in the general price-level balance sheet. The periodic change in the excess of the restated proceeds over the call price, if any, should not be included in net income, but should be added to net income to determine net income to common stockholders in the same manner as preferred dividends are deducted to determine net income to common stockholders.

A different viewpoint held by some Board members is that preferred stock is a monetary item and that general price-level gains or losses from preferred stock outstanding should be included in the computation of net income.

	Monetary	Non-monetary
Common stock		X
Additional paid-in capital		X
Retained earnings	(see discussion)	

Retained earnings is a residual and need not be classified as either monetary or nonmonetary.

The next page is 7541.

AC Section 1071C

Financial Statements Restated for General Price-Level Changes—Appendix C

PROCEDURES TO PREPARE FINANCIAL STATEMENTS RESTATED FOR GENERAL PRICE-LEVEL CHANGES

.01 This section illustrates procedures to apply the general guidelines discussed in section 1071.28-.46. Procedures for restating historical-dollar financial statements for general price-level changes are described and illustrated for two years, 1967 and 1968. Restating the statements for 1967 illustrates the procedures for the first year of restatement; restating the 1968 statements illustrates the procedures for all subsequent years. The procedures for the first year a company restates its financial statements are more time consuming than those for subsequent years.

.02 Financial statements used in this illustration contain a variety of items designed to demonstrate various facets of the restatement technique. Indexes of the general price-level changes which occurred in the United States in recent years are used. For convenience, the general assumptions used in the illustration are summarized below:

a. The XYZ Company was formed in 1957, ten years before the year for which its statements are first restated.

b. All significant costs of the year-end finished goods inventory, carried at FIFO, were incurred in the last quarter of the year; costs incurred before the last quarter of the year are assumed to be not material.

c. Year-end balances of raw materials and parts and supplies inventories, carried at FIFO, were acquired fairly evenly throughout the year.

d. Market value of inventories is above the restated cost of inventories, and the market price of inventories to be delivered is below the restated amount of deferred income.

e. Depreciation is computed on the straight-line basis. A full year's depreciation is taken in the year of acquisition, and no depreciation is taken in the year of sale. Depreciable assets have a ten-year life and no salvage value.

f. Sales, purchases, and selling and administrative expenses (other than depreciation, amortization of prepaid expenses, and deferred income realized) have taken place fairly evenly throughout the year, and federal income taxes accrue ratably throughout the year.

g. Interest expense is included in selling and administrative expenses.

.03 To perform restatement procedures, a company needs (1) its historical-dollar financial statements for the year, (2) index numbers, and (3) conversion factors derived from the index numbers, as described in the following paragraphs.

.04 The historical-dollar financial statements needed for the first year for which statements are to be restated are balance sheets at the beginning and end of the year and the statements of income, retained earnings, and other changes in owners' equity for the year. For each subsequent year, only the balance sheet at the end of the year and the statements of income, retained earnings, and other changes in owners' equity for the year are needed. The historical-dollar balance sheet at the beginning of the first year is restated to determine the restated amount of retained earnings at the beginning of the first year. In the illustration for the 1967 restatement, the historical-dollar balance sheets appear in paragraph .23 and the historical-dollar statement of income and retained earnings appears in paragraph .24. For the 1968 restatement, the historical-dollar balance sheet appears in paragraph .36 and the historical-dollar statement of income and retained earnings appears in paragraph .37.

.05 The Gross National Product Implicit Price Deflator is used in the illustration as the index of changes in the general price level.[1] This index is available on both

[1] See section 1071.30.

 © 1974, American Institute of Certified Public Accountants, Inc.

a quarterly and annual average basis. Indexes are needed for the average and the quarters for each year since the inception of the company or 1945,[2] whichever is later. The annual average index may be used for any year in which its use would produce results not materially different from those which would be produced by using quarterly indexes. The index at the end of a year may be approximated by using the average for the last quarter of the year. To simplify the illustration, quarterly indexes are used only for 1967 and 1968. Indexes used in the 1967 restatement appear in paragraph .22. Indexes used in the 1968 restatement appear in paragraph .35. (Also see section 1071A.)

.06 Conversion factors used in restatement are computed from general price-level index numbers by dividing the index number for the current balance sheet date by each of the other index numbers. To illustrate, assume that 1957 and 1960 expenditures are to be restated to dollars of December 1968 general purchasing power. The following GNP Deflators (general price-level index numbers) are applicable:

Average for 1957	97.5
Average for 1960	103.3
Fourth quarter 1968	123.5

To compute the conversion factors for restatement to dollars of general purchasing power current at December 31, 1968, divide the index number for the fourth quarter of 1968 by each of the other index numbers:

$$1957: 123.5 \div 97.5 = 1.267$$
$$1960: 123.5 \div 103.3 = 1.196$$

[2] The precision of the measure of change in the general price level by any series of index numbers decreases over time because new commodities are continuously introduced and others disappear. No method has been devised to measure the percentage change in the general price level between two periods in which the bulk of commodities in either period is unique. A large portion of the dollar amount of current exchange transactions involves goods and services that originated in discoveries and innovations that grew out of the war effort (World War II) and postwar developments. Consequently, comparison of current prices with prices during and prior to World War II would probably not be reliable enough for accounting purposes because of the dissimilarity of goods and services exchanged then and now. A cutoff date is therefore indicated. The year 1945 is probably the earliest point that offers reasonable comparability of goods and services with later periods. All assets acquired, liabilities incurred, or owners' equity accumulated prior to 1945 should generally be treated as if they had originated during 1945.

To restate a nonmonetary item purchased in 1957, for example, its cost in 1957 dollars is multiplied by 1.267:

Cost in 1957 dollars	$1,500
	× 1.267
Cost in dollars current at December 31, 1968	$1,900

The cost of $1,500 in 1957 dollars is equal to a cost of $1,900 in December 31, 1968 dollars. The cost is not changed; it is merely stated in a larger number of a smaller unit of measure. Conversion factors for the 1967 restatement are computed in paragraph .22. Conversion factors for the 1968 restatement are computed in paragraph .35.

.07 The exhibits and worksheets which comprise the illustration are presented together in paragraphs .20 to .44. Restatement procedures are discussed in eight steps in paragraphs .08 to .19. Each step is first described in general terms and then keyed to the two years in the illustration in two columns below the general description.

General Steps to Prepare General Price-Level Financial Statements

STEP 1: *Identify monetary and nonmonetary assets and liabilities.*

.08 The nature of each asset and liability item must be determined inasmuch as restatement procedures for monetary items are different from those for nonmonetary items as discussed in section 1071.35-.38. Section 1071.17-.23 discusses the difference between monetary and nonmonetary items and gives examples of each. Additional examples are given in section 1071B.

© 1974, American Institute of Certified Public Accountants, Inc.

1967 Restatement

STEP 1: Monetary items in the December 31, 1966 and 1967 balance sheets in paragraph .23 are:

Cash
Receivables
Current liabilities
Long-term debt

Nonmonetary items are:
Marketable securities
Raw materials
Finished goods
Parts and supplies
Prepaid expenses
Property, plant, and equipment
Accumulated depreciation
Deferred income—payments received in advance *
Capital stock
Additional paid-in capital
Retained earnings

*Deferred income—payments received in advance is a nonmonetary liability because it represents an obligation to deliver nonmonetary assets—the company's products.

1968 Restatement

STEP 1: Monetary and nonmonetary items in the December 31, 1968 balance sheet in paragraph .36 are the same as in the December 31, 1966 and 1967 balance sheets.

STEP 2: *Analyze all nonmonetary items in the balance sheet of the current year (and the prior year for the first year of restatement) to determine when the component money amounts originated.*

.09 Schedule the data by years, and by quarters whenever significant general price-level changes occurred during a year. If no significant general price-level changes occurred during a year, or if acquisitions were spread fairly evenly throughout a year, assume the items were acquired when the average general price level for the year was in effect. All balances accumulated prior to 1945 may be treated as if acquired in 1945. See Step 3 for treatment of special problems in restating inventories.

.10 Retained earnings need not be analyzed. Retained earnings in the restated balance sheet at the beginning of the first year for which general price-level restatements

are prepared can be computed as the balancing amount. This avoids the impractical alternative of restating all prior financial statements since the inception of the company. Retained earnings in subsequent restated balance sheets is determined from the restated statements of income and retained earnings.

1967 Restatement

STEP 2: Analysis of raw materials, finished goods, and parts and supplies inventories is discussed in notes 3 and 4 in paragraph .23. Marketable securities, capital stock, and additional paid-in capital are analyzed in columns 3, 5, and 7 in paragraph .25. Prepaid expenses, property, plant, and equipment, accumulated depreciation, and deferred income are analyzed in columns 3 to 6 in paragraphs .26 to .29.

1968 Restatement

STEP 2: Much of the analysis needed for the 1968 restatement has been prepared for the 1967 restatement and merely needs to be updated. Analysis of raw materials, finished goods, and parts and supplies inventories, capital stock, and additional paid-in capital is discussed in notes 4, 5, and 6 in paragraph .36. Prepaid expenses, property, plant, and equipment, accumulated depreciation, and deferred income are analyzed in columns 3 to 6 in paragraphs .38 to .41.

STEP 3: *Analyze all revenue, expense, gain, and loss items in the income statement of the current year, and all dividends and other changes in retained earnings during the year, to determine when the amounts originated that ultimately resulted in the charges and credits in the statements of income and retained earnings.*

.11 A wide range in degree of difficulty is likely to be encountered in restating inventories and cost of goods sold to dollars of current general purchasing power. Raw materials priced on a first-in, first-out basis may already be in dollars of current general purchasing power and need no restatement. If turnover is rapid and spread fairly evenly throughout the year, purchases may be in dollars whose general purchasing power can be approximated by using the average general price level for the year. Restatement of inventories of work in process and finished goods, however, can be quite complicated and time consuming. Weighted average or last-in, first-out pricing increases the amount of detail.

© 1974, American Institute of Certified Public Accountants, Inc.

.12 Short cuts to the restatement of inventories and purchases often produce results that do not differ enough from amounts derived by detailed computation to warrant the additional effort. For example, costs of inventories based on weighted average include, in part, every expenditure ever made to buy or produce them. A short cut would be to assume that the beginning inventory had all been acquired in one turnover period. In the case of beginning LIFO inventories, using the assumption that different layers were acquired each year when the average general price level was in effect for that year will usually approximate the results of a detailed computation, purchase by purchase. Elements of overhead costs included in work in process and finished goods inventories can usually be restated from dollars of average general purchasing power for the year when overhead was applied to that segment of the inventory. Depreciation is the overhead cost element most likely to require extensive analysis, but only when the effect would be material.

.13 Many revenue and expense items are, of course, recognized in the accounts at approximately the same time that the receipts and expenditures occurred (for example, salaries). If these items are spread fairly evenly throughout the year, it can be assumed that the receipts and expenditures all occurred when the average general price level for the year was in effect. When peak and slack periods occur during the year, and the general price level changes significantly between periods, revenue and expense items in this category should be determined for each calendar quarter.

.14 The restatement of revenue and expense items should, of course, reconcile with the restatement of the related balance sheet accounts, and they can be restated as part of the same computation. For example, the beginning balance of merchandise inventory plus purchases, both stated in current dollars, should equal the sum of the cost of sales and the ending balance of merchandise inventory, also stated in current dollars.

1967 Restatement

STEP 3: Sales, cost of sales, selling and administrative expenses, and loss on sale of equipment are analyzed in column 1 in paragraphs .30 and .31. Depreciation is analyzed in column 4 in paragraph .28. Amortization of prepaid expenses is analyzed in column 5 in paragraph .26. Deferred income realized is analyzed in column 5 in paragraph .29. Federal income taxes and dividends are analyzed in paragraph .24.

1968 Restatement

STEP 3: Sales, cost of sales, selling and administrative expenses, gain on sale of equipment, and gain or loss on sale of marketable securities are analyzed in column 1 in paragraphs .42 and .43. Depreciation is analyzed in column 4 in paragraph .40. Amortization of prepaid expenses is analyzed in column 5 in paragraph .38. Deferred income realized is analyzed in column 5 in paragraph .41. Federal income taxes and dividends are analyzed in paragraph .37.

STEP 4: *Restate the nonmonetary items.*

.15 Multiply the component amounts of nonmonetary items in the balance sheet of the current year (and the prior year for the first year of restatement) and in the statement of income and retained earnings for the current year by the conversion factors applicable to the components. The restated amount of each nonmonetary item is the sum of the restated amounts of its components.

1967 Restatement

STEP 4: Restatement of nonmonetary items is demonstrated on the pages in which the nonmonetary items are analyzed in accordance with Steps 2 and 3.

1968 Restatement

STEP 4: Restatement of nonmonetary items is demonstrated on the pages in which the nonmonetary items are analyzed in accordance with Steps 2 and 3. Components which originated in 1967 or earlier generally are restated by merely "rolling forward" their restated amounts from the worksheets for the 1967 restatement.

STEP 5: *Restate the monetary items in the balance sheet at the beginning of the first year.*

.16 Monetary items in the balance sheet at the beginning of the first year for which statements are restated are stated in prior year dollars and are each restated to

 © 1974, American Institute of Certified Public Accountants, Inc.

dollars of current general purchasing power by the conversion factor applicable to the end of the prior year. Monetary items in the balance sheet at the end of each year for which statements are restated are stated in dollars of current general purchasing power and need no restatement.

1967 Restatement	*1968 Restatement*
STEP 5: Restatement of the monetary items in the balance sheet at December 31, 1966 is discussed in note 1 in paragraph .23.	STEP 5: (Not applicable after the first year statements are restated.)

STEP 6: *Apply the "cost or market" rule after restatement to the items to which it applies before restatement.*

.17 To determine that marketable securities and inventories are not stated above market in the restated statements, and that current nonmonetary liabilities are not stated below market, the restated amounts are compared with market and adjusted if necessary.

1967 Restatement	*1968 Restatement*
STEP 6: Market is assumed to be higher than restated marketable securities and inventories and lower than restated deferred income.	STEP 6: Market is assumed to be higher than restated inventories and lower than restated deferred income.

STEP 7: *Compute the general price-level gain or loss for the current year.*

.18 The general price-level gain or loss which arises from holding net balance sheet monetary items during inflation or deflation appears in the general price-level statements but does not appear in the historical-dollar statements. The format used to prepare a statement of source and application of net balance sheet monetary items is a convenient device to use in calculating the general price-level gain or loss. In this calculation the items which cause changes in the monetary items are analyzed and the net balance of the monetary items if there were no gain or loss is determined. A comparison of this net balance with the actual net balance of monetary items at the balance sheet date determines the gain or loss.

1967 Restatement	*1968 Restatement*
STEP 7: The general price-level gain for 1967 is computed in paragraph .32.	STEP 7: The general price-level gain for 1968 is computed in paragraph .44.

STEP 8: *"Roll forward" the restated statements of the prior year to dollars of current general purchasing power.*

.19 Financial statements of the prior year which were restated to dollars current at the end of the prior year are restated to dollars current at the end of the current year simply by multiplying each amount by the conversion factor applicable to the end of the prior year. This "rolling forward" serves two purposes: (1) it provides the amount of retained earnings at the end of the prior year in current dollars for the current year statement of retained earnings, and (2) it provides the prior year statements in current dollars for use as comparative statements.

1967 Restatement	*1968 Restatement*
STEP 8: (Not applicable for the first year statements are restated.)	STEP 8: The restated balance sheet at the end of 1967 is "rolled forward" in columns 1 and 2 in paragraph .36. The restated statement of income and retained earnings for 1967 is "rolled forward" in columns 1 and 2 in paragraph .37.

1967 RESTATEMENT—XYZ COMPANY

EXHIBIT A

.20

XYZ Company
General Price-Level Balance Sheet
December 31, 1967

ASSETS	General Price-Level Basis (Restated to 12/31/67)
Current assets:	
Cash	$(67) 1,700,000
Marketable securities, at cost	1,654,000
Receivables (net)	5,050,000
Inventories, at the lower of cost and market on a first-in, first-out basis:	
Raw materials	2,849,000
Finished goods	2,560,000
Parts and supplies	578,000
Prepaid expenses	49,000
Total current assets	14,440,000
Property, plant, and equipment, at cost	29,580,000
Less: Accumulated depreciation	21,156,000
	8,424,000
	$(67)22,864,000

LIABILITIES AND STOCKHOLDERS' EQUITY	
Current liabilities	$(67) 4,770,000
Deferred income—payments received in advance	101,000
Long-term debt	5,000,000
Stockholders' equity:	
Capital stock – common	2,109,000
Additional paid-in capital	3,785,000
Retained earnings	7,099,000
Total stockholders' equity	12,993,000
	$(67)22,864,000

Notes

(1) 12/31/66 monetary items before restatement are stated in 12/31/66 $'s. The conversion factor for the end of 1966 is used to restate them to 12/31/67 $'s.

(2) 12/31/67 monetary items need no restatement because they are stated in 12/31/67 $'s.

(3) Year-end balance assumed acquired fairly evenly throughout the year.

(4) Assumed that all significant costs of year-end finished goods were incurred in last quarter of the year. Costs incurred before last quarter of the year (e.g., depreciation) assumed not material.

(5) 12/31/66 retained earnings restated in the amount which makes the balance sheet balance.

Notes

(1) From R-2 of 12/31/67

(2) Each item "rolled-forward" from 12/31/67 $'s to 12/31/68 $'s by using conversion factor for the last quarter of 1967—1.039

(3) Monetary items—no restatement needed

(4) Year-end balance assumed acquired fairly evenly throughout the year.

(5) See note 4 in R-2 of 12/31/67

(6) No change in historical balances during 1968. The restated balances in the 12/31/68 balance sheet are therefore the same as the balances in the 12/31/67 balance sheet restated to 12/31/68 $'s in column 2 of this worksheet.

Financial Statements Restated for General Price-Level Changes—Appendix D

GENERAL PRICE-LEVEL CHANGES AND SPECIFIC PRICE CHANGES

.01 General price-level statements deal with changes in the general purchasing power of money. Adjustments for changes in the specific prices of nonmonetary assets and liabilities either by use of market prices or specific indexes, on the other hand, deal with changes in market or replacement values. Restatement for general price-level changes does not attempt to deal with specific market price changes; adjustments for specific price changes do not deal with the effects of inflation as such. The effects of general price-level changes and specific price changes may be dealt with separately or they may be dealt with simultaneously. Dealing with one is not a substitute for dealing with the other. Restatement for general price-level changes is appropriate if the effects of inflation are important, regardless of whether or not specific price changes are recognized currently. The effects of inflation are not treated if only specific price changes are recognized.

.02 The following illustration shows the differences between recognition of general price-level changes and specific price changes. Four different bases of accounting are illustrated:

1. Historical cost, not restated for general price-level changes.
2. Historical cost restated for general price-level changes (the method covered in section 1071).
3. Current value, not restated for general price-level changes.
4. Current value, restated for general price-level changes.

.03 The illustration brings out the following points:

A. In the income statement

1. General price-level statements change the amounts but not the timing of revenue, expenses, gains, and losses.
2. Specific price adjustments (without general price-level restatements) change the timing of recognition of revenue, expenses, gains, and losses, but not the amounts.
3. Recognition of changes in both specific prices and in the general price level (1) changes the timing of recognition of revenue, expenses, gains, and losses and (2) changes the amounts.

B. In the balance sheet

1. General price-level accounting presents restated historical cost.
2. Specific price adjustments present assets at current market value or replacement cost or approximations of them.

Information for Illustration

.04 Land was purchased in year 1 for $20,000. Market price did not change in year 1.

Land was held during year 2, during which market price advanced to $26,000.

Land was sold for $34,000 at the end of year 3.

GNP Deflator indexes:

Year 1	100
Year 2	110
Year 3	120

 © 1974, American Institute of Certified Public Accountants, Inc.

	Historical Cost		Current Value	
	Not restated (Col. 1)	Restated (Col. 2)	Not restated (Col. 3)	Restated (Col. 4)
Balance sheet amount of land				
End of year 1	$20,000	$20,000	$20,000	$20,000
End of year 2	$20,000	$22,000	$26,000	$26,000
Year 3 before sale	$20,000	$24,000	$34,000	$34,000
Income statement gains reported				
In year 1	$ –0–	$ –0–	$ –0–	$ –0–
In year 2	–0–	–0–	6,000	4,000(1)
In year 3	14,000	10,000	8,000	5,640(2)
Total gains for 3 years	$14,000	$10,000	$14,000	$10,000(3) (year 3 dollars)

Notes

(1) Market price, end of year 2 — $26,000

Restated market from year 1: 20,000 x 110/100 = — 22,000

Gain from appreciation — $ 4,000

(2) Selling price, year 3 — $34,000

Restated market from year 2: 26,000 x 120/110 = — 28,360

Gain from sale — $ 5,640

(3) The $4,000 gain in year 2 must be restated to year 3 dollars.

Total gain:		
Year 2 appreciation—		
In year 2 dollars	$4,000	
In year 3 dollars	$4,000 x 120/110	$ 4,360
Year 3 sale		5,640
Total in year 3 dollars		$10,000

Comments

.05 1. Column (1) is presented in accordance with present generally accepted accounting principles. Column (2) is presented in accordance with the recommendations of section 1071.

2. Columns (3) and (4) are not discussed in section 1071. They are presented for illustrative purposes only.

3. The restated historical cost balance sheet (column 2) preserves the cost basis. It does not result in presenting assets at market value or the recognition of unrealized gains or losses.

4. Restating the income statement for changes in the general price level changes the amount but not the timing of gains and losses. Recognizing current values changes the timing but not the amount of gains and losses in the income statement. Thus, in the illustration:

a. In the historical cost columns (1 and 2), the timing of the gains is the same, but the amounts differ ($14,000 and $10,000).

b. In the current value columns (3 and 4), the timing of the gains is the same, but the amounts differ ($14,000 and $10,000).

c. In the unrestated columns (1 and 3), the total gain is the same ($14,000), but the timing and description of the gains are different.

d. In the restated columns (2 and 4), the total gain is the same ($10,000), but the timing and description of the gains are different.

AC Section 1081

Foreign Operations and Foreign Exchange*

[Source: ARB No. 43, Chap. 12, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 The recommendations made in this section apply to United States companies which have branches or subsidiaries operating in foreign countries.

.02 Since World War I foreign operations have been influenced to a marked degree by wars, departures from the gold standard, devaluations of currencies, currency restrictions, government regulations, etc.

.03 Although comparatively few countries in recent years have had unrestricted currencies and exchanges, it is nevertheless true that many companies have been doing business in foreign countries having varying degrees of restrictions; in some cases they have been carrying on all operations regarded as normal, including the transmission of funds. In view of the difficulties mentioned above, however, the accounting treatment of assets, liabilities, losses, and gains involved in the conduct of foreign business and to be included or reflected in the financial statements of United States companies requires careful consideration.

.04 A sound procedure for United States companies to follow is to show earnings from foreign operations in their own accounts only to the extent that funds have been received in the United States or unrestricted funds are available for transmission thereto. Appropriate provision should be made also for known losses.

.05 Any foreign earnings reported beyond the amounts received in the United States should be carefully considered in the light of all the facts. The amounts should be disclosed if they are significant. [As amended, effective for fiscal years beginning on or after January 1, 1976, by FASB Statement No. 8.] (See section 1083.)

---

* See also section 2081, *Financial Reporting for Segments of a Business Enterprise*.

.06 As to assets held abroad, the accounting should take into consideration the fact that most foreign assets stand in some degree of jeopardy, so far as ultimate realization by United States owners is concerned. Under the conditions it is important that especial care be taken in each case to make full disclosure in the financial statements of United States companies of the extent to which they include significant foreign items.

[.07] [Superseded, effective for fiscal years beginning on or after January 1, 1976, by FASB Statement No. 8.] (See section 1083.)

CONSOLIDATION OF FOREIGN SUBSIDIARIES

.08 In view of the uncertain values and availability of the assets and net income of foreign subsidiaries subject to controls and exchange restrictions and the consequent unrealistic statements of income that may result from the translation of many foreign currencies into dollars, careful consideration should be given to the fundamental question of whether it is proper to consolidate the statements of foreign subsidiaries with the statements of United States companies. Whether consolidation of foreign subsidiaries is decided upon or not, adequate disclosure of foreign operations should be made.

.09 The following are among the possible ways of providing information relating to such foreign subsidiaries:

(a) To exclude foreign subsidiaries from consolidation and to furnish (1) statements in which only domestic subsidiaries are consolidated and (2) as to foreign subsidiaries, a summary in suitable form of their assets and liabilities, their income and losses for the year, and the parent company's equity therein. The total amount of investments in foreign subsidiaries should be shown separately, and the basis on which the amount was arrived at should be stated. If these investments include any surplus of foreign subsidiaries and such surplus had previously been included in consolidated surplus, the amount should be separately shown or earmarked in stating the consolidated surplus in the statements here suggested. The exclusion of foreign subsidiaries from consolidation does not make it acceptable practice to include intercompany profits

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

which would be eliminated if such subsidiaries were consolidated.

(b) To consolidate domestic and foreign subsidiaries and to furnish in addition the summary described in (a)(2) above.

(c) To furnish (1) complete consolidated statements and also (2) consolidated statements for domestic companies only.

(d) To consolidate domestic and foreign subsidiaries and to furnish in addition parent company statements showing the investment in and income from foreign subsidiaries separately from those of domestic subsidiaries.

[.10—.22] [Superseded, effective for fiscal years beginning on or after January 1, 1976, by FASB Statement No. 8.] (See section 1083.)

AC Section 1083

Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements

[Source: FASB Statement No. 8.]

October 1975

INTRODUCTION

.001 The expansion of international business activities, extensive currency realignments—including two U. S. dollar devaluations — that followed the recent major revision of the international monetary system, and the acceptance in practice of significantly different methods of accounting have highlighted problems concerning **foreign currency translation.** (Terms defined in the glossary in Appendix E are in boldface type the first time they appear in this Statement.) Appendix B presents background information for this Statement.

.002 This Statement establishes standards of financial accounting and reporting for **foreign currency transactions** in financial statements of a **reporting enterprise** (hereinafter *enterprise*). It also establishes standards of financial accounting and reporting for translating **foreign currency financial statements** incorporated in the financial statements of an enterprise by consolidation, combination, or the equity method of accounting. Translation of financial statements from one currency to another for purposes other than consolidation, combination, or the equity method is beyond the scope of this Statement. For example, this Statement does not cover translation of the financial statements of an enterprise from its **reporting currency** into another currency for the convenience of readers accustomed to that other currency.

.003 To incorporate foreign currency transactions and foreign currency financial statements in its financial statements, an enterprise must translate — that is, express in its reporting

currency[1] — all assets, liabilities, revenue, or expenses that are *measured in foreign currency* or *denominated in foreign currency*[2] and that arise in either of two ways:

> *Foreign currency transactions* — an enterprise (a) buys or sells on credit goods or services whose prices are stated in foreign currency, (b) borrows or lends funds and the amounts payable or receivable are denominated in foreign currency, (c) is a party to an unperformed forward exchange contract, or (d) for other reasons, acquires assets or incurs liabilities denominated in foreign currency.
>
> *Foreign operations* — an enterprise conducts activities through a foreign operation whose assets, liabilities, revenue, and expenses are measured in foreign currency.

The need for translation is discussed further in Appendix C.

.004 This Statement supersedes paragraphs 7 and 10-22 of Chapter 12, "Foreign Operations and Foreign Exchange," of *ARB No. 43* [sections 1081.07 and 1081.10-.22]; paragraph 18 of *APB Opinion No. 6,* "Status of Accounting Research Bulle-

---

[1] For convenience, this Statement assumes that the enterprise uses the U.S. dollar (dollar) as its reporting currency and unit of measure. A currency other than the dollar may be the reporting currency in financial statements that are prepared in conformity with U.S. generally accepted accounting principles. For example, a foreign enterprise may report in its local currency in conformity with U.S. generally accepted accounting principles. If so, the requirements of this Statement apply.

[2] To *measure in foreign currency* is to quantify an attribute of an item in a unit of currency other than the reporting currency. Assets and liabilities are *denominated in foreign currency* if their amounts are fixed in terms of a foreign currency regardless of exchange rate changes. An asset or liability may be both measured and denominated in one currency, or it may be measured in one currency and denominated in another. To illustrate: two foreign branches of a U.S. company, one Swiss and one German, purchase on credit identical assets from a Swiss vendor at identical prices stated in Swiss francs. The German branch measures the cost (an attribute) of that asset in German marks. Although the corresponding liability is also *measured* in marks, it remains *denominated* in Swiss francs since the liability must be settled in a specified number of Swiss francs. The Swiss branch measures the asset and liability in Swiss francs. Its liability is both measured and denominated in Swiss francs. Assets and liabilities can be measured in various currencies. However, currency and rights to receive or obligations to pay fixed amounts of a currency are denominated only in that currency.

 Copyright © 1975 by Financial Accounting Standards Board

tins"; and *FASB Statement No. 1*, "Disclosure of Foreign Currency Translation Information." It also amends the last sentence of paragraph 5 of *ARB No. 43*, Chapter 12 [section 1081.05], to delete "and they should be reserved against to the extent that their realization in dollars appears to be doubtful," and paragraph 13 of *APB Opinion No. 22* [section 2045.13], "Disclosure of Accounting Policies," to delete "translation of foreign currencies" as an example of disclosure "commonly required with respect to accounting policies."

.005 Standards of financial accounting and reporting for the translation of foreign currency transactions and foreign currency financial statements (*foreign statements*) are presented in paragraphs .006-.037. Those paragraphs deal in sequence with the following: objective of translation, foreign currency transactions, foreign statements, exchange gains and losses, income tax consequences of rate changes, forward exchange contracts, use of averages or reasonable approximations, exchange rates, disclosure, and effective date and transition. The basis for the Board's conclusions, as well as alternatives considered and reasons for their rejection, are discussed in Appendix D.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Objective of Translation

.006 For the purpose of preparing an enterprise's financial statements, the objective of translation is to measure and express (a) in dollars and (b) in conformity with U.S. generally accepted accounting principles the assets, liabilities, revenue, or expenses that are measured or denominated in foreign currency. Remeasuring in dollars the assets, liabilities, revenue, or expenses measured or denominated in foreign currency should not affect either the measurement bases for assets and liabilities or the timing of revenue and expense recognition otherwise required by generally accepted accounting principles. That is, translation should change the unit of measure without changing accounting principles.

Foreign Currency Transactions

.007 The objective of translation requires that the following shall apply to all foreign currency transactions of an enterprise other than forward exchange contracts (paragraphs .022-.028):

a) At the transaction date, each asset, liability, revenue, or expense arising from the transaction shall be translated into (that is, measured in) dollars by use of the exchange rate (*rate*) in effect at that date, and shall be recorded at that dollar amount.

b) At each balance sheet date, recorded dollar balances representing cash and amounts owed by or to the enterprise that are denominated in foreign currency shall be adjusted to reflect the current rate.[3]

c) At each balance sheet date, assets carried at market whose current market price is stated in a foreign currency shall be adjusted to the equivalent dollar market price at the balance sheet date (that is, the foreign currency market price at the balance sheet date multiplied by the current rate).

.008 Although paragraph .007 refers to foreign currency transactions of an enterprise whose reporting currency is the dollar, the conclusions expressed therein also apply to a foreign operation that has transactions whose terms are stated in a currency other than its local currency.

Foreign Statements

.009 The objective of translation requires that the assets, liabilities, revenue, and expenses in foreign statements be translated and accounted for in the same manner as assets, liabilities, revenue, and expenses that result from foreign currency transactions of the enterprise. Foreign currency transactions of an enterprise involve amounts denominated or measured in foreign currency, but the assets, liabilities, revenue, and expenses from foreign currency transactions are initially measured and recorded in dollars, and in conformity with U.S. generally accepted accounting principles, following the procedures in paragraph .007(a). In contrast, assets, liabilities, revenue, and expenses in foreign statements are initially measured and recorded in foreign currency and may not be in conformity with U.S. generally accepted accounting principles. Since translation cannot transform the results obtained under dissimilar foreign accounting principles into acceptable measurements under U.S. accounting principles,

---

[3] Debt securities held that are essentially equivalent to notes receivable shall be adjusted to reflect the current rate (paragraph .039).

Copyright © 1975 by Financial Accounting Standards Board

special procedures are necessary to ensure that the translated statements are prepared in conformity with U.S. generally accepted accounting principles.

.010 Accordingly, before translation, foreign statements that are to be included by consolidation, combination, or the equity method in an enterprise's financial statements shall be prepared in conformity with U.S. generally accepted accounting principles. Those financial statements shall then be translated into dollars following the standards in this Statement.[4]

.011 In preparing foreign statements, balances representing cash and amounts receivable or payable that are denominated in other than the local currency shall be adjusted to reflect the current rate between the local and the foreign currency.[5]

Those adjusted balances and other balances representing cash and amounts receivable or payable that are denominated in the local currency shall be translated into dollars at the current rate.

.012 For assets and liabilities other than those described in paragraph .011, the particular measurement basis used shall determine the translation rate. Several measurement bases are used in financial accounting under present generally accepted accounting principles.[6] A measurement may be based on a price in a past exchange (for example, historical cost), a price in a current purchase exchange (for example, replacement cost), or a price in a current sale exchange (for example, market price). Foreign statements may employ various measurement bases. Accordingly, accounts in foreign statements that are carried at exchange prices shall be translated in a manner that retains their measurement bases as follows:

---

[4] In multilevel consolidation, foreign statements may be translated into another foreign currency and consolidated with other foreign statements before being consolidated with the enterprise's financial statements. Translation at each step of a multilevel consolidation shall be in conformity with the standards in this Statement.

[5] Since foreign statements are expressed in local currency, the term *foreign currency* in this context includes the dollar.

[6] Various measurement bases are described in paragraphs 70 and 179 of *APB Statement No. 4* [sections 1023.31 and 1027.05], "Basic Concepts of Accounting Principles Underlying Financial Statements of Business Enterprises."

a) Accounts carried at prices in past exchanges (past prices) shall be translated at historical rates.

b) Accounts carried at prices in current purchase or sale exchanges (current prices) or future exchanges (future prices) shall be translated at the current rate.

.013 Revenue and expense transactions shall be translated in a manner that produces approximately the same dollar amounts that would have resulted had the underlying transactions been translated into dollars on the dates they occurred. Since separate translation of each transaction is usually impractical, the specified result can be achieved by using an average rate for the period. However, revenue and expenses that relate to assets and liabilities translated at historical rates shall be translated at the historical rates used to translate the related assets or liabilities.

.014 The procedures specified in paragraphs .010-.013 generally result in translated statements in which the assets, liabilities, revenue, and expenses are measured in dollars in the same manner as those resulting from foreign currency transactions of the enterprise. Occasionally, however, translation of foreign statements in strict conformity with those paragraphs does not result in dollar measurements required by U.S. generally accepted accounting principles. For example, the test of *cost or market, whichever is lower*, must be applied *in dollars* to ensure that inventory in the translated statements conforms to that rule — a procedure that can result in dollar measurements that are sometimes different from translating inventory in foreign statements in the manner described in paragraph .012. Similarly, timing differences that affect deferred tax accounting sometimes increase or decrease *in dollars* even though their amounts measured in foreign currency remain unchanged.

.015 Appendix A, "Translation of Certain Accounts," (paragraphs .038-.052) explains and illustrates certain applications of the procedures set forth in paragraphs .011-.013. It also describes and illustrates ways to ensure that amounts in translated statements conform to U. S. generally accepted accounting principles in those situations indicated in paragraph .014.

Exchange Gains and Losses

.016 A change in the rate between the dollar and the foreign currency in which assets and liabilities are measured or de-

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

nominated can result in an exchange gain or loss if the translation method uses the dollar as the unit of measure. Exchange gains or losses are a consequence of translation, that is, of remeasuring in dollars. They result from the procedures specified in paragraphs .007(b)and .011-.013 (see paragraphs .167-.169). Exchange gains or losses also result from the **conversion** of foreign currency or the settlement of a receivable or payable denominated in foreign currency at a rate different from that at which the item is recorded.

.017 Exchange gains and losses shall be included in determining net income for the period in which the rate changes. Exchange gains and losses are *gains* and *losses* as those terms are used in paragraph 15(d) of *APB Opinion No. 28* [section 2071.15d], "Interim Financial Reporting," which states: "Gains and losses that arise in any interim period similar to those that would not be deferred at year end should not be deferred to later interim periods within the same fiscal year."

Income Tax Consequences of Rate Changes

.018 Interperiod tax allocation is required in accordance with *APB Opinion No. 11* [section 4091], "Accounting for Income Taxes," if taxable exchange gains or tax-deductible exchange losses resulting from an enterprise's foreign currency transactions are included in income in a different period for financial statement purposes than for tax purposes. Partial or complete elimination of a foreign operation's exchange gains or losses through translation of its statements into dollars shall not alter current inclusion in the dollar income statement of the effects, if any, of the exchange gains or losses on foreign taxes (see paragraph .200).

.019 The use of historical rates to translate certain revenue or expense items may result in an unusual relationship between the translated amounts of foreign pretax income and foreign income taxes. However, that effect of a rate change is not a timing difference as defined in *APB Opinion No. 11* [section 4091], and interperiod tax allocation is not appropriate.

.020 To the extent that exchange gains or losses arising from translating subsidiaries' and investees' foreign statements into dollars are not included currently in U. S. taxable income, the need for deferred taxes shall be determined in accordance with the provisions of *APB Opinion No. 23* [section 4095], "Accounting for Income Taxes—Special Areas," and *APB Opinion No.*

24 [section 4096], "Accounting for Income Taxes—Investments in Common Stock Accounted for by the Equity Method (Other than Subsidiaries and Corporate Joint Ventures)."

.021 Deferred taxes shall be recorded in accordance with *APB Opinion No. 11* [section 4091], for exchange gains or losses that are timing differences arising from including the operations of foreign branches of U. S. companies and certain foreign subsidiaries and investees in determining U. S. taxable income. Since various methods are allowed to measure exchange gains or losses for tax purposes, the determination of whether exchange gains or losses are timing differences or permanent differences must depend on the circumstances in each situation.

Forward Exchange Contracts

.022 A forward exchange contract (*forward contract*) is an agreement to exchange at a specified future date currencies of different countries at a specified rate (the *forward rate*). The purpose of a forward contract may be to hedge either a foreign currency commitment or a foreign currency exposed net asset position or exposed net liability position or to speculate in anticipation of a gain.

.023 A gain or loss shall be included in determining net income for the period in which the rate changes if the gain or loss pertains to a forward contract that is intended to be a (a) hedge of a foreign currency exposed net asset or net liability position, (b) hedge of a foreign currency commitment that does not meet the conditions described in paragraph .027, or (c) speculation.

.024 A gain or loss shall be deferred and included in the measurement of the dollar basis of the related foreign currency transaction if the gain or loss pertains to a forward contract that is intended to be a hedge of an identifiable foreign currency commitment that meets the conditions described in paragraph .027. Losses on a forward contract shall not be deferred, however, if deferral could lead to recognizing losses in later periods.[7]

[7] For example, a loss on a forward contract shall not be deferred if future revenue from sale or other disposition of an asset is estimated to be less than the sum of (a) the asset's dollar cost including the deferred loss on the related forward contract and (b) reasonably predictable costs of sale or disposal.

Copyright © 1975 by Financial Accounting Standards Board

.025 A gain or loss on a forward contract that is intended to be a hedge (paragraphs .023(a), .023(b), and .024) shall be determined by multiplying the foreign currency amount of the forward contract by the difference between the spot rate at the balance sheet date[8] and the spot rate at the date of inception of the contract (or the spot rate last used to measure a gain or loss on that contract for an earlier period). The discount or premium on the forward contract (that is, the foreign currency amount of the contract multiplied by the difference between the contracted forward rate and the spot rate at the date of inception of the contract) shall be accounted for separately from the gain or loss on the contract and shall be included in determining net income over the life of the forward contract. If a gain or loss is deferred under paragraph .024, however, the forward contract's discount or premium that relates to the commitment period may be included in the measure of the dollar basis of the related foreign currency transaction when recorded.

.026 A gain or loss on a forward contract that is a speculation shall be determined by multiplying the foreign currency amount of the forward contract by the difference between the forward rate available for the remaining maturity of the contract and the contracted forward rate (or the forward rate last used to measure a gain or loss on that contract for an earlier period). No separate accounting recognition is given to the discount or premium on a forward contract that is a speculation.

.027 There shall be the presumption that the intent of entering into a forward contract is described in paragraph .023. However, a forward contract shall be considered a hedge of an identifiable foreign currency commitment (paragraph 024), provided *all* of the following conditions are met:

---

[8] If the transaction date for a commitment that is hedged by a forward contract (paragraph .024) occurs during the period before the balance sheet date, the spot rate at the transaction date shall be used instead of the spot rate at the subsequent balance sheet date.

a) The life of the forward contract extends from the foreign currency commitment date to the anticipated transaction date[9] or a later date.[10]

b) The forward contract is denominated in the same currency as the foreign currency commitment.

c) The foreign currency commitment is firm and uncancelable.

The portion of a forward contract that shall be accounted for pursuant to paragraph .024 is limited to the amount of the related commitment. If a forward contract that meets conditions (a) through (c) above exceeds the amount of the related commitment, the gain or loss pertaining to a portion of the forward contract in excess of the commitment shall be deferred to the extent that the forward contract is intended to provide a hedge on an after-tax basis. A gain or loss so deferred shall be included as an offset to the related tax effects in the period in which such tax effects are recognized. A gain or loss that has been offset against related tax effects shall not be included in the aggregate exchange gain or loss disclosure required by paragraph .032. A gain or loss pertaining to the portion of a forward contract in excess of the amount that provides a hedge on an after-tax basis shall not be deferred. Likewise, a gain or loss pertaining to a period after the transaction date of the related commitment shall not be deferred. [As amended, effective January 1, 1978 by FASB Statement No. 20.] (See section 1084.)

.028 If a forward contract previously considered a hedge of a foreign currency commitment is sold or otherwise terminated before the transaction date, the deferred gain or loss, if any, shall continue to be deferred and accounted for in accordance with the requirements of paragraph .024.

---

[9] A long-term commitment may have more than one transaction date. For example, the due date of each progress payment under a construction contract is an anticipated transaction date. For purposes of this Statement, each future progress payment due is a commitment, and the period between the commitment date for the entire contract and the due date of each progress payment is the minimum life for a forward contract that hedges that payment.

[10] The intended use of successive forward contracts satisfies the condition in paragraph .027(a) if the nature of the forward exchange market precludes a single forward contract's covering the entire period, provided the first contract commences at the commitment date.

Use of Averages or Reasonable Approximations

.029 Since literal application of several of the standards in this Statement would require a degree of detail in record-keeping and computations that might be burdensome as well as unnecessary to produce reasonable approximations of the results desired, the use of averages or other methods of approximation is appropriate, provided the results obtained do not differ materially from the results prescribed by the standards. For example, the propriety of average rates in translating certain revenue and expense amounts is noted in paragraph .013. Likewise, the use of averages and other time- and effort-saving methods to approximate the results of detailed calculations will often prove useful in translating certain inventory, deferred income tax, and other accounts that involve translation of numerous individual elements at historical rates.

Exchange Rates

.030 The exchange rate is the ratio between a unit of one currency and the amount of another currency for which that unit can be exchanged at a particular time. For purposes of applying this Statement, the *current rate* is the rate in effect at the balance sheet date (see paragraph .034), and the *historical rate* is the rate in effect at the date a specific transaction or event occurred.[11] The following shall apply if multiple rates exist:

a) *Foreign Currency Transactions.* The applicable rate at which a particular transaction could be settled at the transaction date shall be used to translate and record the transaction. At a subsequent balance sheet date, the current rate is that rate at which the related receivable or payable could be settled at that date.

b) *Foreign Statements.* In the absence of unusual circumstances, the rate applicable to conversion of a

---

[11] If exchangeability between the dollar and the foreign currency is temporarily lacking at the transaction date or balance sheet date, the first subsequent rate at which exchanges could be made shall be used for purposes of this Statement. If the lack of exchangeability is other than temporary, the propriety of consolidating, combining, or accounting for the foreign operation by the equity method in the financial statements of the enterprise shall be carefully considered (*ARB No. 43*, Chapter 12, paragraph 8 [section 1081.08]).

currency for purposes of dividend remittances shall be used to translate foreign statements.[12]

.031 If a foreign operation whose balance sheet date differs from that of the enterprise is consolidated or combined with or accounted for by the equity method in the financial statements of the enterprise, the current rate is the rate in effect at the foreign operation's balance sheet date for purposes of applying the requirements of this Statement to that foreign operation.

Disclosure

.032 The aggregate exchange gain or loss included in determining net income for the period shall be disclosed in the financial statements or in a note thereto.[13] For the purpose of that disclosure, gains and losses on forward contracts determined in conformity with the requirements of paragraphs .025 and .026 shall be considered exchange gains or losses.

.033 Effects of rate changes on reported results of operations, other than the effects included in the disclosure required by paragraph .032, shall, if practicable, be described and quantified. If quantified, the methods and the underlying assumptions used to determine the estimated effects shall be explained (paragraphs .223-.225).

.034 An enterprise's financial statements shall not be adjusted for a rate change that occurs after the date of the financial statements or after the date of the foreign statements of a foreign operation that are consolidated or combined with or accounted for by the equity method in the financial statements of the enterprise. However, disclosure of the rate change and its effects, if significant, may be necessary.

---

[12] If unsettled intercompany transactions are subject to preference or penalty rates, translation at the rate applicable to dividend remittances may cause a difference between intercompany receivables and payables measured in dollars. Until that difference is eliminated by settlement of the intercompany transaction, it shall be treated as a receivable or payable in the enterprise's financial statements.

[13] Certain enterprises, primarily banks, are dealers in foreign exchange. Although certain gains or losses from dealer transactions may fit the definition of exchange gains or losses in this Statement, they need not be included in the aggregate exchange gain or loss required to be disclosed if dealer gains or losses are disclosed.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Effective Date and Transition

.035 This Statement shall be effective for fiscal years beginning on or after January 1, 1976,[14] although earlier application is encouraged. Thereafter, if financial statements for periods before the effective date, and financial summaries or other data derived therefrom, are presented, they shall be restated, if practicable, to conform to the provisions of paragraphs .007-.031 of this Statement. In the year that this Statement is first applied, the financial statements shall disclose the nature of any restatement and its effect on income before extraordinary items, net income, and related per share amounts for each period restated. For purposes of applying the provisions of paragraph .027(a) of this Statement, *FASB Statement No. 20* [section 1084] provides a limited exception for forward contracts that are intended to hedge commitments entered into before the provisions of this Statement are initially applied. [As amended, effective January 1, 1978 by FASB Statement No. 20.] (See section 1084.)

.036 If restatement of financial statements or summaries for all prior periods presented is not practicable, information presented shall be restated for as many consecutive periods immediately preceding the effective date of this Statement as is practicable, and the cumulative effect of applying paragraphs .007-.031 on the retained earnings at the beginning of the earliest period restated (or at the beginning of the period in which the Statement is first applied if it is not practicable to restate any prior periods) shall be included in determining net income of that period (see paragraph 20 of *APB Opinion No. 20* [section 1051.20], "Accounting Changes").[15] The effect on income before extraordinary items, net income, and related per share amounts of applying this Statement in a period in which the cumulative effect is included in determining net income shall be disclosed for that period, and the reason for not restating all of the prior periods presented shall be explained.

.037 Financial statements for periods beginning on or after the effective date of this Statement shall include the disclosures specified by paragraphs .032 and .033 of this Statement. To

---

[14] For enterprises having fiscal years of 52 or 53 weeks instead of the calendar year, this Statement shall be effective for fiscal years beginning in late December 1975.

[15] Pro forma disclosures required by paragraphs 19(d) and 21 of *APB Opinion No. 20* [sections 1051.19d and 1051.21] are not applicable.

the extent practicable, those disclosures shall also be included in financial statements for earlier periods that have been restated pursuant to paragraph .035 or paragraph .036.

The provisions of this Statement need not be applied to immaterial items.

The next page is 7611.

Appendix A

TRANSLATION OF CERTAIN ACCOUNTS

.038 Paragraphs .011 and .012 distinguish those balance sheet accounts in foreign statements that shall be translated at either current or historical rates. The table on the following page indicates the rates at which certain common balance sheet accounts in foreign statements shall be translated. In addition, the following paragraphs discuss certain additional aspects of translating foreign statements. Two topics included in the discussion—applying the rule of cost or market, whichever is lower, to inventory and applying *APB Opinion No. 11* [section 4091] to deferred income taxes—require procedures not described in paragraphs .011 and .012 (see paragraph .014).

Holdings of Debt Securities

.039 Debt securities held that are essentially equivalent to notes receivable shall be translated at the current rate. An example is a bond that is intended to be held to maturity and is carried at an amount that is the present value of future interest and principal payments based on the effective rate of interest at the date of purchase (that is, at maturity amount plus or minus an unamortized premium or discount). A debt security held that is not essentially equivalent to a note receivable shall be translated (a) at the current rate if carried at current market price or (b) at the historical rate if carried at cost.

Translation After a Business Combination [16]

.040 The method an enterprise uses to account for the acquisition of a foreign operation affects certain aspects of translation. If a business combination with a foreign operation is accounted for by the *pooling-of-interests method*, the assets and liabilities of the foreign operation

[16] *APB Opinion No. 16* [section 1091], "Business Combinations," prescribes generally accepted accounting principles for business combinations. Paragraphs 87-92 [section 1091.87-.92] are particularly pertinent.

Rates Used to Translate Assets and Liabilities

	Translation Rates	
	Current	Historical
ASSETS		
Cash on hand and demand and time deposits	X	
Marketable equity securities:		
Carried at cost		X
Carried at current market price	X	
Accounts and notes receivable and related unearned discount	X	
Allowance for doubtful accounts and notes receivable	X	
Inventories:		
Carried at cost		X
Carried at current replacement price or current selling price	X	
Carried at net realizable value	X	
Carried at contract price (produced under fixed price contracts)	X	
Prepaid insurance, advertising, and rent		X
Refundable deposits	X	
Advances to unconsolidated subsidiaries	X	
Property, plant, and equipment		X
Accumulated depreciation of property, plant, and equipment		X
Cash surrender value of life insurance	X	
Patents, trademarks, licenses, and formulas		X
Goodwill		X
Other intangible assets		X
LIABILITIES		
Accounts and notes payable and overdrafts	X	
Accrued expenses payable	X	
Accrued losses on firm purchase commitments	X	
Refundable deposits	X	
Deferred income		X
Bonds payable or other long-term debt	X	
Unamortized premium or discount on bonds or notes payable	X	
Convertible bonds payable	X	
Accrued pension obligations	X	
Obligations under warranties	X

shall be translated as if the foreign operation had always been a subsidiary of the enterprise. Therefore, assets and liabilities that are translated at historical rates shall be translated at the rates in effect at the date the foreign operation recognized the specific transactions or events.

.041 If a business combination with a foreign operation is accounted for by the *purchase method*, assets and liabilities that are translated at historical rates shall be translated at the rates in effect when the enterprise acquired its interest in the assets or liabilities. Thus, assets and liabilities of a foreign operation at the date of its acquisition shall be adjusted to their fair values in local currency and then translated at the rate in effect at the date of acquisition. A difference between the translated net assets and the dollar cost of acquisition by the enterprise is *goodwill* or *an excess of acquired net assets over cost* as those terms are used in *APB Opinion No. 16* [section 1091]. Translation at the date of acquisition, as described, establishes the dollar measures of the assets acquired and liabilities assumed as of the date of acquisition that are translated at historical rates in subsequent balance sheets.

Translation of an Investment Accounted for by the Equity Method[17]

.042 The foreign statements of an investee that are accounted for by the equity method first shall be translated into dollars in conformity with the requirements of this Statement; then the equity method shall be applied.

Minority Interests

.043 The minority interest reported in an enterprise's consolidated financial statements shall be based on the financial statements of the subsidiary in which there is a minority interest after they have been translated according to the requirements of this Statement.

---

[17] *APB Opinion No. 18* [section 5131], "The Equity Method of Accounting for Investments in Common Stock," prescribes generally accepted accounting principles for the equity method.

Preferred Stock

.044 Preferred stock that is essentially a permanent stockholder investment shall be translated in the same manner as common stock, that is, at historical rates. However, if preferred stock not owned by the enterprise is carried in the foreign operation's balance sheet at its liquidation or redemption price, and liquidation or redemption is either required or imminent, that preferred stock shall be translated at the current rate. If translation at the historical rate would result in stating a preferred stock above its stated liquidation or redemption price in foreign currency translated at the current rate, the preferred stock shall be carried at the lesser dollar amount.

Revenue and Expense Transactions

.045 Paragraph .013 permits the use of average rates to translate revenue and expense transactions that do not relate to balance sheet accounts translated at historical rates. Average rates used shall be appropriately weighted by the foreign currency volume of transactions occurring during the accounting period. For example, to translate revenue and expense accounts for an annual period, individual revenue and expense accounts for each quarter or month may be translated at that quarter's or month's average rate. The translated amounts for each quarter or month should then be combined for the annual totals.

Applying the Rule of Cost or Market, Whichever Is Lower

.046 To apply the rule of *cost or market, whichever is lower* (as described in Statement 6 of Chapter 4, "Inventory Pricing," of *ARB No. 43)* [section 5121.09], *translated historical cost* shall be compared with *translated market.* Application of the rule *in dollars* may require write-downs to market in the translated statements even though no write-down in the foreign statements is required by the rule. It may also require a write-down in the foreign statements to be reversed before translation if the translated market amount exceeds translated historical cost; the foreign currency cost shall then

Copyright © 1975 by Financial Accounting Standards Board

be translated at the historical rate.[18] Once inventory has been written down to market in the translated statements, that dollar amount shall continue to be the carrying amount in the dollar financial statements until the inventory is sold or a further write-down is necessary.[19]

.047 Paragraphs .048 and .049 illustrate two different situations.

.048 A foreign subsidiary of a U. S. company purchases a unit of inventory at a cost of FC500 when the rate is FC1=$2.40. At the balance sheet date the *market* (as the term is used in Chapter 4 of *ARB No. 43*) [section 5121] of the item is FC450 and the rate is FC1 = $3.00. Thus, the item's historical cost is $1,200 (FC500 × $2.40) and its market is $1,350 (FC450 × $3.00). If inventory is written down to FC450 in the foreign accounting records, translation of that amount at the current rate would not result in the lower of cost or market measured in dollars. Therefore, the write-down should be reversed in the foreign statements before translation. After translating the foreign currency cost at the historical rate, the inventory will be properly stated in the dollar financial statements at its historical cost of $1,200.

.049 A situation different from the one in the preceding paragraph could also exist. For example, a foreign operation purchases a unit of inventory at a cost of FC500 when the rate is FC1=$2.40. At the balance sheet date the *market* of the item is FC600 and the rate is FC1=$1.80. Thus, the item's historical cost is $1,200 (FC500 x $2.40), its market is $1,080 (FC600 x $1.80), and a write-down of the inventory to market in the translated financial statements is necessary.

---

[18] An asset other than inventory may sometimes be written down from historical cost. Although that write-down is not under the rule of cost of market, whichever is lower, the standards prescribed in this paragraph shall be applied. That is, a write-down may be required in the translated statements even though not required in the foreign statements, and a write-down in the foreign statements may need to be reversed before translation to prevent the translated amount from exceeding translated historical cost.

[19] This paragraph is not intended to preclude recognition of gains in a later interim period to the extent of inventory losses recognized from market declines in earlier interim periods if losses on the same inventory are recovered in the same year, as provided by paragraph 14(c) of *APB Opinion No. 28* [section 2071.14(c)], "Interim Financial Reporting."

Deferred Income Taxes

.050 Present accounting for income taxes is governed by *APB Opinion No. 11* [section 4091], which requires the *deferred method* of interperiod tax allocation. Consistent with the requirements of *APB Opinion No. 11* [section 4091] and paragraph .009 of this Statement, deferred taxes in the translated balance sheet of a foreign operation shall be stated the same as would the deferred tax effects of timing differences from foreign currency transactions of the enterprise that are subject to foreign taxes but measured and recorded in dollars. Accordingly, the following procedures shall apply:

a) Deferred taxes that (1) are determined by the *gross change* method (*APB Opinion No. 11,* paragraph 37(a) [section 4091.36(a)] and (2) do not relate to assets or liabilities translated at the current rate shall be translated at historical rates.

b) Deferred taxes that (1) are determined by the *net change* method (*APB Opinion No. 11,* paragraph 37(b) [section 4091.36(b)] and (2) do not relate to assets or liabilities translated at the current rate shall be measured in dollars by adding to or subtracting from the dollar balance at the beginning of the period the amount determined by translating (in accordance with paragraph .013 of this Statement) the foreign currency deferred tax expense or credit included in the foreign operation's income statement for the period. (Paragraph .051 illustrates that procedure.)

c) Deferred taxes that relate to assets or liabilities translated at the current rate shall be translated at the current rate. (Paragraph .052 illustrates that procedure.)

Applying the current rate to the balance of deferred taxes in (c) above complies with the objective of translation. Translating at the current rate the item in the foreign statements that gave rise to a timing difference remeasures the timing difference in dollars, and, therefore, the tax effect *in dollars* of the change in the timing difference should be recognized.

 Copyright © 1975 by Financial Accounting Standards Board

Illustrations of Applying Paragraph .050

.051 A foreign subsidiary of a U.S. company uses the net change method of deferred tax allocation for timing differences from using an accelerated depreciation method on plant and equipment for tax purposes and the straight-line method of depreciation for financial statement purposes. The dollar measure of the deferred tax credit at the beginning of the year is $100,000 (determined in conformity with the requirements of paragraph .050(b)). The current year's deferred tax expense is FC50,000, and the average exchange rate for translating income tax expense is FC1=$.50. Accordingly, the dollar amount of deferred taxes in the translated balance sheet is $125,000 [$100,000+.50(50,000)].

.052 A foreign subsidiary of a U.S. company accrues warranty obligations for financial statement purposes but is on the cash basis for tax purposes. The accrued warranty obligation at the beginning and end of the year is FC900. No warranty claims are paid during the year. The deferred tax charge using the net change method is FC450 (determined at the 50% local tax rate) at the beginning and end of the year. The exchange rate at the beginning and end of the year is FC1=$1 and FC3=$1, respectively. The dollar measure of the deferred tax charge at the beginning of the year is $450. Accordingly, the dollar amount of the deferred tax charge in the translated balance sheet at year end is $150 (FC450 ÷ 3). The warranty obligation measured in dollars has decreased $600 during the year; therefore, the deferred tax charge should be decreased by $300.

Appendix B

BACKGROUND INFORMATION

.053 Before this Statement was issued, existing accounting pronouncements on foreign currency translation (summarized in paragraphs .060-.064) dealt only with translating foreign statements and not with foreign currency transactions. Since publication of the basic existing pronouncement, the international business activities of U.S. companies have expanded rapidly. In addition, the international business environment has been affected by recent, significant changes in the world monetary system, exemplified by the U.S. dollar devaluations of 1971 and 1973 and the current prevalence of *floating* rather than *fixed* rates in most foreign exchange markets.

.054 Because of those factors and the acceptance in practice of several different methods of accounting for foreign currency translation, the FASB in April 1973 placed on its technical agenda a project on "Accounting for Foreign Currency Translation."

.055 A task force of 14 persons from industry, public accounting, the financial community, and academe was appointed in May 1973 to counsel the Board in preparing a Discussion Memorandum analyzing issues related to the project.

.056 In the meantime, because a variety of methods of determining and accounting for exchange gains and losses existed in practice and not all companies completely disclosed their translation methods or their accounting for exchange gains and losses, the Board issued in October 1973 an Exposure Draft of a proposed FASB Statement on "Disclosure of Foreign Currency Translation Information." After considering the comments received on that Exposure Draft, the Board issued *FASB Statement No. 1* on that topic in December 1973.

.057 The Board issued the Discussion Memorandum, "Accounting for Foreign Currency Translation," on February 21, 1974, and held a public hearing on the subject on June

Copyright © 1975 by Financial Accounting Standards Board

10 and 11, 1974. The Board received 90 position papers, letters of comment, and outlines of oral presentations in response to the Discussion Memorandum. Fifteen presentations were made at the public hearing.

.058 In 1972, the AICPA and the Canadian Institute of Chartered Accountants both published research studies on this subject.[20] While the Discussion Memorandum was being prepared, the Financial Executives Institute completed a survey of the translation practices of 45 major U.S. companies.[21] In addition to the availability of those studies, pronouncements of other professional accounting bodies, and other published research studies and articles that are cited in the Discussion Memorandum, the FASB staff prepared a *Financial Statement Model on Accounting for Foreign Currency Translation.*[22] Its purpose was to aid in identifying possible implementation problems related to adopting a particular method or combination of methods from among those that had been proposed or that were currently used in practice. The FASB staff also reviewed the disclosure of translation practices in recent annual financial statements of 77 companies engaged in foreign activities.

.059 The Board received 190 letters of comment on its Exposure Draft of a proposed Statement on "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements," dated December 31, 1974.

SUMMARY OF PAST PRONOUNCEMENTS AND PRACTICES

.060 Chapter 12 of *ARB No. 43* as modified by paragraph 18 of *APB Opinion No. 6* [section 1081], was the basic authoritative pronouncement on accounting for foreign currency translation before this Statement. Chapter 12 [section 1081] called for trans-

lation of current assets and liabilities at the current rate and translation of noncurrent assets and liabilities at historical rates, that is, the *current-noncurrent* method. Under Chapter 12 [section 1081], exchange losses and realized exchange gains were included in net income, and unrealized exchange gains were preferably deferred, except that unrealized exchange gains might be included in net income to the extent that they offset exchange losses previously included in net income.

.061 Chapter 12 of *ARB No. 43* [section 1081] provided certain exceptions to those general rules. Under special circumstances, inventory could be stated at historical rates. Long-term debt incurred or capital stock issued in connection with the acquisition of long-term assets shortly before a substantial and presumably permanent change in the rate could be restated at the new rate. If the debt or stock was restated, the difference was an adjustment of the cost of the assets acquired.

.062 A research report[23] published in 1960 described the current-noncurrent distinction as one that "seems to reflect the use of an established balance sheet classification for a purpose to which it is not relevant." In addition, the report described the *monetary-nonmonetary* method, which had been proposed earlier.[24] Under that method, inventory is translated at historical rates because it is a nonmonetary asset, and both current and noncurrent receivables and payables are translated at the current rate because they are monetary items.

.063 Translating all payables and receivables at the current rate received official recognition with the issuance in 1965 of *APB Opinion No. 6*. Paragraph 18 of *APB Opinion No. 6* stated, without specifying the circumstances, that "translation of long-term receivables and long-term liabilities at current exchange rates is appropriate in many circumstances." That modification of Chapter 12 of *ARB No. 43* [section 1081] in effect permitted use of the monetary-nonmonetary method of translation.

.064 Because of extensive currency realignments in 1971, the APB considered the problem of foreign currency translation and issued an exposure draft proposing that companies using the monetary-nonmonetary method defer exchange gains and losses to the extent they did not exceed those attributable to long-term debt. Amounts deferred were to be accounted for in a manner similar to debt discount.[25] That draft in effect created another method of accounting for exchange gains and losses. *ARS No. 12* was in process at the time, and the U.S. dollar was devalued during the exposure period. The APB deferred action on the exposure draft and announced that companies should disclose how they accounted for exchange gains and losses. The APB also noted that some companies had adopted the recommendations of the exposure draft, thus achieving somewhat the same effect as translating long-term receivables and payables at historical rates.[26]

Appendix C

NEED FOR TRANSLATION

FOREIGN CURRENCY TRANSACTIONS

.065 If an enterprise engages in a transaction that requires later settlement in a currency other than the one in which its accounts are maintained, translation is required to record the transaction.

.066 An enterprise may be involved in various types of transactions that require settlement in foreign currency, including:

a) Operating transactions (importing, exporting, licensing, etc.);

b) Financing transactions (borrowing and lending);

c) Forward exchange contracts.

.067 Foreign currency transactions may involve three stages:

a) Translation to record the transaction at the transaction date;

b) Subsequent adjustments of the unsettled portion of the transaction (the amount owed by or to the enterprise), if any, to reflect the current rate at balance sheet dates between the transaction date and the settlement date;

c) Conversion of one currency into the other at settlement date.[27]

[27] Although conversion may be at a rate other than the one at which cash, a receivable, or a payable is recorded, *translation* is not involved. However, an exchange gain or loss results from conversion at a different rate.

Copyright © 1975 by Financial Accounting Standards Board

Unit of Measure

.068 At the transaction date it is necessary to measure and record in a particular currency (a unit of measure) the amount of the goods or services purchased or sold or the amount of the loan received or granted and the corresponding amount owed by or to the enterprise. Once the amount of the goods or services purchased or sold is measured and recorded in dollars,[28] it is not subject to further *translation.*

.069 Because the dollar amount of any unsettled portion of the transaction (the amount to be paid in an import or borrowing transaction and the amount to be collected in an export or lending transaction) will be affected by a change in the rate between the dollar and the foreign currency (paragraphs .071 and .072), a potential for gain or loss exists.

.070 If a foreign currency transaction is not settled when the transaction occurs, the question arises whether the amount receivable or payable should be presented in the financial statements of the enterprise until the settlement date at the dollar equivalent established at the transaction date or whether it should be adjusted at each intervening balance sheet date for the rate changes that may have occurred in the meantime. Paragraph .007(b) of this Statement states the Board's conclusion regarding that question, and paragraphs .112-.115 and .161-.166 give the Board's reasoning.

Effect of a Rate Change

.071 An exchange rate is the ratio between a unit of one currency and the amount of another currency for which that unit can be exchanged (converted) at a particular time. For example, a spot rate of $1 = FC2 means that one dollar presently can be exchanged for two foreign currency units of

---

[28] *APB Statement No. 4* (paragraph 165) [section 1026.29] states the following regarding the unit of measure:

> "In the United States, the U.S. dollar fulfills the functions of medium of exchange, unit of account, and store of value. It provides the unit of measure for financial accounting. Stating assets and liabilities and changes in them in terms of a common financial denominator is prerequisite to performing the operations — for example, addition and subtraction — necessary to measure financial position and periodic net income."

money. A change in rate means that more or fewer units of one currency can be subsequently exchanged for a unit of another currency. For example, if the spot rate changed from $1 = FC2 to $1 = FC1, it would take $2 to obtain the same FC2 that $1 could have obtained at the old rate. Therefore, rate changes have a direct economic effect on transactions that require exchanges between a particular unit of money (for example, the dollar) and another unit of money.

Unsettled Foreign Currency Transactions

.072 The effect of a rate change on foreign currency held is measurable in dollars. A rate change has a similar effect on an unsettled foreign currency transaction that was entered into before the rate change and involves the future payment or receipt of a fixed number of foreign currency units.

Future Foreign Currency Transactions

.073 Once a rate changes, all subsequent exchanges between the two currencies are effected at the new rate until another rate change occurs. Therefore, a rate change may also affect the future earnings of an enterprise that has foreign currency transactions. For example, the future revenue in dollars of a U.S. company that exports its domestically manufactured product for sale to customers in a foreign country at a price stated in foreign currency may be affected by a rate change. Whether or not the translation process should consider the future effect of a rate change is discussed in paragraphs .096-.111.

FOREIGN STATEMENTS

Unit of Measure

.074 Foreign statements are derived from accounting records that are not kept in dollars. The unit of measure in foreign statements is usually the local currency of the foreign country, but another foreign currency may be chosen as the unit of measure in particular circumstances. Either way, transactions of a foreign operation are not measured in dollars but in another currency. The foreign currency transactions of a foreign operation require the same translation process as foreign currency transactions of a U.S. company.

Copyright © 1975 by Financial Accounting Standards Board

.075 The need to translate foreign statements arises because an enterprise's financial statements cannot be prepared in dollars directly from accounting records kept in a different currency. The major issue raised in translating foreign statements is whether or not the statements should be translated, either for some or all foreign operations, in a manner that changes the unit of measure from the local currency to the dollar. Paragraph .006 states the Board's conclusion on that issue, and paragraphs .083-.095 give the Board's reasoning.

Effect of a Rate Change

.076 Paragraphs .072 and .073 mention the possible effects of a rate change on an enterprise's unsettled foreign currency transactions and future foreign currency transactions. That discussion applies equally to foreign currency transactions of U.S. and foreign operations. A rate change between the local currency of a foreign operation and the dollar may also affect the accounting results measured in dollars of future local currency transactions of that operation. For example, the measurement in dollars of future revenue and expenses of a French company whose transactions are solely in French francs may be affected by a rate change. Paragraphs .096-.111 consider that possible consequence.

Appendix D

BASIS FOR CONCLUSIONS

.077 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others. Some Board members gave greater weight to some factors than to others.

OBJECTIVE OF TRANSLATION

.078 The Board determined that the first step toward conclusions regarding the unique problems of translating foreign currency transactions and foreign statements should be to identify the objective of the translation process.

.079 Letters of comment received, personal views of Board and task force members, and thoughts expressed in various writings on the subject suggested the following objectives which were considered by the Board.

A. To present the financial statements of the enterprise in conformity with the U.S. generally accepted accounting principles that would apply had all assets, liabilities, revenue, and expenses been measured and recorded in dollars.

B. To retain in the enterprise's financial statements the accounting principles that are accepted in the foreign country for assets, liabilities, revenue, and expenses measured and recorded in foreign currency.

C. To have a single unit of measure for financial statements that include translated foreign amounts; that is, not only to express in dollars the assets, liabilities, revenue, or expenses that are measured or denominated in foreign currency, but also to measure them in dollars.

D. To retain as a unit of measure each currency in which assets, liabilities, revenue, and expenses are measured; that is, to express in dollars the assets, liabilities, revenue, and expenses that are measured in foreign currencies but to retain the foreign currencies as units of measure.

E. To produce an exchange gain or loss that is compatible with the expected economic effect of a rate change on business activities conducted in a currency other than dollars.

U.S. or Foreign Accounting Principles (Objective A v. Objective B)

.080 Unless the same accounting principles are generally accepted in both the U.S. and the countries in which foreign operations are located, Objectives A and B are mutually exclusive. The translation process cannot retain both if the principles are different. One view is that the only meaningful foreign statements for translation purposes are those based on accounting principles generally accepted in the foreign country. Thus, if an attribute of an asset is measured on a basis not in conformity with U.S. generally accepted accounting principles, that measurement basis should, nonetheless, be retained in the translation process.

.081 The opposing view is that U.S. generally accepted accounting principles have been developed and are well known. Accordingly, readers of dollar financial statements, although perhaps not cognizant of all the principles used to prepare the statements, generally understand what the statements represent. Therefore, it is inappropriate to combine in an enterprise's financial statements assets and liabilities that are measured by different accounting principles.

.082 After considering the alternatives, the Board concluded that it should require the concept that has been implicitly understood and applied in practice, namely, that all financial statements included in consolidated financial statements should be prepared in conformity with U.S. generally accepted accounting principles. The Board concluded that consistency of accounting procedures and measurement processes between foreign and domestic operations is desirable in the consolidation of foreign and domestic financial statements. Therefore, foreign statements prepared for purposes of combination, consolidation, or equity accounting should be prepared in conformity with U.S. generally accepted accounting principles, and translation should not change the measurement bases used in those foreign statements. The Board, therefore, accepted Objective A and rejected Objective B.

Copyright © 1975 by Financial Accounting Standards Board

Single or Multiple Units of Measure (Objective C v. Objective D)

.083 Objectives C and D are also mutually exclusive because after a rate change the translation process can either retain two or more currencies as units of measure or have a single unit of measure, but it cannot do both. For example, if an asset is acquired either by a foreign operation or a domestic operation for FC100 when the rate is FC1 = $1, its historical cost measured in either foreign currency or dollars can be expressed as $100 in the dollar financial statements. However, if the rate changes to FC1 = $2, the historical cost of the asset would be expressed as $200 (translated at the current rate) in the dollar financial statements to retain the foreign currency as the unit of measure. Expressing the cost as $100 after the rate change measures the historical cost of the asset in dollars, not in foreign currency.

.084 The desire to retain the foreign currency as the unit of measure stems from the belief that the foreign statements represent the most meaningful presentation of a foreign operation and that translation should preserve the relationships in those statements. That view also supports retaining the foreign accounting principles (paragraphs .080-.082) and is related to the view that the historical cost of a foreign asset can be measured only in foreign currency (paragraphs .133-.138).

.085 The unit-of-measure issue focuses principally on the assets and liabilities of foreign operations that are measured at past prices in foreign currency. There is general agreement that cash, receivables, and payables measured or denominated in foreign currency, and assets and liabilities measured at current or future prices in foreign currency are translated at the current rate regardless of which currency is considered the unit of measure.[29]

.086 An important conceptual distinction between the two opposing views involves the way in which the effect of the translation process is recognized. If the dollar is the unit of

---

[29] Proposals to defer recognition of exchange gains and losses on long-term receivables and payables — either by deferring exchange gains and losses resulting from translating the assets and liabilities at the current rate or by translating the items at historical rates until collection or settlement (as, for example, by the current-noncurrent method) — raise issues separate from the unit-of-measure issue and are discussed in paragraphs .172-.194 and .129-.132.

measure, a change in the dollar carrying amounts of assets and liabilities resulting from a rate change affects net income. If, however, the foreign currency is the unit of measure in dollar statements of foreign operations, prior dollar translated statements need to be restated to current equivalent dollars to make them comparable with current translated statements. Restatement does not change the prior periods' statements in any way except to update the amounts to current equivalent dollars and, therefore, does not result in an exchange gain or loss.

.087 The Board considered the purpose of consolidated financial statements under present generally accepted accounting principles in assessing whether the dollar or the foreign currency should be the appropriate unit of measure for foreign statements included in an enterprise's financial statements. *ARB No. 51*, "Consolidated Financial Statements," paragraph 1 [section 2051.02], states:

> The purpose of consolidated statements is to present, primarily for the benefit of the shareholders and creditors of the parent company, the results of operations and the financial position of a parent company and its subsidiaries essentially as if the group were a single company with one or more branches or divisions.

.088 The Board believes that to be consistent with that purpose the translation process should reflect the transactions of the entire group, including foreign operations, as though the transactions were of a single enterprise. For example, when an enterprise purchases an entity, the cost of the investment to the enterprise establishes the cost for the assets acquired for consolidated financial statements regardless of the carrying amounts recorded by the acquired entity. Therefore, even though the acquired entity may have its own recorded cost for an asset, the acquiring enterprise's cost governs in the consolidation process (paragraph .041).

.089 The dollar is usually the unit of measure for financial statements of a U.S. enterprise, and there is no controversy regarding the cost of an asset acquired by a U.S. company in a foreign currency transaction that is settled at the rate in effect at the transaction date. *Cost* is measured in dollars at the transaction date, and that cost does not subsequently change as a result of rate changes. Although advocates of a one-transaction perspective (paragraph .113) have a different view of what constitutes cost if settlement is at a rate

Copyright © 1975 by Financial Accounting Standards Board

different from the one in effect at the transaction date, they nevertheless recognize the dollar as the unit of measure.

.090 Since translated cost in dollars may be affected by the foreign currency chosen, attempting to use a particular foreign currency as the unit of measure for foreign statements included in dollar financial statements creates a practical problem — that of selecting the particular currency to measure the cost of an asset. For example, if an oil tanker is acquired at a price negotiated in Japanese yen and its cost is recorded in financial statements that use the U.S. dollar as the unit of measure, the dollar cost of that asset remains constant regardless of rate changes (paragraph .089). If, however, the cost is measured and recorded in the financial statements of a foreign operation and translation retains the foreign currency as the unit of measure, the cost of the tanker reported in the dollar statements changes with changes in the dollar rate for that foreign currency. That is true regardless of the currency used to acquire the asset or the currency in which revenue from use of the asset will be generated. The tanker could be used to transport oil from the Middle East to France (and other European countries) and the revenue generated thereby might be stated in French francs (or other European currencies). But the historical cost of the asset in the translated dollar financial statements would fluctuate with changes in the dollar rate for, say, the pound sterling if that were the local currency in which the cost of the tanker was originally measured and recorded.

.091 Another example that also illustrates the potential consequences of selecting the local currency of a foreign operation as the unit of measure involves goodwill. If a U.S. enterprise acquires for cash a foreign operation located in Germany at a price in excess of the fair value of the net assets acquired, the difference is recognized as goodwill. If the enterprise acquires the interest directly, the goodwill is measured in dollars and it does not change solely because of a rate change. If, however, the enterprise's Swiss subsidiary acquires the interest with the proceeds of a Eurodollar borrowing or financing from the enterprise and records the investment in the Swiss accounts, the basis for the same goodwill reported in the dollar statements will change with changes in the dollar rate for the Swiss franc even though it does not change in the Swiss accounts. Moreover, the dollar basis of the goodwill will begin a new pattern of changes based on the relation of the new currency to the dollar if the

enterprise's investment in the foreign operation in Germany is shifted from the Swiss subsidiary to, say, a subsidiary in the United Kingdom, even if the shift is for good business or tax reasons. In other words, adopting a foreign currency rather than the dollar as the unit of measure allows the translated dollar cost of an asset to be affected by discretionary selection of the accounting records in which the asset is recorded.

.092 To use more than one unit of measure in a single set of financial statements raises questions about describing the results. If various foreign currencies are used as the units of measure in translated financial statements of foreign operations of an enterprise, aggregating the resulting dollar amounts with each other and with the dollar amounts from domestic operations would produce totals that are neither dollar measures nor measures in any other currency. In the Board's judgment, the notion of a single enterprise that underlies consolidated financial statements requires a single unit of measure.

.093 Since attempting to use a foreign currency as the unit of measure both produces results not in conformity with generally accepted accounting principles and creates conceptual and practical problems, the Board concluded that the dollar, not the local currency of the foreign operation, should be the unit of measure. Thus, the Board rejected Objective D and adopted Objective C.

.094 Objectives A and C, adopted by the Board, are combined in paragraph .006 of this Statement as a single objective of translation. Some respondents to the Exposure Draft criticized that objective as an attempt to account for local and foreign currency transactions of foreign operations as if they were dollar transactions or, to a few respondents, as if they were dollar transactions in the United States. In the Board's judgment, those criticisms are not valid. Neither the objective nor the procedures to accomplish it change the denomination of a transaction or the environment in which it occurs. The procedures adopted by the Board are consistent with the purpose of consolidated financial statements. The foreign currency transactions of an enterprise and the local and foreign currency transactions of its foreign operations are translated and accounted for as transactions of a single enterprise. The denomination of transactions and the location of assets are not changed; however, the separate

Copyright © 1975 by Financial Accounting Standards Board

corporate identities within the consolidated group are ignored. Translation procedures are merely a means of remeasuring in dollars amounts that are denominated or originally measured in foreign currency. That is, the procedures do *not* attempt to simulate what the cost of a foreign plant would have been had it been located in the United States; instead, they recognize the factors that determined the plant's cost in the foreign location and express that cost in dollars.

.095 If translation procedures were capable of changing the denomination of an asset or liability from foreign currency to dollars, no exchange risk would be present. Translation procedures obviously cannot accomplish that, and the procedures adopted in this Statement affirm the existence of an exchange risk in foreign currency transactions and foreign operations and specify accounting for the resulting exchange gains or losses.[30]

Compatibility with Expected Economic Effects of Rate Change (Objective E)

.096 In its deliberations on each of several translation methods, the Board considered the views of respondents to the Discussion Memorandum and Exposure Draft and others who suggested, directly or indirectly, that the translation method should produce an exchange gain or loss that is compatible with the expected economic effects of a rate change. That is, the translation method should produce an exchange gain (or at least avoid producing an exchange loss) if the economic effect of a rate change appears to be beneficial and an exchange loss (or at least not an exchange gain) if the economic effect appears to be detrimental.

.097 In the Board's opinion, that objective cannot be fulfilled without major changes in the present accounting model. The economic compatibility issue is usually raised in the context of a foreign operation with significant assets carried at cost in the foreign statements and significant long-term debt denominated in foreign currency. Methods used or proposed to achieve the compatibility objective fall into one or a combination of three categories: (a) exchange gains and

---

[30] Some arguments supporting translation of all accounts at the current rate raise questions about whether translation can or should result in exchange gains and losses (paragraphs .080-.082, .084-.086, and .133-.138).

losses are recognized by translating both assets carried at cost and long-term liabilities at the current rate, (b) no exchange gains or losses are recognized when exchange rates change on either assets or liabilities by translating both at historical rates,[31] and (c) no exchange gain or loss is recognized on assets translated at historical rates, and the gain or loss computed on the liabilities translated at the current rate is deferred and recognized over later periods by accounting for it (i) as an adjustment of the translated cost of the assets, (ii) as an adjustment of the effective rate of interest on the liability (that is, as a premium or discount), or (iii) as a deferred credit or deferred charge.[32]

.098 All of the proposed methods meet the compatibility objective in the sense that they at least avoid producing an exchange loss if a rate change is one that the proponents deem beneficial and avoid producing an exchange gain if a rate change is one that the proponents deem detrimental. In addition, if assets exceed liabilities, methods that translate both assets and liabilities at the current rate (paragraph .097(a)) produce a gain or loss that is in the right direction according to the proponents of the proposed objective. In the Board's view, however, the result cannot be described as an accurate measure of the beneficial or detrimental effect of a rate change because its computation involves multiplying the unamortized historical cost of assets in foreign currency by the current rate (paragraphs .106, .107, and .147-.149). Further, in the Board's judgment, the proposed methods either conflict with present generally accepted accounting principles or are unacceptable for other reasons. The Board's views that are summarized in this and the preceding paragraph are expanded and illustrated in the following paragraphs.

.099 Under present generally accepted accounting principles, the time for recognizing gains or losses on assets and liabilities depends on their carrying bases. Thus, recognition of gains and losses on assets accounted for at cost is usually deferred until the assets are sold or their costs are otherwise deducted from operating revenue. The translation method adopted by the Board retains that timing for recognition of gains and losses and by so doing amplifies or highlights one

[31] The argument that a rate change can be ignored because it will probably reverse before a debt is paid or a receivable is collected is a different issue which is considered in paragraphs .166 and .192.

[32] The three categories are discussed individually in paragraphs .140-.152, .129-.132, and .172-.194.

Copyright © 1975 by Financial Accounting Standards Board

effect of carrying assets at cost. A simple example illustrates the type of translated result that proponents of the compatibility objective describe as not compatible with the expected economic effect of a rate change.

.100 The balance sheet of a hypothetical foreign operation consists of FC125 in cash, FC100 owed to a local bank, and FC25 of stockholders' equity. The exchange rate is FC1 = $1. Under the translation procedures adopted by the Board, the asset and liability are translated into $125 and $100, respectively. If the rate changes to FC.50 = $1, translation at the new rate gives $250 for the asset and $200 for the liability. The net exchange gain of $25 ($125 gain on the asset less $100 loss on the liability) is almost universally accepted as the result of a valid translation procedure and few, if any, question whether it is a reasonable representation of the economic effect of the rate change.

.101 However, a different pattern of gains and losses results and a difference of opinion arises if, instead of cash or a receivable, the asset held when the rate changes is one that is normally accounted for at its cost or amortized cost. If the foreign operation in the foregoing example spends its cash balance before the rate changes to buy an asset such as inventory, land, or equipment, the cost of the asset acquired is FC125 = $125. Under the procedures adopted by the Board, the translated dollar cost remains at $125 after the rate change. The liability is translated at $200, however, resulting in an exchange loss of $100 for the period of the rate change. Proponents of the compatibility objective hold that it is erroneous to report the $100 exchange loss on the liability when the rate changes because the expected economic effect of the rate change is beneficial by reason of an equal or greater expected eventual gain on the asset.

.102 The eventual gain or loss on the asset is usually recognized when the asset is sold or its translated cost is otherwise deducted from operating revenue (translated at the new rate). Assuming the rate remains stable and the revenue in foreign currency equals cost in foreign currency, the reported gain on the sale is $125 (sales price FC125 x 1/.50 = $250 less cost $125 = $125 gain), the same as the exchange gain in paragraph 100.

.103 Two criticisms of the translation procedures adopted by the Board may confuse discussions of the economic

compatibility issue. The first is that the Board's procedures result in recognizing only the loss on the liability, thereby ignoring the gain on the asset and misstating the profitability of a net foreign investment. However, the example shows that the gain on the asset is often recognized in a later period than the loss on the liability and is often included in gain or loss on sale of the asset (as in the example), reflected in operating income as the difference between operating revenue translated at the new rate and depreciation or amortization translated at the old rate, or otherwise included in income as other than exchange gain or loss.

.104 The second criticism is that the exchange loss on the liability, which is recognized by the Board's procedures, is not really a loss in dollars because the whole series of transactions from borrowing to repayment is in the same foreign currency. However, the difference between the original borrowing (initially translated as $100) and its repayment (equivalent to $200) must be accounted for. To satisfy the debt requires the equivalent of $200 whether dollars or foreign currency are paid. No question arises if a U.S. parent transfers $200 to settle the debt. The substance is the same if the debt is paid with foreign currency received from operations in the foreign country. The cash (FC100) used to pay the debt is translated as $200 at all times between the rate change or the receipt of the cash and immediately before its use to pay the debt. Repayment of the debt requires cash with an equivalent dollar value of $200, and the loss of $100 is undeniable because cash held or received after the rate change cannot reasonably be translated at other than the new rate (FC.50 = $1). The only way to avoid recognizing a loss of $100 is to translate the original borrowing as $200 by restating the earlier financial statements as if the rate had always been FC.50 = $1. However, that is appropriate only if the foreign currency is the unit of measure in the translated statements (paragraphs .083-.086), not if the dollar is the unit of measure.

.105 Since the *incompatible* loss result described in paragraph .101 can be avoided only by anticipating the gain on the asset or by deferring recognition of the loss on the liability, the proposed objective directly conflicts with present generally accepted accounting principles. Under present generally accepted accounting principles, recognition of gains on assets carried at cost must normally await sale (or depreciation or amortization), and those gains may not be anticipated indirectly by deferring otherwise recognizable

 Copyright © 1975 by Financial Accounting Standards Board

losses. In contrast, under present principles, identified losses should be recognized when they occur and should not be deferred as assets or deferred charges, offset against gains on unsold assets, or treated as valuation accounts to unsold assets.[33]

.106 A major obstacle to implementing the compatibility objective is that to determine whether a translation method produces a compatible exchange gain or loss, one must first be able to ascertain the expected future economic effects of a rate change. The proposal seems to rest significantly on a general assumption that a local currency's strengthening is beneficial and its weakening is detrimental. That assumption rests on a further assumption that the relation between rate changes and economic effects is reasonably straightforward — that only the rate changes, while other variables — such as output, sales volume, production costs, and sales prices — remain essentially unaffected. However, determining the expected economic effect of a rate change is more complex than that.

.107 For example, to assess the expected economic effect of a rate change on a foreign operation's investment in plant and equipment, and possibly other long-lived assets, requires a long-term economic forecast in which many interrelated and interacting forces involved in a rate change should be considered. The Board believes it may be difficult or impossible under most circumstances to predict with reasonable certainty the general effects over an extended future period of a rate change. A foreign operation in a country that experiences a major rate change may be affected both directly and indirectly by the adaptations and shifts that occur in that country's economy as a result of the currency adjustment. The nature and effect of those adaptations and modifications depend on a complex relation among factors, such as the relative degree to which general demand for imports and exports responds to changes in the foreign exchange price, the level of income and employment, the rate of economic expansion, monetary and fiscal policies instituted by the country whose currency has either weakened or strengthened, and conditions and forces existing in countries that are major trading partners. Accordingly, a foreign operation may experience complex changes in the

[33] Matters relating to recognizing gains on assets carried at cost or deferring losses on liabilities are discussed further in paragraphs .147-.149 and .172-.194.

local market demand and market price for its goods, changes in its local cost of goods and services procured, and in the local availability and cost of financing. Moreover, not all operations in the same environment will be affected in the same way because of differences in activities and realignments of price and cost structures within the local economy. In addition, a foreign operation's exposure to the effect of a rate change may go beyond its recorded assets and liabilities. A foreign operation's unrecorded exposure to rate changes might include, for example, sales and purchase backlog commitments at fixed foreign currency prices or fixed foreign currency streams of revenue or expense, such as rent payments. The proposed objective could be impractical in many circumstances because of the foresight required to identify the future economic effects of a rate change at the time it occurs.

.108 Finally, the proposed compatibility objective seems to be based on an assumption that it is needed only in translating foreign statements that are to be incorporated in the financial statements of a U.S. enterprise. However, it appears to be a response to the fact that U.S. generally accepted accounting principles require certain assets to be accounted for at cost. The argument for economic compatibility of reported results with expected effects of rate changes could be directed with equal force to reporting foreign currency transactions of a U.S. enterprise or, with minor modification, even to reporting its domestic operations.

.109 For example, a U.S. enterprise serves the needs of important foreign customers by selling them the entire output of a plant located in the United States. The enterprise also owes long-term debt denominated in the foreign currency, and as a result of the dollar's weakening against the foreign currency it incurs an exchange loss. However, the rate change appears to be beneficial to the enterprise because, other things remaining constant, the dollar value of its foreign revenue (and therefore also its dollar net income) should increase. To report a result compatible with that assessment requires recognition of a gain from an upward adjustment of the related plant assets. Further, a rate change involving a weakening dollar has the same effects on expected dollar revenue and expected dollar gross profit as an increased selling price in a U.S. market. Consistent with the compatibility objective, therefore, an increase in the selling

Copyright © 1975 by Financial Accounting Standards Board

price of the output of a U.S. plant that produces for the U.S. market should, other things being equal, result in a reported gain from revaluation of the plant compatible with the expectation of its improved future revenue and profits. That those kinds of gains are not now recognized reflects a characteristic of present generally accepted accounting principles, not a defect in the Board's translation procedures.

.110 Present financial accounting and reporting reflects primarily the effects of past transactions and existing conditions, not future transactions or conditions. Accordingly, assets are generally carried at cost, and related gains are recognized only when assets are sold or the cost is otherwise deducted from revenue. Many have commented on the strengths and weaknesses of the present accounting model, and some have proposed major changes in it. This Statement pertains to translation of foreign currency transactions and foreign currency financial statements, and the Board believes that consideration of fundamental changes in generally accepted accounting principles relating to measurement bases of assets and liabilities is beyond this Statement's scope. The Board does not intend to use translation procedures to effect major changes in the accounting model presently in use.

.111 Since, for the reasons given, the Board chose an objective of translation and a translation procedure that preserve the present accounting model, it rejected proposed Objective E. The Board rejected the view that the objective of compatibility can be implemented by changing translation procedures without considering the implications for underlying concepts and measurements.

FOREIGN CURRENCY TRANSACTIONS

Import or Export of Goods or Services

.112 The Board's conclusions on accounting for foreign currency transactions reflect the view that collection of a receivable or payment of a liability is a transaction separate from the sale or purchase from which the receivable or liability arose. Thus, if an enterprise has foreign currency exchange exposure (*exchange exposure*) on a receivable from a sale or a liability from a purchase requiring settlement in foreign currency, the results, if any, of that exchange exposure should be accounted for separately from sales, cost

of sales, or inventory. A rate change does not affect previously recorded revenue from exports or the cost of imported goods or services.

.113 An alternate view, sometimes referred to as a one-transaction perspective, is that a transaction involving purchase or sale of goods or services with the price stated in foreign currency is incomplete until the amount in dollars necessary to liquidate the related payable or receivable is determined. The initial amount recorded in dollars as cost or revenue is considered to be an estimate until final settlement. According to that view, an exchange gain or loss related to the transaction should be treated as an adjustment of the cost of imports or revenue from exports.

.114 The Board considered and rejected the one-transaction view. Specifically, the Board rejected the idea that the cost of an imported asset or the reported revenue from an export sale is affected by later changes in the related liability or receivable. The exchange exposure in a purchase or sale transaction whose price is denominated in foreign currency stems not from the purchase or sale itself but from a delay in payment or receipt of the equivalent dollars. No exchange gain or loss can occur if, as soon as the price is fixed in foreign currency, the U.S. purchaser immediately buys foreign currency with dollars and pays the foreign seller, or the U.S. seller receives foreign currency from the foreign buyer and immediately converts it into dollars. In other words, exchange gains and losses on import or export transactions result from a combination of a rate change and one of the following: the U.S. buyer owes an amount denominated in foreign currency, or the U.S. seller holds a receivable denominated in foreign currency or holds foreign currency received from a foreign buyer.

.115 The exchange gain or loss that may result from an exchange exposure is the result of an event (a rate change) that is separate from the original purchase or sale transaction. Since an exchange exposure can usually be eliminated, a determination not to avoid exchange exposure should be accounted for by recognizing the gain or loss that results from that decision.

.116 Paragraph .007(a) specifies that the purchase or sale price in foreign currency be translated into dollars at the rate in effect at the transaction date. Since transactions are often

Copyright © 1975 by Financial Accounting Standards Board

preceded by commitments, and exchange exposure may be viewed as beginning at the commitment date if the price is fixed in foreign currency at that time, the dollar basis of the transaction might be established at the commitment date rather than the transaction date. However, a major obstacle to choosing the commitment date is the fact that, although certain commitments are often disclosed, rarely are commitments recorded under present generally accepted accounting principles. Losses on *firm* commitments are recorded [34] but not the commitments themselves. The Board believes that recognizing exchange gains and losses on a commitment date basis would be both impracticable and inconsistent with the timing of recognizing the underlying transaction in the financial statements.

.117 A commitment date basis could present implementation problems because various degrees of commitment are possible before consummation of a business transaction. For example, a noncancelable sales contract negotiated in a foreign currency might be considered by some as a reasonable basis on which to recognize an exchange gain or loss. However, a firm commitment to provide goods or services might require a commitment by the seller to purchase goods or services in foreign currency to fulfill his obligation. Both commitments would need to be considered to reflect exchange gains and losses properly on a commitment date basis, but the purchase obligations might not necessarily be in the form of fixed contractual commitments. Moreover, since commitments are not now recorded, measuring exchange gains and losses from a commitment date would require ascertaining the commitment date on each individual transaction. An importer or exporter with relatively few individual transactions might manage that, but it would be burdensome, if not impossible, for one with numerous foreign currency transactions or for a foreign operation to separate transactions with commitments from those without commitments and maintain a record of commitment dates, prices, and applicable exchange rates.

.118 The problem of inconsistency in using the commitment date under present generally accepted accounting principles is illustrated by a long-term supply contract for raw materials

[34] *ARB No. 43,* Chapter 4, Statement 10 [section 5121.17] reads: "Accrued net losses on firm purchase commitments for goods for inventory, measured in the same way as are inventory losses, should, if material, be recognized in the accounts."

under which both the purchaser and the seller now recognize cost and revenue, respectively, in their financial statements on a performance basis. Since that kind of agreement might be considered a commitment, an enterprise that is party to a five-year supply contract requiring payments in a foreign currency may conceivably have a significant exchange gain or loss if the total future payments are considered on a commitment basis. Since the supplier recognizes revenue and operating profit over the life of the contract, for him to recognize as current gain or loss the expected effect of a rate change on future income would be inconsistent with the timing of recognition of the operating income from the contract. Likewise, an enterprise that must pay foreign currency for its raw materials could also have a significant exchange gain or loss, but its immediate recognition (except to the extent of "accrued net losses on firm purchase commitments"[35]) would be inappropriate for similar reasons.

Foreign Borrowing or Lending

.119 The Board's conclusions on accounting for foreign currency transactions involving the borrowing or lending of foreign currency reflect the view that the effect of a rate change on the repayment or collection of a loan should be accounted for separately from the original borrowing or lending transaction. An alternate treatment considered by the Board is based on a one-transaction perspective similar to that described in paragraph .113: that an exchange gain or loss related to a loan payable denominated in foreign currency is an adjustment of the cost of assets purchased with the borrowed funds. The Board's reasoning in rejecting a one-transaction perspective for borrowing foreign currency is similar to that stated in paragraphs .114 and .115.

.120 Another possibility in accounting for borrowing or lending of foreign currency is to treat a related exchange gain or loss as an adjustment of the cost of borrowing or the return from lending. Following that concept, an enterprise ideally would adjust the cost or return from funds borrowed or loaned by using the interest method to amortize expected exchange gains or losses on principal and interest over the life of the debt or receivable. Since at the date of lending or borrowing it is impossible to predict the rates that will prevail

---

[35] *ARB No. 43,* Chapter 4, Statement 10 [section 5121.17].

 Copyright © 1975 by Financial Accounting Standards Board

during the life of the loan, prospective (and partially retroactive) methods have been suggested to amortize the exchange gain or loss. The Board rejected those methods for the reasons stated in paragraphs .164, .181, and .182.

FOREIGN STATEMENTS

.121 Paragraphs .123-.139 compare four normative methods for translating assets and liabilities measured in foreign currency against the objective of translation adopted by the Board (a situational approach to the application of those methods is discussed in paragraphs .140-.152). The principal distinction among various normative methods of translation is the requirement to translate particular classifications of assets and liabilities at either the current or historical rate.

a) The temporal method translates cash, receivables and payables, and assets and liabilities carried at present or future prices at the current rate and assets and liabilities carried at past prices at applicable historical rates.

b) The monetary-nonmonetary method generally translates monetary assets and liabilities at the current rate and nonmonetary assets and liabilities at applicable historical rates. For translation purposes, assets and liabilities are monetary if they are expressed in terms of a fixed number of foreign currency units. All other balance sheet items are classified as nonmonetary.

c) The current-noncurrent method generally translates current assets and liabilities at the current rate and noncurrent assets and liabilities at applicable historical rates.

d) The current rate method translates all assets and liabilities at the current rate.

.122 The objective of translation requires that the assets, liabilities, revenue, and expenses in foreign statements be translated and accounted for in the same manner as assets, liabilities, revenue, and expenses that result from foreign currency transactions of the enterprise (paragraph .009). Since foreign statements are prepared in conformity with U.S. generally accepted accounting principles before translation, the objective is generally achieved by (a) translating cash,

receivables, and payables at the current rate and (b) translating other assets and liabilities in a way that retains the accounting principles used to measure them in the foreign statements. The Board adopted intact none of the four normative methods considered but found the temporal method, proposed by *ARS No. 12* (see footnote 20), the most useful in meeting the objective.

Temporal Method

.123 The temporal method generally translates assets and liabilities carried at past, current, or future prices expressed in foreign currency in a manner that retains the accounting principles used to measure them in the foreign statements. That is, the measurement bases of the assets and liabilities measured are the same after translation as before. Thus, the temporal method changes a measurement in foreign currency into a measurement in dollars without changing the basis of the measurement and thereby achieves one of the objectives of translation, which is to retain the measurement bases of foreign statement items (paragraph .082). The temporal method can also accommodate any basis of measurement — for example, historical cost, current replacement price, or current selling price — that is based on exchange prices.

.124 The translation procedures to apply the temporal method are generally the same as those now used by many U.S. enterprises under the monetary-nonmonetary method. The results of the temporal method and the monetary-nonmonetary method now coincide because under present generally accepted accounting principles monetary assets and liabilities are usually measured at amounts that pertain to the balance sheet date and nonmonetary assets and liabilities are usually measured at prices in effect when the assets or liabilities were acquired or incurred. The monetary-nonmonetary classification itself contains nothing to preserve the measurement bases and timing of revenue and expense recognition that are in the foreign statements (paragraphs .126 and .127). Rather, the coincidence of results between the monetary-nonmonetary method and the temporal method is due solely to the nature of present generally accepted accounting principles — assets and liabilities are measured on bases that happen to coincide with their classifications as monetary and nonmonetary. The results of the temporal method and the monetary-nonmonetary method would differ significantly under

Copyright © 1975 by Financial Accounting Standards Board

other accounting principles that, for example, required nonmonetary assets and liabilities to be measured at prices in effect at dates other than those at which they were acquired or incurred. Since the temporal method retains the measurement bases of the foreign statements equally as well under all accounting methods based on exchange prices as it does under historical cost accounting, the Board believes that it is the more generally valid method for achieving the objective of translation. It provides a conceptual basis for the procedures that are now used to apply the monetary-nonmonetary method.

.125 The same point as in the preceding paragraph also applies to the current-noncurrent method. Some of the translation procedures under that method are the same as under the temporal method, but the major exceptions include translation of current assets carried at cost (inventory and prepaid expenses) and noncurrent liabilities and receivables. The current-noncurrent classification itself contains nothing to preserve accounting principles after translation (paragraph .129), but under present generally accepted accounting principles the measurement bases of many assets and liabilities happen to coincide with their classification as current or noncurrent. The major exceptions — inventory and long-term debt — show the deficiencies of the method when the measurement bases and the classifications do not coincide. As long as most foreign currencies weakened against the dollar, as they usually did from the time of the original writing of Chapter 12 of *ARB No. 43* [section 1081] until about 1969, translating inventory at the current rate and long-term debt at historical rates under the current-noncurrent method probably produced conservative results. Inventory was stated lower in dollars than if translated at historical rates (though not necessarily at the lower of cost or market as described in paragraphs .046-.049), and exchange gains (not losses) on long-term debt were deferred until the time of settlement or classification as a current liability. Once the dollar began to weaken against foreign currencies, however, that translation method lost its conservative appeal because it produced the opposite results.

Monetary-Nonmonetary Method

.126 The monetary-nonmonetary method produces acceptable results under present generally accepted accounting principles (paragraph.124), but no comprehensive

principle of translation can be derived solely from the monetary-nonmonetary distinction. Nonmonetary assets and liabilities are measured on different bases (for example, past prices or current prices) under different circumstances, and translation at a past rate does not always fit. Translating nonmonetary items at a past rate produces reasonable results if the items are stated at historical cost but not if they are stated at current market price in foreign currency.

.127 For example, if a foreign operation purchases as an investment 100 shares of another company's common stock (a nonmonetary item) for FC1,000 when the rate is FC1 = $1, the cost of that investment is equivalent to $1,000. If the investment is carried at cost by the foreign operation, treating the investment as a nonmonetary item and translating it at the historical rate is appropriate. However, if the investment is carried at market price, translating that basis by the historical rate usually produces questionable results. For example, if the current market value of the investment is FC1,500 and the current rate is FC1 = $1.25, translating FC1,500 into $1,500 using the historical rate does not result in the current market value measured in dollars (FC1,500 x 1.25 = $1,875) or the historical cost in dollars. The monetary-nonmonetary method can produce the $1,875 current market value only if it is recognized that, under the method, the current rate is the applicable historical rate for nonmonetary assets carried at current prices. The point has been confusing enough to cause some proponents of the monetary-nonmonetary method to argue that nonmonetary assets, such as investments and inventories, become monetary assets if they are carried at market price.

.128 Although the deficiencies of the monetary-nonmonetary method have been recognized and dealt with in practice, the Board found the monetary-nonmonetary method concept inadequate as a comprehensive method of translation.

Current-Noncurrent Method

.129 Existing definitions of current and noncurrent assets and liabilities contain nothing to explain why that classification scheme should determine the rate used to translate. The attributes of assets and liabilities that are measured in financial statements differ from their characteristics that determine their classification as current or noncurrent. Consequently, different kinds of assets or

Copyright © 1975 by Financial Accounting Standards Board

liabilities may be measured the same way but classified differently or classified the same way but measured differently. For example, under present generally accepted accounting principles both inventory and plant and equipment are measured at historical cost, but inventory is classified as a current asset and plant and equipment as noncurrent assets. Since translation is concerned with measurement and not with classification, the characteristics of assets and liabilities that determine their classification for purposes of disclosure are not relevant for selecting the rate for translation. The weaknesses of the method are most pronounced in translating inventory and long-term debt.

.130 Under the current-noncurrent method, inventory carried at historical cost in foreign statements is generally translated at the current rate. As indicated in paragraph .134, that translation results in a measure in dollars that departs from historical-cost-based accounting. Later changes in market prices or rates cannot change the historical cost of an asset already owned. Once recorded, the historical cost of an asset can be amortized or otherwise included in expense in accounting records but cannot be changed because of varying prices without changing the basis of accounting from historical cost to something else. (Paragraphs .153-.158 give additional reasons for the Board's rejection of the current rate to translate inventory carried at cost.)

.131 Measured in local currency, long-term debt denominated in local currency and a related unamortized discount or premium (determined by the interest method) together represent the present value of future interest and principal payments based on the effective rate of interest at the date the debt was incurred. Translating long-term debt and a related discount or premium at the historical rate after a rate change, as required by the current-noncurrent method, does not retain that measurement basis. Translation at the historical rate produces a result that is unrelated to the current dollar equivalent of the present value of the remaining interest and principal payments based on the effective rate of interest at the date the debt was incurred. Furthermore, unless the rate change reverses before the debt is settled, translation at the historical rate merely delays recognition of the exchange gain or loss — it does not avoid the gain or loss. (Paragraph .164 gives additional reasons for translating long-term debt at the current rate.)

.132 For the reasons set forth in paragraphs .129-.131, the Board rejected the current-noncurrent method.

Current Rate Method

.133 The current rate method is, of the four normative methods discussed, the most significant departure from present practice. The arguments for the current rate method discussed in this section are related to those for using the foreign currency as the unit of measure (paragraphs .083-.093). The current rate is used under the situational approach, discussed in the next section, but the underlying concept there is different.

.134 The Board believes that a foreign operation's assets and liabilities should be measured in the foreign statements in conformity with U.S. generally accepted accounting principles applicable to the reporting enterprise and that those principles should be retained in the translation process (paragraphs .082 and .122). If assets and liabilities that are measured at past prices in foreign statements are translated at the current rate and included in dollar financial statements, the dollar financial statements depart from historical-cost-based accounting because inventory, property, plant, equipment, and other assets normally carried at cost are reflected at varying dollar amounts resulting from changes in rates. The dollar amounts do not, except by coincidence, represent reasonable measures of replacement cost or selling price and would be unacceptable under present U.S. generally accepted accounting principles even if they did.

.135 A contrary view expressed is that the historical cost of an asset acquired by a foreign operation can be measured only in the foreign currency and that the asset has no historical cost in dollars. According to that view, translating the foreign currency historical cost of an asset into a fewer or greater number of dollars following a rate change is simply the result of an *absolute, mathematical revision in the rate* and thus does not represent a departure from the historical-cost principle of accounting; the foreign currency cost is the only historical cost, and that cost has not changed.

.136 Some advocates of the view described in paragraph .135 believe that the results of the *absolute, mathematical revision* is an exchange gain or loss and others do not. Those who support the foreign currency as the unit of measure would restate prior financial statements because of the rate change

 Copyright © 1975 by Financial Accounting Standards Board

and, therefore, would report no exchange gain or loss. Those who support the dollar as the unit of measure would report an exchange gain or loss as a result of a rate change. The Board believes that latter approach is inconsistent with the view that there can be no dollar measure of the historical cost.

.137 The Board believes that although an asset's acquisition price may have been stated in a particular currency, its equivalent cost in another currency can be approximated by multiplying the stated currency price by the rate in effect at the date of acquisition. Just as the length of an object can be measured in inches and then remeasured in centimeters by applying the appropriate conversion rate, the *cost* of an asset can likewise be measured in various units of measure (different currencies) by applying the appropriate translation rates.

.138 Assets in foreign countries can be purchased indirectly for dollars by acquiring the necessary foreign currency in a foreign exchange market. The situation is not fundamentally different if the foreign currency is acquired before the purchase; the dollar cost of the purchase is known through the measurement conversion process (paragraph .137). Or, viewed another way, spending foreign currency to buy an asset means that the currency cannot be converted into dollars for remission to a U.S. parent. The dollars not received in conversion because the foreign currency was used to buy an asset — the dollars foregone — are the cost of the asset acquired in the most literal sense of the word *cost.*

.139 Accordingly, the Board rejected the view that historical cost can be measured only in the foreign currency. It also rejected use of the current rate method based on that premise for the reason stated in paragraph .134 as well.

A Situational Approach to Translation

.140 Paragraphs .123-.139 compared the four basic normative methods for translating balance sheet accounts against the objectives of translation adopted by the Board. Another, somewhat different, approach to translation has also been suggested, which is not a normative method but looks instead at the nature of each foreign operation. It distinguishes between foreign operations that are extensions of affiliated

domestic operations (*dependent* operations [36]) and those whose operations are essentially self-contained and, therefore, not dependent on affiliated domestic operations (*independent* operations [36]). The situational argument is that since many factors influence the creation of a foreign operation, translation must look further than the location of a business operation; it should also look at its nature.

.141 According to that view, if a foreign operation depends on domestic operations, the foreign operation should be accounted for as an extension of those domestic operations (that is, as part of a single domestic operation) and its foreign statements should be translated by one of the normative methods other than the current rate method. If a foreign operation is independent, its foreign statements should be translated by the current rate method.

.142 A principal reason given to support using the current rate method to translate independent foreign operations is that the assets and liabilities of those operations are not individually at risk to rate changes; rather, the entire business is at risk. Since the foreign activities are conducted entirely in a foreign environment and future cash flows will be in a foreign currency, future operating results can be expressed in a meaningful way in dollars only if all revenue and costs (including those carried forward from a period before the rate change) are translated at the current rate. From the enterprise's viewpoint, its net investment in the foreign operation represents its total exposure to a rate change. Only by translating the net assets of the foreign operation at the current rate can the effect of rate changes be properly measured.

.143 The situational approach involves both practical and conceptual problems, including the difficulty of finding or developing criteria or conditions to distinguish *independent* and *dependent* foreign operations. Proponents of the situational approach have explained the distinctions only broadly and have not given specific criteria. A few circumstances have been suggested or implied as indicating independence, such as regulation of the foreign operation by local authorities or a minimum of intercompany sale and borrowing transactions between the foreign operation and its parent or other domestic affiliates.

---

[36] The terms *dependent* and *independent* were used by Parkinson (see footnote 20) and are used in the same context here.

Copyright © 1975 by Financial Accounting Standards Board

.144 The Board considered criteria for independence of foreign operations but was unable to develop criteria that it believed to be satisfactory to identify an independent foreign operation. At least part of the difficulty lies in the inherently contradictory concept of an independent subsidiary, which seems to deny the single enterprise concept that underlies consolidated financial statements (*ARB No. 51*, paragraph 1 [section 2051.02]). If foreign operations are as independent of their U. S. parent companies as some proponents of the situational approach seem to argue, the validity of consolidating them is questionable. Further, since many domestic subsidiaries may also have the characteristics of independent operations, however *independence* is defined, the distinction has implications that reach beyond translation of foreign statements.

.145 Certain respondents to the Discussion Memorandum and Exposure Draft, recognizing the purpose of consolidated financial statements as set forth in paragraph .087, recommended that if the current rate method were deemed appropriate for certain foreign operations for the reasons set forth in paragraph .142, those operations should be accounted for under the equity method rather than line-by-line consolidation. The Board believes that the situational approach raises broad questions about concepts of consolidation and the equity method applicable to domestic as well as foreign operations that are beyond the scope of this Statement.

.146 Even if criteria could be developed, there are apt to be problems in applying any set of criteria to determine independence, including whether foreign operations should be viewed on the basis of country-by-country, foreign - operation - by - foreign - operation, or segment - by - segment of each foreign operation. In addition, changes in classification (from dependent to independent or vice versa) between reporting periods, presumably necessitating the use of different translation methods for each period, could produce results that would not be comparable with those of prior periods. It is also unclear how to translate the financial statements of a foreign operation that is independent of its parent but dependent on another foreign economy (for example, a foreign operation that manufactures its product in various European countries and sells its product to an unaffiliated or affiliated South American operation).

.147 The situational approach is a way of looking at the exchange exposure of foreign operations that are considered independent, and the effect of a rate change on the net investment is a gain or loss to be included in income of some accounting period. Proponents of the approach believe that the results are erroneous if exchange gains and losses on liabilities are recognized earlier than exchange gains and losses on assets, especially since the latter are not identified in operating results as exchange gains and losses (paragraphs .100-.102 contain an example). They argue that a foreign operation involves risk of rate changes in addition to the other risks involved in every business operation, and translation procedures should measure the effects of exchange risk. They argue further that since gains and losses can only be measured through valuations, translation must involve valuation at the current exchange rate — the effect of exchange risk is measured by valuing *all* assets and liabilities before and after movements in the rate. Or stated in another way, a net investment is an integrated whole on which the effect of a rate change can best be determined by multiplying the investment by the change in rate. According to that view, all independent foreign operations in a country whose currency weakens should be worth less (the net investment multiplied by the decline in rate gives an exchange loss) and, conversely, independent foreign operations in a country whose currency strengthens should be worth more.

.148 However, translation is a poor valuation process for assets carried in financial statements at cost because it relies on prices in a single market. It reflects only the exchange price between dollars and a single foreign currency and does not adequately reflect prices in other markets in which a foreign operation could buy or sell those assets. Thus, multiplying the historical foreign currency cost of an asset by the current rate cannot, except by coincidence, measure the value of the asset. For example, an enterprise in England acquired land in 1964 at a cost of 1,000,000 pounds sterling when the rate was £1=$2.80; the dollar equivalent historical cost was, therefore, $2,800,000. If the land being carried at cost in the foreign statements at December 31, 1974 is multiplied by the current rate £1=$2.35, the product will be $2,350,000. However, the current dollar equivalent of the value of that land may be more or less than $2,350,000 and depends on prices not included in either historical-cost-based financial statements or exchange rates. In other words,

 Copyright © 1975 by Financial Accounting Standards Board

translation procedures cannot measure the dollar value of a foreign investment that is subject to exchange risk unless the current value of the investment is included in the foreign statements.

.149 Some respondents to the Exposure Draft interpreted the Board's emphasis on a translation method that preserves the measurement bases of assets and liabilities in foreign statements as a denial that translation at the current rate involves valuation. On the contrary, the Board recognizes that accounting for certain assets and liabilities (for example, inventory or investments carried at market price, obligations for pensions and warranties) involves estimates and valuation in the foreign statements and that translating those items at the current rate after a rate change introduces an additional value change in dollars. Foreign currency and receivables and payables denominated in foreign currency are stated in a fixed number of foreign currency units regardless of rate changes, and their foreign currency measures do not change when the rate changes. However, their dollar measurements change solely as a result of a rate change; that value change, which does not exist in the foreign statements, is the exchange gain or loss. The Board believes that all of the value changes in dollars described in this paragraph are the valid result of remeasuring foreign statements in dollars. What the Board did reject, for reasons given in the preceding paragraph, was translation at the current rate of items carried at cost in the foreign statements. In the Board's view, that procedure is not a valid valuation process and, further, it is unacceptable under the historical-cost-basis of accounting required by current generally accepted accounting principles.

.150 The key distinction in the situational approach to translation is between independent and dependent foreign operations, and the difference can result in significantly different accounting. Thus, if the purchase of land in the example in paragraph .148 was financed by locally incurred long-term debt due on December 31, 1974, the $2,350,000 equivalent of the payment to liquidate the debt is $450,000 less than the $2,800,000 equivalent proceeds of borrowing. If the foreign operation is considered to be independent by the advocates of the situational approach, both the land and the debt are translated at the current rate, and no exchange gain or loss is recognized when the rate changes because the amount of the debt equals the carrying basis (cost) of the asset, leaving no net investment subject to exchange risk. If,

however, the foreign operation is assumed to be dependent on its parent, advocates of the situational approach agree that the $450,000 should be recognized as gain on the debt in determining net income over the 10-year period (although they may disagree on the timing of recognition) and that no exchange loss because of the weakening of the pound sterling should be recognized on the land, which is translated at the historical rate.

.151 The Board can see no reason to base the calculation and recognition of exchange gains and losses solely on the dependence or independence of foreign operations. If the argument is sound that the net investment, rather than individual assets and liabilities, is subject to exchange exposure, it is as sound for dependent as for independent foreign operations. To hold that an independent foreign operation is fundamentally different from a dependent operation raises questions about the propriety of consolidation for independent operations that, as already noted, are beyond the scope of this Statement (paragraph .144). In summary, the Board recognized that foreign operations may be structured differently but could find no persuasive reasons to translate their financial statements differently for purposes of consolidation or combination with financial statements of a U.S. reporting enterprise.

.152 A modification of the situational approach to translation is the suggestion that to apply the current rate method to foreign operations located in highly inflationary economies (for example, some South American countries), the foreign statements first should be restated in terms of units of the general purchasing power of the local currency and then translated at the current rate because to do otherwise could produce unreasonable results in dollars. The Board believes that, even without the problem of identifying *highly inflationary* economies, restating part but not all of an enterprise's financial statements in units of general purchasing power mixes the units of measure used in the financial statements and results in an aggregation of numbers that cannot be meaningfully described except in terms of the procedures followed to obtain them. That is, adding units of general purchasing power (the unit of measure used in the restated foreign statements) translated at the current rate and units of money (the unit of measure used in conventional statements) produces a total that represents neither aggregate units of money nor aggregate units of general purchasing

Copyright © 1975 by Financial Accounting Standards Board

power. Moreover, to restate in units of general purchasing power only foreign statements in currencies that weaken against the dollar is to introduce a bias into the translated statements. According to its advocates, translation under the situational approach of all assets and liabilities at the current rate results in exchange losses on investments in countries with weakening currencies and exchange gains on investments in countries with strengthening currencies (paragraph .147). The proposed linking of translation at current rate and restatement in units of general purchasing power of foreign statements has the effect of reducing the exchange losses that normally result from translating net investments in countries with weakening currencies at the current rate while at the same time leaving undiminished the exchange gains that normally result from translating net investments in countries with strengthening currencies at the current rate.

Translation of Inventory

.153 Numerous respondents to the Discussion Memorandum and Exposure Draft recommended that inventory carried at cost be translated at the current rate. Many of those recommendations were from supporters of the current rate or current-noncurrent methods. The Board rejected those methods for reasons given in paragraphs .129-.139. Others argued or implied that inventory should be considered a monetary asset because it is but one step removed from accounts receivable and will soon bring cash into the enterprise. That view is rejected not only because inventory is a nonmonetary asset (paragraph .127) but also because the monetary-nonmonetary distinction is not an appropriate criterion in this Statement for choosing the applicable rate.

.154 Several respondents who generally supported the monetary-nonmonetary or temporal methods recommended that inventory carried at cost — other than on a last in, first out (LIFO) basis — should be translated at the current rate. (Some respondents would apply the current rate to LIFO inventory.) The reasons they gave for that major exception to methods they otherwise supported was the need to reflect economic reality or the impracticality of applying historical rates to inventories.

.155 Certain advocates of the exception described in the preceding paragraph argued that translating inventory at historical rates distorts the dollar gross profit during an

inventory turnover period after a rate change. Related arguments given for reflecting economic reality by using the current rate were that inventory is exposed to exchange risk the same as a receivable and that deducting cost of goods sold translated at historical rates from operating revenue translated at the current rate produces *inventory profits* or *paper profits* if the foreign currency strengthens.

.156 Translating inventory carried at cost at the current rate departs from historical-cost-based accounting (paragraph .134). A desire to approximate replacement cost of inventory may underlie some arguments for using the current rate, which are similar to those used to support replacement cost methods. However, even if the use of replacement cost were presently acceptable in principle, translating inventory cost in foreign currency at the current rate does not, except by coincidence, give a reasonable approximation of replacement cost for reasons given in paragraph .148. Nor does that translation method measure the exposure of inventory to rate changes because the basis of the exposure risk is unrecorded. The exchange exposure of inventory depends on its future selling price, not on its cost.

.157 Applying historical rates to inventory may result in a dollar gross profit on sales immediately after a rate change that differs from the dollar gross profit both on sales before the rate change and on sales after the inventory turnover period following the rate change. The Board believes that is the expected result of using the dollar as the unit of measure in concert with generally accepted accounting principles. That is, when selling prices change, matching historical cost of inventory with sales affects gross profit both in dollar statements of the parent company and in translated statements of foreign operations. For example, gross profit increases in the parent's statements if cost of inventory is deducted from sales after a selling price increase, resulting in so-called *inventory profits* from inflation. In other words, the phenomenon criticized is a feature of historical cost accounting; translation of inventory at historical rates does not introduce that feature.

.158 The Board rejected in principle the proposal to translate inventory at the current rate for the reasons given in the preceding paragraphs. However, the Board recognized the practical aspects of applying historical rates to detailed inventory records and provided for the use of averages and

 Copyright © 1975 by Financial Accounting Standards Board

other reasonable approximations as long as the result is not materially different from the result of following the standards of this Statement (paragraph .029). Translating all or part of an inventory at the current rate may under certain circumstances give a reasonable approximation of translation at historical rates.

Translation of Revenue and Expense Accounts

.159 The Board believes that the transaction method, rather than the closing rate method, should be used to translate revenue and expense accounts because it satisfies an objective of translation adopted by the Board, namely, to measure all transactions in a single unit of measure (dollars).

.160 The closing rate method, in contrast, is linked to the view that the foreign currency should be retained as the unit of measure, requiring at least two units of measure in an enterprise's financial statements. Translating revenue and expenses at the closing rate retains the foreign currency as the unit of measure for transactions occurring during the year (including those previously reported for interim periods). If the rate changes, dollar translations of prior local currency transactions during the current year are restated (updated) to reflect the new dollar equivalents of the transactions, and no exchange gain or loss on the current year's transactions is separately recognized. Since the Board believes that the dollar, rather than the foreign currency, should be the unit of measure in translated statements, it rejected the closing rate method.

EXCHANGE GAINS AND LOSSES

Foreign Currency Transactions

.161 The Board concluded that an exchange gain or loss shall be recorded when a rate change occurs because (a) when the rate changes, certain assets and liabilities should be adjusted to reflect the new rate (paragraph .007(b)), (b) the resulting gain or loss is not an adjustment of the cost of an asset acquired in a foreign purchase or of the revenue recorded in a foreign sale (that is, the Board rejected the so-called *one-transaction* view), and (c) other methods of deferring recognition of the gain or loss are also unacceptable (paragraphs .163-.166).

.162 The Board also concluded that the accounting treatment specified in paragraph .017 offers more practical implementation than does a one-transaction view. Current recognition of an exchange gain or loss does not require, as does the one-transaction view, the tracing of exchange gains or losses on foreign currency payables or receivables to related assets, revenue, or expenses. Another implementation problem under the one-transaction view is that a purchase or sale of goods or services may take place in one accounting period and an exchange gain or loss on the related payable or receivable may occur in a subsequent period.

.163 Other alternative answers considered and rejected were (1) to record an exchange gain or loss when payables or receivables are settled, (2) to record an exchange gain or loss when the rate changes more than a specified percentage from the rate previously used, and (3) to record no gain or loss if the rate change is likely to reverse.

.164 The Board views an enterprise that holds foreign currency or has a receivable or a payable denominated in foreign currency as being in a special situation, namely, the enterprise is subject to a gain or loss solely as a result of a rate change. Accordingly, when the rate changes, an exchange gain or loss resulting from the adjustment of accounts denominated in foreign currency should be immediately included in the determination of net income to report properly the results of that situation at the time it occurs. Financial statement users are thus informed of the results of a rate change in the period of change rather than at conversion or settlement in a later period, which may be several years after the rate change for certain receivables and payables. Methods that involve amortizing exchange gains or losses also fail to recognize the effect of a rate change in the period of occurrence and are, therefore, also rejected (paragraphs .173-.182).

.165 The Board considered and rejected the possibility of recording exchange gains and losses only if the rate changes more than a specified percentage. The allowable percentage range chosen, within which rates might fluctuate without affecting the financial statements, would of necessity be arbitrary. A more serious weakness in the proposal is that, since even a relatively minor change in rate can sometimes have a material impact on the financial statements, depending on the size of an enterprise's exposed position in the foreign

Copyright © 1975 by Financial Accounting Standards Board

currency, the method may ignore material effects of rate changes. Therefore, the Board concluded that the rate at the balance sheet date should be used.

.166 The Board also considered and rejected the view that an exchange gain or loss should be deferred if the rate change that caused it is likely to reverse. The argument is that to recognize gains and losses from all rate changes in determining net income creates needless fluctuations in reported income by reporting exchange gains and losses that are cancelled by reversals of rate changes. The Board rejected the underlying argument and its implication for accounting (paragraphs .196-.199). The proposal is also incapable of practical application. First, it requires distinguishing rate changes that will reverse from those that will not. Second, it requires predicting the changes in an enterprise's exposure to rate changes between the time of a rate change and the time of its reversal. And third, it requires an arbitrary time limit to prevent rate changes from being ignored indefinitely. The proposal contains no objective basis for accounting measurement.

Foreign Statements

.167 In concept, exchange gains or losses from translating foreign statements are the direct effects, measured in dollars on existing assets and liabilities at the dates rates change, that are attributable solely to rate changes between the foreign currency and the dollar.

.168 In practice, however, the exchange gain or loss is usually determined at the close of a period by translating both the ending balance sheet and income statement accounts at the rates required by the translation method (that is, current or historical rates for assets and liabilities and weighted average rate for most revenue and expenses). When the translation is completed and the net income less dividends in dollars is added to the beginning dollar balance of retained earnings, the sum of those amounts will usually not equal the ending dollar retained earnings shown in the translated balance sheet. The difference is the exchange gain or loss from translating foreign statements.

.169 Applying the translation procedures for foreign statements (paragraphs .011-.014) results in an appropriate measure in dollars of the net income of a foreign operation consistent with the objective of translation. However, the

method in practice of calculating the exchange gain or loss from translating foreign statements, as described in paragraph .168, may sometimes include in exchange gains or losses other gains or losses from market price changes. For example, an enterprise that uses the dollar as its unit of measure acquires securities that it accounts for at current market price, and those securities' prices are stated in foreign currency. Since the cost of the securities acquired and subsequent changes in market price are recorded in dollars (not in foreign currency), following the procedures required by paragraphs .007(a) and .007(c), the accounting does not produce *exchange gains and losses* as described in paragraph .016. In the Board's view, it is unnecessary in measuring and recording transactions and events in dollars to distinguish between the effect of changes in the foreign market price of a security and changes in the market price of the foreign currency itself, even if that distinction can be made. To meet the objective of translation (paragraph .009), the same result should be obtained in translating similar securities presented in foreign statements. However, the averaging and approximations permitted by this Statement can result in exchange gains and losses that include gains and losses properly attributable to other revenue and expense accounts. The procedures that would be required to segregate those *other* gains and losses from exchange gains and losses for purposes of this Statement's disclosure requirements (paragraph .032) may not be practical. The Board accepted as reasonable the results determined by applying the requirements of paragraphs .011-.014 by the procedures described in paragraph .168.

.170 Some respondents to the Exposure Draft suggested that certain enterprises that carry investments in securities at current market price but do not include unrealized gains or losses on those investments *in the determination of net income* should be exempt from the requirement of paragraph .017 to include in the determination of net income *exchange* gains and losses relating to those investments.

.171 The Board concluded that if unrealized appreciation or depreciation on investments is measured in dollars, the translation procedures required by this Statement do not produce exchange gains or losses that pertain thereto. Accordingly, the Board concluded that *exemption* for those enterprises was not necessary.

Copyright © 1975 by Financial Accounting Standards Board

.172 The Board considered the following possible methods to account for exchange gains or losses in arriving at its conclusion stated in paragraph .017:

a) Adjust cost of, or amortize over life of, assets carried at cost in dollars (assets translated at historical rates);

b) Amortize over remaining term of long-term liabilities;

c) Adjust stockholders' equity;

d) Defer based on certain criteria;

e) Include immediately in the determination of net income.

Adjustment Related to Assets Carried at Cost

.173 One view to support accounting for exchange gains and losses as adjustments of the cost basis of assets is that the cost of an asset equals the total sacrifice required to discharge all related liabilities. Accordingly, if a foreign operation has an exposed net liability position at the time of a rate change, the exchange gain or loss is an element of the cost of the related assets. That view is similar to a one-transaction perspective and is rejected for reasons similar to those in paragraphs .114 and .115.

.174 Another view is that an exchange loss that results from the combination of the strengthening of a foreign currency and an exposed net liability position is considered *covered*, in whole or in part, by assets carried at cost in foreign currency. *Cover* is the amount by which the foreign currency cost of those assets translated at the current rate exceeds their cost translated at historical rates (their cost in dollars). According to the argument, the *covered* loss should be deferred rather than included in determining net income when the rate changes. The reduction in income over the lives of the assets from amortizing the deferred loss on the net exposed liability position is considered to be at least offset by the effect of depreciation based on lower historical translation rates (*lighter costs*) that will be deducted over the assets' lives from revenue (received in cash or receivables from sales) translated at the higher current rate.

.175 Likewise, an exchange gain that results from the combination of the weakening of a foreign currency and an

exposed net liability position should be deferred under the *cover* approach to the extent required to offset the unrecognized potential loss on the assets translated at the historical rate. The potential loss represents the difference between translating the foreign currency costs of the assets at the higher historical rates and translating them at the lower current rate. The cover approach views translating the assets at historical rates as speculation about the assets' ability to produce a product that will sell for an increased foreign currency selling price which, when translated at the lower current rate, will sufficiently cover the historical dollar cost of the assets. Amortization of the deferred gain over the life of the assets is, therefore, considered appropriate to offset the effect of depreciation based on higher historical rates (*heavier cost*) to be included in determining net income of later periods.

.176 The Board rejected the cover approach because it is essentially a procedure whereby a change that has occurred in the dollar measure of liabilities is deferred to be offset against a *potential* change in the future dollar value of assets carried at cost. That potential dollar value of the assets depends on foreign currency proceeds from sale or other disposition of the assets. Since changes in the values of assets carried at cost (for example, property, plant, and equipment) are not normally recognized under generally accepted accounting principles until the assets are sold, offsetting is accomplished under the cover approach by *not* including immediately in the determination of net income gains or losses on changes in the dollar measure of liabilities denominated in foreign currency. The argument for deferral is in effect that changes in the dollar measure of one item should not be recognized because changes in the dollar value of another item are not recognized. However, the Board believes that offsetting of that type is not proper under present generally accepted accounting principles that recognize certain gains and losses only at time of sale or other disposition. If offsetting is desirable at all, it should be accomplished by changing generally accepted accounting principles to recognize changes in the dollar value of items now carried at cost. However, to do so would require reconsideration of historical cost as a fundamental concept of accounting — a process that is beyond the scope of this Statement.

.177 The questionable result of offsetting recognizable gains and losses from changes in the dollar measurements of liabilities denominated in foreign currency against

Copyright © 1975 by Financial Accounting Standards Board

unrecognizable increases in the values of assets carried at cost in foreign currency is highlighted if the liability is paid but the asset remains unsold. For example, a rate change from FC1 = $1 to FC.80 = $1 occurs while a foreign operation has an exposed net liability position of FC80 and a depreciable asset with an undepreciated cost of FC100 and a remaining life of five years. The $20 loss on the exposed net liability position (FC80 ÷ .80 = $100; $100 - $80 = $20) is *covered* because the foreign currency cost of the asset translated at the current rate ($125) exceeds the cost translated at the historical rate ($100) by $25, which is $5 more than the loss on the liabilities. Thus, under the *cover* approach, the full $20 loss can be deferred and amortized over the remaining five-year life of the asset. Using straight-line depreciation and amortization, the expense for each of the succeeding five years is $24 ($20 depreciation based on cost translated at the historical rate plus $4 amortization of the deferred loss). The added expense ($4 amortization of the deferred loss) is said to be necessary to offset the effect of matching *light* depreciation expense translated at historical rates against foreign currency revenue translated at the higher rate after the rate change.

.178 If, however, all liabilities outstanding at the time of the rate change are settled by the end of the second year, the loss has occurred, even to the satisfaction of those who believe that exchange gains and losses are *unrealized* until payment of liabilities and collection of receivables (paragraph .188). However, the result that is said to justify the *cover* approach — matching of the increased expense from adding the annual amortization of the deferred loss against the increased revenue from translating current sales at the new higher rate — cannot be achieved unless the loss is deferred and amortized after it has been *realized.*

.179 The *cover* approach appears to be based on the presumption that a rate change may be expected to affect future earnings in a way that offsets an exchange gain or loss related to an exposed net liability position. The Board believes that future impacts of rate changes should be reflected in the future and not anticipated by deferring an exchange gain or loss.

.180 Another apparent assumption of the cover approach is that future revenue generated by the assets carried at cost will be in the same currency as the exposed net liability position. That may not be valid for many foreign operations.

Adjustment Related to Life of Long-Term Liabilities

.181 Another method that has been suggested would limit deferral of exchange gains or losses from an exposed net liability position to amounts associated with long-term liabilities denominated in foreign currency. The amount deferred would be amortized over the remaining term of the long-term liabilities, in effect accounting for the deferred exchange gain or loss as an adjustment of financing costs (interest expense). The Board rejected the method because of the Board's basic view (stated in paragraph .164) that the gain or loss results solely from the rate change and to recognize it in other periods obscures what has occurred. Furthermore, the method masks the economic difference in the source (denomination) of financing. That is, foreign currency denominated debt has an exchange exposure that dollar denominated debt or equity financing does not. Spreading the result of the exposure over the future rather than recognizing it in full when a rate changes fails to contrast an economic difference between financing denominated in foreign currency and dollar borrowings or equity financing.

.182 The Board considered the argument that management assesses the likelihood of rate changes and differences in interest rates between countries in deciding to borrow foreign currency rather than dollars or one foreign currency rather than another and that all or part of the effect on long-term debt of a rate change is, therefore, an added or reduced cost of borrowing a particular foreign currency. The Board does not deny that management may assess borrowing alternatives in that manner. To be consistent with that view, though, would require interest accruals over the life of the borrowing at the anticipated effective interest rate. However, the Board concluded that it is inappropriate to attempt to account currently for the expected effect of future rate changes on interest and principal payments. The Board also concluded that adjusting translated long-term debt by the amount of the related exchange gain or loss at the time of a rate change and spreading that gain or loss as an adjustment of interest expense subsequent to the rate change does not produce a result consistent with the expected effective interest rate at the date of the borrowing even if the expectations about rate changes at the time of borrowing are realized. Therefore, the Board rejected the proposal.

Copyright © 1975 by Financial Accounting Standards Board

Adjustment to Stockholders' Equity

.183 Certain respondents to the Discussion Memorandum and Exposure Draft suggested that exchange gains or losses be accounted for as adjustments of stockholders' equity. The Board rejected that method because it believes that a gain or loss resulting from an exposure to rate changes should be included in the determination of net income in accordance with the all-inclusive income statement presently required of most enterprises by generally accepted accounting principles. A foreign investment exposes a U.S. company to the effects of rate changes which can be economically beneficial or detrimental. The Board believes that those benefits or detriments should be reflected in the determination of net income at a time and in a manner that is consistent with generally accepted accounting principles.

Deferral Based on Certain Criteria

.184 The following criteria were suggested for deferring exchange gains or losses:

a) Realization;

b) Conservatism;

c) Likelihood of reversal of rate change;

d) The effect on future income of rate change.

.185 It was suggested that exchange gains or losses be deferred based on the criterion of realization. Realized gains and losses should be recognized immediately while unrealized gains and (possibly) losses should be deferred until realized. Chapter 12 of *ARB No. 43* [section 1081] permitted different accounting treatment for *realized* and *unrealized* exchange gains and losses but gave no guidance on how to distinguish them. In the Board's view, the distinction between *realized* and *unrealized* exchange gains and losses is a questionable concept for the purpose of translation as well as a difficult concept to implement.

.186 The concept of realization usually applied in accounting pertains to conversions of other assets into cash or receivables. It usually applies to conversion of inventory but is also applied to assets such as marketable securities, property, plant, equipment, and certain intangible assets. A

sale of an asset is the most common basis of realization in accounting.

.187 That meaning of realization is preserved if transmission of funds (for example, dividends) from a foreign operation to a domestic operation is the event that determines *realization* of exchange gains and losses from translating foreign statements, but that narrow view of realization is not particularly useful. First, it is questionable how transmission of funds causes an exchange gain or loss to be realized. For example, an exchange gain that results from translating a foreign operation's exposed net liability position cannot be reasonably associated with a dividend remittance. Likewise, an exchange gain that results from translating a foreign operation's exposed net asset position that primarily reflects accounts receivable cannot be reasonably associated with a dividend remittance if the foreign currency collected on settlement of the receivables is used to purchase other assets. Second, if remittance of dividends is the criterion for realization in translation of foreign statements, all of a foreign operation's unremitted earnings must be considered *unrealized.* That interpretation requires investments in foreign operations to be carried at cost and largely invalidates consolidation of foreign operations. It therefore is rejected.

.188 The suggestion by some respondents to the Discussion Memorandum and Exposure Draft that realization of exchange gains and losses should be based on spending cash, collecting receivables, and paying liabilities is the opposite of the usual concept of realization, namely, converting assets into cash or receivables. Converting cash into other assets is usually called a *purchase* and does not constitute realization in any accepted sense of the word. Moreover, it is generally impracticable to determine whether or not a given transaction converts a previously unrealized gain or loss into a realized gain or loss. Under the proposed realization test, not all collections of receivables or payments of liabilities are bases of realization but only collections or payments of receivables and payables that were in existence at the date of a rate change. Similarly, not all cash spent realizes previously unrealized exchange gains or losses but only the spending of cash held at the time of a rate change. The problem was complicated when rate changes were official devaluations or revaluations. Floating rates increase the complexity. The Board believes that attempting to base realization of exchange gains and losses on cash disbursements and collections and

 Copyright © 1975 by Financial Accounting Standards Board

settlements of receivables and payables would involve unreasonable effort to make a distinction between realized and unrealized gains or losses for which the Board sees no theoretical justification.

.189 Another suggestion is that unrealized exchange gains should be deferred based on the criterion of conservatism. The Board believes that although the concept of conservatism may be appropriate in other areas of accounting, its application to exchange gains and losses is inappropriate.

.190 Conservatism is a way of dealing with uncertainty and is intended to avoid recognizing income on the basis of inadequate evidence that a gain has occurred. The Board believes that a rate change in a foreign exchange market provides sufficient objective evidence of the occurrence of a gain or loss to warrant changes in the dollar carrying amounts of cash, receivables, payables, and other assets and liabilities measured in foreign currency at current or future prices. To defer an exchange gain *solely because it is a gain* in effect denies that a rate change has occurred. Thus, the Board believes that even if it were feasible to identify unrealized gains, to defer recognition of unrealized exchange gains while recognizing unrealized exchange losses is an unwarranted inconsistency in translation.

.191 The inconsistency of deferring an exchange gain while recognizing an exchange loss is further illustrated by translation of two accounts receivable from the same customer, one from a sale just before a rate change and the other from a sale just afterwards. Both receivables are translated at the new rate after the rate change and are, therefore, treated as comparable. If the foreign currency weakens against the dollar, the *unrealized* exchange loss on the earlier receivable is recognized to be conservative. Otherwise, the deferral of the loss would have the effect of increasing the dollar measure of the receivable to the same amount as before the rate change. If, however, the foreign currency strengthens against the dollar, the *unrealized* exchange gain on the same receivable is deferred, again to be conservative. But the effect of deferring the gain is to reduce the dollar measure of the receivable to the same amount as before the rate change. Therefore, the earlier receivable is no longer treated as comparable to the later one.

Moreover, the inconsistency is unwarranted because the dollar measure of the earlier receivable is as objectively determinable as that of the later receivable.

.192 The Board rejected the recommendation that exchange gains or losses be deferred if rates are likely to reverse. That proposal is often a part of both the realization and conservatism proposals because those proposals are often based on arguments that gains should not be recognized because the related rate change might reverse *before the gain is realized.* But the proposal to defer if rates are likely to reverse raises separate issues because it depends on predicting rate changes in the future (paragraph .166). Given the high degree of unpredictability of exchange rates, the proposed method creates a situation in which operating results are misstated simply through errors in forecasting. A procedure of that type invariably causes divergent decisions about the movements of rates. In addition, to determine how much of an exchange gain or loss will be reversed when the rate change reverses necessitates a forecast of the financial position at the time of the later rate change, which may be another extremely uncertain variable. In the Board's judgment, the proposal is not practical.

.193 Another recommendation proposed is that accounting for exchange gains or losses vary depending on the likely effect of rate changes on future income. As pointed out in paragraph .107, the future effects of rate changes may vary widely, and the effects are uncertain. The Board believes it inappropriate to inject forecasting of future effects into the accounting for exchange gains or losses.

Additional Factors Considered

.194 An additional factor in the Board's decision to include exchange gains or losses in the determination of net income at the time of a rate change is that deferral approaches generally raise significant questions of implementation. For example, should amounts deferred be determined on a global basis, currency-by-currency, country-by-country, foreign-operation-by-foreign operation, or some other basis? If exchange gains or losses are aggregated on a global basis, most suggested amortization approaches become exceedingly complex, if not impractical, for a company with numerous foreign operations to apply. Not aggregating on a global basis can result in exchange gains being included in the

Copyright © 1975 by Financial Accounting Standards Board

determination of net income at the time of a rate change and exchange losses being deferred, or vice versa, depending on the deferral method employed.

.195 Another factor that supports including exchange gains or losses in the determination of net income at the time of a rate change is that after a rate change operating revenue (other than amortization of deferred income) as well as other cash receipts and disbursements are translated at the current rate. To recognize the effect of a rate change on current transactions (by reporting in the translated statements an increased or decreased dollar equivalent for the transactions) when they occur and yet defer the effect of a rate change on past unsettled transactions (for example, receivables from previously reported sales) places the enterprise in the anomalous position of having recognized the entire effect of the rate change on a recent transaction while holding in suspense its effect on a previous transaction.

Rate Changes and Earnings Fluctuations

.196 Many respondents to the Discussion Memorandum and Exposure Draft commented that to include exchange gains and losses in determining net income when rates change would distort reported net income or otherwise confuse readers of the financial statements. Some of those arguments were based on the assumption that rate changes would reverse. Some respondents to the Exposure Draft presented examples showing how application of the proposed standard would have caused reported income to fluctuate in recent years. Since many of the rate changes did reverse, those comments, based on hindsight, argued that the proposed standard would have caused unnecessary fluctuations in their reported net income.

.197 The Board's view has previously been indicated regarding the assumption that rate changes will reverse (paragraphs.166 and.192).

.198 In addition, the Board rejected the implication that a function of accounting is to minimize the reporting of fluctuations. Past rate changes are historical facts, and the Board believes that users of financial statements are best served by accounting for the changes as they occur. It is the deferring or spreading of those effects, not their recognition and disclosure, that is the artificial process (see *FASB*

Statement No. 2, "Accounting for Research and Development Costs," paragraph 54 [section 4211.54], and *FASB Statement No. 5*, "Accounting for Contingencies," paragraphs 64 and 65 [section 4311.64-.65]).

.199 In the Board's opinion, readers of financial statements will not be confused by fluctuations in reported earnings caused by rate changes. That view was supported by comments of financial analysts who said they preferred to have exchange gains and losses accounted for when rates change. Exchange rates fluctuate; accounting should not give the impression that rates are stable.

INCOME TAX CONSEQUENCES OF RATE CHANGES

.200 The Board concluded that if an exchange gain or loss related to a foreign currency transaction of a foreign operation is taxable in the foreign country, the related tax effect shall be included in the translated income statement when the rate change occurs. Inclusion is appropriate regardless of the fact that the foreign operation's exchange gain or loss may be partially or completely (for a dollar denominated asset or liability) eliminated upon translation, because the rate change is the event that causes the tax effect in the foreign operation's financial statements. The fact that the exchange gain or loss does not exist (or exists only partially) in dollars should in no way affect the accounting for the tax effect, which does exist in dollars.

.201 A method has been proposed for measuring exchange gains or losses resulting from translating foreign statements that in effect would correct what some might consider an erroneous relationship of translated tax expense to translated pretax income. Following the proposal, the exchange gain or loss would include the future tax effect in the translated financial statements of using the historical rate for translating inventory, plant, and equipment. The resulting deferred tax accounts would be amortized as an adjustment of tax expense as inventory and fixed assets are charged against operations.

.202 In the Board's opinion, the use of historical rates to translate certain income or expense items (for example, cost of goods sold and depreciation) does not require interperiod tax allocation. Timing differences, defined as "differences between the periods in which transactions affect taxable income and the periods in which they enter into the

 Copyright © 1975 by Financial Accounting Standards Board

determination of pretax accounting income" (paragraph 13(e) of *APB Opinion No. 11* [section 4091.12(e)]), do not arise from translating assets or liabilities at historical rates. Accordingly, the effective tax rate in the translated dollar statements may differ from the effective tax rate in the foreign statements. Applying historical rates may also change various other relationships in the translated dollar statements from those in the foreign statements (for example, gross profit percentages). However, the Board believes that is the expected result of using the dollar as the unit of measure in concert with generally accepted accounting principles.

.203 The Board concluded that the existing authoritative literature (*APB Opinion Nos. 11, 23,* and *24* [sections 4091, 4095 and 4096]) provides sufficient guidance about whether deferred taxes should be recognized for exchange gains or losses that result from applying the requirements of this Statement. *APB Opinions No. 23* and *24* [sections 4095 and 4096] apply because exchange gains and losses from translation of foreign statements are an integral part of measuring in dollars the undistributed earnings of foreign subsidiaries and investees.

FORWARD EXCHANGE CONTRACTS

.204 A forward contract is an agreement to exchange at a specified future date currencies of different countries at a specified rate (the *forward rate*). The purpose of a forward contract may be to hedge either a foreign currency commitment or a foreign currency exposed net asset or net liability position or to speculate in anticipation of a gain.

Hedge of Foreign Currency Exposed Net Asset or Net Liability Position

.205 The Board concluded that if a forward contract is intended to hedge an exposed foreign currency position, the gain or loss on the forward contract (determined by the method specified in paragraph .025) shall be included in determining net income currently. To recognize the gain or loss only at maturity of the contract could result in benefiting (penalizing) one period's income by recognizing an exchange gain (loss) resulting from the translation process currently to the detriment (benefit) of a later period's income when a loss (gain) on the forward contract is recorded.

Speculative Contract

.206 An enterprise that uses a forward contract to speculate exposes itself to risks from movements in forward rates. Therefore, for reasons similar to those expressed in paragraphs .164-.166, the Board concluded that the gain or loss on the forward contract (determined by the method stated in paragraph .026) shall be included in determining net income currently as the value of the contract changes.

Hedge of Identifiable Foreign Currency Commitment

.207 Although the Board rejected the one-transaction approach as a general basis for translation of foreign currency transactions (paragraphs .114 and .115), it decided (for the reasons given in paragraphs .116-.118) that the dollar basis of a foreign currency transaction shall be established at the transaction date. By rejecting the commitment date as the date for making that determination, the Board implicitly accepted a one-transaction view for an unrecorded future foreign currency transaction (that is, a commitment in foreign currency) for the period from the commitment date to the transaction date. In other words, the effects of rate changes between commitment date and transaction date are not separately identified and accounted for as exchange gains or losses; rather, they are included in the dollar basis of the transaction.

.208 A number of respondents to the Exposure Draft opposed current recognition in income of the gain or loss on a forward contract intended to hedge a future foreign currency transaction. In their view, the exposure to rate changes during the commitment period could (or should) be hedged by a forward contract, even though the accounting does not separately recognize the exposure on the commitment. They believe that to include a gain or loss on a forward contract that hedges a commitment in determining net income when rates change rather than to include the gain or loss in the dollar basis of the related transaction could benefit (penalize) one period's income to the detriment (benefit) of a later period's income. For example, a U.S. enterprise contracts with a U.S. customer to sell for $1,000,000 certain equipment to be delivered in 18 months. At the same time the enterprise enters into a firm, uncancelable commitment with a foreign company to manufacture the specified equipment for FC900,000 (equal

 Copyright © 1975 by Financial Accounting Standards Board

to $900,000 at the existing current rate). Simultaneously, the enterprise enters into a forward contract to receive FC900,000 in 18 months. By so doing, the enterprise is viewed as having fixed its gross profit on the transaction at $100,000 (ignoring premium or discount on the forward contract). If at a balance sheet date between the commitment date and the anticipated transaction date for receipt of the equipment, the spot rate has changed from FC1 = $1 to FC1 = $1.07, a gain of $63,000 exists on the forward contract. However, the dollar price of the equipment has also increased $63,000. If the gain on the forward contract is not deferred, the gross profit on the sale when recorded will be $37,000 rather than $100,000. Since the enterprise's intent on entering into the forward contract was not to speculate in the forward market but to fix the equipment's dollar cost at $900,000 and thus fix the gross profit at $100,000, those respondents argued that the gain on the contract should be deferred until the transaction date. On further consideration, the Board concluded that gains or losses on forward contracts that meet the conditions stated in paragraph .027 shall be deferred until the date the commitment is recorded (that is, the transaction date). The deferred gain or loss shall then be included in the dollar basis of the transaction.

.209 The requirements in this Statement for measuring gains or losses on forward contracts represent a modification of the requirements proposed in the Exposure Draft. That draft proposed accrual of the difference between the original market value of an unperformed forward contract (zero) and its current market value. Stated another way, the difference between the contracted forward rate (or the forward rate last used to measure a gain or loss on the contract) and the forward rate available for the remaining maturity of that forward contract multiplied by the amount of the forward contract is a gain or loss to be included in determining net income.

.210 Certain respondents to the Exposure Draft questioned valuing a forward contract at current market value if the intent is to hold the contract to maturity to hedge a foreign currency receivable or payable. In their view, it is inconsistent to value, for example, a two-year contract at a forward rate because it is a forward contract and translate at the current rate the two-year foreign currency payable that is hedged.

.211 The Board concluded that a gain or loss on a forward contract shall be determined on a basis consistent with management's intent for entering into the contract. That is, the results of a speculative forward contract should be determined by changes in its market value; the results of a forward contract intended to hedge an identifiable foreign currency commitment or exposed net asset or net liability position should be accounted for in a manner consistent with the accounting for the related exposure. Therefore, the Board specified the procedures in paragraphs .023-.026.

.212 An alternative approach for a forward contract intended to hedge a specific foreign currency transaction for the period between transaction date and settlement date is to use the rate in the forward contract rather than the spot rate at the transaction date to establish the related amounts payable or receivable. Although a forward contract may limit or eliminate exposure on a payable or receivable denominated in foreign currency, the Board views such a forward contract as an independent transaction that should be accounted for separately. It also believes that the original discount or premium on a forward contract normally reflects an interest rate differential between two countries which should be recognized over the life of the contract if the contract hedges a foreign currency exposed net asset or net liability position. Further, since specific identification of individual forward contracts with related unsettled foreign currency transactions may not be readily ascertainable, the procedures specified by paragraph .023 are a more practical approach.

DISCLOSURE

.213 In reaching its conclusion regarding disclosures, the Board considered disclosures required by *FASB Statement No. 1* as well as additional possible disclosures presented in the Discussion Memorandum.

.214 Since this Statement specifies a single accounting method for foreign currency translation, the Board concluded that the disclosure requirements as stated in *FASB Statement No. 1* are no longer appropriate.

Copyright © 1975 by Financial Accounting Standards Board

.215 Paragraph .032 herein requires disclosure of the aggregate exchange gain or loss included in the determination of net income for the period. An exchange gain or loss does not measure, nor is it necessarily an indicator of, the full economic effect of a rate change on an enterprise. The disclosure required by paragraph .032 provides information to users of financial statements about the effects of rate changes on certain assets and liabilities which may be useful in evaluating and comparing reported result of operations.

.216 A few respondents to the Exposure Draft suggested that some components of the aggregate exchange gain or loss (for example, gains and losses on unperformed forward exchange contracts) be separately disclosed. The Board concluded that since enterprises often manage and hedge their exchange exposure on an overall basis, separate disclosure of any of the components, particularly gains or losses on forward exchange contracts, should not be required.

.217 Disclosure of gains or losses on forward exchange contracts that are deferred in accordance with paragraph .027 is not required by paragraph .032. The Board reasoned that those gains or losses are, in effect, offset by unrecorded exchange losses or gains on the related foreign currency commitments; therefore, separate disclosure would be inappropriate.

.218 The Exposure Draft (paragraph .020) contained a proposed requirement that the aggregate amount of tax effects related to exchange gains or losses be disclosed. Some respondents to the Exposure Draft explained certain difficulties in determining the tax effects and pointed out that disclosure of tax effects might imply that the gain or loss was *extraordinary*—an implication contrary to the requirement of paragraph 23 of *APB Opinion No. 30* [section 2012.23] that exchange gains or losses not be reported as extraordinary items. Other respondents suggested that other accounting pronouncements already required explanations of unusual tax effects (for example, *APB Opinion No. 11* paragraph 63 [section 4091.62]). The Board concluded that those comments had merit, and, therefore, this Statement does not require disclosure of the tax effects of exchange gains or losses.

.219 Certain respondents to the Exposure Draft proposed an exemption from the disclosure requirements of paragraph .032

for certain enterprises whose principal business purpose is investing in foreign securities and that present those investments at current market price (determined by applying the current rate to the market price of securities traded and quoted in foreign currency). They argued that it is impracticable and of questionable usefulness for those enterprises to attempt to isolate the portion of the change in market price measured in dollars that arises from rate changes from the portion that arises from changes in foreign currency market prices.

.220 The Board concluded that *exemption* for those enterprises was not appropriate because the segregation described in paragraph .219 is not intended by paragraph .032 of this Statement (and was not intended in paragraph .020 of the Exposure Draft). Exchange gains and losses as described in paragraph .016 do not include the effects of rate changes on assets (other than those denominated in foreign currency) carried at current prices measured in dollars. However, those effects should be considered, if practicable, in providing the disclosures required by paragraph .033 (see paragraph .223).

.221 Some respondents to the Exposure Draft stated that disclosing the exchange gain or loss from an exposed net liability position when the foreign currency strengthens would give the wrong signal (a loss) because the rate change is expected to have future beneficial effects. In the Board's opinion, an exchange gain or loss neither is nor should be a signal of the direction of future operating results. An exchange gain or loss merely reflects the effect of a rate change on a given financial position at a specific time. Other respondents indicated that other effects of rate changes on reported results of operations should be disclosed in addition to the disclosure of exchange gains or losses.

.222 The Board acknowledges that more information than disclosure of exchange gains or losses is needed for an understanding of the effects of rate changes on the operating results of an enterprise. Therefore, it modified paragraph .021 of the Exposure Draft in paragraph .033 of this Statement.

.223 Paragraph .033 of this Statement requires that, if practicable, the effects of rate changes on reported revenue and earnings be described and quantified. The Board concluded that a practicability qualification was necessary. As indicated in paragraph .107, it may be difficult or impossible to quantify the economic effects of rate changes

 Copyright © 1975 by Financial Accounting Standards Board

(for example, on selling prices, sales volume, and cost structures). In the Board's opinion, disclosing only the mathematical effects of translating revenue and expenses at rates different from those used in a preceding period could be misinterpreted if other significant direct and indirect economic effects of rate changes on operations are not considered and disclosed. Thus, the Board concluded that since the effect of rate changes on revenue and earnings cannot always be measured with sufficient precision, it could not require disclosures of that type in all financial statements. The Board noted, however, that some companies have disclosed certain information (not necessarily in financial statements) that might be interpreted as showing the effect of rate changes on revenue and earnings. The Board's intention is to encourage disclosures of that kind if, in the opinion of management, they provide useful information. The Board believes that if that information is disclosed in financial statements, a clear explanation of the methods and underlying assumptions used to determine the amounts is also essential, as required by paragraph .033 of this Statement.

.224 The Board believes that management can best decide how information about the effects of rate changes on revenue and earnings should be described or quantified. The nature and extent of foreign currency transactions or foreign operations of enterprises vary, and that which is possible or appropriate for one enterprise may not be possible or appropriate for others. The purpose of disclosure of the effect of rate changes in addition to exchange gains and losses is to assist financial statement users in understanding the financial effects of rate changes on the reported results of operations. Disclosing only exchange gains and losses if rate changes significantly affect reported revenue and earnings in a way or to an extent that can be determined would not, in the view of the Board, comply with the intent of paragraph .033 of this Statement. The disclosures urged by that paragraph are not forecasts, but rather descriptions and estimates of the effect on reported results of operations of rate changes that the Board believes will assist users in comparing recent results with those of prior periods.

.225 Some respondents requested clarification of the circumstances requiring an enterprise's financial statements to be *adjusted* for a change in rate subsequent to the date of the financial statements. The Board concluded that financial

statements should not be adjusted for rate changes after their date; however, disclosure may be necessary (paragraph .034). If the estimated effect of a rate change is disclosed, the disclosure should include consideration of changes in financial position from the date of the financial statements to the date the rate changed. The Board recognizes that in some cases it may not be practicable to determine the changes in financial position; if so, that fact should be stated.

.226 The disclosure of geographical, or otherwise segmented, information on foreign operations is discussed in FASB Statement No. 14 [section 2081], *Financial Reporting for Segments of a Business Enterprise.* [As modified, effective for financial statements for fiscal years beginning after December 15, 1976, and for interim periods within those fiscal years, by FASB Statement No. 14.] (See section 2081.)

EXCHANGE RATES

Multiple Rates

.227 The Board concluded that if multiple rates exist, the rate to be used to translate foreign statements should, in the absence of unusual circumstances, be the rate applicable to dividend remittances. Use of that rate expresses results of operations in dollars in a more meaningful way than any other rate because the earnings can be converted into dollars only at that rate. Further, in translating an asset carried at a current price, the dividend rate measures the dollar amount that might be realized from sale of the asset and remittance of the proceeds and thereby establishes the asset's value in dollars. In translating an asset carried at cost, the dividend rate at the time the asset was acquired measures the sacrifice made by the parent in foregoing a remission of the local-currency cost of the asset and thus establishes the asset's dollar cost.

.228 The dividend rate measures the dollar sacrifice in all situations, including those involving multiple rates in which the foreign operation purchased an imported asset at a preferential or penalty rate. Before being used to pay for the imported asset, the local currency cash with which payment is made is translated at the dividend rate. That rate thus measures the translated cost of the asset. If the preferential or penalty rate, whichever applies, were used to translate the local currency cost of the asset, its translated cost would not represent the dollar sacrifice made.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Differing Balance Sheet Dates

.229 If foreign statements of an operation are as of a date different from that of the enterprise and are combined or consolidated with or accounted for by the equity method in the financial statements of the enterprise, the Board concluded that for purposes of applying the requirements of this Statement, the current rate is the rate in effect at the foreign operation's balance sheet date. The use of that rate is necessary to present dollar measurements as of that date.

.230 Some respondents to the Exposure Draft questioned that conclusion. In their view, use of a foreign operation's financial statements as of a date that differs from that of the enterprise's financial statements is justified only on the basis that those financial statements approximate financial statements as of the enterprise's year end. Accordingly, they argue, the current rate should be the rate in effect at the date of the enterprise's financial statements, not the rate at the date of the foreign operation's financial statements.

.231 Paragraph 4 of *ARB No. 51* [section 2051.05], "Consolidated Financial Statements," states:

> A difference in fiscal periods of a parent and a subsidiary does not of itself justify the exclusion of the subsidiary from consolidation. It ordinarily is feasible for the subsidiary to prepare, for consolidation purposes, statements for a period which corresponds with or closely approaches the fiscal period of the parent. However, where the difference is not more than about three months, it usually is acceptable to use, for consolidation purposes, the subsidiary's statements for its fiscal period; when this is done, recognition should be given by disclosure or otherwise to the effect of intervening events which materially affect the financial position or results of operations.

Similarly, paragraph 19(g) of *APB Opinion No. 18* [section 5131.19(g)] states:

> If financial statements of an investee are not sufficiently timely for an investor to apply the equity method currently, the investor ordinarily should record its share of the earnings or losses of an investee from the most recent available financial statements. A lag in reporting should be consistent from period to period.

.232 Reconsideration of *ARB No. 51* [section 2051] and *APB Opinion No. 18* [section 5131] was not within the scope of the project that led to the issuance of this Statement. Accordingly, the

Board neither accepted nor rejected the view expressed in paragraph .230. However, the Board believes that if that view is appropriate, the determination that the operation's financial statements at other than the enterprise's year-end are reasonable approximations of its financial statements as of the enterprise's year-end should be based on dollar measurements (translated statements) and not local currency measurements (foreign statements). Using as the current rate a rate at a date other than the foreign operation's balance sheet date could produce translated financial statements that are not in accordance with the requirements of this Statement. For example, if between the date of the foreign operation's financial statements and the date of the enterprise's financial statements there have been changes in the foreign currency measure of the foreign operation's financial position (that is, total assets and total liabilities) or the components thereof (for example, cash and inventory), including changes that may have occurred in anticipation of a significant rate change, using the rate as of the enterprise's financial statements will not result in financial statements for the foreign operation that reflect dollar measures of financial position and results of operations as of either date.

.233 Certain respondents to the Exposure Draft expressed another view opposing the Board's conclusion. In their view, using as the current rate a rate at other than the enterprise's balance sheet date raises implemental issues in eliminating intercompany transactions if the rate has changed during the intervening period. The Board believes that those implemental problems are similar to other implemental problems caused by intercompany transactions within the intervening period and, therefore, apparently can be accommodated in the consolidation, combination, or equity accounting process.

.234 Another opposing view expressed in response to the Exposure Draft was that using as the current rate the rate in effect at the foreign operation's balance sheet date rather than the rate in effect on the date of the enterprise's balance sheet would be contrary to the principle underlying *FASB Statement No. 5* [section 4311], "Accounting for Contingencies," if an intervening rate change resulted in an exchange loss. According to that view, the rate change causes an asset to be impaired or liability incurred, and the amount of the loss is known as of the date of the enterprise's balance sheet. The Board believes that if foreign statements are as of a date other than the balance sheet date of the enterprise, the

Copyright © 1975 by Financial Accounting Standards Board

terminology "date of the financial statement" as used in paragraph 8(a) of *FASB Statement No. 5* [section 4311.08a] refers to the end of the most recent accounting period for which foreign statements are being combined, consolidated, or accounted for by the equity method.

.235 The Board believes that rate changes subsequent to the date of a foreign operation's balance sheet are similar to those subsequent to the date of an enterprise's balance sheet. Disclosure may be necessary, but the financial statements should not be adjusted (paragraph .034).

DEFERRED INCOME TAXES

.236 The procedures set forth in this Statement (paragraph .050) for determining the amount of deferred taxes in a translated balance sheet represent a modification of the procedures proposed in the Exposure Draft. That draft proposed that all deferred tax charges or credits be translated at historical rates.

.237 Certain respondents to the Exposure Draft questioned translation at historical rates if the *net change* method of deferred tax allocation is followed. In their view, use of historical rates requires that originating and reversing timing differences be distinguished for translation purposes—a requirement that is inconsistent with the *net change* method. Under the *net change* method, a single computation is made at the *current* tax rate for the net effect of both originating and reversing differences occurring during a period relating to a particular group of similar timing differences. The method results in a balance of deferred taxes that is a residual, that is, the difference between the deferred taxes originally recorded and subsequent reduction of deferred taxes at different tax rates as timing differences reverse.

.238 Other respondents to the Exposure Draft questioned translation at historical rates of deferred income tax charges or credits applicable to timing differences on items translated at the current rate. In their view, that approach does not result in proper dollar measures of deferred tax charges and credits relating to timing differences.

.239 The Board considered those views and the objective of translation (paragraph .006) and concluded that the procedures set forth in paragraph .050 should be followed. The Board

believes that those procedures result in deferred tax charges and credits in a translated balance sheet that are consistent with the requirements of *APB Opinion No. 11* [section 4091] and the objective of translation.

EFFECTIVE DATE AND TRANSITION

.240 The Board concluded that because of the various methods of translation or of recognition of exchange gains and losses now followed in practice and because of the complex nature of the translation process, a prospective method of transition is not feasible. The Board considered whether the transition should be by prior period restatement or by cumulative effect adjustment (the method specified in the Exposure Draft). The Board concluded that prior period restatement is the preferable method to provide useful information about foreign currency transactions and foreign operations for purposes of comparing financial data for periods after the effective date of this Statement with data presented for earlier periods.

.241 The Board recognizes, however, that the procedures called for by this Statement may sometimes differ significantly from procedures followed in previous periods. In addition, restatement requires the availability of records or information that an enterprise may no longer have or that its past procedures did not require. Therefore, if the effect of the restatement on all individual periods presented cannot be computed or reasonably estimated, the cumulative effect adjustment method shall be used in accordance with paragraph .036.

.242 On considering all circumstances, the Board judged the effective date specified in paragraph .035 to be advisable.

Appendix E

GLOSSARY

.243 This Appendix defines certain terms used and not defined elsewhere in this Statement.

Attribute: The quantifiable characteristic of an item that is measured for accounting purposes. For example, historical cost and replacement cost are attributes of an asset.

Conversion: The exchange of one currency for another.

Enterprise: See Reporting Enterprise.

Exposed Net Asset Position: The excess of assets that are measured or denominated in foreign currency and translated at the current rate over liabilities that are measured or denominated in foreign currency and translated at the current rate.

Exposed Net Liability Position: The excess of liabilities that are measured or denominated in foreign currency and translated at the current rate over assets that are measured or denominated in foreign currency and translated at the current rate.

Foreign Currency: A currency other than the currency of the country being referred to; a currency other than the reporting currency of the enterprise being referred to; composites of currencies, such as the Special Drawing Rights on the International Monetary Fund (SDRs), used to set prices or denominate amounts of loans, etc., have the characteristics of foreign currency for purposes of applying this Statement.

Foreign Currency Financial Statements: Financial statements of a foreign operation that employ as the unit of measure a currency other than the reporting currency of the enterprise being referred to.

Foreign Currency Transactions: Transactions (for example, sales or purchases of goods or services or loans payable or receivable) whose terms are stated in a currency other than the local currency.

Foreign Currency Translation: The process of expressing amounts denominated or measured in one currency in terms of another currency by use of the exchange rate between the two currencies.

Foreign Operation: An operation whose financial statements are (a) combined or consolidated with or accounted for on an equity basis in the financial statements of the reporting enterprise and (b) prepared in a currency other than the reporting currency of the reporting enterprise.

Foreign Statements: See Foreign Currency Financial Statements.

Local Currency: Currency of a particular country being referred to; the reporting currency of a domestic or foreign operation being referred to.

Reporting Currency: The currency in which an enterprise prepares its financial statements.

Reporting Enterprise: An entity whose financial statements are being referred to; in this Statement, those financial statements reflect (a) the financial statements of one or more foreign operations by combination, consolidation, or equity accounting and/or (b) foreign currency transactions.

Settlement Date: The date at which a receivable is collected or a payable is paid.

Spot Rate: The exchange rate for immediate delivery of currencies exchanged.

Transaction Date: The date at which a transaction (for example, a sale or purchase of merchandise or services) is recorded in accounting records in conformity with generally accepted accounting principles.

Translation: See Foreign Currency Translation.

Unit of Measure: The currency in which assets, liabilities, revenue, and expenses are measured.

AC Section 1083-1

Translation of Unamortized Policy Acquisition Costs by a Stock Life Insurance Company: An Interpretation of Section 1083

[Source: FASB Interpretation No. 15.]

September 1976

INTRODUCTION

.01 The FASB has been requested to clarify the application of *FASB Statement No. 8* [section 1083], "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements," to the translation of the unamortized policy acquisition costs of a foreign stock life insurance company whose foreign currency financial statements are incorporated in the financial statements of an enterprise by consolidation, combination, or the equity method of accounting. Policy acquisition costs include commissions paid to agents for selling policies and other costs that vary with and are primarily related to the production of new business. The following three approaches have been suggested to the Board:

a. Unamortized policy acquisition costs are deferred charges and should be translated at historical rates. They represent expenses that have been incurred in past transactions that are deferred and amortized in proportion to the related anticipated premium revenue.

b. Unamortized policy acquisition costs are in the nature of long-term receivables and should be translated at the current rate. They represent past services paid for to receive future premium revenue and are recoverable from those future revenues.

c. Unamortized policy acquisition costs and the liability for future policy benefits are so interconnected that they both should be translated at the current rate. Unamortized policy acquisition costs are classified on the balance sheet among assets as an accounting convention for separate disclosure but this method of disclosure does not change their fundamental nature of being an integral part of the liability for future policy benefits.

In addition, if unamortized policy acquisition costs are translated at historical rates, the Board has been asked if Statement No. 8

[section 1083] requires that a "reserve deficiency computation" be made in dollars.

.02 The FASB has not considered the specialized accounting practices for life insurance companies. Those practices are specified for stock life insurance companies by the AICPA Industry Audit Guide, "Audits of Stock Life Insurance Companies." That Audit Guide requires that, because of their nature, unamortized policy acquisition costs should be classified as a deferred charge (page 74). The Guide also requires that unamortized policy acquisition costs be included in the computation of a deficiency, if any, in the reserve [1] applicable to a block of insurance policies; any deficiency is corrected "by a charge to earnings to increase reserves and/or reduce deferred acquisition expense" (page 87).

.03 *FASB Statement No. 8* [section 1083] requires that asset and liability balances representing cash and amounts receivable or payable that are denominated in a foreign currency shall be translated into dollars at the current rate. All other asset and liability accounts measured in a foreign currency shall generally be translated in a manner that retains their measurement bases; that is, accounts carried at prices in past exchanges shall be translated at historical rates and accounts carried at prices in current or future exchanges shall be translated at the current rate. The Statement also requires that existing U. S. generally accepted accounting principles be followed and specifies that translation should change only the unit of measure without changing the accounting principles.

INTERPRETATION

.04 According to the AICPA Industry Audit Guide, "Audits of Stock Life Insurance Companies," unamortized policy acquisition costs of a stock life insurance company are deferred charges under present generally accepted accounting principles. Because *FASB Statement No. 8* [section 1083] relies on generally accepted accounting principles, which for stock life insurance companies are set forth in the Audit Guide, those costs shall be translated at historical rates.

.05 Present generally accepted accounting principles require that a stock life insurance company recognize a loss represented by a reserve deficiency as a charge to current earnings (see para-

[1] The Audit Guide uses the term "reserve" to describe the actuarially determined liability for future benefits on insurance policies in force. Because that term has a special meaning in the insurance industry, it is also used in this Interpretation in referring to that *liability*.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

graph .02 above). *FASB Statement No. 8* [section 1083] requires that the dollar financial statements be in conformity with generally accepted accounting principles. Accordingly, computation of a reserve deficiency shall be made *in dollars* after translation of the unamortized policy acquisition costs at historical rates and the liability for future policy benefits at the current rate. Computation of a reserve deficiency *in dollars* may require a charge (or an increased charge) to current earnings in the dollar statements for a reserve deficiency even though no such charge is required in the foreign statements. It may also require a charge to current earnings in the foreign statements to be reversed in whole or in part in preparing the dollar statements if the translated charge to current earnings exceeds the reserve deficiency computed in dollars. (See paragraph 14 of Statement No. 8 [section 1083.014].)

EFFECTIVE DATE AND TRANSITION

.06 This Interpretation shall be effective for all unamortized policy acquisition costs reported in financial statements for annual and interim periods ending after December 15, 1976, except that it shall not be applied prior to initial application of *FASB Statement No. 8* [section 1083]. Earlier application is encouraged in financial statements for annual and interim periods ending before December 16, 1976 that have not been previously issued. If initially applied concurrently with the initial application of *FASB Statement No. 8* [section 1083], this Interpretation shall be applied in the same manner as the initial application of that Statement. Enterprises that have adopted Statement No. 8 [section 1083] prior to the effective date of this Interpretation and that have reported unamortized policy acquisition costs differently from the requirements of this Interpretation are encouraged to apply this Interpretation in the same manner as they initially applied Statement No. 8 (see paragraphs 35 and 36 of the Statement [sections 1083.035 and 1083.036]), but if they choose not to do so, those enterprises shall report the cumulative effect of applying this Interpretation in the year that it is adopted in the manner required by *APB Opinion No. 20* [section 1051], "Accounting Changes," and *FASB Statement No. 3* [section 2072], "Reporting Accounting Changes in Interim Financial Statements."

The next page is 7689.

AC Section 1083-2

Applying the Lower of Cost or Market Rule in Translated Financial Statements: An Interpretation of Section 1083

[Source: FASB Interpretation No. 17.]

February 1977

INTRODUCTION

.01 The FASB has been asked to clarify the determination of *market* when applying the rule of *cost or market, whichever is lower,* in translated financial statements. The FASB also has been requested to clarify the manner of reporting a write-down of inventory resulting from application of that rule in the translated financial statements.

.02 *FASB Statement No. 8* [section 1083], "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements," relies on existing U. S. generally accepted accounting principles which for purposes of pricing inventories are set forth in Chapter 4, "Inventory Pricing," of *ARB No. 43* [section 5121]. Chapter 4 [section 5121] specifies that inventory should be stated at *cost or market, whichever is lower.* To ensure that inventory in the translated statements conforms to that rule, paragraph 14 of Statement No. 8 [section 1083.014] requires that the rule of *cost or market, whichever is lower,* be applied *in dollars.*[1]

.03 Appendix A of *FASB Statement No. 8* [section 1083] explains and illustrates how to apply the rule of *cost or market, whichever is lower,* in translated financial statements. Paragraph 46 of Statement No. 8 [section 1083.046] states that "to apply the rule of *cost or market, whichever is lower* (as described in Statement 6 of Chapter 4, 'Inventory Pricing,' of *ARB No. 43* [section 5121.08—.10]), *translated historical cost* shall be compared with *translated market.*"

.04 Statement 6 of Chapter 4 of *ARB No. 43* [section 5121.08—.10] is as follows:

> As used in the phrase *lower of cost or market* . . . the term *market* means current replacement cost (by purchase or by reproduction, as the case may be) except that:

[1] For convenience, both *FASB Statement No. 8* [section 1083] and this Interpretation assume that the translated financial statements are prepared using the U. S. dollar (dollar) as the unit of measure. See footnote 1 to *FASB Statement No. 8* [section 1083].

(1) Market should not exceed the net realizable value (i. e. estimated selling price in the ordinary course of business less reasonably predictable costs of completion and disposal); and

(2) Market should not be less than net realizable value reduced by an allowance for an approximately normal profit margin.

Although the above is referred to as the rule of *cost or market, whichever is lower,* the discussion of Statement 6 in Chapter 4 of *ARB No. 43* [section 5121.08—.10] states that "because of the many variations of circumstances encountered in inventory pricing, Statement 6 is intended as a guide rather than a literal rule."

INTERPRETATION

.05 Because *FASB Statement No. 8* [section 1083] relies on U. S. generally accepted accounting principles, *translated market* for inventory shall be determined in accordance with the provisions of Chapter 4 of *ARB No. 43* [section 5121]. When applying the literal rule of *cost or market, whichever is lower,* in translated financial statements, *translated market* shall be current foreign currency replacement cost translated at the current rate,[2] except that:

a. *Translated market* shall not exceed foreign currency net realizable value translated at the current rate;[3] and

b. *Translated market* shall not be less than foreign currency net realizable value reduced by an allowance for an approximately normal profit margin translated at the current rate.[4]

.06 Literal application of the rule of *cost or market, whichever is lower,* will require an inventory write-down[5] in dollar financial statements for locally acquired inventory[6] if the value of the

---

[2] In the case of replacement by *reproduction,* certain elements of replacement cost (e. g., depreciation included in inventory) may need to be translated at historical rates to determine *translated market.*

[3] See footnote 2 above.

[4] In the case of replacement by *purchase,* if *normal profit margin* is viewed as being other than *gross profit margin,* translation entirely at the current rate may not be appropriate. In the case of replacement by *reproduction,* if *normal profit margin* is viewed as other than *gross profit margin,* certain elements, in addition to those referred to in footnote 2, may need to be translated at historical rates.

[5] As to interim periods, paragraph 14(c) of *APB Opinion No. 28* [section 2071.14], "Interim Financial Reporting," states:

> Inventory losses from market declines should not be deferred beyond the interim period in which the decline occurs. Recoveries of such losses on the same inventory in later interim periods of the same fiscal year through market price recoveries should be recognized as gains in the later interim period. Such gains should not exceed previously recognized losses. Some market declines at interim dates, however, can reasonably be expected to be restored in the fiscal year. Such *temporary* market declines need not be recognized at the interim date since no loss is expected to be incurred in the fiscal year.

[6] An inventory write-down may also be required for imported inventory.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

foreign currency has declined in relation to the dollar between the date the foreign operation acquired its inventory and the date of the foreign operation's balance sheet unless foreign currency replacement costs or selling prices have increased sufficiently so that translated market measured in dollars exceeds translated historical cost. Paragraphs .07—.09 illustrate literal application of the rule *in dollars.*

.07 Assume the following:

a. When the rate is FC 1 = $2.40, a foreign subsidiary of a U. S. company purchases a unit of inventory at a cost of FC 500 (measured in dollars, $1,200),

b. At the foreign subsidiary's balance sheet date, the current rate is FC 1 = $2.00 and the current replacement cost of the unit of inventory is FC 560 (measured in dollars, $1,120),

c. Net realizable value is FC 630 (measured in dollars, $1,260),

d. Net realizable value reduced by an allowance for an approximately normal profit margin is FC 550 (measured in dollars, $1,100).

Because current replacement cost measured in dollars ($1,120) is less than translated historical cost ($1,200), an inventory write-down of $80 is required in the dollar financial statements.

.08 Assume the same information as given in the preceding example except that current replacement cost at the foreign subsidiary's balance sheet date is FC 620. Because market measured in dollars (FC 620 × $2.00 = $1,240) exceeds translated historical cost (FC 500 × $2.40 = $1,200), an inventory write-down is not required in the dollar financial statements.

.09 As a further example, assume the same information given in paragraph .07 except that foreign currency selling prices have increased so that net realizable value is FC 720, and net realizable value reduced by an allowance for an approximately normal profit margin is FC 640. In this case, because replacement cost measured in dollars (FC 560 × $2.00 = $1,120) is less than net realizable value reduced by an allowance for an approximately normal profit margin measured in dollars (FC 640 × $2.00 = $1,280), translated market is $1,280. Because translated market ($1,280) exceeds translated historical cost (FC 500 × $2.40 = $1,200), an inventory write-down is not required in the dollar financial statements.

.10 Disclosure of inventory write-downs that result from applying the rule of *cost or market, whichever is lower,* is specified by *ARB No. 43,* Chapter 4, paragraph 14 [section 5121.14], as follows:

> When substantial and unusual losses result from the application of this rule it will frequently be desirable to disclose the amount of the loss in the income statement as a charge separately identified from the consumed inventory costs described as *cost of goods sold.*

Paragraph 16 of Statement No. 8 [section 1083.016] specifies that "exchange gains or losses are a consequence of translation . . ."; that is, "they result from the procedures specified in paragraphs 7(b) [section 1083.007(b)] and 11—13 [section 1083.011—.013]. . . ." Inventory write-downs are a consequence of applying the rule of *cost or market, whichever is lower,* in translated financial statements as required by paragraph 14 of Statement No. 8 [section 1083.014] and, accordingly, are not exchange losses. Therefore, such inventory write-downs in translated financial statements shall *not* be included in the aggregate exchange gain or loss required to be disclosed pursuant to paragraph 32 of Statement No. 8 [section 1083.032], but shall be reported in accordance with paragraph 14 of Chapter 4 of *ARB No. 43* [section 5121.14] and, in addition, included in the disclosures made pursuant to paragraph 33 of Statement No. 8 [section 1083.033].

EFFECTIVE DATE AND TRANSITION

.11 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods ending after March 15, 1977. Earlier application is encouraged in financial statements for annual and interim periods ending before March 16, 1977 that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued annual or interim financial statements unless it is being applied concurrently with initial application of *FASB Statement No. 8* [section 1083], in which case previously issued financial statements shall be restated in accordance with either paragraph 35 or 36 of Statement No. 8 [section 1083.035 or 1083.036].

AC Section 1084

Accounting for Forward Exchange Contracts

an amendment of section 1083
[Source: FASB Statement No. 20.]

December 1977

INTRODUCTION AND BACKGROUND INFORMATION

.01 Paragraph 27 of *FASB Statement No. 8* [section 1083.027], "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements," specifies conditions that must be met to defer a gain or loss on a forward exchange contract (*forward contract*). Paragraph 27 [section 1083.027] states that:

> . . . a forward contract shall be considered a hedge of an identifiable foreign currency commitment . . ., provided *all* of the following conditions are met:
>
> a) The life of the forward contract extends from the foreign currency commitment date to the anticipated transaction date . . . or a later date. . . .
>
> b) The forward contract is denominated in the same currency as the foreign currency commitment and for an amount that is the same or less than the amount of the foreign currency commitment.
>
> c) The foreign currency commitment is firm and uncancelable.

With respect to the application of those conditions, the FASB has been asked:

a. Whether an enterprise may defer a gain or loss on a forward contract that is intended to hedge a commitment that was entered into before the effective date of *FASB Statement No. 8* [1] [section 1083] even though the life of the forward contract does not extend from the commitment date.

b. Whether an enterprise may defer a gain or loss on a portion of a forward contract in excess of the related commitment to the extent that the forward contract is intended to provide a hedge of the commitment on an after-tax basis, i. e., to assure that the gain or loss on the forward contract offsets the effects of an exchange rate change on the foreign currency exposure related to the commitment, after considering the net related tax effects.

---

[1] For purposes of this Statement, the effective date of Statement No. 8 [section 1083] means the date that an enterprise first applied the provisions of Statement No. 8 [section 1083].

Hedging a Commitment Entered into before Section 1083 Became Effective

.02 By specifying that the life of a forward contract must extend from the foreign currency commitment date, paragraph 27(a) of *FASB Statement No. 8* [section 1083.027(a)] would appear to preclude the deferral of a gain or loss on any forward contract entered into after the commitment date. However, that was not the intent of the Board if a forward contract is intended to hedge a commitment entered into before the effective date of Statement No. 8 [section 1083]. Accordingly, the Board is specifying a transition period during which an enterprise may enter into a forward contract to hedge an existing commitment that was entered into before the effective date of Statement No. 8 [section 1083]. For purposes of determining compliance with the conditions for deferral of a gain or loss, such a forward contract will be considered to have met the condition of paragraph 27(a) [section 1083.027(a)] even though its life does not extend from the foreign currency commitment date.

Hedging on an After-Tax Basis

.03 Paragraph 24 of *FASB Statement No. 8* [section 1083.024] states, "a gain or loss shall be deferred and included in the measurement of the dollar basis of the related foreign currency transaction if the gain or loss pertains to a forward contract that is intended to be a hedge of an identifiable foreign currency commitment that meets the conditions described in paragraph 27 [section 1083.027]." The reason for that requirement is explained in paragraphs 207 and 208 of Statement No. 8 [sections 1083.207 and 1083.208].

.04 Paragraph 27 of *FASB Statement No. 8* [section 1083.027] limits the deferral of a gain or loss on a forward contract to the gain or loss pertaining to the portion of the forward contract that is not in excess of the related commitment. Thus, any gain or loss pertaining to a portion of a forward contract in excess of the related commitment is included in the determination of net income currently. After consideration of the question of hedging on an after-tax basis, the Board has decided that paragraph 27 of Statement No. 8 [section 1083.027] should be amended to require the deferral of a gain or loss on a portion of a forward contract *in excess of the related commitment* if certain conditions have been met. Those conditions are specified in paragraph .10 of this Statement.

.05 An Exposure Draft of a proposed Statement on "Accounting for Forward Exchange Contracts" was issued on November 7, 1977. The Board received 30 letters of comment in response to the Exposure Draft, virtually all of which expressed agreement.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

.06 Some respondents recommended that the final Statement should include other amendments of *FASB Statement No. 8* [section 1083] in addition to the provisions in the Exposure Draft, including an amendment to permit the gain or loss pertaining to a hedge of a net monetary position on an after-tax basis to be determined by the method specified in paragraph 25 of Statement No. 8 [section 1083.025]. The Board concluded that consideration of other possible amendments of Statement No. 8 [section 1083] should not delay the issuance of this Statement and noted that the determination of the gain or loss pertaining to a hedge of a net monetary position on an after-tax basis by the method specified in paragraph 25 is not now precluded by Statement No. 8 [section 1083.025].

.07 Some respondents questioned whether the requirement of the Exposure Draft to include the gain or loss pertaining to the portion of a forward contract that is intended to provide a hedge on an after-tax basis as an offset to the related tax effects is contrary to APB Opinion No. 11 [section 4091], "Accounting for Income Taxes." The Board concluded that such a requirement is not contrary to Opinion No. 11 [section 4091] and does not modify the disclosure requirements of paragraph 60 of that Opinion [section 4091.59]. However, the Board concluded that tax effects related to a hedge of a net monetary position should not be offset. The Board believes that with respect to a hedge of a commitment the requirement to offset a gain or loss against the related tax effects is consistent with paragraph 24 of *FASB Statement No. 8* [section 1083.024], which requires a deferred gain or loss pertaining to a forward contract that is intended to hedge an identifiable commitment to be included as an adjustment of the dollar basis of the foreign currency transaction. Further, the Board believes that with respect to a hedge of a net monetary position the requirement not to offset the related tax effects is consistent with the conclusion in paragraph 212 of Statement No. 8 [section 1083.212], which views such forward contracts as independent transactions.

.08 The Board has concluded that on the basis of existing data it can reach an informed decision without a public hearing and that the effective date and transition specified in paragraphs .14 and .15 are advisable in the circumstances.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

.09 For purposes of applying paragraph 27 of *FASB Statement No. 8* [section 1083.027], a forward contract that is intended to hedge an identifiable foreign currency commitment entered into before the effective date of Statement No. 8 [section 1083] shall

be deemed to have met the conditions specified in paragraph 27(a) of Statement No. 8 [section 1083.027(a)] if the life of the forward contract extends from a date prior to March 31, 1978 to the anticipated transaction date [2] or a later date.[3]

.10 If the conditions of paragraph 27 of *FASB Statement No. 8* [section 1083.027] as amended are met, a gain or loss pertaining to a portion of a forward contract *in excess of the related commitment* shall be deferred to the extent that the forward contract is intended to provide a hedge on an after-tax basis. A gain or loss so deferred shall be included as an offset to the related tax effects in the period in which such tax effects are recognized.[4] A gain or loss that has been offset against related tax effects shall not be included in the aggregate exchange gain or loss disclosure required by paragraph 32 of Statement No. 8 [section 1083.032].

.11 A gain or loss pertaining to the portion of a forward contract in excess of the amount that provides a hedge on an after-tax basis shall not be deferred. Likewise, a gain or loss pertaining to a period after the transaction date of the related commitment shall not be deferred.

Amendments to Section 1083

.12 Paragraph 35 of *FASB Statement No. 8* [section 1083.035] is amended to add the following as the last sentence:

> For purposes of applying the provisions of paragraph .027(a) of this Statement, *FASB Statement No. 20* [section 1084] provides a limited exception for forward contracts that are intended to hedge commitments entered into before the provisions of this Statement are initially applied.

.13 The words "and for an amount that is the same or less than the amount of the foreign currency commitment" in paragraph 27(b) of *FASB Statement No. 8* [section 1083.027(b)] are deleted. The last two sentences of paragraph 27 of Statement No. 8 [section 1083.027] are superseded by the following:

> The portion of a forward contract that shall be accounted for pursuant to paragraph .024 is limited to the amount of the related commitment. If a forward contract that meets conditions (a) through (c) above exceeds the amount of the related commitment, the gain

[2] See footnote 9 of Statement No. 8 [section 1083.027].

[3] See footnote 10 of Statement No. 8 [section 1083.027].

[4] The requirement to offset such gains or losses against the related tax effects does not modify the disclosure requirements of paragraph 60 of *APB Opinion No. 11* [section 4091.59].

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

or loss pertaining to a portion of the forward contract in excess of the commitment shall be deferred to the extent that the forward contract is intended to provide a hedge on an after-tax basis. A gain or loss so deferred shall be included as an offset to the related tax effects in the period in which such tax effects are recognized. A gain or loss that has been offset against related tax effects shall not be included in the aggregate exchange gain or loss disclosure required by paragraph .032. A gain or loss pertaining to the portion of a forward contract in excess of the amount that provides a hedge on an after-tax basis shall not be deferred. Likewise, a gain or loss pertaining to a period after the transaction date of the related commitment shall not be deferred.

Effective Date and Transition

.14 This Statement shall be effective prospectively beginning January 1, 1978. Earlier application is encouraged in financial statements for annual and interim periods ending before January 1, 1978 that have not been previously issued. Previously issued annual or interim financial statements shall not be restated to comply with the provisions of this Statement.

.15 An enterprise that has hedged a foreign currency commitment with a forward contract that meets the conditions of paragraph 27 of *FASB Statement No. 8* [section 1083.027] as amended, and, prior to March 31, 1978, has entered into a forward contract for an amount in excess of the related commitment shall defer the gain or loss on the amount of the excess that is intended to provide a hedge on an after-tax basis. Any gain or loss with respect to such excess that has been previously recognized in the determination of net income shall not be restated.

The provisions of this Statement need not be applied to immaterial items.

Appendix A

EXAMPLE OF APPLICATION OF THIS STATEMENT

.16 The following example provides guidance for applying paragraphs .10 and .11 of this Statement.

General Assumptions

.17 Assume the following:

a. ABC Company and XYZ Company, a wholly owned foreign subsidiary of ABC Company, both have fiscal years ending December 31.

b. On November 1, 1978, when the exchange rate is FC1 = $1, XYZ Company enters into a commitment to sell for FC2,120,000 on March 1, 1979 certain previously acquired and paid for assets having a cost of FC1,720,000 ($1,720,000).

c. Foreign income is subject to foreign taxes at the rate of 10 percent.

d. U.S. income is subject to U.S. taxes at the rate of 48 percent.

e. XYZ Company will invest its undistributed earnings indefinitely. Accordingly, under the provisions of *APB Opinion No. 23* [section 4095], "Accounting for Income Taxes—Special Areas," no U.S. income taxes are provided on XYZ Company's undistributed earnings in ABC Company's consolidated financial statements.

f. The forward rate is FC1 = $1. (This example assumes that there is no premium or discount.)

.18 Given the above assumptions, if the exchange rate does not change, ABC Company's reportable pre-tax profit in dollars from the transaction is $400,000 [$2,120,000 (FC2,120,000 x $1) selling price less $1,720,000 cost] and reportable after-tax profit in dollars is $360,000 [$400,000 pre-tax profit less $40,000 (FC40,000 x $1) foreign taxes].

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

.19 Assume the same information as given in paragraph .17 and that the exchange rate changes on December 31, 1978 to FC1 = $.90 and that it remains unchanged through March 1, 1979. In this case, ABC Company's reportable pre-tax profit in dollars from the transaction is $188,000 [$1,908,000 (FC2,120,000 x $.90) selling price less $1,720,000 cost] and reportable after-tax profit is $152,000 [$188,000 pre-tax profit less $36,000 (FC40,000 x $.90) foreign taxes].

.20 Assume further that on November 1, 1978 ABC Company entered into a forward contract to sell forward FC5,000,000 for delivery on March 1, 1979 to hedge XYZ Company's commitment on an after-tax basis and to hedge a specific exposed monetary item of FC1,000,000 of ABC Company. The amount of a forward contract necessary to hedge the sales commitment in full on an after-tax basis is FC4,000,000, computed by dividing the net foreign currency exposure of FC2,080,000 by 52 percent (the complement of the U.S. income tax rate of 48 percent). In other words, a forward contract of FC4,000,000 assures that the effects of any exchange rate change on the foreign currency exposure related to the commitment will be offset by the gain or loss on the forward contract, after considering the net related tax effects. Accordingly, pursuant to paragraph .11 of this Statement, ABC Company cannot defer any gain or loss pertaining to the portion of the forward contract in excess of FC4,000,000. Given the above assumptions, an exchange rate change to FC1 = $.90 on December 31, 1978 results in the following:

Gain on forward contract (determined by the method specified in paragraph 25 of Statement No. 8 [section 1083.025]):

Total forward contract	FC	5,000,000
Exchange rate change	x	($1 - $.90)
Gain on forward contract	$	500,000

Portion of gain deferrable as a hedge of foreign currency sales commitment:

Forward contract	FC	2,120,000
Exchange rate change	x	($1 - $.90)
Gain deferrable as a hedge of foreign currency sales commitment	$	212,000

Portion of gain deferrable as a hedge of the net related tax effects (pursuant to paragraph .10 of this Statement):

Forward contract	FC	1,880,000
Exchange rate change	x	($1 - $.90)
Gain deferrable as hedge of net related tax effects	$	188,000

Portion of gain to be recognized in period in which exchange rate changes (pursuant to paragraph .11 of this Statement):

Forward contract	FC	1,000,000
Exchange rate change	x	($1 - $.90)
Gain to be recognized in period in which exchange rate changes	$	100,000

Calculation of net related tax effects:

Amount of forward contract intended to hedge the sales commitment on an after-tax basis	FC	4,000,000
Exchange rate change	x	($1 - $.90)
Gain on forward contract	$	400,000
U.S. income tax rate		48%
U.S. income taxes attributable to the gain on the forward contract		192,000
Reduction of foreign taxes in dollars resulting from exchange rate change (see below)		4,000
Net related tax effects	$	188,000

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Calculation of reduction of foreign taxes in dollars resulting from exchange rate change:

Selling price	FC	2,120,000
Cost		1,720,000
Pre-tax profit	FC	400,000
Foreign tax rate		10%
Foreign taxes	FC	40,000
Exchange rate change	x	($1 - $.90)
Reduction of foreign taxes in dollars resulting from exchange rate change	$	4,000

If the exchange rate remains at FC1 = $.90 through March 1, 1979, pursuant to paragraph 24 of *FASB Statement No. 8* [section 1083.024], the deferred gain of $212,000 would be included in the measurement of the dollar basis of the selling price of the assets on March 1, 1979. Also, pursuant to paragraph .10 of this Statement, the deferred gain of $188,000 would be included as an offset to the related tax effects in the period in which such tax effects are recognized.

AC Section 1091

Accounting for Business Combinations

[Source: APB Opinion No. 16, as amended.]

Effective to account for business combinations initiated after October 31, 1970, unless otherwise indicated [1]

SUMMARY

Problem

.01 A business combination occurs when a corporation and one or more incorporated or unincorporated businesses are brought together into one accounting entity. The single entity carries on the activities of the previously separate, independent enterprises.

.02 Two methods of accounting for business combinations—"purchase" and "pooling of interests"—have been accepted in practice and supported in pronouncements of the Board and its predecessor, the Committee on Accounting Procedure. The accounting treatment of a combination may affect significantly the reported financial position and net income of the combined corporation for prior, current, and future periods.

.03 The Director of Accounting Research of the American Institute of Certified Public Accountants has published two studies on accounting for business combinations and the related goodwill: Accounting Research Study No. 5, *A Critical Study of Accounting for Business Combinations,* by Arthur R. Wyatt and Accounting Research Study No. 10, *Accounting for Goodwill,* by George R. Catlett and Norman O. Olson.[2] The two studies describe the origin and development of the purchase and pooling of interests methods of accounting for business combinations. The studies also cite the supporting authoritative pronouncements and their influences on accounting practices and evaluate the effects of practices on financial reporting.

Scope and Effect of Section

.04 The Board has considered the conclusions and recommendations of Accounting Research Studies Nos. 5

[1] See paragraphs .97—.99.

[2] Accounting research studies are not pronouncements of the Board or of the Institute but are published for the purpose of stimulating discussion on important accounting matters.

and 10, the discussions of the need for and appropriateness of the two accepted methods of accounting for business combinations, and proposals for alternative accounting methods. It has also observed the present treatments of combinations in various forms and under differing conditions. The Board expresses in this section its conclusions on accounting for business combinations.

.05 This section covers the combination of a corporation and one or more incorporated or unincorporated businesses; both incorporated and unincorporated enterprises are referred to in this section as companies. The conclusions of this section apply equally to business combinations in which one or more companies become subsidiary corporations, one company transfers its net assets to another, and each company transfers its net assets to a newly formed corporation. The acquisition of some or all of the stock held by minority stockholders of a subsidiary is not a business combination, but paragraph .43 of this section specifies the applicable method of accounting. The term business combination in this section excludes a transfer by a corporation of its net assets to a newly formed substitute corporate entity chartered by the existing corporation and a transfer of net assets or exchange of shares between companies under common control (control is described in section 2051.03), such as between a parent corporation and its subsidiary or between two subsidiary corporations of the same parent. This section does not specifically discuss the combination of a corporation and one or more unincorporated businesses or of two or more unincorporated businesses, but its provisions should be applied as a general guide.

.06 This section applies to regulated companies in accordance with the provisions of section 6011, *Accounting Principles for Regulated Industries.*

.07 The conclusions of this section modify previous views of the Board and its predecessor committee.

Conclusions

.08 The Board concludes that the purchase method and the pooling of interests method are both acceptable in accounting for business combinations, although not as alter-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

natives in accounting for the same business combination. A business combination which meets specified conditions requires accounting by the pooling of interests method. A new basis of accounting is not permitted for a combination that meets the specified conditions, and the assets and liabilities of the combining companies are combined at their recorded amounts. All other business combinations should be accounted for as an acquisition of one or more companies by a corporation. The cost to an acquiring corporation of an entire acquired company should be determined by the principles of accounting for the acquisition of an asset. That cost should then be allocated to the identifiable individual assets acquired and liabilities assumed based on their fair values; the unallocated cost should be recorded as goodwill.

BACKGROUND

Present Accounting and Its Development

Development of Two Methods

.09 Most business combinations before World War II were classified either as a "merger," the acquisition of one company by another, or as a "consolidation," the formation of a new corporation. Accounting for both types of combinations generally followed traditional principles for the acquisition of assets or issuance of shares of stock. The accounting adopted by some new corporations was viewed as a precedent for the combining of retained earnings and of amounts of net assets recorded by predecessor corporations as retained earnings and net assets of a new entity.

.10 Emphasis shifted after World War II from the legal form of the combination to distinctions between "a continuance of the former ownership or a new ownership" (ARB No. 40, paragraph 1). New ownership was accounted for as a purchase; continuing ownership was accounted for as a pooling of interests. Carrying forward the stockholders' equity, including retained earnings, of the constituents became an integral part of the pooling of interests method. Significant differences between the purchase and pooling of interests methods accepted today are in the amounts ascribed to assets and liabilities at the time of combination and income reported for the combined enterprise.

Purchase Method [3]

.11 The purchase method accounts for a business combination as the acquisition of one company by another. The acquiring corporation records at its cost the acquired assets less liabilities assumed. A difference between the cost of an acquired company and the sum of the fair values of tangible and identifiable intangible assets less liabilities is recorded as goodwill. The reported income of an acquiring corporation includes the operations of the acquired company after acquisition, based on the cost to the acquiring corporation.

Pooling of Interests Method [4]

.12 The pooling of interests method accounts for a business combination as the uniting of the ownership interests of two or more companies by exchange of equity securities. No acquisition is recognized because the combination is accomplished without disbursing resources of the constituents. Ownership interests continue and the former bases of accounting are retained. The recorded assets and liabilities of the constituents are carried forward to the combined corporation at their recorded amounts. Income of the combined corporation includes income of the constituents for the entire fiscal period in which the combination occurs. The reported income of the constituents for prior periods is combined and restated as income of the combined corporation.

.13 The original concept of pooling of interests as a fusion of equity interests was modified in practice as use of the method expanded.[4] The method was first applied in accounting for combinations of affiliated corporations and then extended to some combinations of unrelated corporate

[3] This section refers to the "purchase method of accounting" for a business combination because the term is widely used and generally understood. However, the more inclusive terms "acquire" (to come into possession of) and "acquisition" are generally used to describe transactions rather than the more narrow term "purchase" (to acquire by the payment of money or its equivalent). The broader terms clearly encompass obtaining assets by issuing stock as well as by disbursing cash and thus avoid the confusion that results from describing a stock transaction as a "purchase." This section does not describe a business combination accounted for by the pooling of interests method as an "acquisition" because the meaning of the word is inconsistent with the method of accounting.

[4] The origin, development, and application of the pooling of interests method of accounting are traced in Accounting Research Study No. 5 and summarized in Accounting Research Study No. 10.

© 1974, American Institute of Certified Public Accountants, Inc.

ownership interests of comparable size. The method was later accepted for most business combinations in which common stock was issued. New and complex securities have been issued in recent business combinations and some combination agreements provide for additional securities to be issued later depending on specified events or circumstances. Most of the resulting combinations are accounted for as poolings of interests. Some combinations effected by both disbursing cash and issuing securities are now accounted for as a "part purchase, part pooling."

.14 Some accountants believe that the pooling of interests method is the only acceptable method for a combination which meets the requirements for pooling. Others interpret the existing pronouncements on accounting for business combinations to mean that a combination which meets the criteria for a pooling of interests may alternatively be accounted for as a purchase.

Appraisal of Accepted Methods of Accounting

.15 The pooling of interests method of accounting is applied only to business combinations effected by an exchange of stock and not to those involving primarily cash, other assets, or liabilities. Applying the purchase method of accounting to business combinations effected by paying cash, distributing other assets, or incurring liabilities is not challenged. Thus, those business combinations effected primarily by an exchange of equity securities present a question of choice between the two accounting methods.

.16 The significantly different results of applying the purchase and pooling of interests methods of accounting to a combination effected by an exchange of stock stem from distinct views of the nature of the transaction itself. Those who endorse the pooling of interests method believe that an exchange of stock to effect a business combination is in substance a transaction between the combining stockholder groups and does not involve the corporate entities. The transaction therefore neither requires nor justifies establishing a new basis of accountability for the assets of the combined corporation. Those who endorse the purchase method believe that the transaction is an issue of stock by a corporation for consideration received from those who become stockholders by the transaction. The consideration

received is established by bargaining between independent parties, and the acquiring corporation accounts for the additional assets at their bargained—that is, current—values.

Purchase Method

.17 The more important arguments expressing the advantages and disadvantages of the purchase method and some of the practical difficulties experienced in implementing it are summarized in paragraphs .18 to .26.

.18 *An acquisition.* Those who favor the purchase method of accounting believe that one corporation acquires another company in almost every business combination. The acquisition of one company by another and the identities of the acquiring and acquired companies are usually obvious. Generally, one company in a business combination is clearly the dominant and continuing entity and one or more other companies cease to control their own assets and operations because control passes to the acquiring corporation.

.19 *A bargained transaction.* Proponents of purchase accounting hold that a business combination is a significant economic event which results from bargaining between independent parties. Each party bargains on the basis of his assessment of the current status and future prospects of each constituent as a separate enterprise and as a contributor to the proposed combined enterprise. The agreed terms of combination recognize primarily the bargained values and only secondarily the costs of assets and liabilities carried by the constituents. In fact, the recorded costs are not always known by the other bargaining party.

.20 Accounting by the purchase method is essentially the same whether the business combination is effected by distributing assets, incurring liabilities, or issuing stock because issuing stock is considered an economic event as significant as distributing assets or incurring liabilities. A corporation must ascertain that the consideration it receives for stock issued is fair, just as it must ascertain that fair value is received for cash disbursed. Recipients of the stock similarly appraise the fairness of the transaction. Thus, a business combination is a bargained transaction regardless of the nature of the consideration.

© 1974, American Institute of Certified Public Accountants, Inc.

.21 *Reporting economic substance.* The purchase method adheres to traditional principles of accounting for the acquisition of assets. Those who support the purchase method of accounting for business combinations effected by issuing stock believe that an acquiring corporation accounts for the economic substance of the transaction by applying those principles and by recording:

a. All assets and liabilities which comprise the bargained cost of an acquired company, not merely those items previously shown in the financial statements of an acquired company.

b. The bargained costs of assets acquired less liabilities assumed, not the costs to a previous owner.

c. The fair value of the consideration received for stock issued, not the equity shown in the financial statements of an acquired company.

d. Retained earnings from its operations, not a fusion of its retained earnings and previous earnings of an acquired company.

e. Expenses and net income after an acquisition computed on the bargained cost of acquired assets less liabilities, not on the costs to a previous owner.

.22 *Defects attributed to purchase method.* Applying the purchase method to business combinations effected primarily by issuing stock may entail difficulties in measuring the cost of an acquired company if neither the fair value of the consideration given nor the fair value of the property acquired is clearly evident. Measuring fair values of assets acquired is complicated by the presence of intangible assets or other assets which do not have discernible market prices. Goodwill and other unidentifiable intangible assets are difficult to value directly, and measuring assets acquired for stock is easier if the fair value of the stock issued is determinable. The excess of the value of stock issued over the sum of the fair values of the tangible and identifiable intangible assets acquired less liabilities assumed indicates the value of acquired unidentified intangible assets (usually called goodwill).

.23 However, the fair value of stock issued is not always objectively determinable. A market price may not

be available for a newly issued security or for securities of a closely held corporation. Even an available quoted market price may not always be a reliable indicator of fair value of consideration received because the number of shares issued is relatively large, the market for the security is thin, the stock price is volatile, or other uncertainties influence the quoted price. Further, the determinable value of one security may not necessarily indicate the fair value of another similar, but not identical, security because their differences affect the value—for example, the absence of registration or an agreement which restricts a holder's ability to sell a security may significantly affect its value.

.24 Those who oppose applying the purchase method to some or most business combinations effected by stock also challenge the theoretical merits of the method. They contend that the goodwill acquired is stated only by coincidence at the value which would be determined by direct valuation. The weakness is attributed not to measurement difficulties (direct valuation of goodwill is assumed) but to the basis underlying an exchange of shares of stock. Bargaining in that type of transaction is normally based on the market prices of the equity securities. Market prices of the securities exchanged are more likely to be influenced by anticipated earnings capacities of the companies than by evaluations of individual assets. The number of shares of stock issued in a business combination is thus influenced by values attributed to goodwill of the acquirer as well as goodwill of the acquired company. Since the terms are based on the market prices of both stocks exchanged, measuring the cost of an acquired company by the market price of the stock issued may result in recording acquired goodwill at more or less than its value determined directly.

.25 A related argument is that the purchase method is improper accounting for a business combination in which a relatively large number of shares of stock is issued because it records the goodwill and fair values of only the acquired company. Critics of purchase accounting say that each group of stockholders of two publicly held and actively traded companies evaluates the other stock, and the exchange ratio for stock issued is often predicated on relative market values. The stockholders and management of each company evaluate the goodwill and fair values of the other.

 © 1974, American Institute of Certified Public Accountants, Inc.

Purchase accounting is thus viewed as illogical because it records goodwill and values of only one side of the transaction. Those who support this view prefer that assets and liabilities of both companies be combined at existing recorded amounts, but if one side is to be stated at fair values, they believe that both sides should be recorded at fair values.

.26 Criticism of the purchase method is directed not only to the theoretical and practical problems of measuring goodwill in combinations effected primarily by stock but also to accounting after the combination for goodwill recorded by the purchase method. Present accounting for goodwill, which often has an indeterminate useful life, is cited as an example of lack of uniformity because selecting among alternative methods of accounting is discretionary.

Pooling of Interests Method

.27 The more important arguments expressing the advantages and disadvantages of the pooling of interests method and some of the practical difficulties experienced in implementing it are summarized in paragraphs .28 to .41.

.28 *Validity of the concept.* Those who support the pooling of interests method believe that a business combination effected by issuing common stock is different from a purchase in that no corporate assets are disbursed to stockholders and the net assets of the issuing corporation are enlarged by the net assets of the corporation whose stockholders accept common stock of the combined corporation. There is no newly invested capital nor have owners withdrawn assets from the group since the stock of a corporation is not one of its assets. Accordingly, the net assets of the constituents remain intact but combined; the stockholder groups remain intact but combined. Aggregate income is not changed since the total resources are not changed. Consequently, the historical costs and earnings of the separate corporations are appropriately combined. In a business combination effected by exchanging stock, groups of stockholders combine their resources, talents, and risks to form a new entity to carry on in combination the previous businesses and to continue their earnings streams. The sharing of risks by the constituent stockholder groups

is an important element in a business combination effected by exchanging stock. By pooling equity interests, each group continues to maintain risk elements of its former investment and they mutually exchange risks and benefits.

.29 A pooling of interests transaction is regarded as in substance an arrangement among stockholder groups. The fractional interests in the common enterprise are reallocated—risks are rearranged among the stockholder groups outside the corporate entity. A fundamental concept of entity accounting is that a corporation is separate and distinct from its stockholders. Elected managements represent the stockholders in bargaining to effect a combination, but the groups of stockholders usually decide whether the proposed terms are acceptable by voting to approve or disapprove a combination. Stockholders sometimes disapprove a combination proposed by management, and tender offers sometimes succeed despite the opposition of management.

.30 Each stockholder group in a pooling of interests gives up its interests in assets formerly held but receives an interest in a portion of the assets formerly held in addition to an interest in the assets of the other. The clearest example of this type of combination is one in which both groups surrender their stock and receive in exchange stock of a new corporation. The fact that one of the corporations usually issues its stock in exchange for that of the other does not alter the substance of the transaction.

.31 *Consistency with other concepts.* Proponents of pooling of interests accounting point out that the pooling concept was developed within the boundaries of the historical-cost system and is compatible with it. Accounting by the pooling of interests method for business combinations arranged through the issuance of common stock is based on existing accounting concepts and is not an occasion for revising historical costs. Both constituents usually have elements of appreciation and of goodwill which are recognized and offset, at least to some extent, in setting a ratio of exchange of stock. The bargaining which occurs usually reflects the relative earning capacities (measured by historical-cost accounts) of the constituents and frequently recognizes the relative market values of the two

 © 1974, American Institute of Certified Public Accountants, Inc.

stocks, which in turn reflect earning capacity, goodwill, or other values. Accounting recognizes the bargaining by means of the new number of shares outstanding distributed in accordance with the bargained ratio, which has a direct effect on earnings per share after the combination.

.32 *Usefulness of the concept.* Those who favor the pooling of interests method of accounting believe that the economic substance of a combination is best reflected by reporting operations up to the date of the exchange of stock based on the same historical-cost information used to develop the separate operating results of each constituent. Also, informative comparison with periods prior to the business combination is facilitated by maintaining historical costs as the basis of reporting combined operations subsequent to the combination.

.33 *Application of the concept.* It has been observed that criteria for distinguishing between a pooling and a purchase have eroded over the years and that present interpretations of criteria have led to abuse. However, most accountants who support the pooling concept believe that criteria can be redefined satisfactorily to eliminate abuses. It is their view that the pooling of interests method of accounting for business combinations is justifiable on conceptual grounds and is a useful technique and therefore should be retained.

.34 Some proponents of pooling of interests accounting support a restriction on the difference in size of combining interests because a significant sharing of risk cannot occur if one combining interest is minor or because a meaningful mutual exchange does not occur if the combination involves a relatively small number of shares. Most, however, believe that there is no conceptual basis for a size restriction and that establishing a size restriction would seriously impair pooling of interests accounting.

.35 *Defects attributed to pooling of interests method.* Those who oppose the pooling of interests method of accounting doubt that the method is supported by a concept. In their view it has become essentially a method of accounting for an acquisition of a company without recognizing the current costs of the assets, including goodwill, underlying the transaction. The concept of a pooling of interests

was described in general terms in the past—for example, as a continuity of equity interests or as a combination of two or more interests of comparable size. The descriptions tend to be contradictory. For example, accountants do not agree on whether or not relative size is part of the pooling of interests concept. Attempts to define the concept in terms of broad criteria for applying the method have also been unsuccessful.

.36 Indeed, many opponents of the pooling of interests method of accounting believe that effective criteria cannot be found. The concept of a uniting or fusing of stockholder groups on which pooling of interests accounting is based implies a broad application of the method because every combination effected by issuing stock rather than by disbursing cash or incurring debt is potentially a pooling of interests unless the combination significantly changes the relative equity interests. However, so broad an application without effective criteria results in applying the pooling of interests method to numerous business combinations which are clearly in economic substance the acquisition of one company by another.

.37 Some critics point out that the method was first applied to combining interests of comparable size and that pronouncements on business combinations have never sanctioned applying pooling of interests accounting to all or almost all business combinations effected by exchanging stock. All pronouncements have indicated that a large disparity in the size of the combining interests is evidence that one corporation is acquiring another.

.38 Other criteria restricting application of pooling of interests accounting, such as those prohibiting future disposals of stock received and providing for continuity of management, were added to the size restriction. Those criteria have, however, tended to strengthen the view that one corporation acquires another because they are unilateral, that is, they are applied only to the stockholders and management of the "acquired" company.

.39 The most serious defect attributed to pooling of interests accounting by those who oppose it is that it does not accurately reflect the economic substance of the business combination transaction. They believe that the method

 © 1974, American Institute of Certified Public Accountants, Inc.

ignores the bargaining which results in the combination by accounting only for the amounts previously shown in accounts of the combining companies. The acquiring corporation does not record assets and values which usually influence the final terms of the combination agreement with consequent effects on subsequent balance sheets and income statements. The combined earnings streams, which are said to continue after a pooling of interests, can continue unchanged only if the cost of the assets producing those earnings is identical for the acquiring corporation and the acquired company. That coincidence rarely occurs because the bargaining is based on current values and not past costs.

.40 Pooling of interests accounting is also challenged because the amount of assets acquired less liabilities assumed is recorded without regard to the number of shares of stock issued. The result does not reflect the presumption that a corporation issues stock only for value received and, in general, the greater the number of shares issued, the larger the consideration to be recorded.

.41 Traditional principles of accounting for acquisitions of assets encompass all business combinations because every combination is effected by distributing assets, incurring liabilities, issuing stock, or some blend of the three. Those who oppose the pooling of interests method believe that a departure from the traditional principles is justified only if evidence shows that financial statements prepared according to other principles better reflect the economic significance of a combination. In their opinion, the characteristics of a business combination do not justify departing from traditional principles of accounting to accommodate the pooling of interests method.

OPINION

Applicability of Accounting Methods

.42 The Board finds merit in both the purchase and pooling of interests methods of accounting for business combinations and accepts neither method to the exclusion of the other. The arguments in favor of the purchase method of accounting are more persuasive if cash or other assets are distributed or liabilities are incurred to effect a combination, but arguments in favor of the pooling of in-

terests method of accounting are more persuasive if voting common stock is issued to effect a combination of common stock interests. Therefore, the Board concludes that some business combinations should be accounted for by the purchase method and other combinations should be accounted for by the pooling of interests method.

.43 The Board also concludes that the two methods are not alternatives in accounting for the same business combination. A single method should be applied to an entire combination; the practice now known as part-purchase, part-pooling is not acceptable. The acquisition after the effective date of this section of some or all of the stock held by minority stockholders of a subsidiary—whether acquired by the parent, the subsidiary itself, or another affiliate—should be accounted for by the purchase method rather than by the pooling of interests method.

.44 The Board believes that accounting for business combinations will be improved significantly by specifying the circumstances in which each method should be applied and the procedures which should be followed in applying each method. The *distinctive conditions* which require pooling of interests accounting are described in paragraphs .45 to .48, and combinations involving all of those conditions should be accounted for as described in paragraphs .50 to .65. All other business combinations should be treated as the acquisition of one company by another and accounted for by the purchase method as described in paragraphs .66 to .96.

Conditions for Pooling of Interests Method

.45 The pooling of interests method of accounting is intended to present as a single interest two or more common stockholder interests which were previously independent and the combined rights and risks represented by those interests. That method shows that stockholder groups neither withdraw nor invest assets but in effect exchange voting common stock in a ratio that determines their respective interests in the combined corporation. Some business combinations have those features. A business combination which meets *all* of the conditions specified and explained in paragraphs .46 to .48 should be accounted for by the pooling of interests method. The conditions are classified

 © 1974, American Institute of Certified Public Accountants, Inc.

by (1) attributes of the combining companies, (2) manner of combining interests, and (3) absence of planned transactions.

.46 *Combining companies.* Certain attributes of combining companies indicate that independent ownership interests are combined in their entirety to continue previously separate operations. Combining virtually all of existing common stock interests avoids combining only selected assets, operations, or ownership interests, any of which is more akin to disposing of and acquiring interests than to sharing risks and rights. It also avoids combining interests that are already related by substantial intercorporate investments.

The two conditions in this paragraph define essential attributes of combining companies.

a. Each of the combining companies is autonomous and has not been a subsidiary or division of another corporation within two years before the plan of combination is initiated.

A plan of combination is initiated on the earlier of (1) the date that the major terms of a plan, including the ratio of exchange of stock, are announced publicly or otherwise formally made known to the stockholders of any one of the combining companies or (2) the date that stockholders of a combining company are notified in writing of an exchange offer. Therefore, a plan of combination is often initiated even though consummation is subject to the approval of stockholders and others.

A new company incorporated within the preceding two years meets this condition unless the company is successor to a part of a company or to a company that is otherwise not autonomous for this condition. A wholly owned subsidiary company which distributes voting common stock of its parent corporation to effect the combination is also considered an autonomous company provided the parent corporation would have met all conditions in paragraphs .46 to .48 had the parent corporation issued its stock directly to effect the combination.

Divestiture of assets to comply with an order of a governmental authority or judicial body results in an exception to the terms of this condition. Either a subsidiary divested

under an order or a new company which acquires assets disposed of under an order is therefore autonomous for this condition.

b. Each of the combining companies is independent of the other combining companies.

This condition means that at the dates the plan of combination is initiated and consummated the combining companies hold as intercorporate investments no more than 10 percent in total of the outstanding voting common stock of any combining company.[5] For the percentage computation, intercorporate investments exclude voting common stock that is acquired after the date the plan of combination is initiated in exchange for the voting common stock issued to effect the combination. Investments of 10 percent or less are explained in paragraph .47-b.

.47 *Combining of interests.* The combining of existing voting common stock interests by the exchange of stock is the essence of a business combination accounted for by the pooling of interests method. The separate stockholder interests lose their identities and all share mutually in the combined risks and rights. Exchanges of common stock that alter relative voting rights, that result in preferential claims to distributions of profits or assets for some common stockholder groups, or that leave significant minority interests in combining companies are incompatible with the idea of mutual sharing. Similarly, acquisitions of common stock for assets or debt, reacquisitions of outstanding stock for the purpose of exchanging it in a business combination, and other transactions that reduce the common stock interests are contrary to the idea of combining existing stockholder interests. The seven conditions in this paragraph relate to the exchange to effect the combination.

a. The combination is effected in a single transaction or is completed in accordance with a specific plan within one year after the plan is initiated.

Altering the terms of exchange of stock constitutes initiation of a new plan of combination unless earlier exchanges of stock are adjusted to the new terms.[6]

---

[5] An exception for common stock held on October 31, 1970 is explained in paragraph .99.

[6] However, an adjustment after the effective date of this section in the terms of exchange in a plan of combination initiated before and consum-

 © 1974, American Institute of Certified Public Accountants, Inc.

A business combination completed in more than one year from the date the plan is initiated meets this condition if the delay is beyond the control of the combining companies because proceedings of a governmental authority or litigation prevents completing the combination.

b. A corporation offers and issues only common stock with rights identical to those of the majority of its outstanding voting common stock[7] in exchange for substantially all of the voting common stock interest of another company at the date the plan of combination is consummated.

The plan to issue voting common stock in exchange for voting common stock may include, within limits, provisions to distribute cash or other consideration for fractional shares, for shares held by dissenting stockholders, and the like but may not include a pro rata distribution of cash or other consideration.

Substantially all of the voting common stock means 90 percent or more for this condition. That is, after the date the plan of combination is initiated, one of the combining companies (issuing corporation) issues voting common stock in exchange for at least 90 percent of the voting common stock of another combining company that is outstanding at the date the combination is consummated. The number of shares exchanged therefore excludes those shares of the combining company (1) acquired before and held by the issuing corporation and its subsidiaries at the date the plan of combination is initiated, regardless of the form of consideration,[8] (2) acquired by the issuing corporation and its subsidiaries after the date the plan of combination is initiated other than by issuing its own voting common stock, and (3) outstanding after the date the combination is consummated.

---

mated after the effective date always constitutes initiation of a new plan. The one year specified in this condition is measured, therefore, from the date of adjustment of terms and all other conditions are evaluated for the new plan. (Paragraph .97 describes the application of this section to a plan of combination initiated before the effective date of this section and consummated later in accordance with the terms of exchange prevailing on the effective date.)

[7] A class of stock that has voting control of a corporation is the majority class.

[8] An exception for common stock held on October 31, 1970 is explained in paragraph .99.

An investment in stock of the issuing corporation held by a combining company may prevent a combination from meeting this condition even though the investment of the combining company is not more than 10 percent of the outstanding stock of the issuing corporation (paragraph .46-b). An investment in stock of the issuing corporation by another combining company is the same in a mutual exchange as an investment by the issuing corporation in stock of the other combining company—the choice of issuing corporation is essentially a matter of convenience. An investment in stock of the issuing corporation must be expressed as an equivalent number of shares of the investor combining company because the measure of percent of shares exchanged is in terms of shares of stock of the investor company. An investment in 10 percent or less of the outstanding voting common stock of the issuing corporation affects the measure of percent of shares exchanged in the combination as follows:

> The number of shares of voting common stock of the issuing corporation held by the investor combining company at the date the plan is initiated plus shares it acquired after that date are restated as an equivalent number of shares of voting common stock of the investor combining company based on the ratio of exchange of stock in the combination.
>
> The equivalent number of shares is deducted from the number of shares of voting common stock of the investor combining company exchanged for voting common stock of the issuing corporation as part of the plan of combination.
>
> The reduced number of shares is considered the number exchanged and is compared with 90 percent of the outstanding voting common stock of the investor combining company at the date the plan is consummated to determine whether the terms of condition .47-b are met.

Since the number of shares of voting common stock exchanged is reduced for an intercorporate investment in voting common stock of the issuing corporation, the terms of condition .47-b may not be met even though 90 percent or more of the outstanding common stock of a combining company is exchanged to effect a combination.

 © 1974, American Institute of Certified Public Accountants, Inc.

A combination of more than two companies is evaluated essentially the same as a combination of two companies. The percent of voting common stock exchanged is measured separately for each combining company, and condition .47-b is met if 90 percent or more of the voting common stock of each of the several combining companies is exchanged for voting common stock of the issuing corporation. The number of shares exchanged for stock of the issuing corporation includes only shares exchanged by stockholders other than the several combining companies themselves. Thus, intercorporate investments in combining companies are included in the number of shares of stock outstanding but are excluded from the number of shares of stock exchanged to effect the combination.

A new corporation formed to issue its stock to effect the combination of two or more companies meets condition .47-b if (1) the number of shares of each company exchanged to effect the combination is not less than 90 percent of its voting common stock outstanding at the date the combination is consummated and (2) condition .47-b would have been met had any one of the combining companies issued its stock to effect the combination on essentially the same basis.

Condition .47-b relates to issuing common stock for the common stock interests in another company. Hence, a corporation issuing stock to effect the combination may assume the debt securities of the other company or may exchange substantially identical securities or voting common stock for other outstanding equity and debt securities of the other combining company. An issuing corporation may also distribute cash to holders of debt and equity securities that either are callable or redeemable and may retire those securities. However, the issuing corporation may exchange only voting common stock for outstanding equity and debt securities of the other combining company that have been issued in exchange for voting common stock of that company during a period beginning two years preceding the date the combination is initiated.

A transfer of the net assets of a combining company to effect a business combination satisfies condition .47-b provided all net assets of the company at the date the plan is consummated are transferred in exchange for stock of

the issuing corporation. However, the combining company may retain temporarily cash, receivables, or marketable securities to settle liabilities, contingencies, or items in dispute if the plan provides that the assets remaining after settlement are to be transferred to the corporation issuing the stock to effect the combination. Only voting common stock may be issued to effect the combination unless both voting common stock and other stock of the other combining company are outstanding at the date the plan is consummated. The combination may then be effected by issuing all voting common stock or by issuing voting common and other stock in the same proportions as the outstanding voting common and other stock of the other combining company. An investment in 10 percent or less of the outstanding voting common stock of a combining company held by another combining company requires special computations to evaluate condition .47-b. The computations and comparisons are in terms of the voting common stock of the issuing corporation and involve:

Stock issued for common stock interest. The total number of shares of voting common stock issued for all of the assets[9] is divided between those applicable to outstanding voting common stock and those applicable to other outstanding stock, if any, of the combining company which transfers assets (transferor company).

Reduction for intercorporate investments. The number of issued shares of voting common stock applicable to the voting common stock interests of the transferor combining company is reduced by the sum of (1) the number of shares of voting common stock of the issuing corporation held by the transferor combining company at the date the plan of combination is initiated plus shares it acquired after that date and (2) the number of shares of voting common stock of the transferor combining company held by the issuing corporation at the date the plan of combination is initiated plus shares it acquired after that date. The shares of the transferor combining company are restated as the equivalent number of shares of voting common stock of the issuing corporation for this purpose. Restate-

[9] Including (for this computation) stock of the issuing corporation held by the transferor combining company.

© 1974, American Institute of Certified Public Accountants, Inc.

ment is based on the ratio of the number of shares of voting common stock of the transferor combining company which are outstanding at the date the plan is consummated to the number of issued shares of voting common stock applicable to the voting common stock interests.

Comparison with 90 percent. The reduced number of shares of stock issued is compared with 90 percent of the issued number of shares of voting common stock applicable to voting common stock interests to determine if the transfer of assets meets the terms of condition .47-b.

c. None of the combining companies changes the equity interest of the voting common stock in contemplation of effecting the combination either within two years before the plan of combination is initiated or between the dates the combination is initiated and consummated; changes in contemplation of effecting the combination may include distributions to stockholders and additional issuances, exchanges, and retirements of securities.

Distributions to stockholders which are no greater than normal dividends are not changes for this condition. Normality of dividends is determined in relation to earnings during the period and to the previous dividend policy and record. Dividend distributions on stock of a combining company that are equivalent to normal dividends on the stock to be issued in exchange in the combination are considered normal for this condition.

d. Each of the combining companies reacquires shares of voting common stock only for purposes other than business combinations, and no company reacquires more than a normal number of shares between the dates the plan of combination is initiated and consummated.

Treasury stock acquired for purposes other than business combinations includes shares for stock option and compensation plans and other recurring distributions provided a systematic pattern of reacquisitions is established at least two years before the plan of combination is initiated. A

systematic pattern of reacquisitions may be established for less than two years if it coincides with the adoption of a new stock option or compensation plan. The normal number of shares of voting common stock reacquired is determined by the pattern of reacquisitions of stock before the plan of combination is initiated.

Acquisitions by other combining companies of voting common stock of the issuing corporation after the date the plan of combination is initiated are essentially the same as if the issuing corporation reacquired its own common stock.

e. The ratio of the interest of an individual common stockholder to those of other common stockholders in a combining company remains the same as a result of the exchange of stock to effect the combination.

This condition means that each individual common stockholder who exchanges his stock receives a voting common stock interest exactly in proportion to his relative voting common stock interest before the combination is effected. Thus no common stockholder is denied or surrenders his potential share of a voting common stock interest in a combined corporation.

f. The voting rights to which the common stock ownership interests in the resulting combined corporation are entitled are exercisable by the stockholders; the stockholders are neither deprived of nor restricted in exercising those rights for a period.

This condition is not met, for example, if shares of common stock issued to effect the combination are transferred to a voting trust.

g. The combination is resolved at the date the plan is consummated and no provisions of the plan relating to the issue of securities or other consideration are pending.

This condition means that (1) the combined corporation does not agree to contingently issue additional shares of stock or distribute other consideration at a later date to the former stockholders of a combining company or (2) the combined corporation does not issue or distribute to an escrow agent common stock or other consideration which

 © 1974, American Institute of Certified Public Accountants, Inc.

is to be either transferred to common stockholders or returned to the corporation at the time the contingency is resolved.

An agreement may provide, however, that the number of shares of common stock issued to effect the combination may be revised for the later settlement of a contingency at a different amount than that recorded by a combining company.

.48 *Absence of planned transactions.* Some transactions after a combination is consummated are inconsistent with the combining of entire existing interests of common stockholders. Including those transactions in the negotiations and terms of the combination, either explicitly or by intent, counteracts the effect of combining stockholder interests. The three conditions in this paragraph relate to certain future transactions.

a. The combined corporation does not agree directly or indirectly to retire or reacquire all or part of the common stock issued to effect the combination.

b. The combined corporation does not enter into other financial arrangements for the benefit of the former stockholders of a combining company, such as a guaranty of loans secured by stock issued in the combination, which in effect negates the exchange of equity securities.

c. The combined corporation does not intend or plan to dispose of a significant part of the assets of the combining companies within two years after the combination other than disposals in the ordinary course of business of the formerly separate companies and to eliminate duplicate facilities or excess capacity.

Subsidiary Corporation

.49 Dissolution of a combining company is not a condition for applying the pooling of interests method of accounting for a business combination. One or more combining companies may be subsidiaries of the issuing corporation after the combination is consummated if the other conditions are met.

Application of Pooling of Interests Method

.50 A business combination which meets all of the conditions in paragraphs .45 to .48 should be accounted for by the pooling of interests method. Appropriate procedures are described in paragraphs .51 to .65.

Assets and Liabilities Combined

.51 The recorded assets and liabilities of the separate companies generally become the recorded assets and liabilities of the combined corporation. The combined corporation therefore recognizes those assets and liabilities recorded in conformity with generally accepted accounting principles by the separate companies at the date the combination is consummated.

.52 The combined corporation records the historical-cost based amounts of the assets and liabilities of the separate companies because the existing basis of accounting continues. However, the separate companies may have recorded assets and liabilities under differing methods of accounting and the amounts may be adjusted to the same basis of accounting if the change would otherwise have been appropriate for the separate company. A change in accounting method to conform the individual methods should be applied retroactively, and financial statements presented for prior periods should be restated. (See sections 1051.34-.35, *Accounting Changes.*)

Stockholders' Equity Combined

.53 The stockholders' equities of the separate companies are also combined as a part of the pooling of interests method of accounting. The combined corporation records as capital the capital stock and capital in excess of par or stated value of outstanding stock of the separate companies. Similarly, retained earnings or deficits of the separate companies are combined and recognized as retained earnings of the combined corporation (paragraph .56). The amount of outstanding shares of stock of the combined corporation at par or stated value may exceed the total amount of capital stock of the separate combining companies; the excess should be deducted first from the combined other contributed capital and then from the combined retained earnings. The combined retained earnings

 © 1974, American Institute of Certified Public Accountants, Inc.

could be misleading if shortly before or as a part of the combination transaction one or more of the combining companies adjusted the elements of stockholders' equity to eliminate a deficit; therefore, the elements of equity before the adjustment should be combined.

.54 A corporation which effects a combination accounted for by the pooling of interests method by distributing stock previously acquired as treasury stock (paragraph .47-d) should first account for those shares of stock as though retired. The issuance of the shares for the common stock interests of the combining company is then accounted for the same as the issuance of previously unissued shares.

.55 Accounting for common stock of one of the combining companies which is held by another combining company at the date a combination is consummated depends on whether the stock is the same as that which is issued to effect the combination or is the same as the stock which is exchanged in the combination. An investment of a combining company in the common stock of the issuing corporation is in effect returned to the resulting combined corporation in the combination. The combined corporation should account for the investment as treasury stock. In contrast, an investment in the common stock of other combining companies (not the one issuing stock in the combination) is an investment in stock that is exchanged in the combination for the common stock issued. The stock in that type of intercorporate investment is in effect eliminated in the combination. The combined corporation should account for that investment as stock retired as part of the combination.

Reporting Combined Operations

.56 A corporation which applies the pooling of interests method of accounting to a combination should report results of operations for the period in which the combination occurs as though the companies had been combined as of the beginning of the period. Results of operations for that period thus comprise those of the separate companies combined from the beginning of the period to the date the combination is consummated and those of the combined operations from that date to the end of the period. Elimi-

nating the effects of intercompany transactions from operations before the date of combination reports operations before and after the date of combination on substantially the same basis. The effects of intercompany transactions on current assets, current liabilities, revenue, and cost of sales for periods presented and on retained earnings at the beginning of the periods presented should be eliminated to the extent possible. The nature of and effects on earnings per share of nonrecurring intercompany transactions involving long-term assets and liabilities need not be eliminated but should be disclosed. A combined corporation should disclose in notes to financial statements the revenue, extraordinary items, and net income of each of the separate companies from the beginning of the period to the date the combination is consummated (paragraph .64-d). The information relating to the separate companies may be as of the end of the interim period nearest the date that the combination is consummated.

.57 Similarly, balance sheets and other financial information of the separate companies as of the beginning of the period should be presented as though the companies had been combined at that date. Financial statements and financial information of the separate companies presented for prior years should also be restated on a combined basis to furnish comparative information. All restated financial statements and financial summaries should indicate clearly that financial data of the previously separate companies are combined.

Expenses Related to Combination

.58 The pooling of interests method records neither the acquiring of assets nor the obtaining of capital. Therefore, costs incurred to effect a combination accounted for by that method and to integrate the continuing operations are expenses of the combined corporation rather than additions to assets or direct reductions of stockholders' equity. Accordingly, all expenses related to effecting a business combination accounted for by the pooling of interests method should be deducted in determining the net income of the resulting combined corporation for the period in which the expenses are incurred. Those expenses include, for example, registration fees, costs of furnishing informa-

tion to stockholders, fees of finders and consultants, salaries and other expenses related to services of employees, and costs and losses of combining operations of the previously separate companies and instituting efficiencies.

Disposition of Assets After Combination

.59 A combined corporation may dispose of those assets of the separate companies which are duplicate facilities or excess capacity in the combined operations. Losses or estimated losses on disposal of specifically identified duplicate or excess facilities should be deducted in determining the net income of the resulting combined corporation. However, a loss estimated and recorded while a facility remains in service should not include the portion of the cost that is properly allocable to anticipated future service of the facility.

.60 Profit or loss on other dispositions of assets of the previously separate companies may require special disclosure unless the disposals are part of customary business activities of the combined corporation. Specific treatment of a profit or loss on those dispositions is warranted because the pooling of interests method of accounting would have been inappropriate (paragraph .48-c) if the combined corporation were committed or planned to dispose of a significant part of the assets of one of the combining companies. The Board concludes that a combined corporation should disclose separately a profit or loss resulting from the disposal of a significant part of the assets or a separable segment of the previously separate companies, provided

the profit or loss is material in relation to the net income of the combined corporation, and

the disposition is within two years after the combination is consummated.

The disclosed profit or loss, less applicable income tax effect, should be classified as an extraordinary item.

Date of Recording Combination

.61 A business combination accounted for by the pooling of interests method should be recorded as of the date the combination is consummated. Therefore, even though a business combination is consummated before one or more

of the combining companies first issues its financial statements as of an earlier date, the financial statements issued should be those of the combining company and not those of the resulting combined corporation. A combining company should, however, disclose as supplemental information, in notes to financial statements or otherwise, the substance of a combination consummated before financial statements are issued and the effects of the combination on reported financial position and results of operations (paragraph .65). Comparative financial statements presented in reports of the resulting combined corporation after a combination is consummated should combine earlier financial statements of the separate companies.

.62 A corporation may be reasonably assured that a business combination which has been initiated but not consummated as of the date of financial statements will meet the conditions requiring the pooling of interests method of accounting. The corporation should record as an investment common stock of the other combining company acquired before the statement date. Common stock acquired by disbursing cash or other assets or by incurring liabilities should be recorded at cost. Stock acquired in exchange for common stock of the issuing corporation should, however, be recorded at the proportionate share of underlying net assets at the date acquired as recorded by the other company. Until the pooling of interests method of accounting for the combination is known to be appropriate, the investment and net income of the investor corporation should include the proportionate share of earnings or losses of the other company after the date of acquisition of the stock. The investor corporation should also disclose results of operations for all prior periods presented as well as the entire current period as they will be reported if the combination is later accounted for by the pooling of interests method. After the combination is consummated and the applicable method of accounting is known, financial statements issued previously should be restated as necessary to include the other combining company.

Disclosure of a Combination

.63 A combined corporation should disclose in its financial statements that a combination which is accounted

© 1974, American Institute of Certified Public Accountants, Inc.

for by the pooling of interests method has occurred during the period. The basis of current presentation and restatements of prior periods may be disclosed in the financial statements by captions or by references to notes.

.64 Notes to financial statements of a combined corporation should disclose the following for the period in which a business combination occurs and is accounted for by the pooling of interests method.

a. Name and brief description of the companies combined, except a corporation whose name is carried forward to the combined corporation.

b. Method of accounting for the combination—that is, by the pooling of interests method.

c. Description and number of shares of stock issued in the business combination.

d. Details of the results of operations of the previously separate companies for the period before the combination is consummated that are included in the current combined net income (paragraph .56). The details should include revenue, extraordinary items, net income, other changes in stockholders' equity, and amount of and manner of accounting for intercompany transactions.

e. Descriptions of the nature of adjustments of net assets of the combining companies to adopt the same accounting practices and of the effects of the changes on net income reported previously by the separate companies and now presented in comparative financial statements (paragraph .52).

f. Details of an increase or decrease in retained earnings from changing the fiscal year of a combining company. The details should include at least revenue, expenses, extraordinary items, net income, and other changes in stockholders' equity for the period excluded from the reported results of operations.

g. Reconciliations of amounts of revenue and earnings previously reported by the corporation that issues the stock to effect the combination with the combined amounts currently presented in financial

statements and summaries. A new corporation formed to effect a combination may instead disclose the earnings of the separate companies which comprise combined earnings for prior periods.

The information disclosed in notes to financial statements should also be furnished on a pro forma basis in information on a proposed business combination which is given to stockholders of combining companies.

.65 Notes to the financial statements should disclose details of the effects of a business combination consummated before the financial statements are issued but which is either incomplete as of the date of the financial statements or initiated after that date (paragraph .61). The details should include revenue, net income, earnings per share, and the effects of anticipated changes in accounting methods as if the combination had been consummated at the date of the financial statements (paragraph .52).

Application of Purchase Method

Principles of Historical-Cost Accounting

.66 Accounting for a business combination by the purchase method follows principles normally applicable under historical-cost accounting to recording acquisitions of assets and issuances of stock and to accounting for assets and liabilities after acquisition.

.67 *Acquiring assets.* The general principles to apply the historical-cost basis of accounting to an acquisition of an asset depend on the nature of the transaction:

a. An asset acquired by exchanging cash or other assets is recorded at cost—that is, at the amount of cash disbursed or the fair value of other assets distributed.

b. An asset acquired by incurring liabilities is recorded at cost—that is, at the present value of the amounts to be paid.

c. An asset acquired by issuing shares of stock of the acquiring corporation is recorded at the fair value of the asset[10]—that is, shares of stock issued are

[10] An asset acquired may be an entire entity which may have intangible assets, including goodwill.

 © 1974, American Institute of Certified Public Accountants, Inc.

recorded at the fair value of the consideration received for the stock.

The general principles must be supplemented to apply them in certain transactions. For example, the fair value of an asset received for stock issued may not be reliably determinable, or the fair value of an asset acquired in an exchange may be more reliably determinable than the fair value of a noncash asset given up. Restraints on measurement have led to the practical rule that assets acquired for other than cash, including shares of stock issued, should be stated at "cost" when they are acquired and "cost may be determined either by the fair value of the consideration given or by the fair value of the property acquired, whichever is the more clearly evident."[11] "Cost" in accounting often means the amount at which an entity records an asset at the date it is acquired whatever its manner of acquisition, and that "cost" forms the basis for historical-cost accounting.

.68 *Allocating cost.* Acquiring assets in groups requires not only ascertaining the cost of the assets as a group but also allocating the cost to the individual assets which comprise the group. The cost of a group is determined by the principles described in paragraph .67. A portion of the total cost is then assigned to each individual asset acquired on the basis of its fair value. A difference between the sum of the assigned costs of the tangible and identifiable intangible assets acquired less liabilities assumed and the cost of the group is evidence of unspecified intangible values.

.69 *Accounting after acquisition.* The nature of an asset and not the manner of its acquisition determines an acquirer's subsequent accounting for the cost of that asset. The basis for measuring the cost of an asset—whether amount of cash paid, fair value of an asset received or given up, amount of a liability incurred, or fair value of stock issued—has no effect on the subsequent accounting for that cost, which is retained as an asset, depreciated, amortized, or otherwise matched with revenue.

---

[11] ARB No. 24; the substance was retained in slightly different words in Chapter 5, ARB No. 43 and ARB No. 48.

Acquiring Corporation

.70 A corporation which distributes cash or other assets or incurs liabilities to obtain the assets or stock of another company is clearly the acquirer. The identities of the acquirer and the acquired company are usually evident in a business combination effected by the issue of stock. The acquiring corporation normally issues the stock and commonly is the larger company. The acquired company may, however, survive as the corporate entity, and the nature of the negotiations sometimes clearly indicates that a smaller corporation acquires a larger company. The Board concludes that presumptive evidence of the acquiring corporation in combinations effected by an exchange of stock is obtained by identifying the former common stockholder interests of a combining company which either retain or receive the larger portion of the voting rights in the combined corporation. That corporation should be treated as the acquirer unless other evidence clearly indicates that another corporation is the acquirer. For example, a substantial investment of one company in common stock of another before the combination may be evidence that the investor is the acquiring corporation.

.71 If a new corporation is formed to issue stock to effect a business combination to be accounted for by the purchase method, one of the existing combining companies should be considered the acquirer on the basis of the evidence available.

Determining Cost of an Acquired Company

.72 The same accounting principles apply to determining the cost of assets acquired individually, those acquired in a group, and those acquired in a business combination. A cash payment by a corporation measures the cost of acquired assets less liabilities assumed. Similarly, the fair values of other assets distributed, such as marketable securities or properties, and the fair value of liabilities incurred by an acquiring corporation measure the cost of an acquired company. The present value of a debt security represents the fair value of the liability, and a premium or discount should be recorded for a debt security issued with an interest rate fixed materially above or below the effective rate or current yield for an otherwise comparable security. (See section 4111.)

 © 1974, American Institute of Certified Public Accountants, Inc.

.73 The distinctive attributes of preferred stocks make some issues similar to a debt security while others possess common stock characteristics, with many gradations between the extremes. Determining cost of an acquired company may be affected by those characteristics. For example, the fair value of a nonvoting, nonconvertible preferred stock which lacks characteristics of common stock may be determined by comparing the specified dividend and redemption terms with comparable securities and by assessing market factors. Thus although the principle of recording the fair value of consideration received for stock issued applies to all equity securities, senior as well as common stock, the cost of a company acquired by issuing senior equity securities may be determined in practice on the same basis as for debt securities.

.74 The fair value of securities traded in the market is normally more clearly evident than the fair value of an acquired company (paragraph .67). Thus, the quoted market price of an equity security issued to effect a business combination may usually be used to approximate the fair value of an acquired company after recognizing possible effects of price fluctuations, quantities traded, issue costs, and the like (paragraph .23). The market price for a reasonable period before and after the date the terms of the acquisition are agreed to and announced should be considered in determining the fair value of securities issued.

.75 If the quoted market price is not the fair value of stock, either preferred or common, the consideration received should be estimated even though measuring directly the fair values of assets received is difficult. Both the consideration received, including goodwill, and the extent of the adjustment of the quoted market price of the stock issued should be weighed to determine the amount to be recorded. All aspects of the acquisition, including the negotiations, should be studied, and independent appraisals may be used as an aid in determining the fair value of securities issued. Consideration other than stock distributed to effect an acquisition may provide evidence of the total fair value received.

.76 *Costs of acquisition.* The cost of a company acquired in a business combination accounted for by the

purchase method includes the direct costs of acquisition. Costs of registering and issuing equity securities are a reduction of the otherwise determinable fair value of the securities. However, indirect and general expenses related to acquisitions are deducted as incurred in determining net income.

Contingent Consideration

.77 A business combination agreement may provide for the issuance of additional shares of a security or the transfer of cash or other consideration contingent on specified events or transactions in the future. Some agreements provide that a portion of the consideration be placed in escrow to be distributed or to be returned to the transferor when specified events occur. Either debt or equity securities may be placed in escrow, and amounts equal to interest or dividends on the securities during the contingency period may be paid to the escrow agent or to the potential security holder.

.78 The Board concludes that cash and other assets distributed and securities issued unconditionally and amounts of contingent consideration which are determinable at the date of acquisition should be included in determining the cost of an acquired company and recorded at that date. Consideration which is issued or issuable at the expiration of the contingency period or which is held in escrow pending the outcome of the contingency should be disclosed but not recorded as a liability or shown as outstanding securities unless the outcome of the contingency is determinable beyond reasonable doubt.

.79 Contingent consideration should usually be recorded when the contingency is resolved and consideration is issued or becomes issuable. In general, the issue of additional securities or distribution of other consideration at resolution of contingencies based on earnings should result in an additional element of cost of an acquired company. In contrast, the issue of additional securities or distribution of other consideration at resolution of contingencies based on security prices should not change the recorded cost of an acquired company.

.80 *Contingency based on earnings.* Additional consideration may be contingent on maintaining or achieving

 © 1974, American Institute of Certified Public Accountants, Inc.

specified earnings levels in future periods. When the contingency is resolved and additional consideration is distributable, the acquiring corporation should record the current fair value of the consideration issued or issuable as additional cost of the acquired company. The additional costs of affected assets, usually goodwill, should be amortized over the remaining life of the asset.

.81 *Contingency based on security prices.* Additional consideration may be contingent on the market price of a specified security issued to effect a business combination. Unless the price of the security at least equals the specified amount on a specified date or dates, the acquiring corporation is required to issue additional equity or debt securities or transfer cash or other assets sufficient to make the current value of the total consideration equal to the specified amount. The securities issued unconditionally at the date the combination is consummated should be recorded at that date at the specified amount.

.82 The cost of an acquired company recorded at the date of acquisition represents the entire payment, including contingent consideration. Therefore, the issuance of additional securities or distribution of other consideration does not affect the cost of the acquired company, regardless of whether the amount specified is a security price to be maintained or a higher security price to be achieved. On a later date when the contingency is resolved and additional consideration is distributable, the acquiring corporation should record the current fair value of the additional consideration issued or issuable. However, the amount previously recorded for securities issued at the date of acquisition should simultaneously be reduced to the lower current value of those securities. Reducing the value of debt securities previously issued to their later fair value results in recording a discount on debt securities. The discount should be amortized from the date the additional securities are issued.

.83 Accounting for contingent consideration based on conditions other than those described should be inferred from the procedures outlined. For example, if the consideration contingently issuable depends on both future earnings and future security prices, additional cost of the

acquired company should be recorded for the additional consideration contingent on earnings, and previously recorded consideration should be reduced to current value of the consideration contingent on security prices. Similarly, if the consideration contingently issuable depends on later settlement of a contingency, an increase in the cost of acquired assets, if any, should be amortized over the remaining life of the assets.

.84 *Interest or dividends during contingency period.* Amounts paid to an escrow agent representing interest and dividends on securities held in escrow should be accounted for according to the accounting for the securities. That is, until the disposition of the securities in escrow is resolved, payments to the escrow agent should not be recorded as interest expense or dividend distributions. An amount equal to interest and dividends later distributed by the escrow agent to the former stockholders should be added to the cost of the acquired assets at the date distributed and amortized over the remaining life of the assets.

.85 *Tax effect of imputed interest.* A tax reduction resulting from imputed interest on contingently issuable stock reduces the fair value recorded for contingent consideration based on earnings and increases additional capital recorded for contingent consideration based on security prices.

.86 *Compensation in contingent agreements.* The substance of some agreements for contingent consideration is to provide compensation for services or use of property or profit sharing, and the additional consideration given should be accounted for as expenses of the appropriate periods.

Recording Assets Acquired and Liabilities Assumed

.87 An acquiring corporation should allocate the cost of an acquired company to the assets acquired and liabilities assumed. Allocation should follow the principles described in paragraph .68.

> First, all identifiable assets acquired, either individually or by type, and liabilities assumed in a business combination, whether or not shown in the financial statements of the acquired company, should be assigned

 © 1974, American Institute of Certified Public Accountants, Inc.

a portion of the cost of the acquired company, normally equal to their fair values at date of acquisition.

Second, the excess of the cost of the acquired company over the sum of the amounts assigned to identifiable assets acquired less liabilities assumed should be recorded as goodwill. The sum of the market or appraisal values of identifiable assets acquired less liabilities assumed may sometimes exceed the cost of the acquired company. If so, the values otherwise assignable to noncurrent assets acquired (except long-term investments in marketable securities) should be reduced by a proportionate part of the excess to determine the assigned values. A deferred credit for an excess of assigned value of identifiable assets over cost of an acquired company (sometimes called "negative goodwill") should not be recorded unless those assets are reduced to zero value.

Independent appraisals may be used as an aid in determining the fair values of some assets and liabilities. Subsequent sales of assets may also provide evidence of values. The effect of taxes may be a factor in assigning amounts to identifiable assets and liabilities (paragraph .89).

.88 General guides for assigning amounts to the individual assets acquired and liabilities assumed, except goodwill, are:

a. Marketable securities at current net realizable values.

b. Receivables at present values of amounts to be received determined at appropriate current interest rates, less allowances for uncollectibility and collection costs, if necessary.

c. Inventories:

  (1) Finished goods and merchandise at estimated selling prices less the sum of (a) costs of disposal and (b) a reasonable profit allowance for the selling effort of the acquiring corporation.

  (2) Work in process at estimated selling prices of finished goods less the sum of (a) costs to complete, (b) costs of disposal, and (c) a reasonable

profit allowance for the completing and selling effort of the acquiring corporation based on profit for similar finished goods.

(3) Raw materials at current replacement costs.

d. Plant and equipment: (1) to be used, at current replacement costs for similar capacity [12] unless the expected future use of the assets indicates a lower value to the acquirer, (2) to be sold or held for later sale rather than used, at current net realizable value, and (3) to be used temporarily, at current net realizable value recognizing future depreciation for the expected period of use.

e. Intangible assets which can be identified and named, including contracts, patents, franchises, customer and supplier lists, and favorable leases, at appraised values.[13]

f. Other assets, including land, natural resources, and nonmarketable securities, at appraised values.

g. Accounts and notes payable, long-term debt, and other claims payable at present values of amounts to be paid determined at appropriate current interest rates.

h. Liabilities and accruals—for example, accruals for pension cost,[14] warranties, vacation pay, deferred compensation—at present values of amounts to be paid determined at appropriate current interest rates.

i. Other liabilities and commitments, including unfavorable leases, contracts, and commitments and plant closing expense incident to the acquisition, at present values of amounts to be paid determined at appropriate current interest rates.

---

[12] Replacement cost may be determined directly if a used asset market exists for the assets acquired. Otherwise, the replacement cost should be approximated from replacement cost new less estimated accumulated depreciation.

[13] Fair values should be ascribed to specific assets; identifiable assets should not be included in goodwill.

[14] An accrual for pension cost should be the greater of (1) accrued pension cost computed in conformity with the accounting policies of the acquiring corporation for one or more of its pension plans or (2) the excess, if any, of the actuarially computed value of vested benefits over the amount of the pension fund.

 © 1974, American Institute of Certified Public Accountants, Inc.

An aquiring corporation should record periodically as a part of income the accrual of interest on assets and liabilities recorded at acquisition date at the discounted values of amounts to be received or paid. An acquiring corporation should not record as a separate asset the goodwill previously recorded by an acquired company and should not record deferred income taxes recorded by an acquired company before its acquisition. An acquiring corporation should reduce the acquired goodwill retroactively for the realized tax benefits of loss carry-forwards of an acquired company not previously recorded by the acquiring corporation.

.89 The market or appraisal values of specific assets and liabilities determined in paragraph .88 may differ from the income tax bases of those items. Estimated future tax effects of differences between the tax bases and amounts otherwise appropriate to assign to an asset or a liability are one of the variables in estimating fair value. Amounts assigned to identifiable assets and liabilities should, for example, recognize that the fair value of an asset to an acquirer is less than its market or appraisal value if all or a portion of the market or appraisal value is not deductible for income taxes. The impact of tax effects on amounts assigned to individual assets and liabilities depends on numerous factors, including imminence or delay of realization of the asset value and the possible timing of tax consequences. Since differences between amounts assigned and tax bases are not timing differences (section 4091.12), the acquiring corporation should not record deferred tax accounts at the date of acquisition.

Amortization of Goodwill

.90 Goodwill recorded in a business combination accounted for by the purchase method should be amortized in accordance with the provisions in section 5141.27-.31.

Excess of Acquired Net Assets Over Cost

.91 The value assigned to net assets acquired should not exceed the cost of an acquired company because the general presumption in historical-cost based accounting is that net assets acquired should be recorded at not more than cost. The total market or appraisal values of identifiable

assets acquired less liabilities assumed in a few business combinations may exceed the cost of the acquired company. An excess over cost should be allocated to reduce proportionately the values assigned to noncurrent assets (except long-term investments in marketable securities) in determining their fair values (paragraph .87). If the allocation reduces the noncurrent assets to zero value, the remainder of the excess over cost should be classified as a deferred credit and should be amortized systematically to income over the period estimated to be benefited but not in excess of forty years. The method and period of amortization should be disclosed.

.92 No part of the excess of acquired net assets over cost should be added directly to stockholders' equity at the date of acquisition.

Acquisition Date

.93 The Board believes that the date of acquisition of a company should ordinarily be the date assets are received and other assets are given or securities are issued. However, the parties may for convenience designate as the effective date the end of an accounting period between the dates a business combination is initiated and consummated. The designated date should ordinarily be the date of acquisition for accounting purposes if a written agreement provides that effective control of the acquired company is transferred to the acquiring corporation on that date without restrictions except those required to protect the stockholders or other owners of the acquired company—for example, restrictions on significant changes in the operations, permission to pay dividends equal to those regularly paid before the effective date, and the like. Designating an effective date other than the date assets or securities are transferred requires adjusting the cost of an acquired company and net income otherwise reported to compensate for recognizing income before consideration is transferred. The cost of an acquired company and net income should therefore be reduced by imputed interest at an appropriate current rate on assets given, liabilities incurred, or preferred stock distributed as of the transfer date to acquire the company.

.94 The cost of an acquired company and the values assigned to assets acquired and liabilities assumed should

 © 1974, American Institute of Certified Public Accountants, Inc.

be determined as of the date of acquisition. The statement of income of an acquiring corporation for the period in which a business combination occurs should include income of the acquired company after the date of acquisition by including the revenue and expenses of the acquired operations based on the cost to the acquiring corporation.

Disclosure in Financial Statements

.95 Notes to the financial statements of an acquiring corporation should disclose the following for the period in which a business combination occurs and is accounted for by the purchase method.

a. Name and a brief description of the acquired company.

b. Method of accounting for the combination—that is, by the purchase method.

c. Period for which results of operations of the acquired company are included in the income statement of the acquiring corporation.

d. Cost of the acquired company and, if applicable, the number of shares of stock issued or issuable and the amount assigned to the issued and issuable shares.

e. Description of the plan for amortization of acquired goodwill, the amortization method, and period (section 5141.27-.31).

f. Contingent payments, options, or commitments specified in the acquisition agreement and their proposed accounting treatment.

Information relating to several relatively minor acquisitions may be combined for disclosure.

.96 Notes to the financial statements of the acquiring corporation for the period in which a business combination occurs and is accounted for by the purchase method should include as supplemental information the following results of operations on a pro forma basis:

a. Results of operations for the current period as though the companies had combined at the beginning of the period, unless the acquisition was at or near the beginning of the period.

b. Results of operations for the immediately preceding period as though the companies had combined at the beginning of that period if comparative financial statements are presented.

The supplemental pro forma information should as a minimum show revenue, income before extraordinary items, net income, and earnings per share. To present pro forma information, income taxes, interest expense, preferred stock dividends, depreciation and amortization of assets, including goodwill, should be adjusted to their accounting bases recognized in recording the combination. Pro forma presentation of results of operations of periods prior to the combination transaction should be limited to the immediately preceding period.

EFFECTIVE DATE

.97 The provisions of this section shall be effective to account for business combinations initiated [15] after October 31, 1970. Business combinations initiated before November 1, 1970 and consummated on or after that date under the terms prevailing on October 31, 1970 (paragraph .47-a) may be accounted for in accordance with this section or the applicable previous pronouncements of the Board and its predecessor committee.

.98 The provisions of this section should not be applied retroactively for business combinations consummated before November 1, 1970.

.99 If a corporation holds as an investment on October 31, 1970 a minority interest in or exactly 50 percent of the common stock of another company and the corporation initiates after October 31, 1970 a plan of combination with that company, the resulting business combination may be accounted for by the pooling of interests method provided the combination meets all conditions specified in paragraphs .45 to .48, except that

(i) the minority interest in the voting common stock of the combining company held on October 31, 1970 may exceed 10 percent of the outstanding voting common stock of the combining company (paragraph .46-b), and

---

[15] Initiated is defined in paragraph .46-a whether the combination is accounted for by the pooling of interests method or by the purchase method.

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

(ii) the corporation which effects the combination issues voting common stock for at least 90 percent of the outstanding voting common stock interest, as described in paragraph .47-b, of the other combining company not already held on October 31, 1970 (rather than 90 percent of all of the common stock interest of the combining company).

The investment in common stock held on October 31, 1970 should not be accounted for as treasury stock or retired stock at the date of the combination. Instead, the excess of cost over the investor corporation's proportionate equity in the net assets of the combining company at or near the date the stock investment was acquired should be allocated to identifiable assets of the combining company at the date the combination is consummated on the basis of the fair values of those assets at the combination date. The unallocated portion of the excess should be assigned to an unidentified intangible asset (goodwill) and should be accounted for according to applicable previous pronouncements of the Board and its predecessor committee. The cost of goodwill should not be amortized retroactively but may be amortized prospectively under the provision of section 5141.35. If the cost of the investment is less than the investor's equity in the net assets of the combining company, that difference should reduce proportionately the recorded amounts of noncurrent assets (except long-term investments in marketable securities) of the combining company. [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

AC Section 1091-1

Applying Sections 1091 and 5141 When a Savings and Loan Association or a Similar Institution Is Acquired in a Business Combination Accounted for by the Purchase Method: An Interpretation of Sections 1091 and 5141

[Source: FASB Interpretation No. 9.]

February 1976

INTRODUCTION

.01 The FASB has been asked to explain how the provisions of *APB Opinions No. 16* [section 1091], "Business Combinations," and *No. 17* [section 5141], "Intangible Assets," should be applied to account for the acquisition of a savings and loan association [1] in a business combination accounted for by the purchase method. In this regard, the FASB has been asked (1) whether the *net-spread* method or the *separate-valuation* method is appropriate for determining the amounts assigned to the assets and liabilities of the acquired savings and loan association and (2) whether any cost not assigned to the identifiable assets acquired less liabilities assumed may be amortized using an accelerated method of amortization rather than the straight-line method of amortization.

.02 Under the net-spread method, the acquisition of a savings and loan association is viewed as the acquisition of a leveraged whole rather than the acquisition of the separate assets and liabilities of the association. Therefore, if the spread between the rates of interest received on mortgage loans and the rates of interest (often called *dividends* in the industry) paid on savings accounts is normal for the particular market area, the acquired savings and loan association's principal assets and liabilities, i. e., its mortgage loan portfolio and savings accounts, are brought forward at the carrying amounts shown in the financial statements of the acquired association.

.03 Under the separate-valuation method, each of the identifiable assets and liabilities of the acquired savings and loan association is accounted for in the consolidated financial statements at an

[1] This Interpretation applies not only in the case of the acquisition of a savings and loan association but also in the case of the acquisition of a savings and loan association holding company, a savings and loan branch, or other financial institution having similar types of assets and liabilities.

amount based on fair value at the date of acquisition, either individually or by types of assets and types of liabilities.

INTERPRETATION

.04 Paragraph 87 of *APB Opinion No. 16* [section 1091.87] states the general principle that "all identifiable assets acquired, either individually or by type, and liabilities assumed in a business combination . . . should be assigned a portion of the cost of the acquired company, normally equal to their fair values at date of acquisition." Because the net-spread method ignores fair value of individual assets and liabilities or types of assets and liabilities, that method is inappropriate under *APB Opinion No. 16* [section 1091].

.05 Paragraph 88 of *APB Opinion No. 16* [section 1091.88] provides "general guides for assigning amounts to the individual assets acquired and liabilities assumed, except goodwill." In paragraph 88(b) [section 1091.88(b)], the general guide for receivables is "present values of amounts to be received determined at appropriate current interest rates, less allowances for uncollectibility and collection costs, if necessary." Ascertaining appropriate current interest rates (and the periods over which the receivables are to be discounted) requires an analysis of the many factors that determine the fair value of the portfolio of loans acquired.

.06 In paragraph 88(e) [section 1091.88(e)], the general guide for "intangible assets which can be identified and named, including contracts, patents, franchises, customer and supplier lists, and favorable leases" is "appraised values." A footnote to that paragraph states that "fair values should be ascribed to specific assets; identifiable assets should not be included in goodwill."

.07 In paragraph 88(g) [section 1091.88(g)], the general guide for "accounts and notes payable, long-term debt, and other claims payable" is "present values of amounts to be paid determined at appropriate current interest rates." That present value for savings deposits due on demand is their face amount plus interest accrued or accruable as of the date of acquisition. That present value for other liabilities assumed, e. g., time savings deposits, borrowings from a Federal Home Loan Bank, or other borrowings, shall be determined by using prevailing interest rates for similar liabilities at the acquisition date.

Copyright © 1976, Financial Accounting Standards Board

.08 The purchase price paid for a savings and loan association may include an amount for one or more factors, such as the following:

a) Capacity of existing savings accounts and loan accounts to generate future income,

b) Capacity of existing savings accounts and loan accounts to generate additional business or new business, and

c) Nature of territory served.

If the amount paid for any such factor can be determined, that amount shall not be included in goodwill. Rather, the amount paid for that separately identified intangible shall be recorded as the cost of the intangible and amortized over its estimated life as specified by *APB Opinion No. 17* [section 5141]. Any portion of the purchase price that cannot be assigned to specifically identifiable tangible and intangible assets acquired (see paragraph .06 above) less liabilities assumed shall be assigned to goodwill.

.09 Paragraph 30 of *APB Opinion No. 17* [section 5141.30] requires that goodwill be amortized using the straight-line method "unless a company demonstrates that another systematic method is more appropriate." An accelerated method would be appropriate and may be used to amortize goodwill when a company demonstrates that (a) the amount assigned to goodwill represents an amount paid for factors such as those listed in paragraph .08 but there is not a satisfactory basis for determining appraised values for the individual factors, and (b) the benefits expected to be received from the factors decline over the expected life of those factors. Unless both (a) and (b) are demonstrated, straight-line amortization shall be used.

EFFECTIVE DATE AND TRANSITION

.10 This Interpretation shall be effective for business combinations initiated on or after March 1, 1976. Application to business combinations initiated before March 1, 1976 but consummated on or after that date is encouraged but not required. Application to a business combination consummated prior to March 1, 1976 is permitted if the annual financial statements for the fiscal year in which the business combination was consummated have not yet been issued; if applied to such a combination, financial statements for interim periods of that fiscal year shall be restated if subsequently presented. Previously issued annual financial statements shall not be restated.

AC Section 1092

Extension of "Grandfather" Provisions for Business Combinations

an amendment of Section 1091

[Source: FASB Statement No. 10.]

October 1975

INTRODUCTION AND BACKGROUND INFORMATION

.01 *APB Opinion No. 16* [section 1091], "Business Combinations," which became effective for business combinations initiated after October 31, 1970, establishes conditions that must be met for a business combination to be accounted for by the pooling of interests method. Paragraph 99 of that Opinion [section 1091.99], however, provides an exemption from certain of those conditions for a business combination between two companies with certain intercorporate investments at October 31, 1970 if "the combination is completed within five years after October 31, 1970." That exemption has been referred to as a "grandfather clause." AICPA Accounting Interpretations Nos. 15, 16, 17, and 26 of *APB Opinion No. 16* relate to that grandfather clause. [Sections U1091.050—.060 and U1091.099—.102.]

.02 In addition, AICPA Accounting Interpretation No. 24 of *APB Opinion No. 16* [section U1091.086—.089] contains a grandfather provision related to paragraph 46(a) of that Opinion [section 1091.46(a)] and permits certain subsidiaries to account for business combinations by the pooling of interests method. In part, the Interpretation states:

> Subsidiaries which had a *significant* outstanding minority interest at October 31, 1970 may take part in a pooling combination completed within five years after that date providing the significant minority also exists at the initiation of the combination. In addition, the combination must meet all of the other pooling conditions specified in paragraphs 46 through 48 [sections 1091.46 through 1091.48] . . .
>
> For purposes of this Interpretation, a significant minority means that at least 20 percent of the voting common stock of the subsidiary is owned by persons not affiliated with the parent company.
>
> This "grandfathering" is consistent with paragraph 99 of the Opinion [section 1091.99] and applies both to combinations where the subsidiary with a significant minority interest is the issuing corporation and those where it is the other combining company. However, it does not permit a pooling between a subsidiary and its parent.

.03 The FASB presently has on its technical agenda a project entitled "Accounting for Business Combinations and Purchased Intangibles," which involves a reconsideration of *APB Opinion No. 16* [section 1091]. Consequently, accounting practices that would change if the grandfather provisions of that Opinion expire on October 31, 1975 might, once again, be changed as a result of the FASB's reconsideration of the Opinion. The Board believes that because it is reconsidering *APB Opinion No. 16* [section 1091] the grandfather provisions of the Opinion and related AICPA Accounting Interpretations should continue in effect so as to maintain the status quo during the Board's reconsideration of that Opinion.

.04 An Exposure Draft of a proposed Statement on "Extension of 'Grandfather' Provisions for Business Combinations" was issued on September 8, 1975. Twenty-two letters were received in response to that Exposure Draft. No substantive changes were suggested by respondents, and this Statement contains no substantive changes from the Exposure Draft.

.05 The Board concluded that on the basis of existing data it could make an informed decision on the matter addressed in this Statement without a public hearing and that the effective date set forth in paragraph .08 is advisable.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

.06 The five-year limitation in the grandfather provisions contained in paragraph 99 of *APB Opinion No. 16* [section 1091.99] and in the AICPA Accounting Interpretations cited in paragraphs .01—.02 of this Statement is eliminated.

Amendment to Existing Pronouncement

.07 The wording "the combination is completed within five years after October 31, 1970 and" in paragraph 99 of *APB Opinion No. 16* [section 1091.99] and similar wording in the AICPA Accounting Interpretations cited in paragraphs .01—.02 of this Statement, imposing an October 31, 1975 expiration date for the grandfather provisions, are deleted.

Effective Date

.08 This Statement shall be effective on November 1, 1975.

The provisions of this Statement need not be applied to immaterial items.

AC Section 2010

Reporting the Results of Operations

[Source: APB Opinion No. 9, as amended.]

Effective for fiscal periods beginning after December 31, 1966, unless otherwise indicated

INTRODUCTION

.01 The American Institute of Certified Public Accountants, through its boards and committees, reviews from time to time the form and content of financial statements to determine how their usefulness may be improved. This section is the result of a review of present practice in the reporting of the results of operations of business entities.

.02 This section concludes that net income should reflect all items of profit and loss recognized during the period except for prior period adjustments, with extraordinary items to be shown separately as an element of net income of the period. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.) [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

.03 This section also specifies the method of treating extraordinary items and prior period adjustments in comparative statements for two or more periods, specifies the disclosures required when previously issued statements of income are restated and recommends methods of presentation of historical, statistical-type financial summaries which include extraordinary items or are affected by prior period adjustments. [As amended, effective for fiscal periods beginning after December 31, 1968, by APB Opinion No. 15.]

.04 For convenience, the term *net income* is used herein to refer to either net income or net loss. [As amended,

effective for fiscal periods beginning after December 31, 1968, by APB Opinion No. 15.]

APPLICABILITY

.05 This section applies to general purpose statements which purport to present results of operations in conformity with generally accepted accounting principles. Investment companies, insurance companies and certain nonprofit organizations have developed income statements with formats different from those of the typical commercial entity described herein, designed to highlight the peculiar nature and sources of their income or operating results. The portion of this section which requires that net income be presented as one amount does not apply to such entities. [As amended, effective for fiscal periods beginning after December 31, 1968, by APB Opinion No. 13.]

NET INCOME AND THE TREATMENT OF PRIOR PERIOD ADJUSTMENTS

DISCUSSION

General

.06 Business entities have developed a reporting pattern under which periodic financial statements are prepared from their accounting records to reflect the financial position of the entity at a particular date and the financial results of its activities for a specified period or periods. The statement of income and the statement of retained earnings (separately or combined) are designed to reflect, in a broad sense, the "results of operations."

.07 A problem in reporting the results of operations of a business entity for one or more periods is the treatment of prior period adjustments. The section also discusses the various types of adjustment which might be considered to be proper adjustments of the recorded results of operations of prior periods. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.) [As amended, effective for financial statements for fiscal years beginning after October 15, 1977 by FASB Statement No. 16.] (See section 2014.)

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Historical Background

General

.08 There is considerable diversity of views as to whether extraordinary items and prior period adjustments should enter into the determination of net income of the period in which they are recognized. When Accounting Research Bulletin No. 32 was issued in December 1947, as well as when it was reissued in June 1953 as Chapter 8 of Accounting Research Bulletin No. 43, two conflicting viewpoints had attracted considerable support. The paragraphs which follow summarize the discussion of these two viewpoints contained in Chapter 8.

Current Operating Performance

.09 Under one viewpoint, designated *current operating performance,* the principal emphasis is upon the ordinary, normal, recurring operations of the entity during the current period. If extraordinary or prior period transactions have occurred, their inclusion might impair the significance of net income to such an extent that misleading inferences might be drawn from the amount so designated.

.10 Advocates of this position believe that users of financial statements attach a particular business significance to the statement of income and the "net income" reported therein. They point out that, while some users are able to analyze a statement of income and to eliminate from it those prior period adjustments and extraordinary items which may tend to impair its usefulness for their purposes, many users are not trained to do this. They believe that management (subject to the attestation of the independent auditors) is in a better position to do this, and to eliminate the effect of such items from the amount designated as net income.

.11 Advocates of this position also point out that many companies, in order to give more useful information concerning their earnings performance, restate the earnings or losses of affected periods to reflect the proper allocation of prior period adjustments. They believe therefore that items of this type may best be handled as direct adjustments of retained earnings or as "special items" excluded from net income of the current period. They

feel that extraordinary items of *all* types may often best be disclosed as direct adjustments of retained earnings, since this eliminates any distortive effect on reported earnings.

All Inclusive

.12 Under the other viewpoint, designated *all inclusive,* net income is presumed to include all transactions affecting the net increase or decrease in proprietorship equity during the current period, except dividend distributions and transactions of a capital nature.

.13 Proponents of this position believe that the aggregate of such periodic net incomes, over the life of an enterprise, constitutes total net income, and that this is the only fair and complete method of reporting the results of operations of the entity. They believe that extraordinary items and prior period adjustments are part of the earnings history of an entity and that omission of such items from periodic statements of income increases the possibility that these items will be overlooked in a review of operating results for a period of years. They also stress the dangers of possible manipulation of annual earnings figures if such items may be omitted from the determination of net income. They believe that a statement of income including all such items is easy to understand and less subject to variations resulting from different judgments. They feel that, when judgment is allowed to determine whether to include or exclude particular items or adjustments, significant differences develop in the treatment of borderline cases and that there is a danger that the use of ''extraordinary'' as a criterion may be a means of equalizing income. Advocates of this theory believe that full disclosure in the income statement of the nature of any extraordinary items or prior period adjustments during each period will enable the user of a statement of income to make his own assessment of the importance of the items and their effects on operating results.

Decisions of Committee on Accounting Procedure—Subsequent Developments

.14 The committee on accounting procedure (predecessor of the Accounting Principles Board) did not em-

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

brace either of these viewpoints in its entirety in issuing its first Accounting Research Bulletin on this subject in December 1947. Instead, the committee stated ". . . it is the opinion of the committee that there should be a general presumption that all items of profit and loss recognized during the period are to be used in determining the figure reported as net income. The only possible exception to this presumption in any case would be with respect to items which in the aggregate are materially significant in relation to the company's net income and are clearly not identifiable with or do not result from the usual or typical business operations of the period. Thus, only extraordinary items such as the following may be excluded from the determination of net income for the year, and they should be excluded when their inclusion would impair the significance of net income so that misleading inferences might be drawn therefrom: . . . ."[1] The list of items which followed consisted of material charges or credits, other than ordinary adjustments of a recurring nature, (a) specifically related to operations of prior years, (b) resulting from unusual sales of assets not acquired for resale and not of the type in which the company usually deals, (c) resulting from losses of a type not usually insured against, (d) resulting from the write-off of a material amount of intangibles or a material amount of unamortized bond discount or premium and expense. The language quoted above was continued substantially unchanged in the 1953 *Restatement and Revision of Accounting Research Bulletins,* becoming Chapter 8 of ARB No. 43.

.15 Since the issuance of these guidelines for the determination of net income, developments in the business and investment environment have increased the emphasis on, and interest in, the financial reporting format of business entities and the nature of the amount shown as net income therein. As a result of the widespread and increasing dissemination of financial data, often in highly condensed form, to investors and potential investors, suggestions have been made that the criteria for the determination of the amount to be reported as net income, insofar as it is affected by extraordinary items and prior period adjustments, should be re-examined.

[1] Accounting Research Bulletin No. 32, *Income and Earned Surplus.*

OPINION

Summary

.16 The Board has considered various methods of reporting the effects of extraordinary events and transactions and of prior period adjustments which are recorded in the accounts during a particular accounting period. The Board has concluded that net income should reflect all items of profit and loss recognized during the period with the sole exception of the prior period adjustments described below. *Extraordinary items* should, however, be segregated from the results of ordinary operations and shown separately in the income statement, with disclosure of the nature and amounts thereof. The criteria for determination of extraordinary items and their presentation are described in section 2012.19-.24. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

.17 Those items that are reported as prior period adjustments shall, in single period statements, be reflected as adjustments of the opening balance of retained earnings. When comparative statements are presented, corresponding adjustments should be made of the amounts of net income (and the components thereof) and retained earnings balances (as well as of other affected balances) for all of the periods reported therein, to reflect the retroactive application of the prior period adjustments. (See paragraph .25 for required disclosures of prior period adjustments.) [As amended, effective for fiscal periods beginning after July 31, 1971 by APB Opinion No. 20]. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

.18 The Board has concluded that the above approach to the reporting of the results of operations of business entities will result in the most meaningful and useful type of financial presentation. The principal advantages are: (a) inclusion of all operating items related to the current period, with segregation and disclosure of the extraordinary items, (b) a reporting of current income from operations free from distortions resulting from material items directly related to prior periods and (c) proper retroactive

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

reflection in comparative financial statements of material adjustments relating directly to prior periods. In reaching its conclusion, the Board recognizes that this approach may involve (a) occasional revision of previously-reported net income for prior periods to reflect subsequently recorded material items directly related thereto, (b) difficulty in segregating extraordinary items and items related to prior periods and (c) the possibility that disclosures regarding adjustments of opening balances in retained earnings or of net income of prior periods will be overlooked by the reader.

[.19-.21] [Superseded, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

[.22-.23] [Superseded, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

[.24] [Superseded, effective for fiscal periods beginning after July 31, 1971 by APB Opinion No. 20.] (See section 1051.)

Disclosure of Prior Period Adjustments and Restatements of Reported Net Income

.25 When prior period adjustments are recorded, the resulting effects (both gross and net of applicable income tax) on the net income of prior periods should be disclosed in the annual report for the year in which the adjustments are made.[2] When financial statements for a single period only are presented, this disclosure should indicate the ef-

The next page is 7929.

[2] The Board recommends disclosure, in addition, in interim reports issued during that year subsequent to the date of recording the adjustments.

fects of such restatement on the balance of retained earnings at the beginning of the period and on the net income of the immediately preceding period. When financial statements for more than one period are presented, which is ordinarily the preferable procedure,[3] the disclosure should include the effects for each of the periods included in the statements. Such disclosures should include the amounts of income tax applicable to the prior period adjustments. Disclosure of restatements in annual reports issued subsequent to the first such post-revision disclosure would ordinarily not be required.

Historical Summaries of Financial Data

.26 It has become customary for business entities to present historical, statistical-type summaries of financial data for a number of periods—commonly five or ten years. The Board recommends that the format for reporting extraordinary items described in section 2012 be used in such summaries. The Board further recommends that, whenever prior period adjustments have been recorded during any of the periods included therein, the reported amounts of net income (and the components thereof), as well as other affected items, be appropriately restated, with disclosure in the first summary published after the adjustments. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

Capital Transactions

.27 The Board reaffirms the conclusion of the former committee on accounting procedure that the following should be excluded from the determination of net income or the results of operations under all circumstances: (a) adjustments or charges or credits resulting from transactions in the company's own capital stock,[4] (b) transfers to and from accounts properly designated as appropriated retained earnings (such as general purpose contingency reserves or provisions for replacement costs of fixed assets) and (c) adjustments made pursuant to a quasi-reorganization.

[4] See section 5542, *Profits or Losses on Treasury Stock.*

Income Statements

.28 Income statements may be prepared in either "single-step" or "multi-step" form. Regardless of the form used, the income statement should disclose revenues (sales), and the elements mentioned in section 2012.11 should be clearly disclosed in the order there indicated. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

AC Section 2011

Earnings per Share*

[Source: APB Opinion No. 15, as amended.]

Effective for fiscal periods beginning after December 31, 1968, unless otherwise indicated [1]

INTRODUCTION

.01 Earnings per share data are used in evaluating the past operating performance of a business, in forming an opinion as to its potential and in making investment decisions. They are commonly presented in prospectuses, proxy material and reports to stockholders. They are used in the compilation of business earnings data for the press, statistical services and other publications. When presented with formal financial statements, they assist the investor in weighing the significance of a corporation's current net income and of changes in its net income from period to period in relation to the shares he holds or may acquire.

.02 In view of the widespread use of earnings per share data, it is important that such data be computed on a consistent basis and presented in the most meaningful manner. The Board and its predecessor committee have previously expressed their views on general standards designed to achieve these objectives, most recently in Part II of APB Opinion No. 9, *Reporting the Results of Operations.*[2]

.03 In this section the Board expresses its views on some of the more specific aspects of the subject, including the guidelines that should be applied uniformly in the computation and presentation of earnings per share data in financial statements.

.04 Computational guidelines for the implementation of this section are contained in section 2011A. Certain views differing from those adopted in this section are summarized in section 2011B. Illustrations of the presentations described in this section are included in the Exhibits

---

* See section 2083, *Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*

[1] See paragraphs .45 and .46.

[2] Editor's Note: Footnote reference eliminated.

contained in section 2011C. Definitions of certain terms as used in this section are contained in section 2011D.

APPLICABILITY

.05 This section applies to financial presentations which purport to present results of operations of corporations in conformity with generally accepted accounting principles and to summaries of those presentations, except as excluded in paragraph .06. Thus, it applies to corporations whose capital structures include only common stock or common stock and senior securities and to those whose capital structures also include securities that should be considered the equivalent of common stock [3] in computing earnings per share data.

.06 This section does not apply to mutual companies that do not have outstanding common stock or common stock equivalents (for example, mutual savings banks, cooperatives, credit unions, and similar entities); to registered investment companies; to government-owned corporations; or to nonprofit corporations. This section also does not apply to parent company statements accompanied by consolidated financial statements, to statements of wholly-owned subsidiaries, or to special purpose statements.

HISTORICAL BACKGROUND

.07 Prior to the issuance of APB Opinion No. 9, earnings per share were generally computed by dividing net income (after deducting preferred stock dividends, if any) by the number of common shares outstanding. The divisor used in the computation usually was a weighted average of the number of common shares outstanding during the period, but sometimes was simply the number of common shares outstanding at the end of the period.

.08 ARB No. 49, *Earnings per Share,* referred to "common stock or other residual security;" however, the concept that a security other than a common stock could be the substantial equivalent of common stock and should,

---

[3] APB Opinion No. 9 referred to certain securities as *residual* securities, the determination of which was generally based upon the market value of the security as it related to investment value. In this section, the Board now uses the term *common stock equivalents* as being more descriptive of those securities other than common stock that should be dealt with as common stock in the determination of earnings per share.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

therefore, enter into the computation of earnings per share was seldom followed prior to the issuance of APB Opinion No. 9. Paragraph 33 of APB Opinion No. 9 stated that earnings per share should be computed by reference to common stock and other residual securities and defined a residual security as follows:

> ''When more than one class of common stock is outstanding, or when an outstanding security has participating dividend rights with the common stock, or when an outstanding security clearly derives a major portion of its value from its conversion rights or its common stock characteristics, such securities should be considered 'residual securities' and not 'senior securities' for purposes of computing earnings per share.''

.09 APB Opinon No. 9 also stated in part (paragraph 43) that:

> ''Under certain circumstances, earnings per share may be subject to dilution in the future if existing contingencies permitting issuance of common shares eventuate. Such circumstances include contingent changes resulting from the existence of (a) outstanding senior stock or debt which is convertible into common shares, (b) outstanding stock options, warrants or similar agreements and (c) agreements for the issuance of common shares for little or no consideration upon the satisfaction of certain conditions (e.g., the attainment of specified levels of earnings following a business combination). If such potential dilution is material, supplementary pro forma computations of earnings per share should be furnished, showing what the earnings would be if the conversions or contingent issuances took place.''

Before the issuance of APB Opinion No. 9 corporations had rarely presented pro forma earnings per share data of this type except in prospectuses and proxy statements.

.10 Under the definition of a residual security contained in paragraph 33 of APB Opinion No. 9, residual status of convertible securities has been determined using the ''major-portion-of-value'' test at the time of the issuance of the security and from time to time thereafter when-

ever earnings per share data were presented. In practice this test has been applied by comparing a convertible security's market value with its investment value, and the security has been considered to be residual whenever more than half its market value was attributable to its common stock characteristics at time of issuance. Practice has varied in applying this test subsequent to issuance with a higher measure used in many cases. Thus, a convertible security's status as a residual security has been affected by equity and debt market conditions at and after the security's issuance.

.11 Application of the residual security concept as set forth in paragraph 33 of APB Opinion No. 9 has raised questions as to the validity of the concept and as to the guidelines developed for its application in practice. The Board has reviewed the concept of residual securities as it relates to earnings per share and, as a result of its own study and the constructive comments on the matter received from interested parties, has concluded that modification of the residual concept is desirable. The Board has also considered the disclosure and presentation requirements of earnings per share data contained in APB Opinion No. 9 and has concluded that these should be revised.

OPINION

Presentation on Face of Income Statement

.12 The Board believes that the significance attached by investors and others to earnings per share data, together with the importance of evaluating the data in conjunction with the financial statements, requires that such data be presented prominently in the financial statements. The Board has therefore concluded that earnings per share or net loss per share data should be shown on the face of the income statement. The extent of the data to be presented and the captions used will vary with the complexity of the company's capital structure, as discussed in the following paragraphs.

 © 1974, American Institute of Certified Public Accountants, Inc.

.13 The reporting of earnings per share data should be consistent with the income statement presentation called for by section 2012. Earnings per share amounts should therefore be presented for (a) income before extraordinary items and (b) net income. It may also be desirable to present earnings per share amounts for extraordinary items. if any. When accounting changes and corrections of errors in previously issued financial statements occur, refer to section 1051, *Accounting Changes.* [As amended, effective for fiscal periods beginning after July 31, 1971 by APB Opinion No. 20.] [As amended, effective for events and transactions occurring after September 30, 1973, by APB Opinion No. 30.] (See section 2012.)

Simple Capital Structures

.14 The capital structures of many corporations are relatively simple—that is, they either consist of only common stock or include no potentially dilutive convertible securities, options, warrants or other rights that upon conversion or exercise could in the aggregate dilute [4] earnings per common share. In these cases, a single presentation expressed in terms such as *Earnings per common share* on the face of the income statement (based on common shares outstanding and computed in accordance with the provisions of section 2011A.02-.05) is the appropriate presentation of earnings per share data.

Complex Capital Structures

.15 Corporations with capital structures other than those described in the preceding paragraph should present two types of earnings per share data (dual presentation) with equal prominence on the face of the income statement. The first presentation is based on the outstanding common shares and those securities that are in substance equivalent to common shares and have a dilutive [4] effect. The second is a pro-forma presentation which reflects the dilution [4] of

---

[4] Any reduction of less than 3% in the aggregate need not be considered as dilution in the computation and presentation of earnings per share data as discussed throughout this section. In applying this test only issues which reduce earnings per share should be considered. In establishing this guideline the Board does not imply that a similar measure should be applied in any circumstances other than the computation and presentation of earnings per share data under this section.

earnings per share that would have occurred if *all* contingent issuances of common stock that would individually reduce earnings per share had taken place at the beginning of the period (or time of issuance of the convertible security, etc., if later). For convenience in this section, these two presentations are referred to as "primary earnings per share" and "fully diluted earnings per share,"[5] respectively, and would in certain circumstances discussed elsewhere in this section be supplemented by other disclosures and other earnings per share data. (See paragraphs .19-.23.)

Dual Presentation

.16 When dual presentation of earnings per share data is required, the primary and fully diluted earnings per share amounts should be presented with equal prominence on the face of the income statement. The difference between the primary and fully diluted earnings per share

[5] APB Opinion No. 9 referred to the latter presentation as "supplementary pro forma earnings per share."

 © 1974, American Institute of Certified Public Accountants, Inc.

amounts shows the maximum extent of potential dilution of current earnings which conversions of securities that are not common stock equivalents could create. If the capital structure contains no common stock equivalents, the first may be designated *Earnings per common share—assuming no dilution* and the second *Earnings per common share—assuming full dilution.* When common stock equivalents are present and dilutive, the primary amount may be designated *Earnings per common and common equivalent share.* The Board recognizes that precise designations should not be prescribed; corporations should be free to designate these dual presentations in a manner which best fits the circumstances provided they are in accord with the substance of this section. The term *Earnings per common share* should not be used without appropriate qualification except under the conditions discussed in paragraph .14.

Periods Presented

.17 Earnings per share data should be presented for all periods covered by the statement of income or summary of earnings. If potential dilution exists in any of the periods presented, the dual presentation of primary earnings per share and fully diluted earnings per share data should be made for all periods presented. This information together with other disclosures required (see paragraphs .19-.23) will give the reader an understanding of the extent and trend of the potential dilution.

.18 When results of operations of a prior period included in the statement of income or summary of earnings have been restated as a result of a prior period adjustment, earnings per share data given for the prior period should be restated. The effect of the restatement, expressed in per share terms, should be disclosed in the year of restatement.

Additional Disclosures

Capital Structure

.19 The use of complex securities complicates earnings per share computations and makes additional disclosures necessary. The Board has concluded that financial

statements should include a description, in summary form, sufficient to explain the pertinent rights and privileges of the various securities outstanding. Examples of information which should be disclosed are dividend and liquidation preferences, participation rights, call prices and dates, conversion or exercise prices or rates and pertinent dates, sinking fund requirements, unusual voting rights, etc.

Dual Earnings per Share Data

.20 A schedule or note relating to the earnings per share data should explain the bases upon which both primary and fully diluted earnings per share are calculated. This information should include identification of any issues regarded as common stock equivalents in the computation of primary earnings per share and the securities included in the computation of fully diluted earnings per share. It should describe all assumptions and any resulting adjustments used in deriving the earnings per share data.[6] There should also be disclosed the number of shares issued upon conversion, exercise or satisfaction of required conditions, etc., during at least the most recent annual fiscal period and any subsequent interim period presented.[7]

.21 Computations and/or reconciliations may sometimes be desirable to provide a clear understanding of the manner in which the earnings per share amounts were obtained. This information may include data on each issue of securities entering into the computation of the primary and fully diluted earnings per share. It should not, however, be shown on the face of the income statement or otherwise furnished in a manner implying that an earnings per share amount which ignores the effect of common stock equivalents (that is, earnings per share based on outstanding common shares only) constitutes an acceptable presentation of primary earnings per share.

Supplementary Earnings per Share Data

.22 Primary earnings per share should be related to the capital structures existing during each of the various

---

[6] These computations should give effect to all adjustments which would result from conversion: for example, dividends paid on convertible preferred stocks should not be deducted from net income; interest and related expenses on convertible debt, less applicable income tax, should be added to net income, and any other adjustments affecting net income because of these assumptions should also be made. (See section 2011A.06.)

[7] See also section 2042 and section 2071.

 © 1974, American Institute of Certified Public Accountants, Inc.

periods presented.[8] Although conversions ordinarily do not alter substantially the amount of capital employed in the business, they can significantly affect the trend in earnings per share data. Therefore, if conversions during the current period would have affected (either dilutively or incrementally) primary earnings per share if they had taken place at the beginning of the period, supplementary information should be furnished (preferably in a note) for the latest period showing what primary earnings per share would have been if such conversions had taken place at the beginning of that period (or date of issuance of the security, if within the period). Similar supplementary per share earnings should be furnished if conversions occur after the close of the period but before completion of the financial report. It may also be desirable to furnish supplementary per share data for each period presented, giving the cumulative retroactive effect of all such conversions or changes. However, primary earnings per share data should not be adjusted retroactively for conversions.

.23 Occasionally a sale of common stock or common stock equivalents for cash occurs during the latest period presented or shortly after its close but before completion of the financial report. When a portion or all of the proceeds of such a sale has been used to retire preferred stock or debt, or is to be used for that purpose, supplementary earnings per share data should be furnished (preferably in a note) to show what the earnings would have been for the latest fiscal year and any subsequent interim period presented if the retirement had taken place at the beginning of the respective period (or date of issuance of the retired security, if later). The number of shares of common stock whose proceeds are to be used to retire the preferred stock or debt should be included in this computation. The bases of these supplementary computations should be disclosed.[9]

Primary Earnings per Share

.24 If a corporation's capital structure is complex and either does not include common stock equivalents or includes common stock equivalents which do not have a dilutive effect, the primary earnings per share figures should be

---

[8] See sections 2011A.03-.04 and 2011A.17-.19 for exceptions to this general rule.

[9] There may be other forms of recapitalization which should be reflected in a similar manner.

based on the weighted average number of shares of common stock outstanding during the period. In such cases, potential dilutive effects of contingent issuances would be reflected in the fully diluted earnings per share amounts. Certain securities, however, are considered to be the equivalent of outstanding common stock and should be recognized in the computation of primary earnings per share if they have a dilutive effect.

Nature of Common Stock Equivalents

.25 The concept that a security may be the equivalent of common stock has evolved to meet the reporting needs of investors in corporations that have issued certain types of convertible and other complex securities. A common stock equivalent is a security which is not, in form, a common stock but which usually contains provisions to enable its holder to become a common stockholder and which, because of its terms and the circumstances under which it was issued, is in substance equivalent to a common stock. The holders of these securities can expect to participate in the appreciation of the value of the common stock resulting principally from the earnings and earnings potential of the issuing corporation. This participation is essentially the same as that of a common stockholder except that the security may carry a specified dividend or interest rate yielding a return different from that received by a common stockholder. The attractiveness of this type of security to investors is often based principally on this potential right to share in increases in the earnings potential of the issuing corporation rather than on its fixed return or other senior security characteristics. With respect to a convertible security, any difference in yield between it and the underlying common stock as well as any other senior characteristics of the convertible security become secondary. The value of a common stock equivalent is derived in large part from the value of the common stock to which it is related, and changes in its value tend to reflect changes in the value of the common stock. Neither conversion nor the imminence of conversion is necessary to cause a security to be a common stock equivalent.

.26 The Board has concluded that outstanding convertible securities which have the foregoing characteristics and which meet the criteria set forth in this section for the

 © 1974, American Institute of Certified Public Accountants, Inc.

determination of common stock equivalents at the time they are issued should be considered the equivalent of common stock in computing primary earnings per share if the effect is dilutive. The recognition of common stock equivalents in the computation of primary earnings per share avoids the misleading implication which would otherwise result from the use of common stock only; use of the latter basis would place form over substance.

.27 In addition to convertible debt and convertible preferred stocks, the following types of securities are or may be considered as common stock equivalents:

Stock options and warrants (and their equivalents) and stock purchase contracts—should always be considered common stock equivalents (see paragraphs .35-.38).

Participating securities and two-class common stocks—if their participation features enable their holders to share in the earnings potential of the issuing corporation on substantially the same basis as common stock even though the securities may not give the holder the right to exchange his shares for common stock (see section 2011A.14-.15).

Contingent shares—if shares are to be issued in the future upon the mere passage of time (or are held in escrow pending the satisfaction of conditions unrelated to earnings or market value) they should be considered as outstanding for the computation of earnings per share. If additional shares of stock are issuable for little or no consideration upon the satisfaction of certain conditions they should be considered as outstanding when the conditions are met (see section 2011A.16-.19).

Determination of Common Stock Equivalents at Issuance

.28 The Board has concluded that determination of whether a convertible security is a common stock equivalent should be made only at the time of issuance and should not be changed thereafter so long as the security remains outstanding. However, convertible securities outstanding or subsequently issued with the same terms as those of a common stock equivalent also should be classified as common stock equivalents. After full consideration of whether a convertible security may change its status as a common

stock equivalent subsequent to issuance, including the differing views which are set forth in section 2011B hereto, the Board has concluded that the dilutive effect of any convertible securities that were not common stock equivalents at time of their issuance should be included only in the fully diluted earnings per share amount. This conclusion is based upon the belief (a) that only the conditions which existed at the time of issuance of the convertible security should govern the determination of status as a common stock equivalent, and (b) that the presentation of fully diluted earnings per share data adequately discloses the potential dilution which may exist because of changes in conditions subsequent to time of issuance.

.29 Various factors should be considered in determining the appropriate "time of issuance" in evaluating whether a security is substantially equivalent to a common stock. The time of issuance generally is the date when agreement as to terms has been reached and announced, even though subject to certain further actions, such as directors' or stockholders' approval.

No Anti-Dilution

.30 Computations of primary earnings per share should not give effect to common stock equivalents or other contingent issuance for any period in which their inclusion would have the effect of increasing the earnings per share amount or decreasing the loss per share amount otherwise computed.[10] Consequently, while a security once determined to be a common stock equivalent retains that status, it may enter into the computation of primary earnings per share in one period and not in another.

Test of Common Stock Equivalent Status

.31 *Convertible securities.* A convertible security which at the time of issuance has terms that make it for all practical purposes substantially equivalent to a common

[10] The presence of a common stock equivalent or other dilutive securities together with income from continuing operations and extraordinary items may result in diluting one of the per share amounts which are required to be disclosed on the face of the income statement—i. e., income from continuing operations, income before extraordinary items and before the cumulative effect of accounting changes, if any, and net income—while increasing another. In such a case, the common stock equivalent or other dilutive securities should be recognized for all computations even though they have an anti-dilutive effect on one of the per share amounts. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

 © 1974, American Institute of Certified Public Accountants, Inc.

stock should be regarded as a common stock equivalent. The complexity of convertible securities makes it impractical to establish definitive guidelines to encompass all the varying terms which might bear on this determination. Consideration has been given, however, to various characteristics of a convertible security which might affect its status as a common stock equivalent, such as cash yield at issuance, increasing or decreasing conversion rates, liquidation and redemption amounts, and the conversion price in relation to the market price of the common stock. In addition, consideration has been given to the pattern of various nonconvertible security yields in recent years, during which period most of the existing convertible securities have been issued, as well as over a longer period of time. Many of the characteristics noted above, which in various degrees may indicate status as a common stock equivalent, are also closely related to the interest or dividend rate of the security and to its market price at the time of issuance.

.32 The Board has also studied the use of market price in relation to investment value (value of a convertible security without the conversion option) and market parity (relationship of conversion value of a convertible security to its market price) as means of determining if a convertible security is equivalent to a common stock. (See discussion of investment value and market parity tests in section 2011B.) It has concluded, however, that these tests are too subjective or not sufficiently practicable.

.33 The Board believes that convertible securities should be considered common stock equivalents if the cash yield to the holder at time of issuance is significantly below what would be a comparable rate for a similar security of the issuer without the conversion option. Recognizing that it may frequently be difficult or impossible to ascertain such comparable rates, and in the interest of simplicity and objectivity, the Board has concluded that a convertible security should be considered as a common stock equivalent at the time of issuance if, based on its market price,[11] it has a cash yield of less than 66⅔% of the then current bank prime interest rate.[12] For any convertible security which

[11] If no market price is available, this test should be based on the fair value of the security.

[12] If convertible securities are sold or issued outside the United States, the most comparable interest rate in the foreign country should be used for this test.

has a change in its cash interest rate or cash dividend rate scheduled within the first five years after issuance, the lowest scheduled rate during such five years should be used in determining the cash yield of the security at issuance.

.34 The Board believes that the current bank prime interest rate in general use for short-term loans represents a practical, simple and readily available basis on which to establish the criteria for determining a common stock equivalent, as set forth in the preceding paragraph. The Board recognizes that there are other rates and averages of interest rates relating to various grades of long-term debt securities and preferred stocks which might be appropriate or that a more complex approach could be adopted. However, after giving consideration to various approaches and interest rates in this regard, the Board has concluded that since there is a high degree of correlation between such indices and the bank prime interest rate, the latter is the most practical rate available for this particular purpose.

.35 *Options and warrants (and their equivalents).* Options, warrants and similar arrangements usually have no cash yield and derive their value from their right to obtain common stock at specified prices for an extended period. Therefore, these securities should be regarded as common stock equivalents at all times. Other securities, usually having a low cash yield (see definition of ''cash yield'', section 2011D.03), require the payment of cash upon conversion and should be considered the equivalents of warrants for the purposes of this section. Accordingly, they should also be regarded as common stock equivalents at all times. Primary earnings per share should reflect the dilution that would result from exercise or conversion of these securities and use of the funds, if any, obtained. Options and warrants (and their equivalents) should, therefore, be treated as if they had been exercised and earnings per share data should be computed as described in the following paragraphs. The computation of earnings per share should not, however, reflect exercise or conversion of any such security [13] if its effect on earnings per share is anti-dilutive (see paragraph .30) except as indicated in paragraph .38.

---

[13] Reasonable grouping of like securities may be appropriate.

 © 1974, American Institute of Certified Public Accountants, Inc.

.36 Except as indicated in this paragraph and in paragraphs .37 and .38, the amount of dilution to be reflected in earnings per share data should be computed by application of the "treasury stock" method. Under this method, earnings per share data are computed as if the options and warrants were exercised at the beginning of the period (or at time of issuance, if later) and as if the funds obtained thereby were used to purchase common stock at the average market price during the period.[14] As a practical matter, the Board recommends that assumption of exercise not be reflected in earnings per share data until the market price of the common stock obtainable has been in excess of the exercise price for substantially all of three consecutive months ending with the last month of the period to which earnings per share data relate. Under the treasury stock method, options and warrants have a dilutive effect (and are, therefore, reflected in earnings per share computations) only when the average market price of the common stock obtainable upon exercise during the period exceeds the exercise price of the options or warrants. Previously reported earnings per share amounts should not be retroactively adjusted, in the case of options and warrants, as a result of changes in market prices of common stock. The Board recognizes that the funds obtained by issuers from the exercise of options and warrants are used in many ways with a wide variety of results that cannot be anticipated. Application of the treasury stock method in earnings per share computations is not based on an assumption that the funds will or could actually be used in that manner. In the usual case, it represents a practical approach to reflecting the dilutive effect that would result from the issuance of common stock under option and warrant agreements at an effective price below the current market price. The Board has concluded, however, that the treasury stock method is inappropriate, or should be modified, in certain cases described in paragraphs .37 and .38.

[14] For example, if a corporation has 10,000 warrants outstanding, exercisable at $54 and the average market price of the common stock during the reporting period is $60, the $540,000 which would be realized from exercise of the warrants and issuance of 10,000 shares would be an amount sufficient to acquire 9,000 shares; thus 1,000 shares would be added to the outstanding common shares in computing primary earnings per share for the period.

.37 Some warrants contain provisions which permit, or require, the tendering of debt (usually at face amount) or other securities of the issuer in payment for all or a portion of the exercise price. The terms of some debt securities issued with warrants require that the proceeds of the exercise of the related warrants be applied toward retirement of the debt. As indicated in paragraph .35, some convertible securities require cash payments upon conversion and are, therefore, considered to be the equivalent of warrants. In all of these cases, the "if converted" method (see section 2011A.06) should be applied as if retirement or conversion of the securities had occurred and as if the excess proceeds, if any, had been applied to the purchase of common stock under the treasury stock method. However, exercise of the options and warrants should not be reflected in the computation unless for the period specified in paragraph .36 either (a) the market price of the related common stock exceeds the exercise price or (b) the security which may be (or must be) tendered is selling at a price below that at which it may be tendered under the option or warrant agreement and the resulting discount is sufficient to establish an effective exercise price below the market price of the common stock that can be obtained upon exercise. Similar treatment should be followed for preferred stock bearing similar provisions or other securities having conversion options permitting payment of cash for a more favorable conversion rate from the standpoint of the investor.

.38 The treasury stock method of reflecting use of proceeds from options and warrants may not adequately reflect potential dilution when options or warrants to acquire a substantial number of common shares are outstanding. Accordingly, the Board has concluded that, if the number of shares of common stock obtainable upon exercise of outstanding options and warrants in the aggregate exceeds 20% of the number of common shares outstanding at the end of the period for which the computation is being made, the treasury stock method should be modified in determining the dilutive effect of the options and warrants upon earnings per share data. In these circumstances all the options and warrants should be assumed to have been exercised and the aggregate proceeds therefrom to have been applied in two steps:

 © 1974, American Institute of Certified Public Accountants, Inc.

a. As if the funds obtained were first applied to the repurchase of outstanding common shares at the average market price during the period (treasury stock method) but not to exceed 20% of the outstanding shares; and then

b. As if the balance of the funds were applied first to reduce any short-term or long-term borrowings and any remaining funds were invested in U. S. government securities or commercial paper, with appropriate recognition of any income tax effect.

The results of steps (a) and (b) of the computation (whether dilutive or anti-dilutive) should be aggregated and, if the net effect is dilutive, should enter into the earnings per share computation.[15]

---

[15] The following are examples of the application of Paragraph .38:

Assumptions:	*Case 1*	*Case 2*
Net income for year	$ 4,000,000	$ 2,000,000
Common shares outstanding	3,000,000	3,000,000
Options and warrants outstanding to purchase equivalent shares	1,000,000	1,000,000
20% limitation on assumed repurchase	600,000	600,000
Exercise price per share	$15	$15
Average and year-end market value per common share to be used (see paragraph 42)	$20	$12
Computations:		
Application of assumed proceeds ($15,000,000):		
Toward repurchase of outstanding common shares at applicable market value	$12,000,000	$ 7,200,000
Reduction of debt	3,000,000	7,800,000
	$15,000,000	$15,000,000
Adjustment of net income:		
Actual net income	$ 4,000,000	$ 2,000,000
Interest reduction (6%) less 50% tax effect	90,000	234,000
Adjusted net income (A)	$ 4,090,000	$ 2,234,000
Adjustment of shares outstanding:		
Actual outstanding	3,000,000	3,000,000
Net additional shares issuable (1,000,000—600,000)	400,000	400,000
Adjusted shares outstanding (B)	3,400,000	3,400,000
Earnings per share:		
Before adjustment	$1.33	$ .67
After adjustment (A ÷ B)	$1.20	$ .66

Non-Recognition of Common Stock Equivalents in Financial Statements

.39 The designation of securities as common stock equivalents in this section is solely for the purpose of determining primary earnings per share. No changes from present practices are recommended in the accounting for such securities, in their presentation within the financial statements or in the manner of determining net assets per common share. Information is available in the financial statements and elsewhere for readers to make judgments as to the present and potential status of the various securities outstanding.

Fully Diluted Earnings Per Share

No Anti-Dilution

.40 The purpose of the fully diluted earnings per share presentation is to show the maximum potential dilution of current earnings per share on a prospective basis. Consequently, computations of fully diluted earnings per share for each period should exclude those securities whose conversion, exercise or other contingent issuance would have the effect of increasing the earnings per share amount or decreasing the loss per share amount [16] for such period.

When Required

.41 Fully diluted earnings per share data should be presented on the face of the statement of income for each period presented if shares of common stock (a) were issued during the period on conversions, exercise, etc., or (b) were contingently issuable at the close of any period presented and if primary earnings per share for such period would have been affected (either dilutively or incrementally) had such actual issuances taken place at the beginning of the period or would have been reduced had such contingent issuances taken place at the beginning of the period. The above contingencies may result from the existence of (a) senior stock or debt which is convertible into common shares but is not a common stock equivalent, (b) options or warrants, or (c) agreements for the issuance of common shares upon the satisfaction of certain conditions (for example, the attainment of specified higher levels of earnings following a business combination). The computation should be based on the assumption that all such issued and issuable

[16] See footnote 10.

 © 1974, American Institute of Certified Public Accountants, Inc.

shares were outstanding from the beginning of the period (or from the time the contingency arose, if after the beginning of the period). Previously reported fully diluted earnings per share amounts should not be retroactively adjusted for subsequent conversions or subsequent changes in the market prices of the common stock.

.42 The methods described in paragraphs .36-.38 should be used to compute fully diluted earnings per share if dilution results from outstanding options and warrants; however, in order to reflect maximum potential dilution, the market price at the close of the period reported upon should be used to determine the number of shares which would be assumed to be repurchased (under the treasury stock method) if such market price is higher than the average price used in computing primary earnings per share (see paragraph .30). Common shares issued on exercise of options or warrants during each period should be included in fully diluted earnings per share from the beginning of the period or date of issuance of the options or warrants if later; the computation for the portion of the period prior to the date of exercise should be based on market prices of the common stock when exercised.

Situations Not Covered in Section

.43 The Board recognizes that it is impracticable to cover all possible conditions and circumstances that may be encountered in computing earnings per share. When situations not expressly covered in this section occur, however, they should be dealt with in accordance with their substance, giving cognizance to the guidelines and criteria outlined herein.

Computational Guidelines

.44 The determination of earnings per share data required under this section reflects the complexities of the capital structures of some businesses. The calculations should give effect to matters such as stock dividends and splits, business combinations, changes in conversion rates, etc. Guidelines which should be used in dealing with some of the more common computational matters are set forth in section 2011A.

EFFECTIVE DATE

.45 This section shall be effective for fiscal periods beginning after December 31, 1968 for all earnings per share data (primary, fully diluted and supplementary) regardless of when the securities entering into computations of earnings per share were issued, except as described in paragraph .46 as it relates to primary earnings per share.* The Board recommends that (a) computations for periods beginning before January 1, 1969 be made for all securities in conformity with the provisions of this section and (b) in comparative statements in which the data for some periods are subject to this section and others are not, the provisions of the section be applied to all periods—in either case based on the conditions existing in the prior periods.

[As amended, effective April 30, 1978, by FASB Statement No. 21.] (See section 2083).

.46 In the case of securities whose time of issuance is prior to June 1, 1969 the following election should be made as of May 31, 1969 (and not subsequently changed) with respect to all such securities for the purpose of computing primary earnings per share:

a. determine the classifications of all such securities under the provisions of this section, or

b. classify as common stock equivalents only those securities which are classified as residual securities under APB Opinion No. 9 regardless of how they would be classified under this section.

If the former election is made, the provisions of this section should be applied in the computation of both primary and fully diluted earnings per share data for all periods presented.

The next page is 7971.

---

* The provisions of this section were suspended by *FASB Statement No. 21* [section 2083] and need not be applied by a nonpublic enterprise as defined in that Statement pending further action by the FASB.

AC Section 2011A

Earnings per Share—Appendix A

COMPUTATIONAL GUIDELINES

.01 The Board has adopted the following general guidelines which should be used in the computation of earnings per share data.

.02 *Weighted average.* Computations of earnings per share data should be based on the weighted average number of common shares and common share equivalents outstanding during each period presented. Use of a weighted average is necessary so that the effect of increases or decreases in outstanding shares on earnings per share data is related to the portion of the period during which the related consideration affected operations. Reacquired shares should be excluded from date of their acquisition. (See definition in section 2011D.28.)

.03 *Stock dividends or splits.* If the number of common shares outstanding increases as a result of a stock dividend or stock split[1] or decreases as a result of a reverse split, the computations should give retroactive recognition to an appropriate equivalent change in capital structure for all periods presented. If changes in common stock resulting from stock dividends or stock splits or reverse splits have been consummated after the close of the period but before completion of the financial report, the per share computations should be based on the new number of shares because the readers' primary interest is presumed to be related to the current capitalization. When per share computations reflect such changes in the number of shares after the close of the period, this fact should be disclosed.

.04 *Business combinations and reorganizations.* When shares are issued to acquire a business in a transaction accounted for as a purchase, the computation of earnings per share should give recognition to the existence of the new shares only from the date the acquisition took place. When a business combination is accounted for as a pooling of interests, the computation should be based on the aggregate of the weighted average outstanding shares of the constituent businesses, adjusted to equivalent shares of

[1] See section 5561, *Stock Dividends and Stock Split Ups.*

the surviving business for all periods presented. This difference in treatment reflects the fact that in a purchase the results of operations of the acquired business are included in the statement of income only from the date of acquisition, whereas in a pooling of interests the results of operations are combined for all periods presented. In reorganizations, the computations should be based on analysis of the particular transaction according to the criteria contained in section 2011.

.05 *Claims of senior securities.* The claims of senior securities on earnings of a period should be deducted from net income (and also from income before extraordinary items if an amount therefor appears in the statement) before computing earnings per share. Dividends on cumulative preferred senior securities, whether or not earned, should be deducted from net income.[2] If there is a net loss, the amount of the loss should be increased by any cumulative dividends for the period on these preferred stocks. If interest or preferred dividends are cumulative only if earned, no adjustment of this type is required, except to the extent of income available therefor. If interest or preferred dividends are not cumulative, only the interest accruable or dividends declared should be deducted. In all cases, the effect that has been given to rights of senior securities in arriving at the earnings per share should be disclosed.

.06 *Use of "if converted" method of computation.* If convertible securities are deemed to be common stock equivalents for the purpose of computing primary earnings per share, or are assumed to have been converted for the purpose of computing fully diluted earnings per share, the securities should be assumed to have been converted at the beginning of the earliest period reported (or at time of issuance, if later). Interest charges applicable to convertible securities and non-discretionary adjustments that would have been made to items based on net income or income before taxes—such as profit sharing expense, certain royalties, and investment credit—or preferred dividends applicable to the convertible securities should be taken into account in determining the balance of income

[2] The per share and aggregate amounts of cumulative preferred dividends in arrears should be disclosed.

 © 1974, American Institute of Certified Public Accountants, Inc.

applicable to common stock. As to primary earnings per share this amount should be divided by the total of the average outstanding common shares and the number of shares which would have been issued on conversion or exercise of common stock equivalents.[3] As to fully diluted earnings per share this amount should be divided by the total of the average outstanding common shares plus the number of shares applicable to conversions during the period from the beginning of the period to the date of conversion and the number of shares which would have been issued upon conversion or exercise of any other security which might dilute earnings.

.07 The if converted method recognizes the fact that the holders of convertible securities cannot share in distributions of earnings applicable to the common stock unless they relinquish their right to senior distributions. Conversion is assumed and earnings applicable to common stock and common stock equivalents are determined before distributions to holders of these securities.

.08 The if converted method also recognizes the fact that a convertible issue can participate in earnings, through dividends or interest, either as a senior security or as a common stock, but not both. The two-class method (see paragraph .10) does not recognize this limitation and may attribute to common stock an amount of earnings per share less than if the convertible security had actually been converted. The amount of earnings per share on common stock as computed under the two-class method is affected by the amount of dividends declared on the common stock.

.09 *Use of "two-class" method of computation.* Although the two-class method is considered inappropriate with respect to the securities described in paragraph .06, its use may be necessary in the case of participating securities and two-class common stock. (See paragraphs .14-.15 for discussion of these securities.) This is the case, for example, when these securities are not convertible into common stock.

.10 Under the two-class method, common stock equivalents are treated as common stock with a dividend rate

[3] Determined as to options and warrants by application of the method described in section 2011.36-.38.

different from the dividend rate on the common stock and, therefore, conversion of convertible securities is not assumed. No use of proceeds is assumed. Distributions to holders of senior securities, common stock equivalents and common stock are first deducted from net income. The remaining amount (the undistributed earnings) is divided by the total of common shares and common share equivalents. Per share distributions to the common stockholders are added to this per share amount to arrive at primary earnings per share.

.11 *Delayed effectiveness and changing conversion rates or exercise prices.* In some cases, a conversion option does not become effective until a future date; in others conversion becomes more (or less) advantageous to the security holder at some later date as the conversion rate increases (or decreases), generally over an extended period. For example, an issue may be convertible into one share of common stock in the first year, 1.10 shares in the second year, 1.20 shares in the third year, etc. Frequently, these securities receive little or no cash dividends. Hence, under these circumstances, their value is derived principally from their conversion or exercise option and they would be deemed to be common stock equivalents under the yield test previously described. (See section 2011.33.)[4] Similarly, the right to exercise options or warrants may be deferred or the exercise price may increase or decrease.

.12 *Conversion rate or exercise price to be used—primary earnings per share.* The conversion rate or exercise price of a common stock equivalent in effect during each period presented should be used in computing primary earnings per share, with the exceptions stated hereinafter in this paragraph. Prior period primary earnings per share should not be restated for changes in the conversion ratio or exercise price. If options, warrants or other common stock equivalents are not immediately exercisable or convertible, the earliest effective exercise price or conversion rate if any during the succeeding five years should be used. If a convertible security having an increasing conversion rate is issued in exchange for another class of security of the issuing company and is convertible back into the same or a similar security, and if a conversion rate equal to or

[4] An increasing conversion rate should not be accounted for as a stock dividend.

 © 1974, American Institute of Certified Public Accountants, Inc.

greater than the original exchange rate becomes effective during the period of convertibility, the conversion rate used in the computation should not result in a reduction in the number of common shares (or common share equivalents) existing before the original exchange took place until a greater rate becomes effective.

.13 *Conversion rate or exercise price to be used—fully diluted earnings per share.* Fully diluted earnings per share computations should be based on the most advantageous (from the standpoint of the security holder) conversion or exercise rights that become effective within ten years following the closing date of the period being reported upon.[5] Conversion or exercise options that are not effective until after ten or more years may be expected to be of limited significance because (a) investors' decisions are not likely to be influenced substantially by events beyond ten years, and (b) it is questionable whether they are relevant to current operating results.

.14 *Participating securities and two-class common.* The capital structures of some companies include:

a. Securities which may participate in dividends with common stocks according to a predetermined formula (for example, two for one) with, at times, an upper limit on the extent of participation (for example, up to but not beyond a specified amount per share).

b. A class of common stock with different dividend rates or voting rights from those of another class of common stock, but without prior or senior rights.

Additionally, some of these securities are convertible into common stock. Earnings per share computations relating to certain types of participating securities may require the use of the two-class method. (See paragraphs .09-.10.)

.15 Because of the variety of features which these securities possess, frequently representing combinations of the features referred to above, it is not practicable to set out specific guidelines as to when they should be considered

[5] The conversion rate should also reflect the cumulative effect of any stock dividends on the preferred stock which the company has contracted or otherwise committed itself to issue within the next ten years.

common stock equivalents. Dividend participation does not *per se* make a security a common stock equivalent. A determination of the status of one of these securities should be based on an analysis of all the characteristics of the security, including the ability to share in the earnings potential of the issuing corporation on substantially the same basis as the common stock.

.16 *Issuance contingent on certain conditions.* At times, agreements call for the issuance of additional shares contingent upon certain conditions being met. Frequently these conditions are either:

a. the maintenance of current earnings levels, or

b. the attainment of specified increased earnings.

Alternatively, agreements sometimes provide for immediate issuance of the maximum number of shares issuable in the transaction with some to be placed in escrow and later returned to the issuer if specified conditions are not met. For purposes of computing earnings per share, contingently returnable shares placed in escrow should be treated in the same manner as contingently issuable shares.

.17 If attainment or maintenance of a level of earnings is the condition, and if that level is currently being attained, the additional shares should be considered as outstanding for the purpose of computing both primary and fully diluted earnings per share. If attainment of increased earnings reasonably above the present level or maintenance of increased earnings above the present level over a period of years is the condition, the additional shares should be considered as outstanding only for the purpose of computing fully diluted earnings per share (but only if dilution is the result); for this computation, earnings should be adjusted to give effect to the increase in earnings specified by the particular agreements (if different levels of earnings are specified, the level that would result in the largest potential dilution should be used). Previously reported earnings per share data should not be restated to give retroactive effect to shares subsequently issued as a result of attainment of specified increased earnings levels. If upon expiration of the term of the agreement providing for contingent issuance of additional shares the conditions have not been met, the shares should not be considered

 © 1974, American Institute of Certified Public Accountants, Inc.

outstanding in that year. Previously reported earnings per share data should then be restated to give retroactive effect to the removal of the contingency.

.18 The number of shares contingently issuable may depend on the market price of the stock at a future date. In such a case, computations of earnings per share should reflect the number of shares which would be issuable based on the market price at the close of the period being reported on. Prior period earnings per share should be restated if the number of shares issued or contingently issuable subsequently changes because the market price changes.

.19 In some cases, the number of shares contingently issuable may depend on both future earnings and future prices of the shares. In that case, the number of shares which would be issuable should be based on both conditions, that is, market prices and earnings to date as they exist at the end of each period being reported on. (For example, if (a) a certain number of shares will be issued at the end of three years following an acquisition if earnings of the acquired company increase during those three years by a specified amount and (b) a stipulated number of additional shares will be issued if the value of the shares issued in the acquisition is not at least a designated amount at the end of the three-year period, the number of shares to be included in the earnings per share for each period should be determined by reference to the cumulative earnings of the acquired company and the value of the shares at the end of the latest period.) Prior-period earnings per share should be restated if the number of shares issued or contingently issuable subsequently changes from the number of shares previously included in the earnings per share computation.

.20 *Securities of subsidiaries.* At times subsidiaries issue securities which should be considered common stock equivalents from the standpoint of consolidated and parent company financial statements for the purpose of computing earnings per share. This could occur when convertible securities, options, warrants or common stock issued by the subsidiary are in the hands of the public and the subsidiary's results of operations are either consolidated or reflected on the equity method. Circumstances in which conversion or exercise of a subsidiary's securities should be assumed for the purpose of computing the consolidated

and parent company earnings per share, or which would otherwise require recognition in the computation of earnings per share data, include those where:

As to the Subsidiary

a. Certain of the subsidiary's securities are common stock equivalents in relation to its own common stock.

b. Other of the subsidiary's convertible securities, although not common stock equivalents in relation to its own common stock, would enter into the computation of its fully diluted earnings per share.

As to the Parent

a. The subsidiary's securities are convertible into the parent company's common stock.

b. The subsidiary issues options and warrants to purchase the parent company's common stock.

The treatment of these securities for the purpose of consolidated and parent company reporting of earnings per share is discussed in the following four paragraphs.

.21 If a subsidiary has dilutive warrants or options outstanding or dilutive convertible securities which are common stock equivalents from the standpoint of the subsidiary, consolidated and parent company primary earnings per share should include the portion of the subsidiary's income that would be applicable to the consolidated group based on its holdings and the subsidiary's primary earnings per share. (See section 2011.39.)

.22 If a subsidiary's convertible securities are not common stock equivalents from the standpoint of the subsidiary, only the portion of the subsidiary's income that would be applicable to the consolidated group based on its holdings and the fully diluted earnings per share of the subsidiary should be included in consolidated and parent company fully diluted earnings per share. (See section 2011.40.)

.23 If a subsidiary's securities are convertible into its parent company's stock, they should be considered among the common stock equivalents of the parent company for the purpose of computing consolidated and parent company primary and fully diluted earnings per share if

 © 1974, American Institute of Certified Public Accountants, Inc.

the conditions set forth in section 2011.33 exist. If these conditions do not exist, the subsidiary's convertible securities should be included in the computation of the consolidated and parent company fully diluted earnings per share only.

.24 If a subsidiary issues options or warrants to purchase stock of the parent company, they should be considered common stock equivalents by the parent in computing consolidated and parent company primary and fully diluted earnings per share.

.25 *Dividends per share.* Dividends constitute historical facts and usually are so reported. However, in certain cases, such as those affected by stock dividends or splits or reverse splits, the presentation of dividends per share should be made in terms of the current equivalent of the number of common shares outstanding at the time of the dividend. A disclosure problem exists in presenting data as to dividends per share following a pooling of interests. In such cases, it is usually preferable to disclose the dividends declared per share by the principal constituent and to disclose, in addition, either the amount per equivalent share or the total amount for each period for the other constituent, with appropriate explanation of the circumstances. When dividends per share are presented on other than an historical basis, the basis of presentation should be disclosed.

AC Section 2011B

Earnings per Share—Appendix B

SUMMARY OF DIFFERING VIEWPOINTS

.01 This section contains a summary of various viewpoints on a number of matters relating to the computation of earnings per share data, which viewpoints differ from the conclusions of the Board as stated in section 2011. The views in this section therefore do not represent the views of the Board as a whole.

Common Stock Equivalent or Residual Concept

.02 Section 2011.26 concludes that, for purposes of computing primary earnings per share, certain securities should be considered the equivalent of common stock. Section 2011.28 further concludes that such treatment—as to convertible securities—should be based on a determination of status made at the time of issuance of each security, based on conditions existing at that date and not subsequently changed. Viewpoints which differ from those conclusions are based on a number of positions, which are summarized below.

Concept Has No Validity

.03 Some believe there should be no such category as ''common stock equivalent'' or ''residual'' security, and hence no such classification as ''primary'' earnings per share including such securities. They contend that the common stock equivalent or residual security concept involves assumptions and arbitrary, intricate determinations which result in figures of questionable meaning which are more likely to confuse than enlighten readers. They advocate that earnings per share data be presented in a tabulation — as part of the financial statements — which first discloses the relationship of net income and the number of common shares actually outstanding and then moves through adjustments to determine adjusted net income and the number of common shares which would be outstanding if all conversions, exercises and contingent issuances took place. Under this approach, all the figures involved would be readily determinable, understandable and significant. Such information, together with the other

disclosures required in section 2011 regarding the terms of securities, would place the reader in a position to make his own judgment regarding prospects of conversion or exercise and the resulting impact on per share earnings. Accounting should not make or pre-empt that judgment.

.04 Until convertible securities, etc., are in fact converted, the actual common stockholders are in control, and the entire earnings could often be distributed as dividends. The conversions, exercises and contingent issuances may, in fact, never take place. Hence, the reporting as "primary" earnings per share of an amount which results from treating as common stock securities which are not common stock is, in the view of some, improper.

Concept Has Validity Both At Issuance and Subsequently

.05 Some who believe in the validity of the common stock equivalent or residual concept feel that the status of a security should be determined not only at the time of its issuance but from time to time thereafter. Securities having the characteristics associated with residual securities—among other things the ability to participate in the economic benefits resulting from the underlying earnings and earnings potential of the common stock through the right of their holders to become common stockholders—do change their nature with increases and decreases in the market value of the common stock after issuance. These securities are designed for this purpose, and therefore, in certain circumstances, they react to changes in the earnings or earnings potential of the issuer just as does the common stock. Furthermore, although many such securities are issued under market and yield conditions which do not place major emphasis at the time of issuance on their common stock characteristics, both the issuer and the holder recognize the possibility that these characteristics may become of increasing significance if, and when, the value of the underlying common stock increases. The limitation of the residual concept for convertible securities to "at issuance only" disregards these significant factors. (For example, a convertible security with a cash yield of 4% at time of issuance [assumed to be in excess of the yield test for common stock equivalent status in section 2011] may well appreciate in value subsequent to issuance,

 © 1974, American Institute of Certified Public Accountants, Inc.

due to its common stock characteristics, to such an extent that its cash yield will drop to 2% or less. It seems unsound to consider such a security a "senior security" for earnings per share purposes at such later dates merely because its yield at date of issuance—possibly years previously—was 4%. This seems particularly unwise when the investment community evaluates such a security currently as the substantial equivalent of the common stock into which it is convertible.) Thus, the "at issuance only" application of the residual security concept is, in the opinion of some, illogical and arbitrary. In connection with the computation of earnings per share data, this approach disregards current conditions in reporting a financial statistic whose very purpose is a reflection of the *current* substantive relationship between the earnings of the issuer and its complex capital structure.

.06 Furthermore, the adoption of the treasury stock method to determine the number of shares to be considered as common stock equivalents under outstanding options and warrants (see section 2011.36-.38) is apparent recognition of the fact that market conditions subsequent to issuance should influence the determination of the status of a security. Thus, the conclusions of section 2011 in these matters are inconsistent.

.07 As for the contention that use of the residual concept subsequent to issuance has a "circular" effect—in that reported earnings per share influences the market, which, in turn, influences the classification status of a security, which, in turn, influences the computation of earnings per share, which, in turn influences the market—analysts give appropriate recognition to the increasing importance of the common stock characteristics of convertible securities as the market rises or falls. It seems only appropriate that a computation purporting to attribute the earnings of a corporation to the various components of its capital structure should also give adequate recognition to the changing substance of these securities. Thus, the movement of securities in and out of residual status subsequent to their issuance is a logical and integral part of the entire concept.

.08 As for the contention that the dual presentation of earnings per share data required by section 2011 appro-

priately reflects the dilutive effect of any convertible securities which were not residual at time of issuance but which might subsequently be considered as residual, the disclosure of "fully-diluted" earnings per share data is aimed at *potential* (i.e., possible future) dilution; for issuers with securities having extremely low yields of the levels described in the preceding paragraph, the dilution has already taken place—these common stock equivalents are being so traded in the market, and any method which does not reflect these conditions results in an amount for "primary earnings per share" which may be misleading. Furthermore, whenever an issuer has more than one convertible security outstanding, the effect of even the "potential" dilution of such "residual" securities is not appropriately reflected in any meaningful manner in the fully-diluted earnings per share amount, since its impact is combined with that of other convertible securities of the issuer which may not currently be "residual".

Criteria and Methods for Determination of Residual Status

.09 Section 2011.33 concludes that a cash yield test—based on a specified percentage of the bank prime interest rate—should be used to determine the residual status of convertible securities, and that options and warrants should be considered residual securities at all times. Viewpoints differing from those conclusions and supporting other criteria or methods are summarized below.

Convertible Securities

.10 *Investment value method.* As explained in section 2011.08-.11, a previous Opinion specified a relative value method for the determination of the residual status of a security. In practice the method has been applied by comparing the market value of a convertible security with its "investment value", and by classifying a security as residual at time of issuance if such market value were 200% or more of investment value, with certain practical modifications of this test subsequent to time of issuance to assure the substance of an apparent change in status and to prevent frequent changes of status for possible temporary fluctuations in the market.

.11 The establishment of investment values for convertible securities involves considerable estimation, and

 © 1974, American Institute of Certified Public Accountants, Inc.

frequently requires the use of experts. Published financial services report estimates of investment value for many, but not all, convertible securities. Most convertible securities are issued under conditions which permit a reasonable estimate of their investment values. In addition, reference to the movements of long-term borrowing rates for groups of issuers with similar credit and risk circumstances—or even reference to general long-term borrowing rates—can furnish effective evidence for an appropriate determination of the investment value of a convertible security subsequent to its issuance. As in many determinations made for accounting purposes, estimates of this nature are often necessary. The necessity of establishing some percentage or level as the line of demarcation between residual and non-residual status is common to all methods under consideration—including the market parity test and various yield tests—and appears justifiable in the interest of reasonable consistency of treatment, both for a single issuer and among issuers.

.12 The investment value method is somewhat similar to the cash yield method specified in section 2011.33. However, the latter method has two apparent weaknesses, in the view of those who support the investment value method. In the first place, it does not differentiate between issuers—that is, it is based on the same borrowing rate for all issuers, without regard for their credit ratings or other risks inherent in their activities. Second, it is based on the current bank prime interest rate, which is essentially a short-term borrowing rate. The relationship between this rate—assuming that it is constant in all sections of the country at any given time—and the long-term corporate borrowing rate may fluctuate to such an extent that the claimed ease of determination may be offset by a lack of correlation. The investment value method, based on the terms of each issue and the status of each issuer, is thus considered by some to be a more satisfactory method.

.13 *Market parity method.* This method compares a convertible security's market value with its conversion value. In general, if the two values are substantially equivalent and in excess of redemption price, the convertible security is considered to be "residual".

.14 The market parity method has the advantage, as compared to the investment value method, of using amounts that usually are readily available or ascertainable, and of avoiding estimates of investment value. More importantly, in the view of some, the equivalence of values is clearly an indication of the equivalence of the securities, while a comparison of relative values of the characteristics of a security is an indication of its status only if arbitrary rules, such as the "major portion of value" test, are used. In similar vein, the yield test also requires the establishment of a point at which to determine residuality. On the other hand, a practical application of the market parity test would also require the establishment of a percentage relationship at which to determine residual status, due to the many variables involved and the need for consistent application. Also, the call or redemption price of a convertible security has an effect on the point at which market parity is achieved.

.15 *Yield methods.* There are various other methods of determining the residual nature of a convertible security based on yield relationships. Each of these is based on a comparison of the cash yield on the convertible security (based on its market value) and some predetermined rate of yield (based on other values, conditions or ratings). The discussion of the various methods contained in section 2011 comprehends the advantages and disadvantages of these other methods.

Options and Warrants

.16 As explained in section 2011.35-.38, options and warrants should be regarded as common stock equivalents at all times; the "treasury stock method" should be used in most cases to determine the number of common shares to be considered the equivalent of the options and warrants; and the number of common shares so computed should be included in the computation of both the "primary" and "fully-diluted" earnings per share (assuming a dilutive effect). Viewpoints which differ from those conclusions and support other treatments or other methods of measurement are summarized below.

.17 *Exclusion from computation of primary earnings per share.* In section 2011 the Board has for the first time

 © 1974, American Institute of Certified Public Accountants, Inc.

considered options and warrants to be common stock equivalents at all times and, because of the treasury stock method of computation established, the primary earnings per share will in some cases be affected by the market price of the stock obtainable on exercise, rather than solely by the economics of the transaction entered into. Some believe that this produces a circular effect in that the reporting of earnings per share may then influence the market which, in turn, influences earnings per share. They believe that earnings per share should affect the market and not vice versa. They point out that the classification of convertible debentures and convertible preferred stocks is determined at time of issuance only and consequently subsequent fluctuations in the market prices of these securities do not affect primary earnings per share. Therefore, they believe that the dual, equally prominent presentation of primary and fully diluted earnings per share is most informative when the effect of options and warrants, other than those whose exercise price is substantially lower than market price at time of issuance, is included only in the fully diluted earnings per share which would be lower than primary earnings per share and thus would emphasize the potential dilution.

.18 *Determination of equivalent common shares.* Some believe that the "treasury stock method" described in section 2011.36 is unsatisfactory and that other methods are preferable. Under one such method the number of equivalent shares is computed by reference to the relationship between the market value of the option or warrant and the market value of the related common stock. In general, it reflects the impact of options and warrants on earnings per share whenever the option or warrant has a market value, and not only when the market price of the related common stock exceeds the exercise price (as does the treasury stock method).

.19 *Measurement of effect of options and warrants.* Some believe that the effect of outstanding options and warrants on earnings per share should be computed by assuming exercise as of the beginning of the period and assuming some use of the funds so attributed to the issuer. The uses which have been suggested include application of such assumed proceeds to (a) reduce outstanding short or long term borrowings, (b) invest in government obli-

gations or commercial paper, (c) invest in operations of the issuer or (d) fulfill other corporate objectives of the issuer. Each of these methods is felt by some to be the preferable approach. Many who support one of these methods feel that the "treasury stock method" is improper since (a) it fails to reflect any dilution unless the market price of the common stock exceeds the exercise price, (b) it assumes a hypothetical purchase of treasury stock which in many cases—due to the significant number of common shares involved—would either not be possible or be possible only at a considerably increased price per share, and (c) it may be considered to be the attribution of earnings assumed on the funds received—in which case the earnings rate for each issuer is a function of the price-earnings ratio of its common stock and is thus similar in result to an arbitrary assumption of a possibly inappropriate earnings rate.

.20 Some believe that no increment in earnings should be attributed to the funds assumed to be received upon the exercise of options and warrants, particularly if such instruments are to be reflected in the computation of primary earnings per share, since the funds were not available to the issuer during the period.

Computational Methods—Convertible Securities

.21 Section 2011A.06 concludes that the "if converted" method of computation should be used for primary earnings per share when convertible securities are considered the equivalent of common stock. Some believe that this method does not properly reflect the actual circumstances existing during the period, and favor, instead, the so-called "two-class" method of computation. (See section 2011A.09-.10.) Under the latter method, securities considered common stock equivalents are treated as common shares with a different dividend rate from that of the regular common shares. The residual security concept is based on common stock equivalence without the necessity of actual conversion; therefore, this method properly recognizes the fact that these securities receive a preferential distribution before the common stock—and also share in the potential benefits of the undistributed earnings through their substantial common stock characteristics in the same way as do the common shares. These securities are designed to achieve these two goals. Those who favor this

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

method believe that the "if converted" method disregards the realities of what occurred during the period. Thus, in their view, the "if converted" method is a "pro-forma" method which assumes conversion and the elimination of preferential distributions to these securities; as such, it is not suitable for use in the computation of *primary earnings per share data,* since the assumed conversions did not take place and the preferential distributions did take place.

.22 Those who favor the "two-class" method point out that it is considered appropriate in the case of certain participating and two-class common situations. In their view, the circumstances existing when common stock equivalents are outstanding are similar; therefore, use of this method is appropriate.

Recognition of Common Stock Equivalents in the Financial Statements

.23 Section 2011.39 concludes that the designation of securities as common stock equivalents is solely for the purpose of determining primary earnings per share; no changes from present practice are recommended in the presentation of such securities in the financial statements. Some believe, however, that the financial statements should reflect a treatment of such securities which is consistent with the method used to determine earnings per share in the financial statements. Accordingly, convertible debt considered to be a common stock equivalent would be classified in the balance sheet in association with stockholders' equity—either under a separate caption immediately preceding stockholders' equity, or in a combined section with a caption such as "Equity of common stockholders and holders of common stock equivalents." In the statement of income and retained earnings, interest paid on convertible debt considered a common stock equivalent would be shown as a "distribution to holders of common stock equivalents," either following the caption of "net income" in the statement of income or grouped with other distributions in the statement of retained earnings.

.24 Some believe that the inconsistency of the positions taken on this matter in section 2011A.21 is clearly evident in the requirement that, when a subsidiary has convertible securities which are common stock equivalents,

the portion of the income of the subsidiary to be included in the consolidated statement of income of the parent and its subsidiaries should be computed disregarding the effect of the common stock equivalents, but that the computation of the primary earnings per share of the parent should reflect the effect of these common stock equivalents in attributing the income of the subsidiary to its various outstanding securities. This inconsistent treatment is, in the opinion of some, not only illogical but misleading.

Earnings per Share—Appendix C

ILLUSTRATIVE STATEMENTS

.01 The following exhibits illustrate the disclosure of earnings per share data on the assumption that section 2011 was effective for all periods covered. The format of the disclosure is illustrative only, and does not necessarily reflect a preference by the Accounting Principles Board.

.02 **Exhibit A.** This exhibit illustrates the disclosure of earnings per share data for a company with a simple capital structure (see section 2011.14). The facts assumed for Exhibit A are as follows:

	Number of Shares	
Common stock outstanding	*1968*	*1967*
Beginning of year	3,300,000	3,300,000
End of year	3,300,000	3,300,000
Issued or acquired during year	None	None
Common stock reserved under employee stock options granted	7,200	7,200
Weighted average number of shares	3,300,000	3,300,000

NOTE: Shares issuable under employee stock options are excluded from the weighted average number of shares on the assumption that their effect is not dilutive (see section 2011.14).

EXHIBIT A

EXAMPLE OF DISCLOSURE OF EARNINGS PER SHARE

Simple Capital Structure

	Thousands Excess per share data	
(Bottom of Income Statement)	*1968*	*1967*
Income before extraordinary item	$ 9,150	$7,650
Extraordinary item—gain on sale of property less applicable income taxes	900	.....
Net Income	$10,050	$7,650
Earnings per common share:		
Income before extraordinary item	$ 2.77	$ 2.32
Extraordinary item	.28	.....
Net Income	$ 3.05	$ 2.32

.03 Exhibit B. This exhibit illustrates the disclosure of earnings per share data for a company with a complex capital structure (see section 2011.15). The facts assumed for Exhibit B are as follows:

Market price of common stock. The market price of the common stock was as follows:

	1968	*1967*	*1966*
Average Price:			
First quarter	50	45	40
Second quarter	60	52	41
Third quarter	70	50	40
Fourth quarter	70	50	45
December 31 closing price	72	51	44

Cash dividends. Cash dividends of $0.125 per common share were declared and paid for each quarter of 1966 and 1967. Cash dividends of $0.25 per common share were declared and paid for each quarter of 1968.

Convertible debentures. 4% convertible debentures with a principal amount of $10,000,000 due 1986 were sold for cash at a price of 100 in the last quarter of 1966. Each $100 debenture was convertible into two shares of common stock. No debentures were converted during 1966 or 1967. The entire issue was converted at the beginning of the third quarter of 1968 because the issue was called by the company.

These convertible debentures were not common stock equivalents under the terms of section 2011. The bank prime rate at the time the debentures were sold in the last quarter of 1966 was 6%. The debentures carried a coupon interest rate of 4% and had a market value of $100 at issuance. The cash yield of 4% was not less than 66⅔% of the bank prime rate (see section 2011.33). Cash yield is the same as the coupon interest rate in this case only because the market value at issuance was $100.

Convertible preferred stock. 600,000 shares of convertible preferred stock were issued for assets in a purchase transaction at the beginning of the second quarter of 1967. The annual dividend on each share of this con-

 © 1974, American Institute of Certified Public Accountants, Inc.

vertible preferred stock is $0.20. Each share is convertible into one share of common stock. This convertible stock had a market value of $53 at the time of issuance and was therefore a common stock equivalent under the terms of section 2011 at the time of its issuance because the cash yield on market value was only 0.4% and the bank prime rate was 5.5% (see section 2011.33).

Holders of 500,000 shares of this convertible preferred stock converted their preferred stock into common stock during 1968 because the cash dividend on the common stock exceeded the cash dividend on the preferred stock.

Warrants. Warrants to buy 500,000 shares of common stock at $60 per share for a period of five years were issued along with the convertible preferred stock mentioned above. No warrants have been exercised. (Note that the number of shares issuable upon exercise of the warrants is less than 20% of outstanding common shares; hence section 2011.38 is not applicable.)

The number of common shares represented by the warrants (see section 2011.36) was 71,428 for each of the third and fourth quarters of 1968 ($60 exercise price × 500,000 warrants = $30,000,000; $30,000,000 ÷ $70 share market price = 428,572 shares; 500,000 shares − 428,572 shares = 71,428 shares). No shares were deemed to be represented by the warrants for the second quarter of 1968 or for any preceding quarter (see section 2011.36) because the market price of the stock did not exceed the exercise price for substantially all of three consecutive months until the third quarter of 1968.

Common stock. The number of shares of common stock outstanding were as follows:

	1968	*1967*
Beginning of year	3,300,000	3,300,000
Conversion of preferred stock	500,000	....
Conversion of debentures	200,000	....
End of year	4,000,000	3,300,000

Weighted average number of shares. The weighted average number of shares of common stock and common stock equivalents was determined as follows:

	1968	*1967*
Common stock:		
Shares outstanding from beginning of period	3,300,000	3,300,000
500,000 shares issued on conversion of preferred stock; assume issuance evenly during year	250,000	....
200,000 shares issued on conversion of convertible debentures at beginning of third quarter of 1968	100,000	....
	3,650,000	3,300,000
Common stock equivalents:		
600,000 shares convertible preferred stock issued at the beginning of the second quarter of 1967, excluding 250,000 shares included under common stock in 1968	350,000	450,000
Warrants: 71,428 common share equivlents outstanding for third and fourth quarters of 1968, i. e., one-half year	35,714	....
	385,714	450,000
Weighted average number of shares	4,035,714	3,750,000

The weighted average number of shares would be adjusted to calculate fully diluted earnings per share as follows:

	1968	*1967*
Weighted average number of shares	4,035,714	3,750,000
Shares applicable to convertible debentures converted at the beginning of the third quarter of 1968, excluding 100,000 shares included under common stock for 1968	100,000	200,000
Shares applicable to warrants included above	(35,714)	....
Shares applicable to warrants based on year-end price of $72 (see section 2011.42)	83,333	....
	4,183,333	3,950,000

 © 1974, American Institute of Certified Public Accountants, Inc.

Income before extraordinary item and net income would be adjusted for interest expense on the debentures in calculating fully diluted earnings per share as follows:

	Thousands		
	Before Adjustment	*Interest, net of tax effect*	*After Adjustment*
1967: Net income	$10,300	$208	$10,508
1968:			
Income before extraordinary item	12,900	94	12,994
Net income	13,800	94	13,894

NOTES: (a) Taxes in 1967 were 48%; in 1968 they were 52.8%.
(b) Net income is before dividends on preferred stock.

EXHIBIT B

EXAMPLE OF DISCLOSURE OF EARNINGS PER SHARE

Complex Capital Structure

(Bottom of Income Statement)	*Thousands Except per share data*	
	1968	*1967*
Income before extraordinary item	$12,900	$10,300
Extraordinary item—gain on sale of property less applicable income taxes	900	......
Net Income	$13,800	$10,300
Earnings per common share and common equivalent share (note x):		
Income before extraordinary item	$ 3.20	$ 2.75
Extraordinary item	.22	......
Net Income	$ 3.42	$ 2.75
Earnings per common share—assuming full dilution (note x):		
Income before extarordinary item	$ 3.11	$ 2.66
Extraordinary item	.21	......
Net Income	$ 3.32	$ 2.66

.04

EXHIBIT C

EXAMPLE OF NOTE X * TO EXHIBIT B

The $0.20 convertible preferred stock is callable by the company after March 31, 1972 at $53 per share. Each share is convertible into one share of common stock.

During 1968, 700,000 shares of common stock were issued on conversions: 500,000 shares on conversion of preferred stock and 200,000 on conversion of all the 4% convertible debentures.

Warrants to acquire 500,000 shares of the company's stock at $60 per share were outstanding at the end of 1968 and 1967. These warrants expire March 31, 1972.

Earnings per common share and common equivalent share were computed by dividing net income by the weighted average number of shares of common stock and common stock equivalents outstanding during the year. The convertible preferred stock has been considered to be the equivalent of common stock from the time of its issuance in 1967. The number of shares issuable on conversion of preferred stock was added to the number of common shares. The number of common shares was also increased by the number of shares issuable on the exercise of warrants when the market price of the common stock exceeds

* The following disclosure in the December 31, 1968 balance sheet is assumed for this note:

	1968	*1967*
Long-term debt:		
4% convertible debentures, due 1986..	—	$10,000,000
Stockholders' equity (note x):		
Convertible voting preferred stock of $1 par value, $0.20 cumulative dividend. Authorized 600,000 shares; issued and outstanding 100,000 shares (600,000 in 1967)	$ 100,000	$ 600,000
(Liquidation value $22 per share, aggregating $2,200,000 in 1968 and $13,200,000 in 1967)		
Common stock of $1 par value per share. Authorized 5,000,000 shares; issued and outstanding 4,000,000 shares (3,300,000 in 1967)	4,000,000	3,300,000
Additional paid-in capital	xxx	xxx
Retained earnings	xxx	xxx
	$ xxx	$ xxx

© 1974, American Institute of Certified Public Accountants, Inc.

the exercise price of the warrants. This increase in the number of common shares was reduced by the number of common shares which are assumed to have been purchased with the proceeds from the exercise of the warrants; these purchases were assumed to have been made at the average price of the common stock during that part of the year when the market price of the common stock exceeded the exercise price of the warrants.

Earnings per common share and common equivalent share for 1968 would have been $3.36 for net income and $3.14 for income before extraordinary item had the 4% convertible debentures due 1986 been converted on January 1, 1968. (These debentures were called for redemption as of July 1, 1968 and all were converted into common shares.)

Earnings per common share—assuming full dilution for 1968 were determined on the assumptions that the convertible debentures were converted and the warrants were exercised on January 1, 1968. As to the debentures, net earnings were adjusted for the interest net of its tax effect. As to the warrants, outstanding shares were increased as described above except that purchases of common stock are assumed to have been made at the year-end price of $72.

Earnings per common share—assuming full dilution for 1967 were determined on the assumption that the convertible debentures were converted on January 1, 1967. The outstanding warrants had no effect on the earnings per share data for 1967, as the exercise price was in excess of the market price of the common stock.

The next page is 8001.

AC Section 2011D

Earnings per Share—Appendix D

DEFINITIONS OF TERMS

.01 There are a number of terms used in discussion of earnings per share which have special meanings in that context. When used in section 2011 they are intended to have the meaning given in the following definitions. Some of the terms are not used in section 2011 but are provided as information pertinent to the subject of earnings per share.

.02 **Call price.** The amount at which a security may be redeemed by the issuer at the issuer's option.

.03 **Cash yield.** The cash received by the holder of a security as a distribution of accumulated or current earnings or as a contractual payment for return on the amount invested, without regard to the par or face amount of the security. As used in section 2011 the term ''cash yield'' refers to the relationship or ratio of such cash to be received annually to the market value of the related security at the specified date. For example, a security with a coupon rate of 4% (on par of $100) and a market value of $80 would have a cash yield of 5%.

.04 **Common stock.** A stock which is subordinate to all other stocks of the issuer.

.05 **Common stock equivalent.** A security which, because of its terms or the circumstances under which it was issued, is in substance equivalent to common stock.

.06 **Contingent issuance.** A possible issuance of shares of common stock that is dependent upon the exercise of conversion rights, options or warrants, the satisfaction of certain conditions, or similar arrangements.

.07 **Conversion price.** The price that determines the number of shares of common stock into which a security is convertible. For example, $100 face value of debt convertible into 5 shares of common stock would be stated to have a conversion price of $20.

.08 **Conversion rate.** The ratio of (a) the number of common shares issuable upon conversion to (b) a unit of

a convertible security. For example, a preferred stock may be convertible at the rate of 3 shares of common stock for each share of preferred stock.

.09 **Conversion value.** The current market value of the common shares obtainable upon conversion of a convertible security, after deducting any cash payment required upon conversion.

.10 **Dilution (Dilutive).** A reduction in earnings per share resulting from the assumption that convertible securities have been converted or that options and warrants have been exercised or other shares have been issued upon the fulfillment of certain conditions. (See section 2011, footnote 4.)

.11 **Dual presentation.** The presentation with equal prominence of two types of earnings per share amounts on the face of the income statement—one is primary earnings per share; the other is fully diluted earnings per share.

.12 **Earnings per share.** The amount of earnings attributable to each share of common stock. For convenience, the term is used in section 2011 to refer to either net income (earnings) per share or to net loss per share. It should be used without qualifying language only when no potentially dilutive convertible securities, options, warrants or other agreements providing for contingent issuances of common stock are outstanding.

.13 **Exercise price.** The amount that must be paid for a share of common stock upon exercise of a stock option or warrant.

.14 **Fully diluted earnings per share.** The amount of current earnings per share reflecting the maximum dilution that would have resulted from conversions, exercises and other contingent issuances that individually would have decreased earnings per share and in the aggregate would have had a dilutive effect. All such issuances are assumed to have taken place at the beginning of the period (or at the time the contingency arose, if later).

.15 **"If converted" method.** A method of computing earnings per share data that assumes conversion of convertible securities as of the beginning of the earliest period reported (or at time of issuance, if later).

 © 1974, American Institute of Certified Public Accountants, Inc.

.16 **Investment value.** The price at which it is estimated a convertible security would sell if it were not convertible, based upon its stipulated preferred dividend or interest rate and its other senior security characteristics.

.17 **Market parity.** A market price relationship in which the market price of a convertible security and its conversion value are approximately equal.

.18 **Option.** The right to purchase shares of common stock in accordance with an agreement, upon payment of a specified amount. As used in section 2011, options include but are not limited to options granted to and stock purchase agreements entered into with employees. Options are considered ''securities'' in section 2011.

.19 **Primary earnings per share.** The amount of earnings attributable to each share of common stock outstanding, including common stock equivalents.

.20 **Redemption price.** The amount at which a security is required to be redeemed at maturity or under a sinking fund arrangement.

.21 **Security.** The evidence of a debt or ownership or related right. For purposes of section 2011 it includes stock options and warrants, as well as debt and stock.

.22 **Senior security.** A security having preferential rights and which is not a common stock or common stock equivalent, for example, nonconvertible preferred stock.

.23 **Supplementary earnings per share.** A computation of earnings per share, other than primary or fully diluted earnings per share, which gives effect to conversions, etc., which took place during the period or shortly thereafter as though they had occurred at the beginning of the period (or date of issuance, if later).

.24 **Time of issuance.** The time of issuance generally is the date when agreement as to terms has been reached and announced, even though such agreement is subject to certain further actions, such as directors' or stockholders' approval.

.25 **Treasury stock method.** A method of recognizing the use of proceeds that would be obtained upon exercise of options and warrants in computing earnings per share. It assumes that any proceeds would be used to purchase

common stock at current market prices. (See section 2011.36-.38.)

.26 "Two-class" method. A method of computing primary earnings per share that treats common stock equivalents as though they were common stocks with different dividend rates from that of the common stock.

.27 Warrant. A security giving the holder the right to purchase shares of common stock in accordance with the terms of the instrument, usually upon payment of a specified amount.

.28 Weighted average number of shares. The number of shares determined by relating (a) the portion of time within a reporting period that a particular number of shares of a certain security has been outstanding to (b) the total time in that period. Thus, for example, if 100 shares of a certain security were outstanding during the first quarter of a fiscal year and 300 shares were outstanding during the balance of the year, the weighted average number of outstanding shares would be 250.

AC Section 2012

Reporting the Results of Operations—Reporting the Effects of Disposal of a Segment of a Business, and Extraordinary, Unusual and Infrequently Occurring Events and Transactions

[Source: APB Opinion No. 30, as amended.]

Effective for events and transactions occurring after September 30, 1973 unless otherwise indicated

INTRODUCTION

.01 In section 2010, *Reporting the Results of Operations,* issued in 1966, the Board concluded that net income for a period should reflect all items of profit and loss recognized during the period except for certain prior period adjustments. The section further provided that *extraordinary items* should be segregated from the results of ordinary operations and shown separately in the income statement and that their nature and amounts should be disclosed.

.02 Financial reporting practices in recent years indicate that interpreting the criteria for extraordinary items in section 2010 has been difficult and significant differences of opinion exist as to certain of its provisions. The Board is also concerned with the varying accounting treatments accorded to certain transactions involving the sale, abandonment, discontinuance, condemnation, or expropriation of a segment of an entity (referred to in this section as disposals of a segment of a business).

.03 The purposes of this section are (1) to provide more definitive criteria for extraordinary items by clarifying and, to some extent, modifying the existing definition and criteria, (2) to specify disclosure requirements for ex-

traordinary items, (3) to specify the accounting and reporting for disposal of a segment of a business, (4) to specify disclosure requirements for other unusual or infrequently occurring events and transactions that are not extraordinary items.

DISCUSSION

.04 Some accountants believe that financial statements would be improved by presenting an all-inclusive income statement without separate categories for continuing operations, discontinued operations and extraordinary items. In their view, the use of arbitrary and subjectively defined categories tends to mislead investors and to invite abuse of the intended purposes of the classifications. They believe, therefore, that basically an income statement should reflect only the two broad categories, (a) revenue and gains and (b) expenses and losses. They also believe that investors would be better served by reporting separately the primary types of revenue and expense, including identification of items that are unusual or occur infrequently. Alternatively, sufficient information relating to those items should be otherwise disclosed to permit investors to evaluate their relevance. These accountants believe that such changes should be implemented at the present time.

.05 Other accountants believe that the income statement is more useful if the effects of events or transactions that occur infrequently and are of an unusual nature are segregated from the results of the continuing, ordinary, and typical operations of an entity. They also believe that the criteria for income statement classification should relate to the environment in which an entity operates. In their view the criteria in APB Opinion No. 9, paragraph 21,[1] for determining whether an event or transaction should be reported as extraordinary lack precision. Accordingly, they conclude that the criteria should be clarified and modified to provide that to be classified as an extraordinary item an event or transaction should be both unusual in nature and infrequent in occurrence when considered in relation to the environment in which the entity operates. They also believe that to enhance the usefulness of the income statement (a) the results of continuing operations of an entity should be reported sepa-

[1] Editor's Note: Footnote reference eliminated.

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

rately from the operations of a segment of the business which has been or will be discontinued and (b) the gain or loss from disposal of a segment should be reported in conjunction with the operations of the segment and not as an extraordinary item. They further believe that material events and transactions that are either unusual or occur infrequently, but not both, should be adequately disclosed.

.06 Still other accountants agree in part with the views described in paragraph .05 but believe that a combination of infrequency of occurrence and abnormality of financial effect should also result in classifying an event or transaction as extraordinary.

APPLICABILITY

.07 This section supersedes section 2010.19-.21, section 2010.28, insofar as it refers to examples of financial statements, and section 2010A. It also amends section 2011.13 and section 2011.30, footnote 10, *Earnings per Share,* insofar as this section prescribes the presentation and computation of earnings per share of continuing and discontinued operations. This section does not modify or amend the conclusions of sections 4091.44 and 4091.60, *Accounting for Income Taxes,* or of section 1091.60, *Business Combinations,* with respect to the classification of the effects of certain events and transactions as extraordinary items. Prior sections that refer to the superseded paragraphs noted above are modified to insert a cross reference to this section.[2]

OPINION

Income Statement Presentation and Disclosure

.08 *Discontinued Operations of a Segment of a Business.* For purposes of this section, the term *discontinued operations* refers to the operations of a segment of a business as defined in paragraph .13 that has been sold, abandoned, spun off, or otherwise disposed of or, although still operating, is the subject of a formal plan for disposal (see paragraph .14). The Board concludes that the results of

[2] This section amends sections 1021-1029, *Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises,* to the extent that they describe an extraordinary item.

continuing operations should be reported separately from discontinued operations and that any gain or loss from disposal of a segment of a business (determined in accordance with paragraphs .15 and .16) should be reported in conjunction with the related results of discontinued operations and not as an extraordinary item. Accordingly, operations of a segment that has been or will be discontinued should be reported separately as a component of income before extraordinary items and the cumulative effect of accounting changes (if applicable) in the following manner:

Income from continuing operations before income taxes[3]	$xxxx	
Provision for income taxes	xxx	
Income from continuing operations[3]		$xxxx
Discontinued operations (Note ......):		
Income (loss) from operations of discontinued Division X (less applicable income taxes of $..........)	$xxxx	
Loss on disposal of Division X, including provision of $.......... for operating losses during phase-out period (less applicable income taxes of $..........)	xxxx	xxxx
Net Income		$xxxx

Amounts of income taxes applicable to the results of discontinued operations and the gain or loss from disposal of the segment should be disclosed on the face of the income statement or in related notes. Revenues applicable to the discontinued operations should be separately disclosed in the related notes.

.09 Earnings per share data for income from continuing operations and net income, computed in accordance with section 2011, should be presented on the face of the income

[3] These captions should be modified appropriately when an entity reports an extraordinary item and/or the cumulative effect of a change in accounting principle in accordance with section 1051, *Accounting Changes*. The presentation of per share data will need similar modification.

 © 1974, American Institute of Certified Public Accountants, Inc.

statement.[4] If presented, per share data for the results of discontinued operations and gain or loss from disposal of the business segment may be included on the face of the income statement or in a related note.

.10 *Extraordinary Items.* The Board has also reconsidered the presentation of extraordinary items in an income statement as prescribed in APB Opinion No. 9, and reaffirms the need to segregate extraordinary items for the reasons given in paragraph .05 of this section and section 2010.18.

.11 In the absence of discontinued operations and changes in accounting principles, the following main captions should appear in an income statement if extraordinary items are reported (sections 2010.16-.18):

Income before extraordinary items[5]	$xxx
Extraordinary items (less applicable income taxes of $..........) (Note ....)	xxx
Net income	$xxx

The caption *extraordinary items* should be used to identify separately the effects of events and transactions, other than the disposal of a segment of a business, that meet the criteria for classification as extraordinary as discussed in paragraphs .19-.24. Descriptive captions and the amounts for *individual* extraordinary events or transactions should be presented, preferably on the face of the income statement, if practicable; otherwise disclosure in related notes is acceptable. The nature of an extraordinary event or transaction and the principal items entering into the determination of an extraordinary gain or loss should be described. The income taxes applicable to extraordinary items should be disclosed on the face of the income statement; alterna-

[4] The presence of a common stock equivalent or other dilutive securities together with income from continuing operations and extraordinary items may result in diluting one of the per share amounts which are required to be disclosed on the face of the income statement—i. e., income from continuing operations, income before extraordinary items and before the cumulative effect of accounting changes, if any, and net income—while increasing another. In such a case, the common stock equivalent or other dilutive securities should be recognized for all computations even though they have an anti-dilutive effect on one of the per share amounts.

[5] This caption should be modified appropriately when an entity reports the cumulative effect of an accounting change.

tively, disclosure in the related notes is acceptable. The caption *net income* should replace the three captions shown above if the income statement includes no extraordinary items.

.12 Earnings per share data for income before extraordinary items and net income should be presented on the face of the income statement, as prescribed by section 2011.

Accounting for the Disposal of a Segment of a Business

.13 For purposes of this section, the term *segment of a business* refers to a component of an entity whose activities represent a separate major line of business or class of customer. A segment may be in the form of a subsidiary, a division, or a department, and in some cases a joint venture or other nonsubsidiary investee, provided that its assets, results of operations, and activities can be clearly distinguished, physically and operationally and for financial reporting purposes, from the other assets, results of operations, and activities of the entity. Financial statements of *current and prior* periods that include results of operations prior to the measurement date (as defined in paragraph .14) should disclose the results of operations of the disposed segment, less applicable income taxes, as a separate component of income before extraordinary items (see paragraph .08). The fact that the results of operations of the segment being sold or abandoned cannot be separately identified strongly suggests that the transaction should not be classified as the disposal of a segment of the business. The disposal of a segment of a business should be distinguished from other disposals of assets incident to the evolution of the entity's business, such as the disposal of part of a line of business, the shifting of production or marketing activities for a particular line of business from one location to another, the phasing out of a product line or class of service, and other changes occasioned by technological improvements. The disposal of two or more unrelated assets that individually do not constitute a segment of a business should not be combined and accounted for as a disposal of a segment of business.

.14 *Definition of Measurement and Disposal Dates.* For purposes of applying the provisions of this section, the

© 1974, American Institute of Certified Public Accountants, Inc.

measurement date of a disposal is the date on which the management having authority to approve the action commits itself to a formal plan to dispose of a segment of the business, whether by sale or abandonment. The plan of disposal should include, as a minimum, identification of the major assets to be disposed of, the expected method of disposal, the period expected to be required for completion of the disposal, an active program to find a buyer if disposal is to be by sale, the estimated results of operations of the segment from the measurement date to the disposal date, and the estimated proceeds or salvage to be realized by disposal. For purposes of applying this section, the *disposal date* is the date of closing the sale if the disposal is by sale or the date that operations cease if the disposal is by abandonment.

.15 *Determination of Gain or Loss on Disposal of a Segment of a Business.* If a loss is expected from the proposed sale or abandonment of a segment, the estimated loss should be provided for at the measurement date.[6] If a gain is expected, it should be recognized when realized, which ordinarily is the disposal date. The determination of whether a gain or a loss results from the disposal of a segment of a business should be made at the measurement date based on estimates at that date of the net realizable value of the segment after giving consideration to any estimated costs and expenses directly associated with the disposal and, if a plan of disposal is to be carried out over a period of time and contemplates continuing operations during that period, to any estimated income or losses from operations. If it is expected that net losses from operations will be incurred between the measurement date and the expected disposal date, the computation of the gain or loss on disposal should also include an estimate of such amounts. If it is expected that income will be generated from operations during that period the computation of the gain or loss should include the estimated income, limited however to the amount of any loss otherwise recognizable

---

[6] If financial statements for a date prior to the measurement date have not been issued, and the expected loss provides evidence of conditions that existed at the date of such statements and affects estimates inherent in the process of preparing them, the financial statements should be adjusted for any change in estimates resulting from the use of such evidence. (See AU section 560.03, volume 1, AICPA PROFESSIONAL STANDARDS.)

from the disposal; any remainder should be accounted for as income when realized. The Board believes that the estimated amounts of income or loss from operations of a segment between measurement date and disposal date included in the determination of loss on disposal should be limited to those amounts that can be projected with reasonable accuracy. In the usual circumstance, it would be expected that the plan of disposal would be carried out within a period of one year from the measurement date and that such projections of operating income or loss would not cover a period exceeding approximately one year.[7]

.16 Gain or loss from the disposal of a segment of a business should not include adjustments, costs, and expenses associated with normal business activities that should have been recognized on a going-concern basis up to the measurement date, such as adjustments of accruals on long-term contracts or write-down or write-off of receivables, inventories, property, plant, and equipment used in the business, equipment leased to others, or intangible assets. However, such adjustments, costs, and expenses which (a) are clearly a *direct* result of the decision to dispose of the segment and (b) are clearly not the adjustments of carrying amounts or costs, or expenses that should have been recognized on a going-concern basis prior to the measurement date should be included in determining the gain or loss on disposal. Results of operations before the measurement date should not be included in the gain or loss on disposal. [As modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2.] (Section 4211.)

.17 Costs and expenses *directly* associated with the decision to dispose include items such as severance pay, additional pension costs, employee relocation expenses, and future rentals on long-term leases to the extent they are not offset by sub-lease rentals.

.18 *Disclosure.* In addition to the amounts that should be disclosed in the financial statements (paragraph .08), the notes to financial statements for the period encompassing the measurement date should disclose:

[7] When disposal is estimated to be completed within one year and subsequently is revised to a longer period of time, any revision of the net realizable value of the segment should be treated as a change in estimate (see paragraph .25).

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

(a) the identity of the segment of business that has been or will be discontinued,

(b) the expected disposal date, if known (see paragraph .14),

(c) the expected manner of disposal,

(d) a description of the remaining assets and liabilities of the segment at the balance sheet date,[8] and

(e) the income or loss from operations and any proceeds from disposal of the segment during the period from the measurement date to the date of the balance sheet.

For periods subsequent to the measurement date and including the period of disposal, notes to the financial statements should disclose the information listed in (a), (b), (c), and (d) above and also the information listed in (e) above compared with the prior estimates.

Criteria for Extraordinary Items

.19 Judgment is required to segregate in the income statement the effects of events or transactions that are extraordinary items (as required by paragraph .11). The Board concludes that an event or transaction should be presumed to be an ordinary and usual activity of the reporting entity, the effects of which should be included in income from operations, unless the evidence clearly supports its classification as an extraordinary item as defined in this section.

.20 Extraordinary items are events and transactions that are distinguished by their unusual nature *and* by the infrequency of their occurrence. Thus, *both* of the following criteria should be met to classify an event or transaction as an extraordinary item:

(a) *Unusual nature*—the underlying event or transaction should possess a high degree of abnormality and be of a type clearly unrelated to, or only incidentally related to, the ordinary and typical activi-

[8] Consideration should be given to disclosing this information by segregation in the balance sheet of the net assets and liabilities (current and noncurrent) of the discontinued segment. Only liabilities which will be assumed by others should be designated as liabilities of the discontinued segment. If the loss on disposal cannot be estimated within reasonable limits, this fact should be disclosed.

ties of the entity, taking into account the environment in which the entity operates. (See discussion in paragraph .21.)

(b) *Infrequency of occurrence*—the underlying event or transaction should be of a type that would not reasonably be expected to recur in the foreseeable future, taking into account the environment in which the entity operates. (See discussion in paragraph .22.)

.21 *Unusual Nature.* The specific characteristics of the entity, such as type and scope of operations, lines of business, and operating policies should be considered in determining ordinary and typical activities of an entity. The environment in which an entity operates is a primary consideration in determining whether an underlying event or transaction is abnormal and significantly different from the ordinary and typical activities of the entity. The environment of an entity includes such factors as the characteristics of the industry or industries in which it operates, the geographical location of its operations, and the nature and extent of governmental regulation. Thus, an event or transaction may be unusual in nature for one entity but not for another because of differences in their respective environments. Unusual nature is not established by the fact that an event or transaction is beyond the control of management.

.22 *Infrequency of Occurrence.* For purposes of this section, an event or transaction of a type not reasonably expected to recur in the foreseeable future is considered to occur infrequently. Determining the probability of recurrence of a particular event or transaction in the foreseeable future should take into account the environment in which an entity operates. Accordingly, a specific transaction of one entity might meet that criterion and a similar transaction of another entity might not because of different probabilities of recurrence. The past occurrence of an event or transaction for a particular entity provides evidence to assess the probability of recurrence of that type of event or transaction in the foreseeable future. By definition, extraordinary items occur infrequently. However, mere infrequency of occurrence of a particular event or transaction does not alone imply that its effects should be classified as

© 1974, American Institute of Certified Public Accountants, Inc.

extraordinary. An event or transaction of a type that occurs frequently in the environment in which the entity operates cannot, by definition, be considered as extraordinary, regardless of its financial effect.

.23 Certain gains and losses should not be reported as extraordinary items because they are usual in nature or may be expected to recur as a consequence of customary and continuing business activities. Examples include:

(a) Write-down or write-off of receivables, inventories, equipment leased to others, or intangible assets.

(b) Gains or losses from exchange or translation of foreign currencies, including those relating to major devaluations and revaluations.

(c) Gains or losses on disposal of a segment of a business.

(d) Other gains or losses from sale or abandonment of property, plant, or equipment used in the business.

(e) Effects of a strike, including those against competitors and major suppliers.

(f) Adjustment of accruals on long-term contracts.

In rare situations, an event or transaction may occur that clearly meets both criteria specified in paragraph .20 of this section and thus gives rise to an extraordinary gain or loss that includes one or more of the gains or losses enumerated above. In these circumstances, gains or losses such as (a) and (d) above should be included in the extraordinary item if they are a direct result of a major casualty (such as an earthquake), an expropriation, or a prohibition under a newly enacted law or regulation that clearly meets both criteria specified in paragraph .20. However, any portion of such losses which would have resulted from a valuation of assets on a going concern basis should not be included in the extraordinary items. Disposals of a segment of a business should be accounted for pursuant to paragraph .13 and presented in the income statement pursuant to paragraph .08 even though the circumstances of the disposal meet the criteria specified in paragraph .20. [As modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2.] (See section 4211.)

.24 *Materiality.* The effect of an extraordinary event or transaction should be classified separately in the income

statement in the manner described in paragraph .11 if it is material in relation to income before extraordinary items or to the trend of annual earnings before extraordinary items, or is material by other appropriate criteria. Items should be considered individually and not in the aggregate in determining whether an extraordinary event or transaction is material. However, the effects of a series of related transactions arising from a single specific and identifiable event or plan of action that otherwise meets the two criteria in paragraph .20 should be aggregated to determine materiality.

Adjustment of Amounts Reported in Prior Periods

.25 Circumstances attendant to disposals of a segment of a business and extraordinary items frequently require estimates, for example, of associated costs and occasionally of associated revenue, based on judgment and evaluation of the facts known at the time of first accounting for the event. Each adjustment in the current period of a loss on disposal of a business segment or of an element of an extraordinary item that was reported in a prior period should be separately disclosed as to year of origin, nature, and amount and classified separately in the current period in the same manner as the original item. If the adjustment is the correction of an error, the provisions of section 1051.36-.37, *Accounting Changes,* should be applied. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

Disclosure of Unusual or Infrequently Occurring Items

.26 A material event or transaction that is unusual in nature or occurs infrequently but not both, and therefore does not meet both criteria for classification as an extraordinary item, should be reported as a separate component of income from continuing operations. The nature and financial effects of each event or transaction should be disclosed on the face of the income statement or, alternatively, in notes to the financial statements. Gains or losses of a similar nature that are not individually material should be aggregated. Such items should not be reported on the face of the income statement net of income taxes or in any manner in-

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

consistent with the provisions of paragraphs .08 and .11 of this section or in any other manner that may imply that they are extraordinary items. Similarly, the earnings per share effects of those items should not be disclosed on the face of the income statement.[9]

EFFECTIVE DATE

.27 This section shall be effective for events and transactions occurring after September 30, 1973. Events and transactions that were reported as extraordinary items in statements of income for fiscal years ending before October 1, 1973 should not be restated, except that a statement of income including operations of discontinued segments of a business may be reclassified in comparative statements to conform with the provisions of paragraphs .08 and .09 of this section and the Board encourages such reclassification. In addition, the accounting for events and transactions that have been reported previously for the fiscal year in which September 30, 1973 occurs may be restated retroactively to comply with the provisions of this section, and the Board encourages such restatement. Differences in classification of the effects of events and transactions in the financial statements of the current and any prior periods presented should be disclosed in notes to the financial statements.

The next page is 8045.

[9] Exceptions to the final two sentences of this paragraph are specified in the following AICPA industry audit guides: *Audits of Banks*, p. 36; *Audits of Fire and Casualty Insurance Companies*, p. 66; and *Audits of Stock Life Insurance Companies*, p. 89.

AC Section 2013

Reporting Gains and Losses from Extinguishment of Debt

an amendment of section 2012

[Source: FASB Statement No. 4.]

March 1975

INTRODUCTION AND BACKGROUND INFORMATION

.01 *APB Opinion No. 26* [section 5362], "Early Extinguishment of Debt," became effective for extinguishment of debt occurring on or after January 1, 1973. Paragraph 19 of that Opinion [section 5362.19] states "that all extinguishments of debt before scheduled maturities are fundamentally alike. The accounting for such transactions should be the same regardless of the means used to achieve the extinguishment." Paragraph 20 of the same Opinion [section 5362.20] states that "a difference between the reacquisition price and the net carrying amount of the extinguished debt should be recognized currently in income of the period of extinguishment as losses or gains and identified as a separate item. . . . The criteria in *APB Opinion No. 9* [section 2010] ['Reporting the Results of Operations'] should be used to determine whether the losses or gains are ordinary or extraordinary items. Gains and losses should not be amortized to future periods."

.02 *APB Opinion No. 30* [section 2012], "Reporting the Results of Operations," became effective for events and transactions occurring after September 30, 1973 and superseded *APB Opinion No. 9* [section 2010] with respect to the determination of extraordinary items. *APB Opinion No. 30* [section 2012] and the related Accounting Interpretation issued by the AICPA staff (see *The Journal of Accountancy*, November 1973, pages 82-84) [section U2012.001-.013] can be read literally to preclude classifying most if not all gains or losses from early extinguishment of debt as an extraordinary item in the income statement. The Board has observed that in those cases coming to its attention where a gain or loss from early extinguishment of debt has been reported in an income statement to which *APB Opinion No. 30* [section 2012] was applicable, the gain or loss was included in income before extraordinary items.

.03 Since the effective date of *APB Opinion No. 30* [section 2012], the Board has had inquiries regarding that Opinion be-

cause application of the criteria, especially as illustrated in the related AICPA Accounting Interpretation, appears to preclude classifying gains or losses from most transactions or events as extraordinary items in the income statement. Many respondents to the Board's July 12, 1973 request for views concerning APB Opinions and Accounting Research Bulletins suggested that the conclusions of *APB Opinion No. 26* [section 5362] relating to *early* extinguishment of debt be reconsidered. Since that time, concern also has been expressed to the Board with respect to the accounting for extinguishment of debt at its *scheduled maturity date or later* because the authoritative accounting pronouncements do not address that issue. In addition, the Securities and Exchange Commission and others have expressed concern to the Board about including gains and losses from extinguishment of debt in the determination of income before extraordinary items in the income statement.

.04 The Board considered carefully the suggestions that *APB Opinion No. 26* [section 5362] be reconsidered and concluded that the issues extend beyond *APB Opinion No. 26* [section 5362] and could involve *APB Opinion No. 14* [section 5516], "Accounting for Convertible Debt and Debt Issued with Stock Purchase Warrants," and *APB Opinion No. 21* [section 4111], "Interest on Receivables and Payables," and could extend to exchanges or sales and related purchases of similar monetary assets. The Board concluded that the pervasiveness of those issues makes broad reconsideration of all these Opinions and the other related issues a more comprehensive undertaking than can be accomplished in the near future. The Board also considered carefully the questions raised with respect to *APB Opinion No. 30* [section 2012] and concluded that there is insufficient experience under that Opinion to warrant a general reconsideration of the criteria set forth therein at this time.

.05 Prior to the issuance of the Exposure Draft of this Statement, the Board had been considering an Interpretation of *APB Opinion No. 26* [section 5362] that would have specified disclosure requirements regarding gains and losses from extinguishment of debt, but that course of action was changed when it became clear to the Board that the income statement classification of gains or losses on extinguishment of debt also required attention. The Board believes that an immediate response is needed to the concern expressed regarding income statement classification of gains and losses from certain extinguishments of debt. Further, the Board continues to believe that guidelines are needed regarding disclosures related to certain debt extinguishments because a

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

review of a number of financial statements by the FASB staff indicates that disclosures often have been unclear, particularly with regard to the income tax effects.

.06 The Board has concluded that on the basis of existing data it can make an informed decision on the narrow issues identified in paragraph .05 without a public hearing and that the effective date and transition requirements set forth in paragraphs .11 and .12 are advisable.

.07 This Statement applies to regulated enterprises in accordance with the provisions of the Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit.'"

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Income Statement Classification

.08 Gains and losses from extinguishment of debt that are included in the determination of net income shall be aggregated and, if material,[1] classified as an extraordinary item, net of related income tax effect. That conclusion shall apply whether an extinguishment is early or at scheduled maturity date or later. The conclusion does not apply, however, to gains or losses from cash purchases of debt made to satisfy current or future sinking-fund requirements.[2] Those gains and losses shall be aggregated and the amount shall be identified as a separate item.

Disclosure

.09 Gains or losses from extinguishment of debt that are classified as extraordinary items should be described sufficiently to enable users of financial statements to evaluate their significance. Accordingly, the following information, to the extent not shown separately on the face of the income statement, shall be disclosed in a single note to the financial statements or adequately cross-referenced if in more than one note:

(a) A description of the extinguishment transactions, including the sources of any funds used to extinguish debt if it is practicable to identify the sources.

(b) The income tax effect in the period of extinguishment.

(c) The per share amount of the aggregate gain or loss net of related income tax effect.

---

[1] See the first sentence of paragraph 24 of *APB Opinion No. 30* [section 2012.24].

[2] Some obligations to acquire debt have the essential characteristics of sinking-fund requirements, and resulting gains or losses are not required to be classified as extraordinary items. For example, if an enterprise is required each year to purchase a certain percentage of its outstanding bonds before their scheduled maturity, the gain or loss from such purchase is not required to be classified as an extraordinary item. Debt maturing serially, however, does not have the characteristics of sinking-fund requirements, and gain or loss from extinguishment of serial debt shall be classified as an extraordinary item.

Amendment to Existing Pronouncement

.10 This Statement amends *APB Opinion No. 30* [section 2012] only to the extent that classification of gains or losses from extinguishment of debt as an extraordinary item pursuant to the first two sentences of paragraph .08 of this Statement shall be made without regard to the criteria in paragraph 20 of that Opinion [section 2012.20].

Effective Date and Transition

.11 This Statement shall be effective for extinguishments occurring after March 31, 1975, except that it need not be applied to extinguishments occurring on or after April 1, 1975 pursuant to the terms of an offer or other commitment made prior to that date. Application to *all* extinguishments occurring during a fiscal year in which April 1, 1975 falls is encouraged. Retroactive application to extinguishments occurring in prior fiscal years is encouraged but not required.

.12 Although the requirements of this Statement may be applied retroactively, such application is not intended to change the accounting for amounts deferred on refundings of debt that occurred prior to the effective date of *APB Opinion No. 26* [section 5362] or the income statement classification of the amortization of those amounts.

The provisions of this Statement need not be applied to immaterial items.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

APPENDIX A

SUMMARY OF CONSIDERATION OF COMMENTS ON EXPOSURE DRAFT

.13 In response to the request for comments on the Exposure Draft issued January 31, 1975, the FASB received and considered 120 letters in its deliberations on this Statement. Certain of the comments and the FASB's consideration of them are summarized in paragraphs .14-.17.

.14 For a variety of reasons, many respondents recommended that the FASB not adopt the Exposure Draft as a final Statement. Some respondents recommended that *APB Opinion No. 26* [section 5362] and related issues be reconsidered. Others recommended that the criteria for determining extraordinary items as set forth in *APB Opinion No. 30* [section 2012] be reconsidered. The Board concluded not to address these issues for the reasons stated in paragraph .04.

.15 Some respondents suggested that the proposals in the Exposure Draft, if adopted, would result in erosion of the criteria in *APB Opinion No. 30* [section 2012] for determining extraordinary items. However, this Statement is neither an amendment nor an interpretation of the criteria for classifying and reporting an event or transaction as an extraordinary item as set forth in paragraph 20 of that Opinion [section 2012.20]. Rather, the Board is proscribing the application of those criteria to certain extinguishments of debt in the same way that the application of those criteria has been proscribed with respect to the realization of tax benefits from an operating loss carryforward and to certain profits or losses resulting from the disposal of a significant part of the assets or a separable segment acquired in a business combination accounted for as a pooling of interests.[3] The Board recognizes that the application of the criteria in *APB Opinion No. 30* [section 2012] to extinguishments of debt would seldom, if ever, require that resulting gains and losses be classified as extraordinary items. In issuing this Statement requiring that a gain or loss from certain debt extinguishments be classified as an extraordinary item in the income statement, the Board is neither modifying the criteria set forth in that Opinion nor intending to start a piecemeal revision of those criteria. Although as a result of this Statement questions may be raised regarding the application of the criteria for determining extraordinary items pursuant to *APB Opinion No. 30* [section 2012], the Board has concluded that, on balance, this Statement represents a practical and reasonable solu-

[3] See paragraph 7 of *APB Opinion No. 30* [section 2012.07].

tion to the question regarding income statement classification of gains or losses from extinguishment of debt until such time as the broader issues involved can be addressed.

.16 Many respondents argued that gains and losses from extinguishment of debt pursuant to sinking-fund requirements should not be required to be classified as extraordinary items. The Board agrees primarily because acquisitions for sinking-fund purposes are made to meet continuing contractual requirements assumed in connection with the incurrence of the debt.

.17 In addition to the fact that many respondents recommended that the Exposure Draft not be issued as a final Statement, some respondents objected to the proposal that the Statement be applied retroactively. On further consideration of all the circumstances, the Board concluded that application of the Statement should be required only on a prospective basis although retroactive application is encouraged.

AC Section 2014

Prior Period Adjustments

[Source: FASB Statement No. 16.]

June 1977

INTRODUCTION AND BACKGROUND INFORMATION

.01 The AICPA Committee on SEC Regulations and others have requested that the FASB consider the criteria for prior period adjustments stated in paragraph 23 of *APB Opinion No. 9*, "Reporting the Results of Operations," and provide further guidelines for the application of those criteria. Paragraph 23 of *APB Opinion No. 9* states:

> Adjustments related to prior periods — and thus excluded in the determination of net income for the current period — are limited to those material adjustments which (a) can be specifically identified with and directly related to the business activities of particular prior periods, and (b) are not attributable to economic events occurring subsequent to the date of the financial statements for the prior period, and (c) depend primarily on determinations by persons other than management and (d) were not susceptible of reasonable estimation prior to such determination. Such adjustments are rare in modern financial accounting. They relate to events or transactions which occurred in a prior period, the accounting effects of which could not be determined with reasonable assurance at that time, usually because of some major uncertainty then existing. Evidence of such an uncertainty would be disclosure thereof in the financial statements of the applicable period, or of an intervening period in those cases in which the uncertainty became apparent during a subsequent period. Further, it would be expected that, in most cases, the opinion of the reporting independent auditor on such prior period would have contained a qualification because of the uncertainty. Examples are material, nonrecurring adjustments or settlements of income taxes, of renegotiation proceedings or of utility revenue under rate processes. Settlements of significant amounts resulting from litigation or similar claims may also constitute prior period adjustments.

.02 The requests referred to in paragraph .01 were prompted by Securities and Exchange Commission staff administrative interpretations of *APB Opinion No. 9* [section 2010] during 1975 limiting prior period adjustments for out-of-court settlements of litigation. The view of the SEC staff was later explained in *Staff Accounting Bulletin No. 8* (see Appendix C). In addition, differing interpretations of the criteria of paragraph 23 and of the provisions of paragraph 24 of *APB Opinion No. 9* have been cited as a basis for requesting a reconsideration of the concept of prior period adjustments.

.03 Paragraph 24 of *APB Opinion No. 9* elaborates on paragraph 23 by giving examples of items that do not qualify as prior period adjustments. Paragraph 24 states:

> Treatment as prior period adjustments should not be applied to the normal, recurring corrections and adjustments which are the natural result of the use of estimates inherent in the accounting process. For example, changes in the estimated remaining lives of fixed assets affect the computed amounts of depreciation, but these changes should be considered prospective in nature and not prior period adjustments. Similarly, relatively immaterial adjustments of provisions for liabilities (including income taxes) made in prior periods should be considered recurring items to be reflected in operations of the current period. Some uncertainties, for example those relating to the realization of assets (collectibility of accounts receivable, ultimate recovery of deferred costs or realizability of inventories or other assets), would not qualify for prior period adjustment treatment, since economic events subsequent to the date of the financial statements must of necessity enter into the elimination of any previously-existing uncertainty. Therefore, the effects of such matters are considered to be elements in the determination of net income for the period in which the uncertainty is eliminated. Thus, the Board [APB] believes that prior period adjustments will be rare.

.04 *APB Opinion No. 20* [section 1051], "Accounting Changes," affirmed the conclusions of paragraph 24 of *APB Opinion No. 9* by requiring that "a change in an estimate should not be accounted for by restating amounts reported in financial statements of prior periods . . . unless the change meets all the conditions for a prior period adjustment (paragraph 23 of *APB Opinion No. 9*)."

.05 *FASB Statement No. 5* [section 4311], "Accounting for Contingencies," (effective for fiscal years beginning on or after July 1, 1975) establishes the conditions for accrual of an estimated loss

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

from a loss contingency and prohibits accrual before those conditions are met. The two conditions for accrual of an estimated loss from a loss contingency set forth in paragraph 8 of Statement No. 5 [section 4311.08] are that "(a) information available prior to issuance of the financial statements indicates that it is probable that an asset had been impaired or a liability had been incurred at the date of the financial statements . . ." and "(b) the amount of loss can be reasonably estimated." Paragraph 8 of the Statement [section 4311.08] requires that "an estimated loss from a loss contingency . . . shall be accrued by a charge to income . . . ." A footnote to that paragraph states that "paragraphs 23 - 24 of *APB Opinion No. 9* . . . describe the 'rare' circumstances in which a prior period adjustment is appropriate" and indicates that "those paragraphs are not amended" by Statement No. 5 [section 4311].

.06 The Board has, among other things, (a) reviewed an FASB staff survey of prior period adjustments made in recent years pursuant to the criteria of *APB Opinion No. 9* [section 2010], (b) considered the relationship of the criteria of *APB Opinion No. 9* [section 2010], for prior period adjustments to the rationale of subsequent APB Opinions (see paragraphs .29-.36), and (c) examined the relationship of the criteria of *APB Opinion No. 9* [section 2010] for prior period adjustments to the conditions of *FASB Statement No. 5* [section 4311] for accrual of estimated losses from loss contingencies (see paragraph .37).

.07 An Exposure Draft of a proposed Statement on "Prior Period Adjustments" was issued July 29, 1976, and a public hearing based on the Exposure Draft was held on October 15, 1976. The Board received 162 position papers and letters of comment in response to the Exposure Draft. Ten presentations were made at the public hearing. On April 12, 1977 the FASB announced that it was unable to attain the necessary five assenting votes for issuance of a final Statement on prior period adjustments. That announcement stated that four FASB members agreed to support the position in the Exposure Draft, modified in certain respects for interim reporting, and that the other three Board members dissented for varied reasons. On June 21, 1977 the Trustees of the Financial Accounting Foundation announced that they had approved the implementation of a number of the recommendations made by the Trustees' Structure Committee in its April 1977 report, "the Structure of Establishing Financial Accounting Standards." The recommendations approved included amending the Foundation's by-laws to change the voting requirement for adoption of pronouncements by the

FASB from five affirmative votes among the seven members to a simple majority. Subsequent to the action by the Trustees, the Board reconsidered the subject and voted to issue this Statement.

.08 The Board concluded that, with limited exceptions, items of profit and loss recognized during a period shall be included in the determination of net income of that period. Paragraphs .11 and .13-.15 describe the exceptions that shall be accounted for and reported as prior period adjustments. The basis for the Board's conclusions, as well as alternatives considered and reasons for their rejection, are discussed in Appendix A to this Statement. The results of the FASB staff survey of prior period adjustments made pursuant to the criteria of *APB Opinion No. 9* [section 2010] in annual financial statements for fiscal years ending from July 1973 through June 1975 are summarized in Appendix B to this Statement.

.09 The Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'," states that "differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect in regulated businesses of the rate-making process," and discusses the application of generally accepted accounting principles to regulated industries. FASB Statements and Interpretations should therefore be applied to regulated companies that are subject to the rate-making process in accordance with the provisions of the Addendum.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

.10 Except as specified in paragraph .11 and in paragraphs .13 and .14 with respect to prior interim periods of the current year, all items of profit and loss recognized during a period,[1] including accruals of estimated losses from loss contingencies, shall be included in the determination of net income for that period.[2]

---

[1] As used in this Statement, the term "period" refers to both annual and interim reporting periods.

[2] Many items that would previously have been reported as prior period adjustments will be subject to existing disclosure requirements when that type of item is included in the determination of current net income. For example, *APB Opinion No. 28* [section 2071], "Interim Financial Reporting," specifies certain disclosures for interim reporting periods and *APB Opinion No. 30* [section 2012], "Reporting the Results of Operations," specifies disclosures for certain types of items discussed by that Opinion.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.11 Items of profit and loss related to the following shall be accounted for and reported as prior period adjustments[3] and excluded from the determination of net income for the current period:

a) Correction of an error in the financial statements of a prior period[4] and

b) Adjustments that result from realization of income tax benefits of pre-acquisition operating loss carryforwards of purchased subsidiaries.[5]

.12 This Statement does not affect the manner of reporting accounting changes required or permitted by an FASB Statement, an FASB Interpretation, or an APB Opinion.[6]

Adjustments Related to Prior Interim Periods of the Current Fiscal Year

.13 For purposes of this Statement, an "adjustment related to prior *interim* periods of the current fiscal year" is an adjustment or settlement of litigation or similar claims, of income taxes, of renegotiation proceedings, or of utility revenue under rate-making processes provided that the adjustment or settlement meets each of the following criteria:

a) The effect of the adjustment or settlement is material in relation to income from continuing operations of the current fiscal year or in relation to the trend of income from continuing operations or is material by other appropriate criteria, and

---

[3] The reporting of prior period adjustments is described in paragraph 18 of *APB Opinion No. 9* [section 2010.17], as modified by paragraph .16 of this Statement, and in paragraph 26 of *APB Opinion No. 9* [section 2010.25].

[4] As defined in paragraph 13 of *APB Opinion No. 20* [Section 1051.13]. That paragraph also describes the distinction between a correction of an error and a change in accounting estimate.

[5] See paragraph 49 of *APB Opinion No. 11* [section 4091.48], "Accounting for Income Taxes," and paragraph 88 of *APB Opinion No. 16* [section 1091.88], "Business Combinations."

[6] In addition to transition requirements of these pronouncements, accounting changes resulting in restatement of previously issued financial statements of prior periods include a change in accounting method permitted by paragraph 52 of *APB Opinion No. 16* [section 1091.52], a change in the reporting entity described in paragraph 34 of *APB Opinion No. 20* [section 1051.34], and special changes in accounting principle described in paragraphs 27 and 29 of *APB Opinion No. 20* [sections 1051.27 and 1051.29]. See also footnote 5 to *APB Opinion No. 20* [section 1051, footnote 6].

b) All or part of the adjustment or settlement can be specifically identified with and is directly related to business activities of specific prior interim periods of the current fiscal year, and

c) The amount of the adjustment or settlement could not be reasonably estimated prior to the current interim period but becomes reasonably estimable in the current interim period.

Criterion (b) above is not met solely because of incidental effects such as interest on a settlement. Criterion (c) would be met by the occurrence of an event with currently measurable effects such as new retroactive tax legislation or a final decision on a rate order. Treatment as adjustments related to prior interim periods of the current fiscal year shall not be applied to the normal recurring corrections and adjustments that are the result of the use of estimates inherent in the accounting process. Changes in provisions for doubtful accounts shall not be considered to be adjustments related to prior interim periods of the current fiscal year even though the changes result from litigation or similar claims.

.14 If an item of profit or loss occurs in *other than the first* interim period of the enterprise's fiscal year and all or a part of the item of profit or loss is an adjustment related to prior interim periods of the current fiscal year, as defined in paragraph .13 above, the item shall be reported as follows:

a) The portion of the item that is directly related to business activities of the enterprise during the current interim period, if any, shall be included in the determination of net income for that period.

b) Prior interim periods of the current fiscal year shall be restated to include the portion of the item that is directly related to business activities of the enterprise during each prior interim period in the determination of net income for that period.

c) The portion of the item that is directly related to business activities of the enterprise during prior fiscal years, if any, shall be included in the determination of net income of the first interim period of the current fiscal year.

.15 The following disclosures shall be made in interim financial reports about an adjustment related to prior interim

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

periods of the current fiscal year. In financial reports for the interim period in which the adjustment occurs, disclosure shall be made of (a) the effect on income from continuing operations, net income, and related per share amounts for each prior interim period of the current fiscal year, and (b) income from continuing operations, net income, and related per share amounts for each prior interim period restated in accordance with paragraph .14 of this Statement.

Amendments to Existing Pronouncements

.16 The conclusions of this Statement require the following amendments to existing pronouncements:

a) *APB Opinion No. 9* [section 2010]. Delete paragraphs 23 and 24. The first sentence of paragraph 18 [section 2010.17] is modified to read as follows:

> Those items that are reported as prior period adjustments shall, in single period statements, be reflected as adjustments of the opening balance of retained earnings.

b) *APB Opinion No. 20* [section 1051]. Delete footnote 9 to paragraph 31 [section 1051.31, footnote 10].

c) *APB Opinion No. 30* [section 2012]. Delete the following words from the second and third sentences of paragraph 25 [section 2012.25]: "should not be reported as a prior period adjustment unless it meets the criteria for a prior period adjustment as defined in paragraph 23 of *APB Opinion No. 9*. An adjustment that does not meet such criteria," and combine the remainder of the two sentences into one sentence as follows:

> Each adjustment in the current period of a loss on disposal of a business segment or of an element of an extraordinary item that was reported in a prior period should be separately disclosed as to year of origin, nature, and amount and classified separately in the current period in the same manner as the original item.

d) *FASB Statement No. 5* [section 4311]. Delete footnote 3 to paragraph 8 [section 4311.08, footnote 3].

Effective Date and Transition

.17 This Statement shall be effective for financial statements for fiscal years beginning after October 15, 1977. Application

in financial statements for fiscal years beginning before October 16, 1977 that have not been previously issued, and in interim periods within those fiscal years, is encouraged but not required. This Statement shall not be applied retroactively to previously issued annual financial statements.

The provisions of this Statement need not be applied to immaterial items.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Appendix A

BASIS FOR CONCLUSIONS

.18 This Appendix contains a discussion of the factors deemed significant by members of the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others. Individual Board members gave greater weight to some factors than to others.

Scope

.19 The initial request referred to in paragraph .01 was for clarification of the application of criterion (b)[7] and criterion (c)[8] of paragraph 23 of *APB Opinion No. 9* to negotiated settlements of litigation. Paragraph 23 of *APB Opinion No. 9* included "settlements of significant amounts resulting from litigation or similar claims" as an example of items that may qualify as prior period adjustments. SEC *Staff Accounting Bulletin No. 8* states the SEC staff's conclusion that "litigation is inevitably an 'economic event' and that settlements would constitute 'economic events' of the period in which they occur. Accordingly, it would seem that charges or credits relating to settlements would also not meet" criterion (b).[9] *Staff Accounting Bulletin No. 8* also states the view that when litigation is settled, management must make a number of significant judgments, and, hence, criterion (c) [10] has not been met.

.20 As described in Appendix B, the FASB staff searched approximately 6,000 annual reports for fiscal years ended from July 1973 through June 1975 and identified 191 annual reports that showed prior period adjustments that appeared to have been made pursuant to the criteria of paragraph 23 of *APB Opinion No. 9*. The purpose of the research was to determine the extent and nature of those prior period adjustments and the possible interpretative problems the

[7] Criterion (b) of paragraph 23 of *APB Opinion No. 9* requires that the adjustments "are not attributable to economic events occurring subsequent to the date of the financial statements for the prior period."

[8] Criterion (c) of paragraph 23 of *APB Opinion No. 9* requires that the adjustment "depend primarily on determinations by persons other than management."

[9] See footnote 7.

[10] See footnote 8.

Board would face if it decided to clarify the criteria in paragraph 23 of *APB Opinion No. 9*. Over one-third of the identified adjustments resulted from litigation and similar claims, and most of these were negotiated. Income tax settlements also represented over one-third of the identified adjustments. Because of the similarity of the process involved in settling litigation and income taxes, and because they constitute most of the identified prior period adjustments made pursuant to the criteria of paragraph 23 of *APB Opinion No. 9*, the Board concluded that this Statement should not be limited to the area of negotiated settlements of litigation, but rather, should address all items reported as prior period adjustments pursuant to the criteria of paragraph 23 of *APB Opinion No. 9*.

.21 Some respondents to the Exposure Draft questioned whether this Statement was intended to change the reporting of adjustments that are required by *APB Opinion No. 9* [section 2010], *11* [section 4091], and *16* [section 1091] to be reported as adjustments to paid-in capital, goodwill, or other assets. This Statement is not intended to require those adjustments to be included in the determination of net income of the current period. This Statement is also not intended to proscribe restatements of earnings per share that are required by *APB Opinions No. 15* [section 2011], "Earnings Per Share," and *16* [section 1091] or by other APB Opinions and FASB Statements.

Summary

.22 In considering possible clarification of the criteria in paragraph 23 of *APB Opinion No. 9* (see paragraph .24), the purpose of the criteria (see paragraph .25), and the effect on prior period adjustments of subsequent pronouncements (see paragraphs .29-.37), the Board determined that an amendment of *APB Opinion No. 9* [section 2010] was needed. The Board concluded for the reasons indicated in paragraphs .24-.39 that all items of profit and loss recognized during a period, with the limited exceptions indicated in paragraphs .11 and .13-.15 and explained in paragraphs .41-.46, shall be included in the determination of net income for that reporting period. The Board also concluded, for the reasons indicated in paragraphs .47-.51, that the manner of reporting accounting changes should not be modified at this time (see paragraph .12).

.23 Some respondents recommended that this project be included in or deferred pending completion of the Board's agenda project entitled "Conceptual Framework for Financial Ac-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

counting and Reporting." The Board determined that this problem required resolution at this time and could be resolved in the existing accounting framework. As outlined in paragraphs .29-.37, the all-inclusive income statement is predominant in the existing accounting framework.

Possible Clarification of Criteria

.24 Relating the criteria of paragraph 23 of *APB Opinion No. 9* and the examples given in that paragraph to prior period adjustments identified in the FASB staff survey (see Appendix B) led to the conclusion that any attempted clarification could result in an amendment of *APB Opinion No. 9* [section 2010] and that the problem could not be satisfactorily resolved by an Interpretation as indicated by the following examples:

a) Settlements of income taxes and litigation constitute the majority of identified prior period adjustments. The former is included in paragraph 23 as an example of a prior period adjustment when material and nonrecurring and the latter is included as an example of an item that *may* qualify as a prior period adjustment. Such settlements are usually negotiated and often do not depend *primarily* on determinations by *any* single party. Accordingly, for out-of-court settlements of both income taxes and litigation to qualify as prior period adjustments, the phrase "depend primarily on determinations by persons other than management" (criterion(c)) would have to be amended to read "*not* depending primarily on management."

b) The term "economic events" in criterion (b)[11] has been interpreted in significantly different ways (see paragraph .19 and Appendix C). Refining the definition of this term could result in an effective amendment.

c) Refining the requirement that prior period adjustments be "material" or of the word "nonrecurring" in the examples in paragraph 23 would likely be an effective amendment.

Purpose of the Criteria of Paragraph 23 of APB Opinion No. 9

.25 Paragraph 17 of *APB Opinion No. 9* [section 2010.16] states that "net income should reflect all items of profit and loss recog-

---

[11] See footnote 7.

nized during the period with the sole exception of . . . prior period adjustments. . . ." *APB Opinion No. 9* [section 2010.16] requires restatement of affected prior periods only if the statements of the affected prior periods are presented; otherwise, only the effect on beginning retained earnings of the earliest period presented is required. The Board believes that a decision to exclude certain items of profit and loss recognized during a period from the determination of net income for that period should be based on a determination that some expected user or class of users would be benefited. Items of profit and loss clearly related to prior period operations and unrelated to the current period operations, for example, might be excluded from the determination of net income for the current period because existing and potential investors might be misled by their inclusion. The criteria of paragraph 23 of *APB Opinion No. 9* do not serve this purpose because they do not comprehend many other items of profit and loss related to prior periods and unrelated to the current period operations. The Board concluded that users will not be benefited by special treatment for some items of profit and loss recognized during a period but not for other similar items. The reasons for the limited exceptions indicated in paragraphs .11 and .13-.15 are explained in paragraphs .41-.46.

The Matching Concept

.26 A number of respondents to the Exposure Draft noted that adjustments that are reported as prior period adjustments are unrelated to operations of the current period. In their view, inclusion in net income of the current period of costs or revenues that are directly related to business activities of prior periods distorts net income in the current period by matching revenue of one period with costs of another period.

.27 *APB Statement No. 4* [sections 1021-1029], "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises," explicitly avoids using the term "matching" because it has a variety of meanings in the accounting literature. In its broadest sense, matching refers to the entire process of income determination — described in paragraph 147 of *APB Statement No. 4* [section 1026.11] as "identifying, measuring, and relating revenue and expenses of an enterprise for an accounting period." Matching may also be used in a more limited sense to refer only to the process of expense recognition or in an even more limited sense to refer to the

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

recognition of expenses by associating costs with revenue on a cause and effect basis.

.28 The Board reviewed items that were reported as prior period adjustments in recent years. The results of that review are summarized in Appendix B. Based on that review, the Board concluded that the items that were reported as prior period adjustments were not sufficiently different from other items that were included in the determination of net income in the current period to justify their exclusion.

Relationship to Subsequent Pronouncements

.29 *APB Opinion No. 9* [section 2010] was issued in December 1966. Since then, other APB Opinions and FASB Statements have changed the standards of accounting for some items related to prior periods. The following paragraphs refer to certain of those changes and their relationship to prior period adjustments.

.30 Paragraph 23 of *APB Opinion No. 9* includes "material, nonrecurring adjustments or settlements of income taxes" as an example of items that would meet the criteria for prior period adjustments. Paragraph 24 of Opinion No. 9 states that "relatively immaterial adjustments of provisions for liabilities (including income taxes) made in prior periods should be considered recurring items to be reflected in operations of the current period." *APB Opinion No. 11* [section 4091], issued in December 1967, requires the use of comprehensive allocation in accounting for income taxes. Prior to the issuance of that Opinion, some enterprises applied partial allocation, a method that did not require taxes to be allocated for certain timing differences. Many settlements of income taxes involve timing differences. With the use of comprehensive allocation, tax settlements relating to timing differences normally do not affect income; thus, *APB Opinion No. 11* [section 4091] probably has reduced the income effect of some settlements of income tax and accordingly the number of settlements that would be accounted for as prior period adjustments.

.31 Paragraph 45 of *APB Opinion No. 11* [section 4091.44] requires that the benefits of prior year tax loss carryforwards not recognized in the year of the loss be recognized as an extraordinary item in the year in which the benefits are realized. Previously, Chapter 10B, "Income Taxes," of *ARB No. 43* provided that ". . . where it is believed that misleading inferences would be

drawn from such inclusion, the tax reduction should be credited to surplus." Thus, *APB Opinion No. 11* [section 4091] requires that an item that is related to specific prior periods be included in the determination of current income.

.32 Paragraph 50 of *APB Opinion No. 11* [section 4091.49] requires that realized tax benefits of loss carryforwards arising prior to a "quasi-reorganization" be added to contributed capital if not recognized prior to the "quasi-reorganization." Thus, *APB Opinion No. 11* [section 4091] requires inclusion of an item that relates to specific prior periods as an addition to contributed capital in the current period. (See paragraph .34.)

.33 Paragraphs 79-83 of *APB Opinion No. 16* [section 1091.79-.83] require that adjustments resulting from resolution of certain contingencies be accounted for as adjustments of the cost of the acquired enterprise. The required accounting is prospective rather than retroactive. Thus, *APB Opinion No. 16* [section 1091] requires that resolution of certain contingencies relating to specific prior periods be reported as an adjustment of the purchase price of assets in the current period. (See paragraph .34.)

.34 *APB Opinion No. 19* [section 2021], "Reporting Changes in Financial Position," established the statement of changes in financial position as a new basic financial statement. This statement purports to present all changes in financial position that occur during the period. The interaction of Opinion No. 19 [section 2021], *APB Opinion No. 9* [section 2010], and other APB Opinions results in the following anomalies:

a) Realized tax benefits of loss carryforwards arising prior to a "quasi-reorganization" are considered related to prior operations and are added to contributed capital, but are reported as changes in financial position in the current period (see paragraph .32); whereas settlements of income taxes, when they meet the criteria of paragraph 23 of *APB Opinion No. 9*, are reported as changes in financial position in the prior period.

b) Adjustments arising from resolution of certain pre-acquisition contingencies of acquired subsidiaries, considered unrelated to current operations and thus reported as adjustments to the cost of the acquired enterprise, are reported as changes in financial position in the current period (see paragraph .33); whereas

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

> adjustments of contingencies that meet the criteria of paragraph 23 of *APB Opinion No. 9* are reported as changes in financial position in the prior period.

The Board concluded that all items of profit and loss recognized in a period, with the limited exceptions indicated in paragraphs .11 and .13-.15 and explained in paragraphs .41-.46, shall be included in the determination of net income and accordingly shall be reported as changes in financial position in that reporting period.

.35 Paragraph 31 of *APB Opinion No. 20* [section 1051.31] requires that the effect of changes in accounting estimates be accounted for in the current period, or the current and future periods if the change affects both. Restatement of amounts reported in prior periods and reporting of pro forma amounts for prior periods are prohibited. However, the Opinion includes a footnote that states:

> Financial statements of a prior period should not be restated for a change in estimate resulting from later resolution of an uncertainty which may have caused the auditor to qualify his opinion on previous financial statements unless the change meets all the conditions for a prior period adjustment (paragraph 23 of *APB Opinion No. 9*).

Thus, Opinion No. 20 [section 1051] requires that most items related to prior periods be included in the determination of current net income without disclosure of the pro forma effect of those items on prior periods but continues the requirements of paragraph 23 of *APB Opinion No. 9* that a few similar items be reported as prior period adjustments.

.36 In addition to establishing criteria for prior period adjustments, which were expected to be rare, *APB Opinion No. 9* [section 2010] also established criteria for "extraordinary items," which were to be reported separately in net income of the current period. *APB Opinion No. 30* [section 2012], "Reporting the Results of Operations," issued in June 1973, established new criteria for extraordinary items, including a change of "would not be expected to recur frequently" in *APB Opinion No. 9* [section 2010] to "not reasonably expected to recur in the foreseeable future" in *APB Opinion No. 30* [section 2012]. Although *APB Opinion No. 30* [section 2012] did not address prior period adjustments, it significantly restricted the eligibility for classification as an extraordinary item. Under Opinion No. 9 [section 2010] the statement that

prior period adjustments would be *nonrecurring* adjustments was often interpreted in practice to mean adjustments that would not be expected to recur frequently, but in the current accounting environment, including *APB Opinion No. 30* [section 2012], *nonrecurring* would be defined as "not reasonably expected to recur in the foreseeable future."

.37 Paragraph 8 of *FASB Statement No. 5* [section 4311.08], issued in March 1975, establishes two conditions for accrual of an estimated loss from a loss contingency and prohibits accrual before those conditions are met. The Board did not reexamine the concept of prior period adjustments at that time. Consideration in this Statement of the kinds of items, if any, to be accounted for as prior period adjustments led to the following questions: If pursuant to *FASB Statement No. 5* [section 4311] a loss cannot be accrued in the period when it is probable that an asset had been impaired or a liability had been incurred because the amount of loss cannot be reasonably estimated, should the loss be charged retroactively to that period when it can be reasonably estimated in a subsequent period? Does the loss accrue to the earlier period, when it was probable that an asset had been impaired or a liability had been incurred, or to the later period, when the amount of loss can be reasonably estimated? The Board believes that the requirement under *APB Opinion No. 9* [section 2010] that certain losses, when they can be reasonably estimated in a later period, be charged retroactively to an earlier period is inconsistent with the intent of *FASB Statement No. 5* [section 4311] in prohibiting accrual of an estimated loss when the amount of loss cannot be reasonably estimated, even though it is probable that an asset has been impaired or a liability has been incurred. The Board concluded that all estimated losses for loss contingencies should be charged to income rather than charging some to income and others to retained earnings as prior period adjustments.

Consideration of Specific Types of Adjustments

.38 A number of respondents questioned the appropriateness of a rate-regulated utility's reporting refunds in the period in which the refunds are ordered if the refunded amounts were originally collected subject to refund. Upon request, several of those respondents furnished additional data that further explained the effect of those refunds. The Board is aware that there are differing views about the reporting of both the contingently refundable revenue when it is billed and the

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

subsequent refunds. Determining the reporting that would be appropriate for the contingently refundable revenue when it is billed is outside the scope of this Statement. Except for the possible effect of the rate-making process, the Board does not believe that the reporting of any adjustment at the time that a subsequent refund is determined is sufficiently different from the reporting of other adjustments that result from previous uncertainties to justify special treatment in this Statement. However, the Board did not consider whether the effect of the rate-making process might permit or require special treatment for those refunds. (See also paragraphs .46, concerning adjustments related to prior interim periods of the current fiscal year, and .55, concerning the Addendum to *APB Opinion No. 2* [section 6011].)

.39 A number of respondents recommended that this Statement be modified to provide that specific types of adjustments, such as renegotiation, continue to be reported as prior period adjustments. The Board rejected this recommendation because none of the items cited is sufficiently different from other adjustments that are included in the determination of net income of the current period to justify special treatment. (However, see paragraph .46 concerning adjustments related to prior interim periods of the current fiscal year.)

Prior Period Adjustments That Are Not Affected by This Statement

.40 The Board reviewed other kinds of items reported as prior period adjustments, described in paragraphs .41-.45. In each case, the Board concluded that the accounting for these items should not be modified at this time.

Correction of an error

.41 Paragraph 13 of *APB Opinion No. 20* [section 1051.13] states:

> Errors in financial statements result from mathematical mistakes, mistakes in the application of accounting principles, or oversight or misuse of facts that existed at the time the financial statements were prepared. In contrast, a change in accounting estimate results from new information or subsequent developments and accordingly from better insight or improved judgment. Thus, an error is distinguishable from a change in estimate. A change from an accounting principle that is not generally accepted to one that is generally accepted is a correction of an error for purposes of applying this Opinion.

A major distinguishing feature of a correction of an error is that the financial statements of the affected prior period, when originally issued, should have reflected the adjustment. In contrast, a prior period adjustment that meets the criteria of paragraph 23 of *APB Opinion No. 9* could not have been determined when the financial statements were originally issued. The Board concluded that a correction of an error, as defined above, should continue to be reflected by restating the financial statements of the affected prior period.

.42 Some respondents contended that the distinction between a correction of an error and a change in estimate is too vague to be a basis for different accounting. The Board noted that *APB Opinion No. 20* [section 1051] used that same distinction as the basis for different accounting for corrections of errors and changes in estimates that did not meet the criteria of Opinion No. 9 [section 2010] for prior period adjustments. No problems of application resulting from that requirement of Opinion No. 20 [section 1051] have been brought to the Board's attention.

.43 Several respondents stated that an exception to permit the reporting of corrections of errors as prior period adjustments is not justified. The Board concluded that the normal procedures of revising and reissuing financial statements promptly when an error is discovered or otherwise advising users that the financial statements contain erroneous data appear to satisfy the interests of financial statement users. Those procedures also permit enterprises to disclose the inaccuracies on as timely a basis as is practicable in the circumstances.

Income tax benefits of pre-acquisition operating loss carryforwards of purchased subsidiaries

.44 Paragraph 88 of *APB Opinion No. 16* [section 1091.88] states that "an acquiring corporation should reduce the acquired goodwill retroactively for the realized tax benefits of loss carry-forwards of an acquired company not previously recorded by the acquiring corporation." The corresponding reduction in the amount of goodwill amortization in prior years is reported as a prior period adjustment as described in paragraph 49 of *APB Opinion No. 11* [section 4091.48]. The FASB presently has on its technical agenda a project entitled "Accounting for Business Combinations and Purchased Intangibles" that includes a reconsideration of *APB Opinion No. 16* [section 1091]. The Board believes that because it is reconsidering *APB*

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Opinion No. 16 [section 1091] the requirements of that Opinion should continue in effect so as to maintain the status quo during the Board's reconsideration.

.45 Some respondents recommended that the acquired goodwill be reduced *in the current year* for the realized tax benefits of loss carryforwards of an acquired company not previously recorded by the acquiring corporation. The adjustment would thus in effect be amortized only prospectively rather than both retroactively, as a prior period adjustment, and prospectively. Accounting for realized tax benefits of loss carryforwards of an acquired company is addressed as Problem 2 of Technical Issue Two at paragraphs 512 - 520 of the August 19, 1976 FASB Discussion Memorandum, "Accounting for Business Combinations and Purchased Intangibles." As indicated in paragraph .44 above, the Board believes that the status quo should be maintained on that project during the Board's deliberations.

Adjustments Related to Prior Interim Periods of the Current Fiscal Year

.46 A number of respondents to the Exposure Draft and to the October 7, 1976 Exposure Draft on "Accounting for Income Taxes in Interim Periods" recommended that this Statement be applied to annual financial statements only, rather than to annual and interim financial statements. Several of those respondents noted that the APB concluded in paragraph 9 of *APB Opinion No. 28* [section 2071.09] that "the usefulness of such [interim financial] information rests on the relationship that it has to the annual results of operations." In those respondents' view, restatement of interim periods is necessary to make interim data relate in a meaningful way to anticipated annual results. Several other of those respondents observed that the Board has on its technical agenda a project entitled "Interim Financial Reporting" that includes a reconsideration of *APB Opinion No. 28* [section 2071] and contended that, because Opinion No. 28 [section 2071] was issued when the criteria of Opinion No. 9 [section 2010] for prior period adjustments were in effect, the Board should not change interim reporting during its reconsideration of Opinion No. 28 [section 2071] by proscribing adjustments to prior interim periods. While not necessarily agreeing with these arguments, the Board decided to continue the practice of interim period restatements in the current fiscal year on a limited basis for the present. To avoid the interpretation problems that have resulted from the criteria of paragraph 23 of Opinion No. 9, the Board (a) limited such restatements to the specific examples cited in

paragraph 23 of Opinion No. 9, (b) required that the adjustments meet the definition of materiality for extraordinary items (paragraph 24 of *APB Opinion No. 30* [section 2012.24]), and (c) required that the adjustments meet the two criteria of paragraph 23 of Opinion No. 9 that have not created interpretation problems in the past. The Board believes that application of the criteria in paragraph .13 will substantially continue existing practice for interim periods of the current fiscal year. Some Board members believe that this exception is inconsistent with some of the other conclusions of this Statement; however, they are willing to accept the provisions of paragraphs .13-.15 during the Board's consideration of its project on interim financial reporting.

Accounting changes

.47 Paragraph 25 of *APB Opinion No. 9* addressed the subject of accounting changes as follows:

> A change in the application of accounting principles may create a situation in which retroactive application is appropriate. In such situations *these changes should receive the same treatment as that for prior period adjustments.* [Emphasis added]

While distinguishing a retroactive accounting change from the prior period adjustments covered by paragraph 23 of that Opinion, the APB did prescribe the same accounting treatment for both.

.48 Accounting changes (but not prior period adjustments covered by paragraph 23 of *APB Opinion No. 9*) were subsequently dealt with in *APB Opinion No. 20* [section 1051]. Paragraph 5 of Opinion No. 20 [section 1051.05] states:

> Paragraph 25 of *APB Opinion No. 9* is superseded. Although the conclusion of that paragraph is not modified, this Opinion deals more completely with accounting changes.

.49 The Board believes that retroactive accounting changes, whether specified in transition requirements of FASB Statements and Interpretations and APB Opinions or in the requirements of APB Opinion No. 20 [section 1051], differ significantly in nature from the prior period adjustments covered by paragraph 23 of *APB Opinion No. 9*, as described in the following paragraph. For that reason, the Board concluded that it should not, in this standard, reexamine existing

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

requirements for retroactive accounting changes or proscribe the use of retroactive accounting changes in future Statements or Interpretations.

.50 Requirements for restatements of prior periods to reflect changes in accounting principles address categories of transactions that are usually recurring and pervasive. Those restatements provide useful information for purposes of comparing financial data for periods after initial application of the accounting principles with data presented for earlier periods. In contrast, the criteria of paragraph 23 of *APB Opinion No. 9* address isolated adjustments that are stated to be "rare in modern financial accounting." The purpose of restatement of prior periods for nonrecurring items cannot be to make the affected prior period comparable to subsequent periods because comparability cannot be accomplished by shifting nonrecurring items among periods. Instead, the purpose is to exclude material items directly related to prior periods from the determination of net income in the current period to avoid impairing the significance of net income of the current period (see paragraphs 10 - 12 of *APB Opinion No. 9* [section 2010.09-.11]). As previously stated, the Board concluded that purpose is not accomplished by paragraph 23 of *APB Opinion No. 9* (see paragraph .25 above).

.51 Paragraph 52 of *APB Opinion No. 16* [section 1091.52] states that a change in accounting method of one of the combining enterprises in a pooling of interests that is made to conform the accounting methods of the combining enterprises shall be applied retroactively. Like the item discussed in paragraph .44, this provision will be reconsidered as a part of the current FASB technical agenda project entitled "Accounting for Business Combinations and Purchased Intangibles," and the Board believes the status quo should be maintained in the meantime.

Income Statement Classification

.52 Some respondents noted that most adjustments that would have been reported as prior period adjustments prior to the issuance of this Statement will not meet the criteria of *APB Opinion No. 30* [section 2012] for classification as extraordinary items. Some of those respondents recommended that this Statement require adjustments to be classified in the future as extraordinary items if they meet the present criteria of paragraph 23 of *APB Opinion No. 9*. Others contended that

inclusion of such adjustments in income from continuing operations would obscure current income from ongoing operations. Considerations of income statement classification under Opinion No. 30 [section 2012] are not different for items previously classified as prior period adjustments and for other changes in estimates. The Board concluded that income statement classification is too pervasive to be dealt with in this project and that it probably should be considered in some phase of the FASB agenda project entitled "Conceptual Framework for Financial Accounting and Reporting."

.53 A number of respondents observed that the "average" investor relies primarily on earnings per share data or earnings summaries in the financial press and thus might be misled by the inclusion of adjustments that are related to prior periods in income from continuing operations in the current period. The effect of random, irregular, or unpredictable events may make periodic earnings per share data unrepresentative of an enterprise's earning activities during that period. For example, completed contract accounting for long-term contracts may result in an enterprises's reporting activities of one period in a subsequent period. However, the Board does not believe that investors are served by excluding the effects of such events from reported earnings. Disclosure of the effects of such events is required by certain APB Opinions and FASB Statements. Thus, reliance on a single earnings per share amount or a summary in the financial press may not be a sound basis for investment decisions.

.54 Some respondents to the Exposure Draft contended that this Statement substitutes a narrow rule for managements' and auditors' judgments. The Board agrees that judgment is necessary in financial reporting but does not believe that judgment should result in special treatment for some items of profit and loss recognized during a period but not for other similar items unless special treatment is justified by different circumstances. On the other hand, management's judgment may indicate that disclosure should be furnished to allow a user to properly evaluate the enterprise's earnings. For example, *APB Opinion No. 30* [section 2012] requires disclosure of the effect of "unusual" or "infrequently occurring" items. Similar disclosure for items that are not "unusual" or "infrequently occurring," as defined in that Opinion, may also be appropriate if management feels that such disclosure is needed.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Addendum to APB Opinion No. 2 [section 6011]

.55 A number of respondents requested that the FASB clarify how the Addendum to *APB Opinion No. 2* [section 6011] applies to prior period adjustments. The Board is aware that differing applications of the Addendum exist in practice and has not addressed that issue.

Effective Date and Transition

.56 Some respondents recommended that the Statement not apply to certain categories of preexisting contingencies. Those respondents suggested a variety of criteria for determining the preexisting contingencies to be exempted, including prior disclosure of the contingency, prior partial settlements of the same or of a related matter that were reported as prior period adjustments, and qualifications of auditors' earlier reports with respect to the contingency. The Board concluded that there was no equitable basis for exempting certain preexisting contingencies and not others.

.57 The Exposure Draft proposed that the Statement be applied to fiscal years beginning on or after December 15, 1976. Several respondents recommended earlier application to avoid an interim period of confusion. Several others recommended a delay in the effective date because management may have disclosed in good faith that an anticipated adjustment would be reported as a prior period adjustment and might as a result be charged with having misled investors if the adjustment is reported in income of the current period. Following further consideration the Board concluded that it was appropriate to modify the effective date of this Statement to fiscal years beginning after October 15, 1977.

Applicability to Interim Periods

.58 Some respondents questioned whether this Statement was intended to apply to interim as well as annual financial statements. As a result the Board added footnote 1 to paragraph .10. In addition, as explained in paragraph .46, paragraphs .13-.15 were added.

Disclosure

.59 Some respondents recommended that this Statement specify the disclosures that should be made for an adjustment that would

previously have been reported as a prior period adjustment under the criteria of *APB Opinion No. 9* [section 2010]. The Board concluded that existing disclosure requirements that have been applied to other similar items included in the determination of current net income also apply to items that would previously have been reported as prior period adjustments. For example, *APB Opinion No. 30* [section 2012] specifies the disclosure requirements for "unusual items," "infrequently occurring items," and "extraordinary items"; *APB Opinion No. 28* [section 2071] specifies the disclosure requirements for various categories of adjustments in interim financial reports; and other pronouncements specify disclosures that apply to certain types of items.

Appendix B

SUMMARY OF FASB STAFF RESEARCH

Other Studies Available

.60 A recent survey of the annual reports of 600 industrial and commercial corporations contained the following summary of adjustments to the opening balances of retained earnings during the four fiscal years of those enterprises ended not later than February 2, 1975:[12]

Reasons for adjustment	1974	1973	1972	1971
Poolings of interests	30	56	67	69
Research and development expenditures charged to operations	23	—	—	—
Litigation or income tax settlements	12	29	26	15
Other	18	36	89	87
Total adjustments	83	121	182	171

Investigation revealed that the "other" category consisted principally of accounting changes (adopting tax allocation, adopting recommendations of AICPA Industry Audit Guides that required retroactive application, etc.) and changes in the reporting entity. The items categorized as "litigation or income tax settlements" were prior period adjustments made pursuant to the criteria of paragraph 23 of *APB Opinion No. 9*. Since the adjustments represented by this caption were few in number, the broader study described in the following paragraphs was undertaken. The adjustments in the above table that were determined to have been made pursuant to paragraph 23 of *APB Opinion No. 9* were used as a control to ensure that the selection procedures were adequate to locate substantially all of such adjustments made by enterprises included in the study.

[12] American Institute of Certified Public Accountants, *Accounting Trends & Techniques — 1975*, 29th ed. (New York: AICPA, 1975), p. 363.

Methodology

.61 The research by the FASB staff utilized the National Automated Accounting Research System (NAARS).[13] NAARS includes a file of annual reports of publicly held enterprises. Enterprises reporting or referring to prior period adjustments in either the footnotes or the retained earnings statement were identified. The control group referred to in paragraph .60 was used to provide assurance that no substantial number of items was omitted. Complete reliability of the results of such a search could not be assured because of the variety of ways that enterprises disclose such adjustments. Adjustments were located in approximately 1,200 reports and those adjustments were reviewed in detail, and the adjustments made pursuant to paragraph 23 of *APB Opinion No. 9* were identified. If it was unclear whether the adjustment belonged in this category, it was included, except that in a few instances where there was virtually no disclosure of the nature or circumstances of the adjustment, the adjustment was excluded from the study because no meaningful conclusions could be derived. Subsidiary companies that reported the same prior period adjustment reported in consolidated statements were excluded to avoid duplication. At the time the research was conducted, the NAARS system included:

Year*	Total reports including subsidiaries	Approximate total enterprises
1973	3,617	3,350
1974	3,150	2,800
1975	650	600
Total	7,417	6,750

*The NAARS system classifies fiscal year-ends from July through June as a "year" (e.g., 1974 includes fiscal years ended July 1974 through June 1975).

The detail summaries following are limited to 1974 and 1973; 1975 was reviewed to determine whether significant trends were apparent (none were noted) but the file was considered not sufficiently complete to justify any further conclusions. In addition, later 1975 results, if available, would probably have reflected the effect of the recent SEC staff interpretations.

Overall Results

.62 The following table compares 1974 and 1973 identified prior period adjustments:

[13] NAARS is a computer-assisted accounting retrieval system developed by the American Institute of Certified Public Accountants in conjunction with Mead Data Central, Inc.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Category	1974 Number of enterprises reporting adjustments	1974 Percentage of enterprises	1973 Number of enterprises reporting adjustments	1973 Percentage of enterprises
Income taxes	30	1.1%	53	1.6%
Litigation and similar claims	37	1.3%	37	1.1%
Utility rate and similar matters	13	0.5%	13	0.4%
Renegotiation	—	0.0%	6	0.2%
Economic Stabilization	1	0.0%	2	0.1%
Other	—	0.0%	5	0.1%
Total*	81		116	
Total enterprises*	79	2.8%	112	3.3%

*Individual categories add to more than the total enterprises shown because some enterprises reported prior period adjustments in more than one category.

.63 The following table compares the relative size of the identified adjustments reported for 1974 and 1973:

Range of prior period adjustment as a percentage of net income or loss in the year reported		Number of enterprises reporting adjustments in the range			
Over	But not over	Income taxes	Litigation and similar claims	Utility rate and similar matters	All other
0%	5%	13	18	7	4
5%	10%	29	7	6	3
10%	20%	17	17	6	3
20%	50%	16	19	4	1
50%	100%	5	8	—	—
100%		2	5	2	3
Not determinable		1	—	1	—
Total		83	74	26	14

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.64 Investigation of the adjustments relating to income taxes and litigation disclosed the following circumstances:

Apparent circumstances of the adjustment, based on financial statement disclosures	Adjustments relating to	
	Income taxes	Litigation and similar claims
Negotiated settlements	56	45*
Adjudicated settlements	5	14
Combination of negotiated and adjudicated settlements	—	5
Not settled at the date the financial statements were issued	8	7
Negotiated by outside parties without participation by the enterprise	—	1
Change in estimate, with no other party involved	5	—
Not determinable	9	2
Total	83	74

*17 required court approval.

Other Findings

.65 Paragraphs .66-.70 describe other findings of the survey.

Changes in accounting estimates

.66 *APB Opinion No. 20* [section 1051] prohibits restatement of amounts reported in prior periods as a result of changes in accounting estimates except for adjustments that meet all of the criteria of paragraph 23 of *APB Opinion No. 9* (see paragraph .35). Twenty of the 197 identified 1974 and 1973 prior period adjustments were changes in previously recorded accounting estimates. These consisted of seven reversals of income tax accruals, six adjustments of prior year provisions for loss on disposal of discontinued operations, and seven adjustments of prior year provisions for other litigation and similar claims.

Frequency of occurrence

.67 Paragraph 23 of *APB Opinion No. 9* stated that prior period adjustments would be "nonrecurring." Paragraph 24 of Opinion No. 9 stated that "treatment as prior period adjustments should not be applied to the normal, recurring corrections. . . ." The term "nonrecurring" is discussed in paragraph .36 above. Many of the identified prior period adjustments appeared to be of a nature that would be reasonably expected to recur in the foreseeable future in the enterprise's operating environment. Nine enterprises reported similar or related prior period adjustments in both 1974 and 1973.

Application of criterion (a)

.68 Criterion (a) of paragraph 23 of *APB Opinion No. 9* requires that an item "can be specifically identified with and directly related to the business activities of particular prior periods." Most of the identified prior period adjustments for settlements of litigation were charged to the period in which the underlying event that gave rise to the litigation occurred. Some, however, were charged or credited to a prior period subsequent to the underlying event, including (a) the period the litigation was initiated, (b) the period of a prior criminal conviction for the alleged acts, or (c) the period that an amount was accrued in excess of the eventual cost of the settlement.

Utility rate and similar matters

.69 Utility rate making processes sometimes allow rates to customers to be increased on a provisional basis prior to the regulatory commission's final action on a requested rate increase. If a portion of the requested increase is subsequently disallowed, the utility is required to refund the disallowed portion. Of the 26 identified adjustments relating to utility rate and similar matters, 14 relate to this process.

Income taxes

.70 Identified adjustments for income tax matters included 12 settlements for which the underlying basis of the settlement was recorded (e.g., retroactive adjustment of depreciation to reflect longer useful lives). These may have been corrections of errors. As explained in paragraph .61, these adjustments were included because it was unclear whether the adjustments were made pursuant to paragraph 23 of *APB Opinion No. 9*.

Appendix C

EXCERPTS FROM SEC STAFF ACCOUNTING BULLETIN NO. 8

.71 On June 4, 1976 the SEC published *Staff Accounting Bulletin No. 8*. This Bulletin included a statement of the SEC staff's interpretation and application of the criteria of *APB Opinion No. 9* [section 2010] for prior period adjustments.

.72 Staff Accounting Bulletins contain the following statement concerning their authoritative status:

> The statements in the Bulletin are not rules or interpretations of the Commission nor are they published as bearing the Commission's official approval; they represent interpretations and practices followed by the Division [of Corporation Finance] and the Chief Accountant in administering the disclosure requirements of the federal securities laws.

.73 *Staff Accounting Bulletin No. 8* included the following:

> H. Prior Period Adjustments
>
> Facts:
>
> Accounting Principles Board Opinion No. 9, paragraph 23, limits treatment as a prior period adjustment "to those material adjustments which (a) can be specifically identified with and directly related to the business activities of particular prior periods, and (b) are not attributable to economic events occurring subsequent to the date of the financial statements for the prior period, and (c) depend primarily on determinations by persons other than management and (d) were not susceptible of reasonable estimation prior to such determination."
>
> It is not uncommon for parties to litigation to reach settlement of the matter at issue in an out-of-court settlement.
>
> Question:
>
> Do out-of-court settlements meet the criteria for prior period adjustments?
>
> Interpretive Response:
>
> The staff has been extremely reluctant to permit registrants to charge items to retained earnings as prior period adjustments in the light of the clear intent expressed in APB 9 to limit such charges severely. That opinion effectively adopted an all-inclusive approach to the measurement of periodic

income. While such an approach may not result in the best matching of costs and revenues, it does provide assurance that all items will at some time be accounted for as elements of income and it prevents the abuses which were noted prior to the adoption of APB 9 whereby adverse circumstances could be at least partially obscured through the vehicle of a direct charge to retained earnings. If unusual items and items related to matters arising in prior years are properly isolated and described in the income statement, we believe that investors will be able to interpret results in an intelligent fashion. Were the Financial Accounting Standards Board to revise the basic accounting philosophy of the all-inclusive income statement, the staff would, of course, review its position in the light of that revision.

In the meantime, however, the staff intends to continue to apply the four restrictive tests set forth in paragraph 23 of Accounting Principles Board Opinion No. 9 strictly. In this connection, the issue which has arisen most frequently is the treatment of litigation settlements. It is the staff's view that when litigation is settled, the management must make a number of significant judgments and, hence, the test that the amounts must "depend primarily on determinations by persons other than management" (criterion (c) above) has not been met. In addition, in a business world increasingly characterized by litigation to an extent far in excess of that when Accounting Principles Board Opinion No. 9 was adopted (1966), it seems that litigation is inevitably an "economic event" and that settlements would constitute "economic events" of the period in which they occur. Accordingly, it would seem that charges or credits relating to settlements would also not meet the second test (criterion (b) above) set forth in paragraph 23 of Opinion 9 that they not be "attributable to economic events occurring subsequent to the date of the financial statements for the prior period."

AC Section 2021

Reporting Changes in Financial Position

[Source: APB Opinion No. 19, as amended.]

Effective for fiscal periods ending after September 30, 1971 unless otherwise indicated

In view of the broadened concept of the Funds Statement adopted in this section, the Board has recommended that the title of the statement be changed to "Statement of Changes in Financial Position."

INTRODUCTION

.01 In 1963 the Accounting Principles Board issued Opinion No. 3, *The Statement of Source and Application of Funds.* Support of that Opinion by the principal stock exchanges and its acceptance by the business community have resulted in a significant increase in the number of companies that present a statement of sources and uses of funds (funds statement) in annual financial reports to shareholders. Several regulatory agencies have acted recently to require funds statements in certain reports filed with them.

.02 APB Opinion No. 3 encouraged but did not require presentation of a funds statement. In view of the present widespread recognition of the usefulness of information on sources and uses of funds, the Board has considered whether presentation of such a statement should be required to complement the income statement and the balance sheet. APB Opinion No. 3 also offered considerable latitude as to form and content of funds statements, and practice has varied widely. The Board has therefore also considered establishing guides for presenting such statements.

.03 This section sets forth the Board's conclusions.

DISCUSSION

.04 The objectives of a funds statement are (1) to summarize the financing and investing activities of the entity, including the extent to which the enterprise has generated funds from operations during the period, and (2)

to complete the disclosure of changes in financial position during the period. The information shown in a funds statement is useful to a variety of users of financial statements in making economic decisions regarding the enterprise.

.05 The funds statement is related to both the income statement and the balance sheet and provides information that can be obtained only partially, or at most in piecemeal form, by interpreting them. An income statement together with a statement of retained earnings reports results of operations but does not show other changes in financial position. Comparative balance sheets can significantly augment that information, but the objectives of the funds statement require that all such information be selected, classified, and summarized in meaningful form. The funds statement cannot supplant either the income statement or the balance sheet but is intended to provide information that the other statements either do not provide or provide only indirectly about the flow of funds and changes in financial position during the period.

.06 The concept of *funds* in funds statements has varied somewhat in practice, with resulting variations in the nature of the statements. For example, *funds* is sometimes interpreted to mean *cash* or its equivalent, and the resulting funds statement is a summary of cash provided and used. Another interpretation of *funds* is that of *working capital,* i. e., current assets less current liabilities, and the resulting funds statement is a summary of working capital provided and used.[1] However, a funds statement based on either the cash or the working capital concept of funds sometimes excludes certain financing and investing activities because they do not directly affect cash or working capital during the period. For example, issuing equity securities to acquire a building is both a financing and investing transaction but does not affect either cash or working capital. To meet all of its objectives, a funds statement should disclose separately the financing and investing aspects of all significant transactions that affect financial

[1] Examples of different uses of the term *funds* are found in *"Cash Flow" Analysis and the Funds Statement,* by Perry Mason, Accounting Research Study No. 2, published by the American Institute of Certified Public Accountants in November 1961, pp. 51-56. This study contains numerous examples of other aspects of these statements. (Accounting research studies are not pronouncements of the Board or of the Institute but are published for the purpose of stimulating discussion on important accounting issues.)

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

position during a period. These transactions include acquisition or disposal of property in exchange for debt or equity securities and conversion of long-term debt or preferred stock to common stock.

OPINION

Applicability

.07 The Board concludes that information concerning the financing and investing activities of a business enterprise and the changes in its financial position for a period is essential for financial statement users, particularly owners and creditors, in making economic decisions. When financial statements purporting to present both financial position (balance sheet) and results of operations (statement of income and retained earnings) are issued, a statement summarizing changes in financial position should also be presented as a basic financial statement for each period for which an income statement is presented.[2] These conclusions apply to all profit-oriented business entities, whether or not the reporting entity normally classifies its assets and liabilities as current and noncurrent.

Concept

.08 The Board also concludes that the statement summarizing changes in financial position should be based on a broad concept embracing all changes in financial position and that the title of the statement should reflect this broad concept. The Board therefore recommends that the title be Statement of Changes in Financial Position (referred to below as "the Statement"). The Statement of each reporting entity should disclose all important aspects of its financing and investing activities regardless of whether cash or other elements of working capital are directly affected. For example, acquisitions of property by issuance of securities or in exchange for other property, and conversions of long-term debt or preferred stock to common stock, should be appropriately reflected in the Statement.

Format

.09 The Board recognizes the need for flexibility in form, content, and terminology of the Statement to meet

---

[2] The Board recognizes that a statement of changes in financial position will be omitted in some circumstances; for example, from financial statements restricted for internal use only (see AU section 516.05-.06) and financial statements prepared for special purposes (see AU section 621, volume 1, AICPA PROFESSIONAL STANDARDS).

its objectives in differing circumstances. For example, a working capital format is not relevant to an entity that does not distinguish between current and noncurrent assets and liabilities. Each entity should adopt the presentation that is most informative in its circumstances. The Board believes, however, that the guides set forth in the paragraphs that follow should be applied in preparing and presenting the Statement.

.10 The ability of an enterprise to provide working capital or cash from operations is an important factor in considering its financing and investing activities. Accordingly, the Statement should prominently disclose working capital or cash provided from or used in operations for the period, and the Board believes that the disclosure is most informative if the effects of extraordinary items (see section 2012, *Reporting the Results of Operations*) are reported separately from the effects of normal items. The Statement for the period should begin with income or loss before extraordinary items, if any, and add back (or deduct) items recognized in determining that income or loss which did not use (or provide) working capital or cash during the period. Items added and deducted in accordance with this procedure are not sources or uses of working capital or cash, and the related captions should make this clear, e. g., "Add —Expenses not requiring outlay of working capital in the current period." An acceptable alternative procedure, which gives the same result, is to begin with total revenue that provided working capital or cash during the period and deduct operating costs and expenses that required the outlay of working capital or cash during the period. In either case the resulting amount of working capital or cash should be appropriately described, e. g., "Working capital provided from [used in] operations for the period, exclusive of extraordinary items." This total should be immediately followed by working capital or cash provided or used by income or loss from extraordinary items, if any; extraordinary income or loss should be similarly adjusted for items recognized that did not provide or use working capital or cash during the period. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.11 Provided that these guides are met, the Statement may take whatever form gives the most useful portrayal of the financing and investing activities and the changes in financial position of the reporting entity. The Statement may be in balanced form or in a form expressing the changes in financial position in terms of cash, of cash and temporary investments combined, of all quick assets, or of working capital. The Statement should disclose all important changes in financial position for the period covered; accordingly, types of transactions reported may vary substantially in relative importance from one period to another.[3]

Content

.12 Whether or not working capital flow is presented in the Statement, net changes in each element of working capital (as customarily defined) should be appropriately disclosed for at least the current period, either in the Statement or in a related tabulation.

a. If the format shows the flow of cash, changes in other elements of working capital (e. g., in receivables, inventories, and payables) constitute sources and uses of cash and should accordingly be disclosed in appropriate detail in the body of the Statement.

b. If the format shows the flow of working capital and two-year comparative balance sheets are presented, the changes in each element of working capital for the current period (but not for earlier periods) can be computed by the user of the statements. Nevertheless, the Board believes that the objectives of the Statement usually require that the net change in working capital be analyzed in appropriate detail in a tabulation accompanying the Statement, and accordingly this detail should be furnished.

.13 The effects of other financing and investing activities should be individually disclosed. For example, both outlays for acquisitions and proceeds from retirements of property should be reported;[4] both long-term borrowings

[3] As stated in section 2051.23, *Consolidated Financial Statements,* in some cases parent-company financial statements (including, in conformity with this section, a statement of changes in financial position) may be needed in addition to consolidated financial statements for adequate disclosure.

[4] However, normal trade-ins to replace equipment should ordinarily be reported on a net basis.

and repayments of long-term debt should be reported; and outlays for purchases[5] of consolidated subsidiaries should be summarized in the consolidated Statement by major categories of assets obtained and obligations assumed. Related items should be shown in proximity when the result contributes to the clarity of the Statement. Individual immaterial items may be combined.

.14 In addition to working capital or cash provided from operations (see paragraph .10) and changes in elements of working capital (see paragraph .12), the Statement should clearly disclose:

a. Outlays for purchase of long-term assets (identifying separately such items as investments, property, and intangibles).

b. Proceeds from sale (or working capital or cash provided by sale) of long-term assets (identifying separately such items as investments, property, and intangibles) not in the normal course of business, less related expenses involving the current use of working capital or cash.

c. Conversion of long-term debt or preferred stock to common stock.

d. Issuance, assumption, redemption, and repayment of long-term debt.

e. Issuance, redemption, or purchase of capital stock for cash or for assets other than cash.

f. Dividends in cash or in kind or other distributions to shareholders (except stock dividends and stock split-ups as defined in section 5561—*Stock Dividends and Stock Split-Ups*).

Terminology

.15 The amount of working capital or cash provided from operations is not a substitute for or an improvement upon properly determined net income as a measure of results of operations and the consequent effect on financial position. Terms referring to "cash" should not be used

[5] When a business combination is accounted for as a pooling of interests, financial statements (including, in conformity with this section, statements of changes in financial position) of the separate companies should be restated on a combined basis for all periods presented. See section 1091.57, *Business Combinations*.

 © 1974, American Institute of Certified Public Accountants, Inc.

to describe amounts provided from operations unless all non-cash items have been appropriately adjusted. The adjusted amount should be described accurately, in conformity with the nature of the adjustments, e. g., "Cash provided from operations for the period" or "Working capital provided from operations for the period" as appropriate. The Board strongly recommends that isolated statistics of working capital or cash provided from operations, especially per-share amounts, not be presented in annual reports to shareholders. If any per-share data relating to flow of working capital or cash are presented, they should as a minimum include amounts for inflow from operations, inflow from other sources, and total outflow, and each per-share amount should be clearly identified with the corresponding total amount shown in the Statement.

EFFECTIVE DATE

.16 This section shall be effective for fiscal periods ending after September 30, 1971. However, the Board encourages earlier application of the provisions of this section.

AC Section 2031

Current Assets and Current Liabilities

[Source: ARB 43, Chap. 3A, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 The working capital of a borrower has always been of prime interest to grantors of credit; and bond indentures, credit agreements, and preferred stock agreements commonly contain provisions restricting corporate actions which would effect a reduction or impairment of working capital. Many such contracts forego precise or uniform definitions and merely provide that current assets and current liabilities shall be determined in accordance with generally accepted accounting principles. Considerable variation and inconsistency exist, however, with respect to their classification and display in financial statements. In this section the committee discusses the nature of current assets and current liabilities with a view toward a more useful presentation thereof in financial statements.

.02 The committee believes that, in the past, definitions of current assets have tended to be overly concerned with whether the assets may be immediately realizable. The discussion which follows takes cognizance of the tendency for creditors to rely more upon the ability of debtors to pay their obligations out of the proceeds of current operations and less upon the debtor's ability to pay in case of liquidation. It should be emphasized that financial statements of a going concern are prepared on the assumption that the company will continue in business. Accordingly, the views expressed in this section represent a departure from any narrow definition or strict *one year* interpretation of either current assets or current liabilities; the objective is to relate the criteria developed to the operating cycle of a business.

.03 Financial position, as it is reflected by the records and accounts from which the statement is prepared is revealed in a presentation of the assets and liabilities of the enterprise. In the statements of manufacturing, trading, and service enterprises these assets and liabilities are generally classified and segregated; if they are classified logically, summations or totals of the *current* or *circulating* or *working* assets, hereinafter referred to as *current assets,* and of obligations currently payable, designated as *current liabilities,* will permit the ready determination of working capital. *Working capital,* sometimes called *net working capital,* is represented by the excess of current assets over current liabilities and identifies the relatively liquid portion of total enterprise capital which constitutes a margin or buffer for meeting obligations within the ordinary operating cycle of the business. If the conventions of accounting relative to the identification and presentation of current assets and current liabilities are made logical and consistent, the amounts, bases of valuations, and composition of such assets and liabilities and their relation to the total assets or capital employed will provide valuable data for credit and management purposes and afford a sound basis for comparisons from year to year. It is recognized that there may be exceptions, in special cases, to certain of the inclusions and exclusions as set forth in this section. When such exceptions occur they should be accorded the treatment merited in the particular circumstances under the general principles outlined herein.

.04 For accounting purposes, the term *current assets* is used to designate cash and other assets or resources commonly identified as those which are reasonably expected to be realized in cash or sold or consumed during the normal operating cycle of the business. Thus the term comprehends in general such resources as (a) cash available for current operations and items which are the equivalent of cash; (b) inventories of merchandise, raw materials, goods in process, finished goods, operating supplies, and ordinary maintenance material and parts; (c) trade accounts, notes, and acceptances receivable; (d) receivables from officers, employees, affiliates, and others, if collectible in the ordinary course of business within a year; (e) instalment or deferred accounts and notes receivable if they conform gen-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

erally to normal trade practices and terms within the business; (f) marketable securities representing the investment of cash available for current operations; and (g) prepaid expenses such as insurance, interest, rents, taxes, unused royalties, current paid advertising service not yet received, and operating supplies. Prepaid expenses are not current assets in the sense that they will be converted into cash but in the sense that, if not paid in advance, they would require the use of current assets during the operating cycle.

.05 The ordinary operations of a business involve a circulation of capital within the current asset group. Cash is expended for materials, finished parts, operating supplies, labor, and other factory services, and such expenditures are accumulated as inventory cost. Inventory costs, upon sale of the products to which such costs attach, are converted into trade receivables and ultimately into cash again. The average time intervening between the acquisition of materials or services entering this process and the final cash realization constitutes an *operating cycle.*

The next page is 8073-3.

A one-year time period is to be used as a basis for the segregation of current assets in cases where there are several operating cycles occurring within a year. However, where the period of the operating cycle is more than twelve months, as in, for instance, the tobacco, distillery, and lumber businesses, the longer period should be used. Where a particular business has no clearly defined operating cycle, the one-year rule should govern.

.06 This concept of the nature of current assets contemplates the exclusion from that classification of such resources as: (a) cash and claims to cash which are restricted as to withdrawal or use for other than current operations, are designated for expenditure in the acquisition or construction of noncurrent assets, or are segregated[1] for the liquidation of long-term debts; (b) investments in securities (whether marketable or not) or advances which have been made for the purposes of control, affiliation, or other continuing business advantage; (c) receivables arising from unusual transactions (such as the sale of capital assets, or loans or advances to affiliates, officers, or employees) which are not expected to be collected within twelve months; (d) cash surrender value of life insurance policies; (e) land and other natural resources; (f) depreciable assets; and (g) long-term prepayments which are fairly chargeable to the operations of several years, or deferred charges such as unamortized debt issue costs, bonus payments under a long-term lease, and costs of rearrangement of factory layout or removal to a new location. [As amended, effective October 1, 1971, by APB Opinion No. 21 (See section 4111.); as modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2. (See section 4211.)]

.07 The term *current liabilities* is used principally to designate obligations whose liquidation is reasonably expected to require the use of existing resources properly classifiable as current assets, or the creation of other current liabilities. As a balance-sheet category, the classification is intended to include obligations for items which

---

[1] Even though not actually set aside in special accounts, funds that are clearly to be used in the near future for the liquidation of long-term debts, payments to sinking funds, or for similar purposes should also, under this concept, be excluded from current assets. However, where such funds are considered to offset maturing debt which has properly been set up as a current liability, they may be included within the current asset classification.

have entered into the operating cycle, such as payables incurred in the acquisition of materials and supplies to be used in the production of goods or in providing services to be offered for sale; collections received in advance of the delivery of goods or performance of services;[2] and debts which arise from operations directly related to the operating cycle, such as accruals for wages, salaries, commissions, rentals, royalties, and income and other taxes. Other liabilities whose regular and ordinary liquidation is expected to occur within a relatively short period of time, usually twelve months, are also intended for inclusion, such as short-term debts arising from the acquisition of capital assets, serial maturities of long-term obligations, amounts required to be expended within one year under sinking fund provisions, and agency obligations arising from the collection or acceptance of cash or other assets for the account of third persons.[3]

---

[2] Examples of such current liabilities are obligations resulting from advance collections on ticket sales, which will normally be liquidated in the ordinary course of business by the delivery of services. On the contrary, obligations representing long-term deferments of the delivery of goods or services would not be shown as current liabilities. Examples of the latter are the issuance of a long-term warranty or the advance receipt by a lessor of rental for the final period of a ten-year lease as a condition to execution of the lease agreement.

[3] Loans accompanied by pledge of life insurance policies would be classified as current liabilities when, by their terms or by intent, they are to be repaid within twelve months. The pledging of life insurance policies does not affect the classification of the asset any more than does the pledging of receivables, inventories, real estate, or other assets as collateral for a short-term loan. However, when a loan on a life insurance policy is

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

.08 This concept of current liabilities would include estimated or accrued amounts which are expected to be required to cover expenditures within the year for known obligations (a) the amount of which can be determined only approximately (as in the case of provisions for accruing bonus payments) or (b) where the specific person or persons to whom payment will be made cannot as yet be designated (as in the case of estimated costs to be incurred in connection with guaranteed servicing or repair of products already sold). The current liability classification, however, is not intended to include debts to be liquidated by funds which have been accumulated in accounts of a type not properly classified as current assets, or long-term obligations incurred to provide increased amounts of working capital for long periods. When the amounts of the periodic payments of an obligation are, by contract, measured by current transactions, as for example by rents or revenues received in the case of equipment trust certificates or by the depletion of natural resources in the case of property obligations, the portion of the total obligation to be included as a current liability should be that representing the amount accrued at the balance-sheet date. [As amended, effective December 31, 1975, by FASB Statement No. 6.] (See section 2033.)

.09 The amounts at which various current assets are carried do not always represent their present realizable cash values. Accounts receivable net of allowances for uncollectible accounts, and for unearned discounts where unearned discounts are considered, are effectively stated at the amount of cash estimated as realizable. However, practice varies with respect to the carrying basis for current assets such as marketable securities and inventories. In the case of marketable securities where market value is less than cost by a substantial amount and it is evident that the decline in market value is not due to a mere temporary condition, the amount to be included as a current asset should not exceed the market value.* The basis for carrying inventories is stated in section 5121.15. It is important that the amounts at which current assets are stated be supplemented by information which reveals, for

obtained from the insurance company with the intent that it will not be paid but will be liquidated by deduction from the proceeds of the policy upon maturity or cancellation, the obligation should be excluded from current liabilities.

* Modified by section 5132, *Accounting for Certain Marketable Securities.*

temporary investments, their market value at the balance-sheet date, and for the various classifications of inventory items, the basis upon which their amounts are stated and, where practicable, indication of the method of determining the cost—e.g., *average cost, first-in first-out, last-in first-out,* etc.

.10 Unearned discounts (other than cash or quantity discounts and the like), finance charges and interest included in the face amount of receivables should be shown as a deduction from the related receivables. [As amended, effective for fiscal periods beginning after December 31, 1965, by APB Opinion No. 6.]

AC Section 2032

Offsetting Securities Against Taxes Payable

[Source: APB Opinion No. 10, Par. 7.]

Effective for fiscal periods beginning after December 31, 1966

.01 It is a general principle of accounting that the offsetting of assets and liabilities in the balance sheet is improper except where a right of setoff exists. Accordingly, the offset of cash or other assets against the tax liability or other amounts owing to governmental bodies is not acceptable except in the circumstances described in paragraph .03 below.

.02 Most securities now issued by governments are not by their terms designed specifically for the payment of taxes and, accordingly, should not be deducted from taxes payable on the balance sheet.

.03 The only exception to this general principle occurs when it is clear that a purchase of securities (acceptable for the payment of taxes) is in substance an advance payment of taxes that will be payable in the relatively near future, so that in the special circumstances the purchase is tantamount to the prepayment of taxes. This occurs at times, for example, as an accommodation to a local government and in some instances when governments issue securities that are specifically designated as being acceptable for the payment of taxes of those governments.

AC Section 2033

Classification of Short-Term Obligations Expected to Be Refinanced

an amendment of Section 2031
[Source: FASB Statement No. 6.]

May 1975

INTRODUCTION AND BACKGROUND INFORMATION

.01 Some short-term obligations are expected to be refinanced on a long-term basis and, therefore, are not expected to require the use of enterprise working capital during the ensuing fiscal year. Examples include commercial paper, construction loans, and the currently maturing portion of long-term debt. Those obligations have been presented in balance sheets in a number of ways, including the following: (a) classification as current liabilities, (b) classification as long-term liabilities, and (c) presentation as a class of liabilities distinct from both current liabilities and long-term liabilities.

.02 For purposes of this Statement, *short-term obligations* are those that are scheduled to mature within one year after the date of an enterprise's balance sheet or, for those enterprises that use the operating cycle concept of working capital described in paragraphs 5 and 7 of Chapter 3A, "Current Assets and Current Liabilities," of *Accounting Research Bulletin (ARB) No. 43* [sections 2031.05 and 2031.07], within an enterprise's operating cycle that is longer than one year. *Long-term obligations* are those scheduled to mature beyond one year (or the operating cycle, if applicable) from the date of an enterprise's balance sheet. *Refinancing a short-term obligation on a long-term basis* means either replacing it with a long-term obligation or with equity securities or renewing, extending, or replacing it with short-term obligations for an uninterrupted period extending beyond one year (or the operating cycle, if applicable) from the date of an enterprise's balance sheet. Accordingly, despite the fact that the short-term obligation is scheduled to mature during the ensuing fiscal year (or the operating cycle, if applicable), it will not require the use of working capital during that period.

.03 Exclusion of some short-term obligations from the current liability classification has been supported by paragraph 8 of Chapter 3A of *ARB No. 43* [section 2031.08], which states that the current liability classification "is not intended to include a contractual obligation falling due at an early date which is expected to be refunded." In assessing whether a short-term obligation is "expected to be refunded," enterprise *intent* to refinance on a long-term basis and its *prior ability* to refinance its short-term obligations have sometimes been considered sufficient for exclusion of the short-term obligation from current liabilities. In other cases, *future ability* to refinance as demonstrated by the existence of an agreement for long-term financing has been viewed as necessary.

.04 SEC *Accounting Series Release (ASR) No. 148*, issued November 13, 1973, requires that commercial paper and other short-term debt be classified as a current liability unless (a) the borrower has a noncancelable binding agreement from a creditor to refinance the paper or other short-term debt and (b) the refinancing would extend the maturity date beyond one year (or operating cycle, if longer) and (c) the borrower's intention is to exercise this right.

.05 Because of the diverse practices referred to in paragraphs .01 and .03 of this Statement and questions brought to the Board's attention concerning the differences between the criteria in paragraph 8 of Chapter 3A of *ARB No. 43* [section 2031.08] and those in *ASR No. 148,* the Board concluded that it should examine the criteria for classification of short-term obligations that are expected to be refinanced on a long-term basis.

.06 The Board concluded that on the basis of existing data it could make an informed decision on the classification of short-term obligations expected to be refinanced without a public hearing. An Exposure Draft of a proposed Statement on "Classification of Short-Term Obligations Expected to Be Refinanced" was issued on November 11, 1974. Ninety-two letters were received in response to the request for comments. On January 9, 1975, the Board announced that it would not issue a final statement effective for fiscal periods ending December 31, 1974, as had been proposed in the Exposure Draft, to allow additional time for consideration of points raised in the comment letters. Appendix A describes the principal changes from the Exposure Draft and also sets

Copyright © 1975, Financial Accounting Standards Board

forth the basis for the Board's conclusions, including alternatives considered and reasons for accepting some and rejecting others. Examples of application of this Statement are presented in Appendix B.

APPLICABILITY

.07 The balance sheets of most enterprises show separate classifications of current assets and current liabilities (commonly referred to as classified balance sheets) permitting ready determination of working capital. Enterprises in several specialized industries (including broker-dealers and finance, real estate, and stock life insurance companies) for which the current/noncurrent distinction is deemed in practice to have little or no relevance prepare unclassified balance sheets. The standards established by this Statement apply only when an enterprise is preparing a classified balance sheet for financial accounting and reporting purposes.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Classification

.08 Short-term obligations arising from transactions in the normal course of business that are due in customary terms shall be classified as current liabilities. Those obligations (as described in the second sentence of paragraph 7 of Chapter 3A of *ARB No. 43* [section 2031.07]) are "obligations for items which have entered into the operating cycle, such as payables incurred in the acquisition of materials and supplies to be used in the production of goods or in providing services to be offered for sale; collections received in advance of the delivery of goods or performance of services; . . . and debts which arise from operations directly related to the operating cycle, such as accruals for wages, salaries, commissions, rentals, royalties, and income and other taxes."

.09 A short-term obligation other than one classified as a current liability in accordance with paragraph .08 shall be

excluded from current liabilities only if the conditions in paragraphs .10 and .11 are met.[1]

Intent to Refinance

.10 The enterprise intends to *refinance the obligation on a long-term basis* (see paragraph .02).

Ability to Consummate the Refinancing

.11 The enterprise's intent to refinance the short-term obligation on a long-term basis is supported by an ability to consummate the refinancing demonstrated in either of the following ways:

a) *Post-balance-sheet-date issuance of a long-term obligation or equity securities.* After the date of an enterprise's balance sheet but before that balance sheet is issued, a long-term obligation or equity securities[2] have been issued for the purpose of refinancing the short-term obligation on a long-term basis; or

b) *Financing agreement.* Before the balance sheet is issued, the enterprise has entered into a financing agreement that clearly permits the enterprise to refinance the short-term obligation on a long-term basis on terms that are readily determinable, and all of the following conditions are met:

 (i) The agreement does not expire within one year (or operating cycle—see paragraph .02) from the date of the enterprise's balance sheet and during that period the agreement is not cancelable by the lender or the prospective lender or investor (and

---

[1] Paragraph 8 of Chapter 3A, *ARB No. 43* [section 2031.08], describes a circumstance, unaffected by this Statement, in which obligations maturing within one year would be excluded from current liabilities as follows: "The current liability classification, however, is not intended to include . . . debts to be liquidated by funds which have been accumulated in accounts of a type not properly classified as current assets. . . ." Footnote 1 to paragraph 6(a) of Chapter 3A, *ARB No. 43* [section 2031.06 (a)], describes another circumstance, also unaffected by this Statement. Under that paragraph, "funds that are clearly to be used in the near future for liquidation of long-term debts, payments to sinking funds, or for similar purposes should . . . be excluded from current assets. However, where such funds are considered to offset maturing debt which has properly been set up as a current liability, they may be included within the current asset classification." Accordingly, funds obtained on a long-term basis prior to the balance sheet date would be excluded from current assets if the obligation to be liquidated is excluded from current liabilities.

[2] If equity securities have been issued, the short-term obligation, although excluded from current liabilities, shall not be included in owners' equity.

 Copyright © 1975, Financial Accounting Standards Board

obligations incurred under the agreement are not callable during that period) except for violation of a provision[3] with which compliance is objectively determinable or measurable.[4]

(ii) No violation of any provision in the financing agreement exists at the balance-sheet date and no available information indicates that a violation has occurred thereafter but prior to the issuance of the balance sheet, or, if one exists at the balance-sheet date or has occurred thereafter, a waiver has been obtained.

(iii) The lender or the prospective lender or investor with which the enterprise has entered into the financing agreement is expected to be financially capable of honoring the agreement.

.12 If an enterprise's ability to consummate an intended refinancing of a short-term obligation on a long-term basis is demonstrated by post-balance-sheet-date issuance of a long-term obligation or equity securities (paragraph .11(a)), the amount of the short-term obligation to be excluded from current liabilities shall not exceed the proceeds of the new long-term obligation or the equity securities issued. If ability to refinance is demonstrated by the existence of a financing agreement (paragraph .11(b)), the amount of the short-term obligation to be excluded from current liabilities shall be reduced to the amount available for refinancing under the agreement when the amount available is less than the amount of the short-term obligation. The amount to be excluded shall be reduced further if information (such as restrictions in other agreements or restrictions as to transferability of funds) indicates that funds obtainable under the agreement will not be available to liquidate the short-term obligation. Further, if amounts that could be obtained under the financing agreement fluctuate (for example, in relation to the enterprise's needs, in proportion to the value of collateral, or in accordance with other terms of the agreement), the amount to be excluded from current liabilities shall be

---

[3] For purposes of this Statement, *violation of a provision* means failure to meet a condition set forth in the agreement or breach or violation of a provision such as a restrictive covenant, representation, or warranty, whether or not a grace period is allowed or the lender is required to give notice.

[4] Financing agreements cancelable for violation of a provision that can be evaluated differently by the parties to the agreement (such as "a material adverse change" or "failure to maintain satisfactory operations") do not comply with this condition.

limited to a reasonable estimate of the minimum amount expected to be available at any date from the scheduled maturity of the short-term obligation to the end of the fiscal year (or operating cycle—see paragraph .02). If no reasonable estimate can be made, the entire outstanding short-term obligation shall be included in current liabilities.

.13 The enterprise may intend to seek an alternative source of financing rather than to exercise its rights under the existing agreement when the short-term obligation becomes due. The enterprise must intend to exercise its rights under the existing agreement, however, if that other source does not become available.[5]

.14 Replacement of a short-term obligation with another short-term obligation after the date of the balance sheet but before the balance sheet is issued is not, by itself, sufficient to demonstrate an enterprise's ability to refinance the short-term obligation on a long-term basis. If, for example, the replacement is made under the terms of a revolving credit agreement that provides for renewal or extension of the short-term obligation for an uninterrupted period extending beyond one year (or operating cycle—see paragraph .02) from the date of the balance sheet, the revolving credit agreement must meet the conditions in paragraph .11(b) to justify excluding the short-term obligation from current liabilities. Similarly, if the replacement is a roll-over of commercial paper accompanied by a "stand-by" credit agreement, the stand-by agreement must meet the conditions in paragraph .11(b) to justify excluding the short-term obligation from current liabilities.

Disclosure

.15 A total of current liabilities shall be presented in classified balance sheets. If a short-term obligation is excluded from current liabilities pursuant to the provisions of this Statement, the notes to the financial statements shall include a general description of the financing agreement and the terms of any new obligation incurred or expected to be incurred or equity securities issued or expected to be issued as a result of a refinancing.

---

[5] The intent to exercise may not be present if the terms of the agreement contain conditions or permit the prospective lender or investor to establish conditions, such as interest rates or collateral requirements, that are unreasonable to the enterprise.

Copyright © 1975, Financial Accounting Standards Board

Amendments to Existing Pronouncement

.16 The Board's conclusions require deletion of the following words from the second sentence of paragraph 8 of Chapter 3A, *ARB No. 43* [section 2031.08] : *a contractual obligation falling due at an early date which is expected to be refunded, or.* Footnote 4 and the reference to it in paragraph 8 of Chapter 3A [section 2031.08] are also deleted.

Effective Date and Transition

.17 The provisions of this Statement shall be effective December 31, 1975 and shall apply to balance sheets dated on or after that date and to related statements of changes in financial position. Reclassification in financial statements for periods ending prior to December 31, 1975 is permitted but not required.

The provisions of this Statement need not be applied to immaterial items.

Appendix A

BASIS FOR CONCLUSIONS

.18 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement. Individual Board members gave greater weight to some factors than to others. The Appendix also sets forth suggestions made by those responding to the Exposure Draft and reasons for accepting some and rejecting others.

SCOPE OF THIS STATEMENT

.19 Some respondents indicated that the Exposure Draft appeared to require all enterprises to prepare a classified balance sheet regardless of normal industry practice or other justification for adopting a balance sheet format that does not identify current assets and current liabilities. The question of whether it is appropriate for an enterprise to present an unclassified balance sheet is beyond the scope of this Statement. Accordingly, paragraph .07 indicates that the standards established by this Statement apply only if an enterprise is preparing a classified balance sheet.

.20 The Board also concluded that it should not, as part of this project, re-examine the accounting concept of working capital described in detail in Chapter 3A of *ARB No. 43* [section 2031]. Paragraph 7 of Chapter 3A [section 2031.07] defines current liabilities as those whose liquidation "is reasonably expected to require the use of existing resources properly classified as current assets, or the creation of other current liabilities." That paragraph goes on to say that the current liabilities classification "is intended to include obligations for items which have entered into the operating cycle . . . and debts which arise from operations directly related to the operating cycle. . . ." Accordingly, paragraph .08 of this Statement requires that short-term obligations arising from transactions in the normal course of business that are to be paid in customary terms shall be included in current liabilities. On the other hand, short-term obligations arising from the acquisition or construction of noncurrent assets would be excluded from current liabilities if the conditions in paragraphs .10 and .11 are met. Similarly, short-term obligations not directly related to the operating cycle — for example, a note given to a supplier to replace an account payable that originally arose in the normal course of

→ *The next page is 8091.* ←

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

business and had been due in customary terms — would be excluded if the conditions in paragraphs .10 and .11 are met. This Statement does not specify disclosures relating to short-term obligations that are *included* in current liabilities, although the Statement does make explicit that a total of current liabilities shall be presented in classified balance sheets (see paragraph .15).

BALANCE SHEET CLASSIFICATION

.21 The alternative solutions considered by the Board with regard to the question of how to classify a short-term obligation that is expected to be refinanced on a long-term basis (see paragraph .02) ranged between:

a) A *strict maturity-date* approach under which all obligations scheduled to mature within one year (or, in certain cases, within an enterprise's operating cycle) would be classified as current liabilities regardless of any intention to refinance on a long-term basis.

b) An approach based *solely* on management's intention to seek refinancing on a long-term basis without requiring evidence of the enterprise's ability to do so.

.22 The Board also considered alternatives within that range. Those alternatives all require that the *intent* of the enterprise to refinance a short-term obligation on a long-term basis be demonstrated by an *ability* to consummate the refinancing, but they differ in terms of the conditions required to demonstrate that ability.

.23 The Board rejected a strict maturity-date approach because the scheduled maturity date of an obligation is not necessarily indicative of the point in time at which that obligation will require the use of the enterprise's funds. Inclusion of all short-term obligations within the current liability classification ignores the fact that enterprises, for sound economic reasons, often use commercial paper and other short-term debt instruments as means of long-term financing or that they often replace the currently maturing portion of long-term debt with other long-term debt. Borrowings under long-term revolving credit agreements and borrowings backed by long-term stand-by credit agreements are commonplace. A strict maturity-date approach would

deny that these borrowings are sometimes, in substance, long-term financing. That approach would also result in a major change in the concept of current liabilities described in paragraph 7 of Chapter 3A of *ARB No. 43* [section 2031.07] as "obligations whose liquidation is reasonably expected to require the use of existing resources properly classifiable as current assets, or the creation of other current liabilities."

.24 The Board also rejected classification based solely on an enterprise's intention to seek refinancing on a long-term basis. The Board concluded that intent, while essential, is insufficient to justify excluding a short-term obligation from current liabilities. The intent of an enterprise is an essential condition because without intent to refinance there is a presumption that liquidation of the short-term obligation would require the use of current assets or the creation of other current liabilities. The existence of a financing agreement, even one that requires that funds obtained thereunder be used to liquidate the short-term obligation, is irrelevant if the enterprise does not intend to refinance on a long-term basis. In the Board's judgment, however, intent alone does not provide sufficiently objective evidence to overcome the presumption that a short-term obligation will require the use of funds at its scheduled maturity date. The intent must be supported by a demonstrated ability to carry out that intent.

.25 The two conditions set forth in this Statement for exclusion of a short-term obligation from current liabilities — intent and ability — are essentially the same as the requirements proposed in the Exposure Draft. That draft had proposed that a short-term obligation be classified as a current liability unless all of the following conditions were met:

a) The borrower has a noncancelable binding agreement to refinance the obligation from a source reasonably expected to be financially capable of honoring the agreement.

b) The maturity date of the new obligation expected to be incurred by the borrower as a result of the refinancing under the agreement will be more than one year from the date of the financial statements.

c) The borrower intends to exercise its rights under the agreement.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.26 Many respondents to the Exposure Draft indicated that the requirement of a "noncancelable binding agreement" was unrealistic because lenders generally do not make unqualified commitments. Financing agreements often include provisions that could restrict borrowing under the agreement. As indicated by the conditions in paragraphs .11(b)(i) and .11(b)(ii) of this Statement, the inclusion of a restrictive covenant, representation, warranty, or other provision in a financing agreement does not prevent a short-term obligation from being excluded from current liabilities provided that compliance with the provision can be objectively determined or measured and provided that there is no evidence of a violation for which a waiver has not been obtained. In the Board's view, inability to objectively determine or measure compliance, or the existence of a violation of a provision for which a waiver has not been obtained, raises a serious doubt about the enterprise's ability to consummate an intended refinancing to avoid the use of working capital and, consequently, requires classification of the short-term obligation as a current liability. The existence of a situation that permits the lender to cancel the agreement or otherwise to prevent the enterprise from exercising its rights thereunder after expiration of a grace period or after notice to the enterprise or both is also considered a violation of a provision that will, in the absence of a waiver, require classification of the short-term obligation as a current liability.

.27 The Board has concluded that exclusion of a short-term obligation from current liabilities should not be precluded as long as the financing agreement *clearly permits* the enterprise to replace the short-term obligation with a long-term obligation or with equity securities or to renew, extend, or replace the short-term obligation with another short-term obligation for an uninterrupted period extending beyond one year (or operating cycle). The Board considered and rejected the proposal that a short-term obligation should be excluded from current liabilities only if a financing agreement is *specifically linked* to the short-term obligation, either by specifically permitting or requiring that funds obtained thereunder be used to liquidate the short-term obligation. In the Board's judgment, that proposal places undue emphasis on the form of an agreement rather than on its substance. It is neither practicable nor realistic to trace specific funds to their ultimate use. The financial position of an enterprise that has refinanced under a linked agreement will be indistinguishable from the financial position of an enterprise that has entered into the same transactions under an

agreement that is not linked but clearly permits refinancing the short-term obligation. Moreover, whether or not a financing agreement is specifically linked to a particular short-term obligation, the enterprise is not precluded from issuing another short-term obligation at approximately the same time as the old obligation is refinanced under the agreement. The potential effect of such a transaction can be avoided only if a strict maturity-date approach is adopted, but the Board rejected that alternative for the reasons stated in paragraph .23. The Board believes that the requirement in paragraph .10 that the enterprise intend to refinance on a long-term basis and thus not to use working capital to repay the maturing short-term obligation more closely comports with the spirit of this Statement and Chapter 3A of *ARB No. 43* [section 2031] than would a requirement for specific linkage.

.28 Respondents to the Exposure Draft indicated that many enterprises enter into agreements that assure their ability to refinance short-term obligations although they might not intend to exercise their rights under the agreement if an alternative source of financing becomes available. One of the conditions in the Exposure Draft was that the enterprise intend to exercise its rights under the agreement (see paragraph .25(c)). A footnote in the Exposure Draft indicated that this condition would be met if the enterprise intended to exercise its rights under the agreement when the short-term obligations could not continue to be refinanced on a short-term basis. Respondents asked the Board to clarify the intent of the condition in the Exposure Draft and the related footnote. The Board believes that the justification for excluding a short-term obligation from current liabilities is not negated simply because an enterprise may intend to seek a more advantageous source of financing (including, perhaps, short-term financing) than that provided under the financing agreement in existence when the balance sheet is issued. However, the condition in paragraph .11(b)(i) requires that the agreement extend beyond one year (or operating cycle) from the date of the enterprise's balance sheet to demonstrate clearly the enterprise's ability to avoid using working capital to repay the short-term obligation. Moreover, paragraph .13 requires that the enterprise intend to exercise its rights under the agreement if another source of financing does not become available.

.29 A number of respondents to the Exposure Draft asked whether events occurring after the date of the balance sheet but before the balance sheet is issued should be considered in

Copyright © 1975, Financial Accounting Standards Board

assessing an enterprise's ability to consummate the refinancing of a short-term obligation on a long-term basis. In particular, the two types of post-balance-sheet-date events cited were (a) actual issuance of a long-term obligation or equity securities for the purpose of refinancing the short-term obligation on a long-term basis and (b) entering into a financing agreement after the balance-sheet date but before the balance sheet is issued. In the Board's judgment, both of those types of post-balance-sheet-date events should be considered in determining liability classification and in assessing an enterprise's ability to consummate an intended refinancing, and they are explicitly provided for in paragraphs .11(a) and .11(b).

.30 Several respondents to the Exposure Draft asked whether a short-term obligation could be excluded from current liabilities if it is intended to be replaced (or, in fact, has been replaced after the balance sheet date) by issuing equity securities. A short-term obligation will not require the use of working capital regardless of whether refinancing on a long-term basis is accomplished by issuing debt securities or equity securities. Accordingly, *refinancing on a long-term basis* is defined in paragraph .02 to include issuance of equity securities, and a short-term obligation intended to be refinanced in that manner would be excluded from current liabilities if the conditions in paragraphs .10 and .11 are met. Although it is appropriate to exclude the short-term obligation from current liabilities when those conditions are met, the Board concluded that it is not appropriate to include the short-term obligation in owners' equity (see footnote 2 to paragraph .11(a)). The intent of an enterprise to refinance a short-term obligation on a long-term basis and its ability to do so relate to the question of whether the obligation is expected to require the use of working capital, not whether it is a liability. The obligation is a liability and not owners' equity at the date of the balance sheet.

EFFECTIVE DATE AND TRANSITION

.31 Many respondents opposed the proposal in the Exposure Draft that balance sheets for dates prior to the effective date of the Statement be restated to conform to the provisions of the Statement. They indicated that restatement would not achieve comparability of balance sheets for dates prior to the effective date of the Statement with balance sheets for subsequent dates because of the new conditions established

by paragraph .11. After considering all of the circumstances, the Board concluded that prospective application of this Statement is appropriate, with restatement permitted but not required, and that the effective date in paragraph .17 is advisable.

Appendix B

EXAMPLES OF APPLICATION OF THIS STATEMENT

.32 The following examples provide guidance for applying this Statement. It should be recognized that these examples do not comprehend all possible circumstances and do not include all the disclosures that would typically be made regarding long-term debt or current liabilities.

GENERAL ASSUMPTIONS

.33 The assumptions on which the examples are based are:

a) ABC Company's fiscal year end is December 31, 19x5.

b) The date of issuance of the December 31, 19x5 financial statements is March 31, 19x6; the Company's practice is to issue a classified balance sheet.

c) At December 31, 19x5, short-term obligations include $5,000,000 representing the portion of 6% long-term debt maturing in February 19x6 and $3,000,000 of 9% notes payable issued in November 19x5 and maturing in July 19x6.

d) The Company intends to refinance on a long-term basis both the current maturity of long-term debt and the 9% notes payable.

e) Accounts other than the long-term debt maturing in February 19x6 and the notes payable maturing in July 19x6 are:

Current assets	$30,000,000
Other assets	$50,000,000
Accounts payable and accruals	$10,000,000
Other long-term debt	$25,000,000
Shareholders' equity	$37,000,000

Copyright © 1975, Financial Accounting Standards Board

f) Unless otherwise indicated, the examples also assume that the lender or prospective lender is expected to be capable of honoring the agreement, that there is no evidence of a violation of any provision, and that the terms of borrowings available under the agreement are readily determinable.

EXAMPLE 1

.34 The Company negotiates a financing agreement with a commercial bank in December 19x5 for a maximum borrowing of $8,000,000 at any time through 19x7 with the following terms:

a) Borrowings are available at ABC Company's request for such purposes as it deems appropriate and will mature three years from the date of borrowing.

b) Amounts borrowed will bear interest at the bank's prime rate.

c) An annual commitment fee of ½ of 1% is payable on the difference between the amount borrowed and $8,000,000.

d) The agreement is cancelable by the lender only if:

(i) The Company's working capital, excluding borrowings under the agreement, falls below $10,000,000.

(ii) The Company becomes obligated under lease agreements to pay an annual rental in excess of $1,000,000.

(iii) Treasury stock is acquired without the prior approval of the prospective lender.

(iv) The Company guarantees indebtedness of unaffiliated persons in excess of $500,000.

.35 The enterprise's intention to refinance meets the condition specified by paragraph .10. Compliance with the provisions listed in paragraph .34(d) is objectively determinable or measurable; therefore, the condition specified by paragraph .11(b)(i) is met. The proceeds of borrowings under the agreement are clearly available for the liquidation of the 9% notes payable and the long-term debt maturing

in February 19x6. Both obligations, therefore, would be classified as other than current liabilities.

.36 Following are the liability section of ABC Company's balance sheet at December 31, 19x5 and the related footnote disclosures required by this Statement, based on the information in paragraphs .33 and .34. Because the balance sheet is issued subsequent to the February 19x6 maturity of the long-term debt, the footnote describes the refinancing of that obligation.

	December 31, 19x5
Current Liabilities:	
Accounts payable and accruals	$10,000,000
Total Current Liabilities	10,000,000
Long-Term Debt:	
9% notes payable (Note A)	3,000,000*
6% debt due February 19x6 (Note A)	5,000,000*
Other long-term debt	25,000,000
Total Long-Term Debt	33,000,000
Total Liabilities	$43,000,000

*These obligations may also be shown in captions distinct from both current liabilities and long-term debt, such as "Interim Debt," "Short-Term Debt Expected to Be Refinanced," and "Intermediate Debt."

Note A

The Company has entered into a financing agreement with a commercial bank that permits the Company to borrow at any time through 19x7 up to $8,000,000 at the bank's prime rate of interest. The Company must pay an annual commitment fee of ½ of 1% of the unused portion of the commitment. Borrowings under the financing agreement mature three years after the date of the loan. Among other things, the agreement prohibits the acquisition of treasury stock without prior approval by the bank, requires maintenance of working capital of $10,000,000 exclusive of borrowings under the agreement, and limits the annual rental under lease agreements to $1,000,000. In February 19x6, the Company borrowed $5,000,000 at 8% and liquidated the 6% long-term debt, and it intends to borrow additional funds available under the agreement to refinance the 9% notes payable maturing in July 19x6.

Copyright © 1975, Financial Accounting Standards Board

EXAMPLE 2

.37 A foreign subsidiary of the enterprise negotiates a financing agreement with its local bank in December 19x5. Funds are available to the subsidiary for its unrestricted use, including loans to affiliated companies; other terms are identical to those cited in paragraph .34. Local laws prohibit the transfer of funds outside the country.

.38 The requirement of paragraph .11(b)(i) is met because compliance with the provisions of the agreement is objectively determinable or measurable. Because of the laws prohibiting the transfer of funds, however, the proceeds from borrowings under the agreement are not available for liquidation of the debt maturing in February and July 19x6. Accordingly, both the 6% debt maturing in February 19x6 and the 9% notes payable maturing in July 19x6 would be classified as current liabilities.

EXAMPLE 3

.39 Assume that instead of utilizing the agreement cited in paragraph .34, the Company issues $8,000,000 of ten-year debentures to the public in January 19x6. The Company intends to use the proceeds to liquidate the $5,000,000 debt maturing February 19x6 and the $3,000,000 of 9% notes payable maturing July 19x6. In addition, assume the debt maturing February 19x6 is paid prior to the issuance of the balance sheet, and the remaining proceeds from the sale of debentures are invested in a U.S. Treasury note maturing the same day as the 9% notes payable.

.40 Since the Company refinanced the long-term debt maturing in February 19x6 in a manner that meets the conditions set forth in paragraph .11 of this Statement, that obligation would be excluded from current liabilities. In addition, the 9% notes payable maturing in July 19x6 would also be excluded because the Company has obtained funds expressly intended to be used to liquidate those notes and not intended to be used in current operations. In balance sheets after the date of sale of the debentures and before the maturity date of the notes payable, the Company would exclude the notes payable from current liabilities if the U.S. Treasury note is excluded from current assets (see paragraph 6 of Chapter 3A of *ARB No. 43* [section 2031.06], which is not altered by this Statement)

.41 If the debentures had been sold prior to January 1, 19x6, the $8,000,000 of obligations to be paid would be excluded from current liabilities in the balance sheet at that date if the $8,000,000 in funds were excluded from current assets.

.42 If, instead of issuing the ten-year debentures, the Company had issued $8,000,000 of equity securities and all other facts in this example remained unchanged, both the 6% debt due February 19x6 and the 9% notes payable due July 19x6 would be classified as liabilities other than current liabilities, such as "Indebtedness Due in 19x6 Refinanced in January 19x6."

EXAMPLE 4

.43 In December 19x5 the Company negotiates a revolving credit agreement providing for unrestricted borrowings up to $10,000,000. Borrowings will bear interest at 1% over the prevailing prime rate of the bank with which the agreement is arranged but in any event not less than 8%, will have stated maturities of ninety days, and will be continuously renewable for ninety-day periods at the Company's option for three years provided there is compliance with the terms of the agreement. Provisions of the agreement are similar to those cited in paragraph .34(d). Further, the enterprise intends to renew obligations incurred under the agreement for a period extending beyond one year from the balance-sheet date. There are no outstanding borrowings under the agreement at December 31, 19x5.

.44 In this instance, the long-term debt maturing in February 19x6 and the 9% notes payable maturing in July 19x6 would be excluded from current liabilities because the Company consummated a financing agreement meeting the conditions set forth in paragraph .11(b) prior to the issuance of the balance sheet.

EXAMPLE 5

.45 Assume that the agreement cited in Example 4 included an additional provision limiting the amount to be borrowed by the Company to the amount of its inventory, which is pledged as collateral and is expected to range between a high

Copyright © 1975, Financial Accounting Standards Board

of $8,000,000 during the second quarter of 19x6 and a low of $4,000,000 during the fourth quarter of 19x6.

.46 The terms of the agreement comply with the conditions required by this Statement; however, because the minimum amount expected to be available from February to December 19x6 is $4,000,000, only that amount of short-term obligations can be excluded from current liabilities (see paragraph .12). Whether the obligation to be excluded is a portion of the currently maturing long-term debt or some portions of both it and the 9% notes payable depends on the intended timing of the borrowing.

.47 If the Company intended to refinance only the 9% notes payable due July 19x6 and the amount of its inventory is expected to reach a low of approximately $2,000,000 during the second quarter of 19x6 but be at least $3,000,000 in July 19x6 and thereafter during 19x6, the $3,000,000 9% notes payable would be excluded from current liabilities at December 31, 19x5 (see paragraph .12).

EXAMPLE 6

.48 In lieu of the facts given in paragraphs .33(c) and .33(d), assume that during 19x5 the Company entered into a contract to have a warehouse built. The warehouse is expected to be financed by issuance of the Company's commercial paper. In addition, the Company negotiated a stand-by agreement with a commercial bank that provides for maximum borrowings equal to the expected cost of the warehouse, which will be pledged as collateral. The agreement also requires that the proceeds from the sale of commercial paper be used to pay construction costs. Borrowings may be made under the agreement only if the Company is unable to issue new commercial paper. The proceeds of borrowings must be used to retire outstanding commercial paper and to liquidate additional liabilities incurred in the construction of the warehouse. At December 31, 19x5 the Company has $7,000,000 of commercial paper outstanding and $1,000,000 of unpaid construction costs resulting from a progress billing through December 31.

.49 Because the commercial paper will be refinanced on a long-term basis, either by uninterrupted renewal or, failing that, by a borrowing under the agreement, the commercial paper would be excluded from current liabilities. The $1,000,000 liability for the unpaid progress billing results

from the construction of a noncurrent asset and will be refinanced on the same basis as the commercial paper and, therefore, it would also be excluded from current liabilities (see paragraphs .08 and .20).

EXAMPLE 7

.50 Following are two methods of presenting liabilities in ABC Company's balance sheet at December 31, 19x5 assuming the Company intends to refinance the 6% debt maturing in February 19x6 and the 9% notes payable maturing in July 19x6 but has not met the conditions required by this Statement to exclude those obligations from current liabilities.

Alternative 1

	December 31, 19x5
Current Liabilities:	
Accounts payable and accruals	$10,000,000
Notes payable, due July 19x6	3,000,000
6% debt due February 19x6	5,000,000
Total Current Liabilities	18,000,000
Long-Term Debt	25,000,000
Total Liabilities	$43,000,000

Alternative 2

		December 31, 19x5
Current Liabilities:		
Accounts payable and accruals		$10,000,000
Short-term debt expected to be refinanced:		
Notes payable, due July 19x6	$3,000,000	
6% debt due February 19x6	5,000,000	8,000,000
Total Current Liabilities		18,000,000
Long-Term Debt		25,000,000
Total Liabilities		$43,000,000

AC Section 2033-1

Classification of a Short-Term Obligation Repaid Prior to Being Replaced by a Long-Term Security: An Interpretation of Section 2033

[Source: FASB Interpretation No. 8.]

January 1976

INTRODUCTION

.01 *FASB Statement No. 6* [section 2033], "Classification of Short-Term Obligations Expected to Be Refinanced," specifies that a short-term obligation shall be excluded from current liabilities only if the enterprise intends to refinance the obligation on a long-term basis and before the balance sheet is issued has either (a) completed the refinancing by issuing a long-term obligation or by issuing equity securities or (b) has entered into a financing agreement that permits refinancing on a long-term basis. (See paragraphs 9—11 of the Statement [section 2033.09—.11].)

.02 The FASB has been asked to clarify whether a short-term obligation should be included in or excluded from current liabilities if it is repaid after the balance sheet date and subsequently replaced by long-term debt before the balance sheet is issued. For example, assume that an enterprise has issued $3,000,000 of short-term commercial paper during the year to finance construction of a plant. At June 30, 1976, the enterprise's fiscal year end, the enterprise intends to refinance the commercial paper by issuing long-term debt. However, because the enterprise temporarily has excess cash, in July 1976 it liquidates $1,000,000 of the commercial paper as the paper matures. In August 1976, the enterprise completes a $6,000,000 long-term debt offering. Later during the month of August, it issues its June 30, 1976 financial statements. The proceeds of the long-term debt offering are to be used to replenish $1,000,000 in working capital, to pay $2,000,000 of commercial paper as it matures in September 1976, and to pay $3,000,000 of construction costs expected to be incurred later that year to complete the plant.

INTERPRETATION

.03 The concept that a short-term obligation will not require the use of current assets during the ensuing fiscal year if it is to be excluded from current liabilities underlies *FASB Statement*

No. 6 [section 2033] (see paragraphs 1, 2, and 20 of the Statement [sections 2033.01, 2033.02, and 2033.20]). That concept is also fundamental to Chapter 3A, "Current Assets and Current Liabilities," of *ARB No. 43* [section 2031], which was not changed by *FASB Statement No. 6* [section 2033] (except as specified in paragraph 16 of the Statement [section 2033.16]). Repayment of a short-term obligation *before* funds are obtained through a long-term refinancing requires the use of current assets. Therefore, if a short-term obligation is repaid after the balance sheet date and subsequently a long-term obligation or equity securities are issued whose proceeds are used to replenish current assets before the balance sheet is issued, the short-term obligation shall not be excluded from current liabilities at the balance sheet date.

.04 In the example described in paragraph .02 above, the $1,000,000 of commercial paper liquidated in July would be classified as a current liability in the enterprise's balance sheet at June 30, 1976. The $2,000,000 of commercial paper liquidated in September 1976 but refinanced by the long-term debt offering in August 1976 would be excluded from current liabilities in balance sheets at the end of June 1976, July 1976, and August 1976.[1] It should be noted that the existence of a financing agreement at the date of issuance of the financial statements rather than a completed financing at that date would not change these classifications.

EFFECTIVE DATE

.05 This Interpretation shall be effective February 29, 1976 and shall apply to balance sheets dated on or after that date and to related statements of changes in financial position. Reclassification in financial statements for periods ending prior to February 29, 1976 is permitted but not required.

→ *The next page is 8111.* ←

[1] At the end of August 1976, $2,000,000 of cash would be excluded from current assets or if included in current assets, a like amount of debt would be classified as a current liability. (See footnote 1 and paragraph 40 of *FASB Statement No. 6* [section 2033.40].)

AC Section 2041

Comparative Financial Statements

[Source: ARB 43, Chap. 2A, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 The presentation of comparative financial statements in annual and other reports enhances the usefulness of such reports and brings out more clearly the nature and trends of current changes affecting the enterprise. Such presentation emphasizes the fact that statements for a series of periods are far more significant than those for a single period and that the accounts for one period are but an instalment of what is essentially a continuous history.

.02 In any one year it is ordinarily desirable that the balance sheet, the income statement, and the surplus statement be given for one or more preceding years as well as for the current year. Footnotes, explanations, and accountants' qualifications which appeared on the statements for the preceding years should be repeated, or at least referred to, in the comparative statements to the extent that they continue to be of significance. If, because of reclassifications or for other reasons, changes have occurred in the manner of or basis for presenting corresponding items for two or more periods, information should be furnished which will explain the change. This procedure is in conformity with the well recognized principle that any change in practice which affects comparability should be disclosed.

.03 It is necessary that prior-year figures shown for comparative purposes be in fact comparable with those shown for the most recent period, or that any exceptions to comparability be clearly brought out. When accounting changes and corrections of errors in previously issued financial statements occur, refer to section 1051, *Accounting Changes*. [As amended, effective for fiscal periods beginning after July 31, 1971 by APB Opinion No. 20.]

.04 Circumstances vary so greatly that it is not practicable to deal here specifically with all situations. The independent accountant should, however, make very clear what statements are included within the scope of his report.

The next page is 8121.

AC Section 2042

Capital Changes

[Source: APB Opinion No. 12, Pars. 9, 10.]

Effective for fiscal periods beginning after December 31, 1967, unless otherwise indicated

.01 Section 2010.06 states that "The statement of income and the statement of retained earnings (separately or combined) are designed to reflect, in a broad sense, the 'results of operations'." Section 2010.27 states that certain capital transactions ". . . should be excluded from the determination of net income or the results of operations under all circumstances." Companies generally have reported the current year's changes in stockholders' equity accounts other than retained earnings in separate statements or notes to the financial statements when presenting both financial position and results of operations for one or more years. A question has arisen as to whether, because of the language of section 2010, changes in stockholders' equity accounts other than retained earnings are required to be reported.

.02 When both financial position and results of operations are presented, disclosure of changes in the separate accounts comprising stockholders' equity (in addition to retained earnings) and of the changes in the number of shares of equity securities during at least the most recent annual fiscal period and any subsequent interim period presented is required to make the financial statements sufficiently informative. Disclosure of such changes may take the form of separate statements or may be made in the basic financial statements or notes thereto.

The next page is 8131.

AC Section 2043

Disclosure of Depreciable Assets and Depreciation

[Source: APB Opinion No. 12, Pars. 4, 5.]

Effective for fiscal periods beginning after December 31, 1967, unless otherwise indicated

.01 Disclosure of the total amount of depreciation expense entering into the determination of results of operations has become a general practice. The balances of major classes of depreciable assets are also generally disclosed. Practice varies, however, with respect to disclosure of the depreciation method or methods used.

.02 Because of the significant effects on financial position and results of operations of the depreciation method or methods used, the following disclosures should be made in the financial statements or in notes thereto:

a. Depreciation expense for the period,

b. Balances of major classes of depreciable assets, by nature or function, at the balance-sheet date,

c. Accumulated depreciation, either by major classes of depreciable assets or in total, at the balance-sheet date, and

d. A general description of the method or methods used in computing depreciation with respect to major classes of depreciable assets.

The next page is 8141.

AC Section 2044

Classification and Disclosure of Allowances

[Source: APB Opinion No. 12, Pars. 2, 3.]

Effective for fiscal periods beginning after December 31, 1967, unless otherwise indicated

.01 Although it is generally accepted that accumulated allowances for depreciation and depletion and asset valuation allowances for losses such as those on receivables and investments should be deducted from the assets to which they relate, there are instances in which these allowances are shown among liabilities or elsewhere on the credit side of the balance sheet.

.02 It is the Board's opinion that such allowances should be deducted from the assets or groups of assets to which the allowances relate, with appropriate disclosure.

The next page is 8151.

AC Section 2045

Disclosure of Accounting Policies

[Source: APB Opinion No. 22, as amended.]

Effective for fiscal years beginning after December 31, 1971, unless otherwise indicated

INTRODUCTION

.01 In recent years, a number of business enterprises have adopted the practice of including in their annual reports to shareholders a separate summary of the significant accounting policies followed in preparing the financial statements. This disclosure has been favorably received by users of financial statements and endorsed by organizations representing corporate business.

.02 Practice by those entities that present summaries of accounting policies has varied considerably. Some present the summary of accounting policies as an integral part of the financial statements; others present it as supplementary information. In addition, both the nature and the degree of disclosure vary, and related guidelines are lacking.

.03 Disclosure of accounting policies by those entities that do not present separate summaries has varied also. Some have included, in footnotes relating to particular items in the financial statements, descriptions of all significant accounting policies. Most entities, however, have disclosed no information as to certain significant accounting policies.

.04 In view of the increasing recognition of the usefulness of disclosure of accounting policies, the Accounting Principles Board has considered whether this disclosure should be required in financial statements and whether guides should be established for the form and scope of disclosure. This section sets forth the Board's conclusions.

DISCUSSION

.05 Financial statements are the end product of the financial accounting process, which is governed by generally accepted accounting principles on three levels: pervasive principles, broad operating principles, and detailed princi-

ples.[1] Applying generally accepted accounting principles requires that judgment be exercised as to the relative appropriateness of acceptable alternative principles and methods of application in specific circumstances of diverse and complex economic activities. Although the combined efforts of professional accounting bodies, of business, and of the regulatory agencies have significantly reduced the number of acceptable alternatives and are expected to reduce the number further, judgment must nevertheless be exercised in applying principles at all three levels.

.06 The *accounting policies* of a reporting entity are the specific accounting principles and the methods of applying those principles that are judged by the management of the entity to be the most appropriate in the circumstances to present fairly financial position, changes in financial position, and results of operations in accordance with generally accepted accounting principles and that, accordingly, have been adopted for preparing the financial statements.

.07 The accounting policies adopted by a reporting entity can affect significantly the presentation of its financial position, changes in financial position, and results of operations. Accordingly, the usefulness of financial statements for purposes of making economic decisions about the reporting entity depends significantly upon the user's understanding of the accounting policies followed by the entity.

OPINION

Applicability

.08 The Board concludes that information about the accounting policies adopted by a reporting entity is essential for financial statement users. When financial statements are issued purporting to present fairly financial position, changes in financial position, and results of operations in accordance with generally accepted accounting principles, a description of all significant accounting policies of the reporting entity should be included as an integral part of the financial statements. In circumstances where it may be appropriate to issue one or more of the basic financial statements without the others, purporting to present fairly the information given in accordance with generally accepted

[1] See *Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises,* sections 1026, 1027, and 1028.

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

accounting principles, statements so presented should also include disclosure of the pertinent accounting policies.

.09 The Board also concludes that information about the accounting policies adopted and followed by not-for-profit entities should be presented as an integral part of their financial statements.

.10 The provisions of paragraphs .08 and .09 above are not intended to apply to unaudited financial statements issued as of a date between annual reporting dates (e. g., each quarter) if the reporting entity has not changed its accounting policies since the end of its preceding fiscal year.[2]

.11 This section does not supersede any prior pronouncement of the American Institute of Certified Public Accountants relating to disclosure requirements.

Content

.12 Disclosure of accounting policies should identify and describe the accounting principles followed by the reporting entity and the methods of applying those principles that materially affect the determination of financial position, changes in financial position, or results of operations. In general, the disclosure should encompass important judgments as to appropriateness of principles relating to recognition of revenue and allocation of asset costs to current and future periods; in particular, it should encompass those accounting principles and methods that involve any of the following:

a. A selection from existing acceptable alternatives;

b. Principles and methods peculiar to the industry in which the reporting entity operates, even if such principles and methods are predominantly followed in that industry;

c. Unusual or innovative applications of generally accepted accounting principles (and, as applicable, of principles and methods peculiar to the industry in which the reporting entity operates).

---

[2] The Board recognizes also that it may be appropriate to omit disclosure of accounting policies in some other circumstances; for example, from financial statements restricted to internal use only (see AU section 516.05-.06) and from certain special reports in which incomplete or no financial presentations are made (AU section 621).

.13 Examples of disclosures by a business entity commonly required with respect to accounting policies would include, among others, those relating to basis of consolidation, depreciation methods, amortization of intangibles, inventory pricing, recognition of profit on long-term construction-type contracts, and recognition of revenue from franchising and leasing operations. This list of examples is not all-inclusive. [As amended, effective for fiscal years beginning on or after January 1, 1975, by FASB Statement No. 2.] (See section 4211.) [As amended, effective for fiscal years beginning on or after January 1, 1976, by FASB Statement No. 8.] (See section 1083.)

.14 Financial statement disclosure of accounting policies should not duplicate details (e. g., composition of inventories or of plant assets) presented elsewhere as part of the financial statements. In some cases, the disclosure of accounting policies should refer to related details presented elsewhere as part of the financial statements; for example, changes in accounting policies during the period should be described with cross-reference to the disclosure required by section 1051, *Accounting Changes,* of the current effect of the change and of the pro forma effect of retroactive application.

Format

.15 The Board recognizes the need for flexibility in matters of format (including the location) of disclosure of accounting policies provided that the reporting entity identifies and describes its significant accounting policies as an integral part of its financial statements in accordance with the foregoing guides in this section. The Board believes that the disclosure is particularly useful if given in a separate *Summary of Significant Accounting Policies* preceding the notes to financial statements or as the initial note. Accordingly, it expresses its preference for that format under the same or a similar title.

EFFECTIVE DATE

.16 This section shall be effective for fiscal years beginning after December 31, 1971. The Board, however, encourages earlier application of the provisions of this section.

AC Section 2051

Consolidated Financial Statements

[Source: ARB 43, Chap. 1A, Par. 3; ARB 51, as amended.]

Issue date, unless otherwise indicated: August, 1959

.01 Earned surplus of a subsidiary company created prior to acquisition does not form a part of the consolidated earned surplus of the parent company and subsidiaries; nor can any dividend declared out of such surplus properly be credited to the income account of the parent company.[1]

PURPOSE OF CONSOLIDATED STATEMENTS

.02 The purpose of consolidated statements is to present, primarily for the benefit of the shareholders and creditors of the parent company, the results of operations and the financial position of a parent company and its subsidiaries essentially as if the group were a single company with one or more branches or divisions. There is a presumption that consolidated statements are more meaningful than separate statements and that they are usually necessary for a fair presentation when one of the companies in the group directly or indirectly has a controlling financial interest in the other companies.

CONSOLIDATION POLICY

.03 The usual condition for a controlling financial interest is ownership of a majority voting interest, and, therefore, as a general rule ownership by one company, directly or indirectly, of over fifty per cent of the outstanding voting shares of another company is a condition pointing toward consolidation. However, there are exceptions to this general rule. For example, a subsidiary should not be consolidated where control is likely to be temporary, or where it does not rest with the majority owners (as, for instance, where the subsidiary is in legal

[1] The above rule was adopted by the membership of the Institute in 1934. It had been recommended in 1932 to the New York Stock Exchange by the Institute's committee on cooperation with stock exchanges.

reorganization or in bankruptcy). There may also be situations where the minority interest in the subsidiary is so large, in relation to the equity of the shareholders of the parent in the consolidated net assets, that the presentation of separate financial statements for the two companies would be more meaningful and useful. However, the fact that the subsidiary has a relatively large indebtedness to bondholders or others is not in itself a valid argument for exclusion of the subsidiary from consolidation. (Also, see section 1081 for the treatment of foreign subsidiaries.)

.04 In deciding upon consolidation policy, the aim should be to make the financial presentation which is most meaningful in the circumstances. The reader should be given information which is suitable to his needs, but he should not be burdened with unnecessary detail. Thus, even though a group of companies is heterogeneous in character, it may be better to make a full consolidation than to present a large number of separate statements. On the other hand, separate statements or combined statements would be preferable for a subsidiary or group of subsidiaries if the presentation of financial information concerning the particular activities of such subsidiaries would be more informative to shareholders and creditors of the parent company than would the inclusion of such subsidiaries in the consolidation. For example, separate statements may be required for a subsidiary which is a bank or an insurance company and may be preferable for a finance company where the parent and the other subsidiaries are engaged in manufacturing operations.

.05 A difference in fiscal periods of a parent and a subsidiary does not of itself justify the exclusion of the subsidiary from consolidation. It ordinarily is feasible for the subsidiary to prepare, for consolidation purposes, statements for a period which corresponds with or closely approaches the fiscal period of the parent. However, where the difference is not more than about three months, it usually is acceptable to use, for consolidation purposes, the subsidiary's statements for its fiscal period; when this is done, recognition should be given by disclosure or otherwise to the effect of intervening events which materially affect the financial position or results of operations.

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

.06 Consolidated statements should disclose the consolidation policy which is being followed. In most cases this can be made apparent by the headings or other information in the statements, but in other cases a footnote is required.

CONSOLIDATION PROCEDURE GENERALLY

.07 In the preparation of consolidated statements, intercompany balances and transactions should be eliminated. This includes intercompany open account balances, security holdings, sales and purchases, interest, dividends, etc. As consolidated statements are based on the assumption that they represent the financial position and operating results of a single business enterprise, such statements should not include gain or loss on transactions among the companies in the group. Accordingly, any intercompany profit or loss on assets remaining within the group should be eliminated; the concept usually applied for this purpose is gross profit or loss. (See also paragraph .16.) However, in a regulated industry where a parent or subsidiary manufactures or constructs facilities for other companies in the consolidated group, the foregoing is not intended to require the elimination of intercompany profit to the extent that such profit is substantially equivalent to a reasonable return on investment ordinarily capitalized in accordance with the established practice of the industry.

ELIMINATION OF INTERCOMPANY INVESTMENTS [2]

.08 The earned surplus or deficit of a purchased [3] subsidiary at the date of acquisition by the parent should not be included in consolidated earned surplus.

.09 When one company purchases two or more blocks of stock of another company at various dates and eventually obtains control of the other company, the date of acquisition (for the purpose of preparing consolidated statements) depends on the circumstances. If two or more purchases are made over a period of time, the earned surplus of the subsidiary at acquisition should generally be determined on a step-by-step basis; however, if small purchases are made

[2] As amended, effective for fiscal periods beginning after October 31, 1970, by APB Opinion No. 16.

[3] See section 1091 for the difference in treatment between a purchase and a pooling of interests.

over a period of time and then a purchase is made which results in control, the date of the latest purchase, as a matter of convenience, may be considered as the date of acquisition. Thus there would generally be included in consolidated income for the year in which control is obtained the postacquisition income for that year, and in consolidated earned surplus the postacquisition income of prior years, attributable to each block previously acquired. For example, if a 45% interest was acquired on October 1, 1957 and a further 30% interest was acquired on April 1, 1958, it would be appropriate to include in consolidated income for the year ended December 31, 1958, 45% of the earnings of the subsidiary for the three months ended March 31, and 75% of the earnings for the nine months ended December 31, and to credit consolidated earned surplus in 1958 with 45% of the undistributed earnings of the subsidiary for the three months ended December 31, 1957.

.10 When a subsidiary is purchased during the year, there are alternative ways of dealing with the results of its operations in the consolidated income statement. One method, which usually is preferable, especially where there are several dates of acquisition of blocks of shares, is to include the subsidiary in the consolidation as though it had been acquired at the beginning of the year, and to deduct at the bottom of the consolidated income statement the preacquisition earnings applicable to each block of stock. This method presents results which are more indicative of the current status of the group, and facilitates future comparison with subsequent years. Another method of prorating income is to include in the consolidated statement only the subsidiary's revenue and expenses subsequent to the date of acquisition.

.11 Where the investment in a subsidiary is disposed of during the year, it may be preferable to omit the details of operations of the subsidiary from the consolidated income statement, and to show the equity of the parent in the earnings of the subsidiary prior to disposal as a separate item in the statement.

.12 Shares of the parent held by a subsidiary should not be treated as outstanding stock in the consolidated balance sheet.

 © 1974, American Institute of Certified Public Accountants, Inc.

MINORITY INTERESTS

.13 The amount of intercompany profit or loss to be eliminated in accordance with paragraph .07 is not affected by the existence of a minority interest. The complete elimination of the intercompany profit or loss is consistent with the underlying assumption that consolidated statements represent the financial position and operating results of a single business enterprise. The elimination of the intercompany profit or loss may be allocated proportionately between the majority and minority interests.

.14 In the unusual case in which losses applicable to the minority interest in a subsidiary exceed the minority interest in the equity capital of the subsidiary, such excess and any further losses applicable to the minority interest should be charged against the majority interest, as there is no obligation of the minority interest to make good such losses. However, if future earnings do materialize, the majority interest should be credited to the extent of such losses previously absorbed.

INCOME TAXES

[.15] [Superseded, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 23.] (See section 4095.)

.16 If income taxes have been paid on intercompany profits on assets remaining within the group, such taxes should be deferred. [As amended, effective for fiscal periods beginning after December 31, 1967, by APB Opinion No. 11.]

STOCK DIVIDENDS OF SUBSIDIARIES

.17 Occasionally, subsidiary companies capitalize earned surplus arising since acquisition, by means of a stock dividend or otherwise. This does not require a transfer to capital surplus on consolidation, inasmuch as the retained earnings in the consolidated financial statements should reflect the accumulated earnings of the consolidated group not distributed to the shareholders of, or capitalized by, the parent company.

UNCONSOLIDATED SUBSIDIARIES IN CONSOLIDATED STATEMENTS

.18 The equity method described in section 5131 should be used for all subsidiaries which are not consolidated unless the limitations described at 2051.03 and at 1081.08 apply. When these limitations apply, the investment in a subsidiary should be carried at cost. Under the cost method, dividends received from a subsidiary out of its net earnings accumulated subsequent to the date of investment are recognized as income and dividends in excess of earnings subsequent to the date of investment are reductions of cost of the investment. Provision should be made for any material impairment of the investment, such as through losses sustained by the subsidiaries, unless it is deemed to be temporary.* When the cost method is followed, the consolidated statements should disclose, by footnote or otherwise, the cost of the investment in the unconsolidated subsidiaries, the equity of the consolidated group of companies in their net assets, the dividends received from them in the current period, and the equity of the consolidated group in their earnings for the period; this information may be given in total or by individual subsidiaries or groups of subsidiaries. [As amended, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 18.]

.19 When the cost method of dealing with unconsolidated subsidiaries is followed, if there is a difference between the cost of the investment and the equity in net assets at the date of acquisition, appropriate recognition should be given to the possibility that, had the subsidiaries been consolidated, part of such difference would have been reflected in adjusted depreciation or amortization. Also, appropriate recognition should be given to the necessity for an adjust-

* Modified by section 5132, *Accounting for Certain Marketable Securities.*

ment for intercompany gains or losses on transactions with unconsolidated subsidiaries. It is not necessary to eliminate the intercompany gain on sales to such subsidiaries, if the gain on the sales does not exceed the unrecorded equity in undistributed earnings of the unconsolidated subsidiaries. If such gain is material, it should be appropriately disclosed. Where the sales are made by the unconsolidated subsidiaries to companies included in the consolidated group, the intercompany gains or losses should be eliminated in arriving at the amount of the equity in the undistributed earnings of the unconsolidated subsidiaries which will be disclosed in a footnote or otherwise. (See paragraph .18.) [As amended, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 18.]

.20 Where the unconsolidated subsidiaries carried at cost are, in the aggregate, material in relation to the consolidated financial position or operating results, summarized information as to their assets, liabilities and operating results should be given in the footnotes or separate statements should be presented for such subsidiaries, either individually or in groups, as appropriate. [As amended, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 18.]

COMBINED STATEMENTS

.21 To justify the preparation of consolidated statements, the controlling financial interest should rest directly or indirectly in one of the companies included in the consolidation. There are circumstances, however, where combined financial statements (as distinguished from consolidated statements) of commonly controlled companies are likely to be more meaningful than their separate statements. For example, combined financial statements would be useful where one individual owns a controlling interest in several corporations which are related in their operations. Combined statements would also be used to present the financial position and the results of operations of a group of unconsolidated subsidiaries. They might also be used to combine the financial statements of companies under common management.

.22 Where combined statements are prepared for a group of related companies, such as a group of unconsolidated subsidiaries or a group of commonly controlled companies, intercompany transactions and profits or losses should be eliminated, and if there are problems in connection with such matters as minority interests, foreign operations, different fiscal periods, or income taxes, they should be treated in the same manner as in consolidated statements.

PARENT-COMPANY STATEMENTS

.23 In some cases parent-company statements may be needed, in addition to consolidated statements, to indicate adequately the position of bondholders and other creditors or preferred stockholders of the parent. Consolidating statements, in which one column is used for the parent company and other columns for particular subsidiaries or groups of subsidiaries, often are an effective means of presenting the pertinent information.

AC Section 2062

Accounting and Reporting by Development Stage Enterprises

[Source: FASB Statement No. 7.]

June 1975

INTRODUCTION

.01 This Statement specifies the guidelines for identifying an enterprise in the development stage and the standards of financial accounting and reporting applicable to such an enterprise. The transition requirements of this Statement are also applicable to certain established operating enterprises.[1]

.02 Some development stage enterprises have adopted special financial accounting and reporting practices, including special forms of financial statement presentation or types of disclosure, that are different from those used by established operating enterprises. Some of the special practices have resulted from applying regulations of the Securities and Exchange Commission; other practices appear simply to have evolved. Special accounting practices have included (a) deferral of all types of costs without regard to their recoverability, (b) nonassignment of dollar amounts to shares of stock issued for consideration other than cash, and (c) offset of revenue against deferred costs. Special reporting formats have included statements of (a) assets and unrecovered preoperating costs, (b) liabilities, (c) capital shares, and (d) cash receipts and disbursements. Sometimes, a balance sheet or a statement of operations is presented in conjunction with one or more special formats. Other development stage enterprises issue financial statements like those of established operating enterprises that present financial position, changes in financial position, and results of operations in conformity with generally accepted accounting principles.

.03 No special standards of financial accounting and reporting were established for development stage enterprises by the

[1] See paragraphs .14—.16.

AICPA Accounting Principles Board or its predecessor, the Committee on Accounting Procedure. In 1973, the AICPA Committee on Companies in the Development Stage issued an exposure draft of a proposed Audit Guide recommending special financial statements and accounting methods, but no action was taken on the exposure draft and the matter was referred to the FASB. *FASB Statement No. 2* [section 4211], "Accounting for Research and Development Costs," issued in October 1974, has been interpreted by the FASB to apply to "the accounting for research and development costs of development stage enterprises whose financial statements present financial position, changes in financial position, or results of operations in conformity with generally accepted accounting principles."[2] However, pending the issuance of a Statement on the subject of accounting and reporting by development stage enterprises, the FASB Interpretation stated that "a development stage enterprise that issues financial statements that do not purport to present financial position, changes in financial position, or results of operations in conformity with generally accepted accounting principles need not apply *Statement No. 2* in accounting for its research and development costs."[3]

.04 The standards of financial accounting and reporting set forth in this Statement apply to any separate financial statements of a development stage subsidiary or other investee[4] of an established operating enterprise, as well as to the financial statements of a separate development stage enterprise (or of a group of companies that, as a whole, is considered to be in the development stage). Hereinafter, the term "development stage enterprise" is used to include a development stage subsidiary or other investee that is issuing separate financial statements.

.05 This Statement applies to development stage enterprises in all industries. This Statement applies to development stage enterprises in regulated industries in accordance with the provisions of the Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit.'" However, paragraphs .11—.12 of this Statement, which require disclosure

---

[2] *FASB Interpretation No. 5,* "Applicability of FASB Statement No. 2 to Development Stage Enterprises," par. 6 [section 4211-2.06].

[3] *Ibid.,* par. 7 [section 4211-2.07].

[4] The terms *subsidiary* and *investee* are defined in paragraph 3 of *APB Opinion No. 18* [section 5131.03], "The Equity Method of Accounting for Investments in Common Stock."

Copyright © 1975, Financial Accounting Standards Board

of additional information, apply to development stage enterprises in regulated industries in all cases.

.06 This Statement supersedes *FASB Interpretation No. 5* [section 4211-2], "Applicability of FASB Statement No. 2 to Development Stage Enterprises." It does not supersede, alter, or amend any other present requirement in an Accounting Research Bulletin (ARB), Accounting Principles Board (APB) Opinion, or FASB Statement or Interpretation. Neither does this Statement change generally accepted accounting principles that are currently applicable to established operating enterprises but that are not explicitly stated in an ARB, APB Opinion, or FASB Statement or Interpretation. For example, this Statement does not change generally accepted accounting principles applicable to (a) established operating enterprises generally in expanding their existing businesses, (b) established operating enterprises in the extractive industries in their exploration and development activities, and (c) established operating enterprises in the real estate industry in developing their properties.

.07 Standards of financial accounting and reporting for development stage enterprises are set forth in paragraphs .08—.16. Appendix B sets forth the basis for the Board's conclusions, including alternatives considered and reasons for accepting some and rejecting others. Appendix A provides background information.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Guidelines for Identifying a Development Stage Enterprise

.08 For purposes of this Statement, an enterprise shall be considered to be in the development stage if it is devoting substantially all of its efforts to establishing a new business and either of the following conditions exists:

a) Planned principal operations have not commenced.

b) Planned principal operations have commenced, but there has been no significant revenue therefrom.

.09 A development stage enterprise will typically be devoting most of its efforts to activities such as financial planning; raising capital; exploring for natural resources; developing

natural resources; research and development;[5] establishing sources of supply; acquiring property, plant, equipment, or other operating assets, such as mineral rights; recruiting and training personnel; developing markets; and starting up production.

Financial Accounting and Reporting

.10 Financial statements issued by a development stage enterprise shall present financial position, changes in financial position, and results of operations in conformity with the generally accepted accounting principles that apply to established operating enterprises and shall include the additional information required by paragraphs .11—.12. Special accounting practices and reporting formats, such as those described in paragraph .02 of this Statement, that are based on a distinctive accounting for development stage enterprises are no longer acceptable. Generally accepted accounting principles that apply to established operating enterprises shall govern the recognition of revenue by a development stage enterprise and shall determine whether a cost incurred by a development stage enterprise is to be charged to expense when incurred or is to be capitalized or deferred. Accordingly, capitalization or deferral of costs shall be subject to the same assessment of recoverability that would be applicable in an established operating enterprise. For a development stage subsidiary or other investee, the recoverability of costs shall be assessed within the entity for which separate financial statements are being presented.

.11 In issuing the same basic financial statements as an established operating enterprise, a development stage enterprise shall disclose therein certain additional information. The basic financial statements to be presented[6] and the additional information shall include the following:

a) A balance sheet, including any cumulative net losses reported with a descriptive caption such as "deficit

[5] *Research and development* is defined in paragraph 8 of *FASB Statement No. 2* [section 4211.08], "Accounting for Research and Development Costs."

[6] Under some circumstances, an established operating enterprise may issue less than a full set of financial statements, for example, only a balance sheet. This Statement does not preclude that possibility for development stage enterprises. Also, different titles or formats used by some established operating enterprises may be used provided that the prescribed information is included.

Copyright © 1975, Financial Accounting Standards Board

accumulated during the development stage" in the stockholders' equity section.

b) An income statement, showing amounts of revenue and expenses for each period covered by the income statement and, in addition, cumulative amounts from the enterprise's inception.[7]

c) A statement of changes in financial position, showing the sources and uses of financial resources for each period for which an income statement is presented[8] and, in addition, cumulative amounts from the enterprise's inception.

d) A statement of stockholders' equity, showing from the enterprise's inception:[9]

   1) For each issuance, the date and number of shares of stock, warrants, rights, or other equity securities issued for cash and for other consideration.

   2) For each issuance, the dollar amounts (per share or other equity unit and in total) assigned to the consideration received for shares of stock, warrants, rights, or other equity securities. Dollar amounts shall be assigned to any noncash consideration received.

   3) For each issuance involving noncash consideration, the nature of the noncash consideration and the basis for assigning amounts.

.12 The financial statements shall be identified as those of a development stage enterprise and shall include a description of the nature of the development stage activities in which the enterprise is engaged.

---

[7] For a dormant enterprise that is reactivated to undertake development stage activities, the disclosure of cumulative amounts required by this paragraph shall be from inception of the development stage.

[8] Subject to the exceptions described in paragraphs 7 and 16 of *APB Opinion No. 19* [sections 2021.07 and 2021.16], "Reporting Changes in Financial Position."

[9] Separate issuances of equity securities within the same fiscal year for the same type of consideration and for the same amount per equity unit may be combined in the statement of stockholders' equity. Appropriate modification of the statement of stockholders' equity may be required for (a) a combined group of companies that, as a whole, is considered to be in the development stage and (b) an unincorporated development stage enterprise.

.13 The financial statements for the first fiscal year in which an enterprise is no longer considered to be in the development stage shall disclose that in prior years it had been in the development stage. If financial statements for prior years are presented for comparative purposes, the cumulative amounts and other additional disclosures required by paragraphs .11—.12 need not be shown.

Effective Date and Transition

.14 This Statement shall be effective for fiscal periods beginning on or after January 1, 1976, although earlier application is encouraged. Thereafter, when financial statements, or financial summaries or other data derived therefrom, are presented for periods prior to the effective date of this Statement, they shall be restated, where necessary, to conform to the provisions of this Statement. Accordingly, any items that would have been accounted for differently by a development stage enterprise if the provisions of paragraph .10 had then been applicable shall be accounted for by prior period adjustment (described in paragraphs 18 and 26 of *APB Opinion No. 9* [sections 2010.17 and 2010.25], "Reporting the Results of Operations").

.15 An established operating enterprise that during its development stage would have accounted for any items differently if the provisions of paragraph .10 had then been applicable shall account for those items by prior period adjustment. In some cases, those items will have been amortized or otherwise included in an income statement in periods prior to the effective date of this Statement. Financial statements, or financial summaries or other data derived therefrom, for those periods shall be restated when they are included for comparative purposes with financial data for periods after the effective date of this Statement.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.16 The nature of any adjustment or restatement resulting from application of paragraphs .14—.15 and, where appropriate, its effect on income before extraordinary items, net income, and related per share amounts shall be disclosed in the period of change for all periods presented. Any related income tax effects shall be recognized and disclosed.

The provisions of this Statement need not be applied to immaterial items.

Appendix A

BACKGROUND INFORMATION

.17 In April 1973, the FASB placed on its technical agenda a project on "Accounting for Research and Development and Similar Costs." The scope of the project also encompassed accounting and reporting by development stage enterprises, the subject of this Statement.

.18 A task force of sixteen persons from industry, government, public accounting, the financial community, and academe was appointed in July 1973 to provide counsel to the Board in preparing a Discussion Memorandum analyzing issues related to the project.

.19 The FASB did not undertake a major research effort in connection with the project but rather relied primarily on published research studies and articles that are cited in the Discussion Memorandum. Especially important in this regard was *Accounting for Companies in the Development Stage*, an exposure draft of an Audit Guide originally issued for comment in 1973 by the Committee on Companies in the Development Stage of the American Institute of Certified Public Accountants.

.20 The Discussion Memorandum was issued by the Board on December 28, 1973, and a public hearing on the subject was held on March 15, 1974. Seventy-four position papers, letters of comment, and outlines of oral presentations were received by the Board in response to the Discussion Memorandum. Thirty-nine of those responses included recommendations about development stage enterprises. Fourteen oral presentations were made at the public hearing.

.21 In the course of its deliberations following the hearing, the Board concluded that accounting and reporting by development stage enterprises should be addressed in a separate Statement of Financial Accounting Standards. An Exposure Draft of a proposed Statement on "Accounting and Reporting by Development Stage Companies, Subsidiaries, Divisions and Other Components" was issued on July 19, 1974. The Board received 138 letters of comment on the Exposure Draft. In November 1974, the Board announced that "because of questions raised in many of the comment

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

letters received during exposure of the proposed Statement on development stage companies, the Standards Board is continuing its consideration of that subject and a final Statement is not expected to be issued before April or May of 1975."[10]

Appendix B

BASIS FOR CONCLUSIONS

.22 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others.

SCOPE OF THIS STATEMENT

.23 As indicated by the title, the Exposure Draft, "Accounting and Reporting by Development Stage Companies, Subsidiaries, Divisions and Other Components," explicitly encompassed a development stage subsidiary, division, or other component of an established operating enterprise as well as a separate development stage enterprise. A number of respondents to the Exposure Draft interpreted the inclusion of subsidiaries, divisions, or other components of an established operating enterprise to mean that new financial accounting standards were being proposed for the costs incurred by established operating enterprises in expanding their existing businesses. Those respondents suggested that any changes called for by the proposed new standards in that regard were unclear. They further suggested that the proposed new standards for financial statement presentation and disclosure were inapplicable to components of established operating enterprises except as they might apply to separate financial statements occasionally issued by subsidiaries in the development stage.

.24 In addition to accounting for research and development costs and accounting for development stage enterprises, the Discussion Memorandum comprehended accounting for start-up costs and other costs that are similar to research and

---

[10] *FASB Status Report,* No. 19, November 16, 1974.

development costs in the sense that they share certain distinguishing characteristics.[11] In issuing the Exposure Draft, however, the Board did not intend to propose new financial accounting standards for start-up costs and those other "similar costs" incurred by established operating enterprises. To eliminate that possible source of confusion and to deal more directly with the financial accounting and reporting matters affecting development stage enterprises, the scope of this Statement is restricted to the financial statements of a development stage enterprise (or of a group of companies that, as a whole, is considered to be in the development stage) and to any separate financial statements of a development stage subsidiary or other investee of an established operating enterprise (see paragraph .04).

Development Stage Enterprises in the Extractive Industries

.25 A number of respondents to the Exposure Draft questioned the application of this Statement to development stage enterprises in certain industries (see paragraph .05 of this Statement), especially to development stage enterprises in the extractive industries. The Discussion Memorandum made a distinction for the extractive industries between (1) costs that are indistinguishable in nature from those costs incurred in other industries and (2) costs that are incurred uniquely in the extractive industries. It stated that "research and development and similar costs that are indistinguishable in nature from the research and development and similar costs incurred in other industries are embraced by this project." The Discussion Memorandum also stated that costs that are incurred uniquely in the extractive industries are generally believed to warrant separate consideration and "are specifically outside the scope of this project."[12] *FASB Statement No. 2* [section 4211], "Accounting for Research and Development Costs," in paragraph .03, recognized that distinction by indicating that it "does not apply to activities that are unique to enterprises in the extractive industries."

.26 Chapter four, "Companies in the Development Stage," of the Discussion Memorandum states that "this Discussion Memorandum excludes from this project only those 'costs that are incurred uniquely in the extractive industries.' Therefore, whether extractive industry companies in the

[11] *FASB Discussion Memorandum*, "Accounting for Research and Development and Similar Costs," pp. 2-5.

[12] *Ibid.*, pp. 8-9.

Copyright © 1975, Financial Accounting Standards Board

development stage have sufficiently different characteristics to warrant exclusion from or special handling in a definition of a company in the development stage requires consideration."[13]

.27 The AICPA Committee on Companies in the Development Stage indicated in its 1973 exposure draft that the proposed provisions should be applicable to any development stage enterprise in any industry. Similarly, the APB Committee on Extractive Industries states, "new companies still in the exploratory and development stage in the oil and gas industry are no different than companies in a similar stage in other industries and probably should not be afforded any special treatment."[14]

.28 The Board has concluded that consideration of the accounting for costs incurred in activities that are unique to enterprises in the extractive industries is outside the scope of this Statement. Paragraph .06 explains that this Statement does not change generally accepted accounting principles that are applicable to established operating enterprises but that are not explicitly stated in an ARB, APB Opinion, or FASB Statement or Interpretation, and cites as an example generally accepted accounting principles that are applicable to established operating enterprises in the extractive industries in their exploration and development activities. The effect of this Statement being applicable to development stage enterprises in all industries, therefore, is not to change the generally accepted accounting principles applicable to costs incurred in activities that are unique to enterprises in the extractive industries, but to require those generally accepted accounting principles applicable to established operating enterprises in the extractive industries to be applied to development stage enterprises in the extractive industries as well. This includes presentation of the same basic financial statements.

GUIDELINES FOR IDENTIFYING A DEVELOPMENT STAGE ENTERPRISE

.29 The broad guidelines set forth in paragraphs .08—.09 for identifying a development stage enterprise are designed to

[13] *Ibid.*, p. 55.

[14] American Institute of Certified Public Accountants, Accounting Principles Board Committee on Extractive Industries, *Accounting and Reporting Practices in the Oil and Gas Industry* (New York: AICPA, May 31, 1973), p. 24.

include enterprises engaged in diverse areas of economic activity. The point at which an enterprise ceases to be in the development stage, and, therefore, need not present the cumulative amounts since its inception and other additional disclosures required by paragraphs .11—.12, must be evaluated in each case.

ACCOUNTING

.30 The Board has concluded that the generally accepted accounting principles that apply to established operating enterprises shall govern the recognition of revenue by a development stage enterprise and shall determine whether a cost incurred by a development stage enterprise is to be charged to expense when incurred or is to be capitalized or deferred. The primary reasons for this conclusion are:

a) The kinds of transactions engaged in by development stage enterprises are also common to established operating enterprises in expanding their existing businesses. Accounting treatment should be governed by the nature of the transaction rather than by the degree of maturity of the enterprise. Thus, the determination of whether a particular cost should be charged to expense when incurred or should be capitalized or deferred should be based on the same accounting standards regardless of whether the enterprise incurring the cost is already operating or is in the development stage.

b) Any different standards for a development stage enterprise that would result in deferral of costs that would not be deferred if the generally accepted accounting principles applicable to established operating enterprises had been applied may cause financial statement users to reach unjustified conclusions about the nature of the costs incurred by a development stage enterprise. The Board believes that adequate financial statement disclosures concerning the costs incurred by a development stage enterprise, both for the current period and cumulatively since its inception, will mitigate that possibility and provide useful financial information for decisions about that kind of enterprise.

.31 Established operating enterprises incur costs under various circumstances and with varying degrees of

Copyright © 1975, Financial Accounting Standards Board

uncertainty about future benefits, especially in expanding their existing businesses. Authoritative accounting literature does not contain general criteria or guidelines for determining when costs should be charged to expense as incurred and when costs should be capitalized or deferred,[15] and this Statement does not attempt to specify such criteria or guidelines.

.32 The absence of explicit criteria or guidelines, however, does not provide a free choice to defer costs or to charge them to expense when incurred. The scope of generally accepted accounting principles is broader than the authoritative literature and encompasses practices that have evolved and gained acceptance with time and experience. Many of those practices are described in *APB Statement No. 4* [sections 1021—1029], "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises." For example, paragraph 160 of *APB Statement No. 4* [section 1026.24] describes generally accepted accounting principles as calling for immediate recognition as expense when "(1) costs incurred during the period provide no discernible future benefits, (2) costs recorded as assets in prior periods no longer provide discernible benefits or (3) allocating costs either on the basis of association with revenue or among several accounting periods is considered to serve no useful purpose."[16]

.33 In concluding that the generally accepted accounting principles applicable to established operating enterprises shall determine whether a cost incurred by a development stage enterprise is to be charged to expense when incurred or is to be capitalized or deferred, the Board is relying primarily on the assessment of recoverability of incurred costs that those principles require. Heretofore, some have felt that generally

---

[15] Guidance is provided for some specific situations. For example, *FASB Statement No. 2* [section 4211] prescribes that the research and development costs encompassed by that Statement shall be charged to expense when incurred and describes the considerations that led to that conclusion. Also, AICPA Industry Audit Guides provide guidance about accounting for costs incurred by enterprises in particular industries. Although Audit Guides do not constitute authoritative accounting literature, those issued in recent years state that members of the AICPA may be called upon to justify departures from the recommendations contained therein.

[16] *APB Statement No. 4*, in paragraph 4 [section 1021.04], describes its status as follows: "The accounting principles described are those that the [Accounting Principles] Board believes are generally accepted today. The Board has not evaluated or approved present generally accepted accounting principles except to the extent that principles have been adopted in Board Opinions. Publication of this Statement does not constitute approval by the Board of accounting principles that are not covered in its Opinions."

accepted accounting principles did not apply to the special accounting practices and special financial reporting formats that have been used by some development stage enterprises. The Board's conclusion that the generally accepted accounting principles applicable to established operating enterprises also apply to development stage enterprises, including presentation of the same basic financial statements, eliminates the special practices and formats and the question about the applicability of generally accepted accounting principles to them.

SEC Regulations and AICPA Committee Proposal

.34 Both the regulations of the Securities and Exchange Commission (SEC) and the proposed Audit Guide issued by the AICPA Committee on Companies in the Development Stage provide for the use by development stage enterprises of certain accounting practices that differ from those appropriate for established operating enterprises.

.35 Article 5A of SEC *Regulation S-X* prescribes the form and content of financial statements filed with the SEC by development stage enterprises. It provides for separate statements of (a) assets and unrecovered promotional, exploratory, and development costs; (b) liabilities; (c) capital shares; (d) other securities; and (e) cash receipts and disbursements. Among the types of costs indicated as includible in *unrecovered promotional, exploratory, and development costs* are:

> (a) development expenses, (b) plant and equipment maintenance expenses, (c) rehabilitation expenses, (d) general administrative expenses incurred in a period when there was little or no actual mining and (e) other expenses. . . . General administrative expenses incurred in connection with subcaptions (a), (b) and (c) should be included therein. Any other general administrative expenses not chargeable to those subcaptions nor written off as costs or other operating charges (including taxes, protection and conservation of property when inactive) shall be included under subcaption (d).[17]

Rule 12-06a of *Regulation S-X* allows for the offset of certain proceeds and other income against promotional, exploratory, and development costs.

---

[17] U. S., Securities and Exchange Commission, *Regulation S-X,* Rule 5a-02, "Statement of Assets and Unrecovered Promotional, Exploratory, and Development Costs," item 14.

Copyright © 1975, Financial Accounting Standards Board

.36 The AICPA Committee proposed the presentation of cumulative cost outlays, together with assets, liabilities, and investment by stockholders, in a special statement referred to as a "preoperating accountability statement." Cumulative cost outlays would have been deferred and amortized by charges against income when operations commenced. Incidental revenue received during the development stage would have been deducted from the cumulative cost outlays.

.37 The AICPA Committee stated the basis for its conclusion as follows:

> A company in the development stage is engaged in building an enterprise, and the expenditures it makes are in the nature of investments for the future. Costs incurred during the development stage are accumulated because they have been incurred in the expectation that they will generate future revenues or otherwise benefit periods after the company reaches the operating stage. Accumulating costs is consistent with the business fact that for many companies a development stage must precede the attainment of ordinary business operations. . . . The only outlays that should not be carried as accumulated costs during the preoperating period are those relating to known losses. . . .
>
> For a company in the development stage there is from inception a presumption that uncertainty as to cost recovery will both exist and persist. (By contrast, the presumption for an operating company is that cost recoverability can be reasonably evaluated.) It would be unrealistic and arbitrary to write off immediately the costs incurred during the development stage simply because of this predictable uncertainty.[18]

.38 Both the SEC and AICPA Committee approaches draw attention to the uncertainty about cost recovery surrounding most development stage costs by segregating them in a special category in a special financial statement (or group of statements) similar to the conventional balance sheet. Those costs are not reported as "assets," and they need not be subjected to the assessment of recoverability that is applied to costs incurred by established operating enterprises. The Board believes, however, that the distinction between costs that would be reported as "assets" and costs that would be reported as "unrecovered costs" or "cumulative cost outlays"

---

[18] American Institute of Certified Public Accountants, Committee on Companies in the Development Stage, *Accounting for Companies in the Development Stage,* an exposure draft of an Audit Guide (New York: AICPA, March 1973), pp. 25-26, 28.

under the SEC and AICPA Committee approaches is one that is likely to be overlooked by many financial statement users. In addition, as indicated in paragraphs .30—.33, the Board believes that all costs of a development stage enterprise should be subjected to the same assessment of recoverability applicable to costs incurred by established operating enterprises. In the Board's view, the nature of development stage activities and their related costs can best be indicated by the additional financial statement disclosures required by paragraphs .11—.12, rather than by accumulation or deferral of costs that would be charged to expense when incurred if generally accepted accounting principles applicable to established operating enterprises were applied.

.39 Accumulation or deferral of development stage costs requires amortization after operations commence. Article 5A does not address the question of amortization, and the AICPA Committee noted that "while the current practices are anything but uniform, the most prevalent policy noted is to amortize such costs over a short period of time, usually not more than five years."[19] The Board believes that the difficulty in reasonably relating subsequent revenue to accumulated or deferred costs that would not be deferred under generally accepted accounting principles applicable to established operating enterprises limits the usefulness of the data that would result from such accumulation or deferral by a development stage enterprise. Moreover, the initial operating periods of such an enterprise would include both the amortization of those costs incurred during the development stage and the charging to expense of certain costs incurred currently.

.40 Some respondents to the Discussion Memorandum and to the Exposure Draft supported the SEC approach, the proposed approach of the AICPA Committee, or similar approaches. The reasons offered were generally similar to those stated by the AICPA Committee (see paragraph .37). A number of respondents to the Discussion Memorandum and to the Exposure Draft recommended that development stage enterprises follow the same accounting standards as established operating enterprises. The reasons given by the respondents were generally similar to those specified in paragraph .30.

---

[19] *Ibid.*, p. 11.

Relationship to "Similar Costs"

.41 The Exposure Draft stated that the Board was considering an additional pronouncement on the "similar costs" identified in the Discussion Memorandum. A number of respondents to the Exposure Draft indicated that because, in their view, many costs incurred by development stage enterprises are within a broader category of costs that include start-up costs generally, the Board should address accounting for those "similar costs" before issuing a final Statement on development stage enterprises. The Board considered those suggestions, but concluded that it could reach an informed decision on the issues covered in this Statement without first addressing the more pervasive issues associated with accounting for "similar costs." In the Board's view, this Statement will significantly improve financial accounting and reporting for development stage enterprises.

FINANCIAL STATEMENT PRESENTATION AND ADDITIONAL DISCLOSURES

.42 The Board believes that a development stage enterprise should present the same basic financial statements as any other enterprise. The conventional balance sheet, income statement, statement of changes in financial position, and statement of stockholders' equity are sufficiently adaptable to provide the distinctive information that might be considered useful for development stage enterprises. Unique financial statements for development stage enterprises might imply that the nature and results of the transactions entered into by those enterprises are unique, but many established operating enterprises have similar transactions. Further, unique financial statements would not be readily comparable with financial statements issued after an enterprise has emerged from the development stage. Also, the conclusion that the same accounting principles are appropriate for the transactions of development stage enterprises suggests that conventional basic financial statements should be presented.

.43 A development stage enterprise typically will be incurring substantial costs in connection with development stage activities and will not have significant revenue. Development stage activities are likely to extend into two or more financial reporting periods. To reflect the significance of development stage activities, the Board believes that the

basic financial statements presented by a development stage enterprise should be expanded to provide cumulative financial information since its inception, as well as current information. The Board concluded that disclosure of cumulative revenue and expenses and cumulative amounts of funds obtained from various sources to finance the development effort and initial operations will provide useful information about the activities of development stage enterprises without sacrificing the advantages of retaining the familiar format and content of the basic financial statements of established operating enterprises. Those additional disclosures are specified in paragraphs .11—.12.

.44 Some respondents to the Discussion Memorandum and Exposure Draft suggested that the differences between established operating enterprises and development stage enterprises are so fundamental as to require unique financial statements for development stage enterprises. The AICPA Committee concluded that, because of the absence of revenue, a conventional income statement would be inappropriate for a development stage enterprise; unique financial statements were deemed necessary to emphasize accountability for financial resources received and expended and to direct attention to accumulated costs rather than to measurement of performance. To accomplish those objectives, the Committee recommended the following special statements:

Preoperating accountability statement — to show the assets and cumulative cost outlays, the liabilities, and the investment by stockholders.

Statement of preoperating financial activities — to show the sources and uses of financial resources, preferably cumulative since an enterprise's inception along with data for the current period.

Statement of investment by stockholders — to show the classes and numbers of shares authorized, issued, and outstanding and the types and amounts of consideration received for the shares issued.

.45 The AICPA Committee proposed extensive disclosures emphasizing that the enterprise is in the development stage, calling attention to the uncertainties that surround the enterprise and making clear that the financial statements do

Copyright © 1975, Financial Accounting Standards Board

not purport to present financial position and results of operations.

.46 Other respondents to the Discussion Memorandum and to the Exposure Draft took the position that different basic financial statements or additional disclosures are not necessary for a development stage enterprise. Still others asserted that the same basic financial statements are appropriate but should be supplemented by additional disclosures relevant to the distinctive features of a development stage enterprise.

Other Suggestions

.47 The Board considered other presentation and disclosure possibilities for a development stage enterprise (including forecasts, disclosure of liquidation priorities and values, and a description of the business environment) and concluded that they should not be required solely for development stage enterprises. The Board also considered the possibility of a statement of cash receipts and disbursements and concluded that the statement of changes in financial position including amounts on a cumulative basis required by paragraph .11(c) would fulfill that need.

POTENTIAL ECONOMIC IMPACT

.48 Some respondents to the Exposure Draft expressed concern that requiring development stage enterprises to present the same basic financial statements and to apply the same generally accepted accounting principles as established operating enterprises might make it difficult, if not impossible, for development stage enterprises to obtain capital. They suggested that those requirements would likely cause many development stage enterprises to report periodic losses in an income statement and a cumulative deficit in a balance sheet. Because those results would not be fully understood, suppliers of capital would be disinclined to invest in those enterprises.

.49 During the course of developing the Discussion Memorandum and preparing the Exposure Draft, the FASB solicited information about the potential economic impact of applying to development stage enterprises the same generally accepted accounting principles that apply to established

operating enterprises. Responses of financial statement users to the Discussion Memorandum and to the Exposure Draft provided only limited information about the potential economic impact. To obtain additional information, the FASB arranged for discussions with officers of fifteen venture capital enterprises. The consensus of those officers was that whether a development stage enterprise defers or expenses preoperating costs has little effect on (a) the amount of any venture capital to be provided to that enterprise and (b) the terms under which any venture capital is provided. According to those officers, the venture capital investor typically relies on an investigation of the technological, marketing, management, and financial aspects of an enterprise. That investigation provides a basis for estimating potential cash flows and the probabilities of achieving them. Whether a development stage enterprise defers or expenses its preoperating costs does not affect those estimates. Based on their experience, those officers also expressed the opinion that the accounting treatment of preoperating costs would have minimal impact on the availability of short-term credit from commercial banks, but might have impact on the investment and credit decisions of unsophisticated investors.

.50 In January 1975, the U.S. Department of Commerce issued a report of a study entitled "Impact of FASB's Rule Two Accounting for Research and Development Costs on Small/Developing Stage Firms." The study involved interviews with forty lenders and investors, eleven small, high-technology firms, eleven accountants, and selected government agencies. It focused primarily on the impact on investment and credit decisions concerning development stage enterprises if they were required to charge research and development costs to expense when incurred. That issue is related to the issue at hand — that is, the potential economic impact on development stage enterprises of requiring certain costs to be expensed when incurred rather than deferred. The conclusions of the Department of Commerce study were generally consistent with the FASB findings described in paragraph .49 of this Statement. Specifically, the study concluded that "FASB's Statement Two should not have a significant impact on those firms who have heretofore capitalized R&D."[20]

---

[20] U. S., Department of Commerce, "Impact of FASB's Rule Two Accounting for Research and Development Costs on Small/Developing Stage Firms" (Washington, D. C.: U. S., Department of Commerce, January 20, 1975), p. 3.

Copyright © 1975, Financial Accounting Standards Board

.51 In summary, the Board has concluded that the cumulative income statement information and the cumulative information about changes in financial position required in paragraph .11 of this Statement will provide the cumulative information about preoperating costs that is typically provided by development stage enterprises currently when using special reporting formats and special accounting practices, such as those cited in paragraph .02. In addition, this Statement requires such information to be presented in financial statements whose formats are familiar and, therefore, less likely to be misinterpreted. As for the concerns of some respondents, the results of FASB discussions and the Department of Commerce study suggest that this Statement will have no significant adverse effect on the ability of development stage enterprises to obtain capital.

ISSUANCE OF SHARES OF STOCK OTHER THAN FOR CASH

.52 Under the provisions of Article 5A of SEC *Regulation S-X*, dollar amounts are not assigned to shares of stock issued by a development stage enterprise for noncash consideration, or to the consideration received, unless the noncash consideration has a "fixed or objectively determinable value."

.53 The proposed AICPA Audit Guide would have required assignment of dollar amounts to shares of stock issued for noncash consideration, and to the consideration received, at the time of issuance.

.54 The Board agrees with the conclusion of the AICPA Committee, and of a number of respondents to the Discussion Memorandum and Exposure Draft who addressed this question, that those transactions should be accounted for when the shares are issued in accordance with the guidelines applicable to acquisition of assets or issuance of shares in general. The transactions are not unique to development stage enterprises and should not be accounted for differently by those enterprises, even if estimates and judgments are required to determine their values.

EFFECTIVE DATE AND TRANSITION

.55 The Board adopted the restatement provisions set forth in paragraphs .14—.16 because, in its view, this approach provides the most useful information about development stage enterprises and about those previously in the development stage in comparing financial data for periods after the effective date of this Statement with data presented for earlier periods.

AC Section 2062-1

Applying Section 2062 in Financial Statements of Established Operating Enterprises: An Interpretation of Section 2062

[Source: FASB Interpretation No. 7.]

October 1975

INTRODUCTION

.01 The FASB has been asked to explain the applicability of *FASB Statement No. 7* [section 2062], "Accounting and Reporting by Development Stage Enterprises," to an established operating enterprise's financial statements that include the financial statements of a development stage subsidiary or other investee either by consolidation or by the equity method,[1] in terms of the following questions:

a) Must the effect of a change in accounting principle adopted in the separate financial statements of a development stage subsidiary to conform to the provisions of *Statement No. 7* [section 2062] be reflected in the consolidated financial statements of an established operating enterprise that include the financial statements of that subsidiary?

b) If it is appropriate that the established operating enterprise's consolidated financial statements reflect the effect of its development stage subsidiary's change to a new principle of accounting adopted to conform to the provisions of *Statement No. 7* [section 2062], how should the effect of the change be reported in the established operating enterprise's financial statements?

.02 Paragraph 10 of *Statement No. 7* [section 2062.10] states:

> Financial statements issued by a development stage enterprise shall present financial position, changes in financial position, and results of operations in conformity with the generally accepted accounting principles that apply to established operating enterprises. . . . Generally accepted accounting principles that apply to established operating enterprises shall govern the recognition of revenue by a development stage enterprise and shall determine whether a cost incurred by a development stage enterprise is to be charged to expense when incurred or is to be capitalized or deferred. Accordingly, capitalization or deferral of costs shall be subject to the same assessment of recoverability that would be

[1] Hereinafter, in this Interpretation, the term *subsidiary* comprehends all *investees* that are accounted for by the equity method as described in *APB Opinion No. 18* [section 5131], "The Equity Method of Accounting for Investments in Common Stock." Likewise, the term *consolidated financial statements* hereinafter comprehends the *equity method of accounting*.

> applicable in an established operating enterprise. For a development stage subsidiary or other investee, the recoverability of costs shall be assessed within the entity for which separate financial statements are being presented.

.03 Paragraph 14 of *Statement No. 7* [section 2062.14] provides for initial application of the Statement as follows:

> This Statement shall be effective for fiscal periods beginning on or after January 1, 1976, although earlier application is encouraged. Thereafter, when financial statements, or financial summaries or other data derived therefrom, are presented for periods prior to the effective date of this Statement, they shall be restated, where necessary, to conform to the provisions of this Statement. Accordingly, any items that would have been accounted for differently by a development stage enterprise if the provisions of paragraph 10 had then been applicable shall be accounted for by prior period adjustment (described in paragraphs 18 and 26 of *APB Opinion No. 9* [sections 2010.17 and 2010.25], "Reporting the Results of Operations").

Further, paragraph 1 of *Statement No. 7* [section 2062.01] states, in part, that "the transition requirements of this Statement are also applicable to certain established operating enterprises" and makes specific reference to paragraphs 14—16 of *Statement No. 7* [section 2062.14—.16] by footnote.

INTERPRETATION

.04 *Statement No. 7* [section 2062] does not address and does not alter generally accepted accounting principles for the preparation of consolidated financial statements. Therefore, *Statement No. 7* [section 2062] does not address the question of whether the effect of a change in accounting principle adopted in the separate financial statements of a development stage subsidiary to conform to the provisions of that Statement must be reflected in an established operating enterprise's consolidated financial statements that include the financial statements of the subsidiary. However, paragraph 10 of the Statement [section 2062.10] specifies that "capitalization or deferral of costs shall be subject to the same assessment of recoverability that would be applicable in an established operating enterprise" and further specifies that "for a development stage subsidiary or other investee, the recoverability of costs shall be assessed within the entity for which separate financial statements are being presented." In specifying that the same assessment of recoverability be made, the Statement does not require that the results of that assessment must necessarily be the same. Further, the Statement does not affect any accepted practice in consolidation of financial statements where the results of an assessment of recoverability of a cost may be different (a) in the broader context of a consolidated enterprise and (b) in the context of a development stage subsidiary standing alone. Under

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

any such accepted practice, a cost incurred by a development stage subsidiary could be assessed as recoverable within the consolidated enterprise and be capitalized or deferred in consolidated financial statements even though that cost is assessed as not being recoverable within a development stage subsidiary and, therefore, charged to expense in the separate financial statements of the development stage subsidiary.

.05 Except in the circumstances described in the preceding paragraph, the effect of a development stage subsidiary's change in accounting principle to conform its accounting to the requirements of *Statement No. 7* [section 2062] generally would be reflected in an established operating enterprise's consolidated financial statements that include that subsidiary. When a development stage subsidiary adopts a new accounting principle to conform its accounting to the requirements of *Statement No. 7* [section 2062] and the effect of that subsidiary's accounting change is also reflected in an established operating enterprise's consolidated financial statements that include that subsidiary, the provisions of paragraph 14 of *Statement No. 7* [section 2062.14] apply. In that situation, the established operating enterprise's consolidated financial statements for periods prior to the period in which the subsidiary's accounting change is made and financial summaries and other data derived therefrom shall be restated by prior period adjustment. It should be noted that *Statement No. 7* [section 2062] does not address the question of how an established operating enterprise should report accounting changes adopted with respect to the revenue and costs related to activities of the parent company or any subsidiaries that are not in the development stage; that question is covered by *APB Opinion No. 20* [section 1051], "Accounting Changes."

EFFECTIVE DATE

.06 This Interpretation shall be effective for fiscal periods beginning on or after January 1, 1976, although earlier application is encouraged, except that it shall not be applied prior to initial application of *Statement No. 7* [section 2062].

AC Section 2071

Interim Financial Reporting

[Source: APB Opinion No. 28, as amended.]

Effective for interim financial information issued for all interim periods relating to fiscal years beginning after December 31, 1973, unless otherwise indicated

DISCUSSION

.01 The purpose of this section is to clarify the application of accounting principles and reporting practices to interim financial information, including interim financial statements and summarized interim financial data of publicly traded companies issued for external reporting purposes.

.02 Interim financial information may include current data during a fiscal year on financial position, results of operations and changes in financial position. This information may be issued on a monthly or quarterly basis or at other intervals and may take the form of either complete financial statements or summarized financial data. Interim financial information often is provided for each interim period or on a cumulative year-to-date basis, or both, and for the corresponding periods of the preceding year.

.03 APB Opinions and Accounting Research Bulletins make few specific references to the applicability of generally accepted accounting principles to financial statements for interim periods. A wide variety of practice exists in the application of accounting principles to interim financial information. This section indicates the applicability of generally accepted accounting principles to interim financial information and indicates types of disclosures necessary to report on a meaningful basis for a period of less than a full year.

.04 The determination of the results of operations on a meaningful basis for intervals of less than a full year presents inherent difficulties. The revenues of some businesses fluctuate widely among interim periods because of

seasonal factors, while in other businesses heavy fixed costs incurred in one interim period may benefit other periods. In these situations, financial information for periods of less than a full year may be of limited usefulness. In other situations costs and expenses related to a full year's activities are incurred at infrequent intervals during the year and need to be allocated to products in process or to other interim periods to avoid distortion of interim financial results. In view of the limited time available to develop complete information, many costs and expenses are estimated in interim periods. For example, it may not be practical to perform extensive reviews of individual inventory items, costs on individual long-term contracts and precise income tax calculations for each interim period. Subsequent refinement or correction of these estimates may distort the results of operations of later interim periods. Similarly, the effects of disposal of a segment of a business and extraordinary, unusual or infrequently occurring events and transactions on the results of operations in an interim period will often be more pronounced than they will be on the results for the annual period. Special attention must be given to disclosure of the impact of these items on financial information for interim periods.

.05 The variety of practice that exists in the presentation of interim financial information is partly attributable to differing views as to the principal objective of interim financial information.

a. Some view each interim period as a basic accounting period and conclude that the results of operations for each interim period should be determined in essentially the same manner as if the interim period were an annual accounting period. Under this view deferrals, accruals, and estimations at the end of each interim period are determined by following essentially the same principles and judgments that apply to annual periods.

b. Others view each interim period primarily as being an integral part of the annual period. Under this view deferrals, accruals, and estimations at the end of each interim period are affected by judgments made at the interim date as to results of operations

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

for the balance of the annual period. Thus, an expense item that might be considered as falling wholly within an annual accounting period (no fiscal year-end accrual or deferral) could be allocated among interim periods based on estimated time, sales volume, productive activity, or some other basis.

.06 Despite these differing views and limitations, periodic and timely financial information during a fiscal year is useful to investors and others. The principal objectives of this section are to provide guidance on accounting and disclosure issues peculiar to interim reporting and to set forth minimum disclosure requirements for interim financial reports of publicly traded companies.[1] The section is not intended to deal with unresolved matters of accounting related to annual reporting.

OPINION

Applicability

.07 The Board has reviewed the applicability of APB Opinions and Accounting Research Bulletins in relation to the current practices followed in the preparation and reporting of interim financial information. The Board believes the accounting principles and reporting practices in the Opinions and Bulletins should apply to interim financial information in the manner set forth in this section. The guides expressed in this section are applicable whenever companies issue interim financial information.

.08 This section (a) outlines (Part I, paragraphs .09-.29) the application of generally accepted accounting principles to the determination of income when interim financial information is presented, (b) provides (paragraphs .19 and .20) for the use of estimated effective income tax rates (thus modifying section 4091.05, *Accounting for Income Taxes*), and (c) specifies (Part II, paragraphs .30-.33) certain disclosure requirements for summarized financial information issued by publicly traded companies.

---

[1] A publicly traded company for purposes of this section includes any company whose securities trade in a public market on either (1) a stock exchange (domestic or foreign) or (2) in the over-the-counter market (including securities quoted only locally or regionally). When a company makes a filing with a regulatory agency in preparation for sale of its securities in a public market it is considered a publicly traded company for this purpose.

PART I

Standards for Determining Interim Financial Information

.09 Interim financial information is essential to provide investors and others with timely information as to the progress of the enterprise. The usefulness of such information rests on the relationship that it has to the annual results of operations. Accordingly, the Board has concluded that each interim period should be viewed primarily as an integral part of an annual period.

.10 In general, the results for each interim period should be based on the accounting principles and practices used by an enterprise in the preparation of its latest annual financial statements unless a change in an accounting practice or policy has been adopted in the current year (paragraphs .23-.29). However, the Board has concluded that certain accounting principles and practices followed for annual reporting purposes may require modification at interim reporting dates so that the reported results for the interim period may better relate to the results of operations for the annual period. Paragraphs .12-.20 set forth the modifications that are necessary or desirable at interim dates in accounting principles or practices followed for annual periods.

Revenue

.11 Revenue from products sold or services rendered should be recognized as earned during an interim period on the same basis as followed for the full year. For example, revenues from long-term construction-type contracts accounted for under the percentage-of-completion method should be recognized in interim periods on the same basis followed for the full year. Losses projected on such contracts should be recognized in full during the interim period in which the existence of such losses becomes evident.

Costs and Expenses

.12 Costs and expenses for interim reporting purposes may be classified as:

a. Costs associated with revenue—those costs that are associated directly with or allocated to the products sold or to the services rendered and which are charged against income in those interim periods in which the related revenue is recognized.

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

b. All other costs and expenses—those costs and expenses that are not allocated to the products sold or to the services rendered and which are charged against income in interim fiscal periods as incurred, or are allocated among interim periods based on an estimate of time expired, benefit received, or other activity associated with the periods.

Costs Associated with Revenue

.13 Those costs and expenses that are associated directly with or allocated to the products sold or to the services rendered for annual reporting purposes (including, for example, material costs, wages and salaries and related fringe benefits, manufacturing overhead, and warranties) should be similarly treated for interim reporting purposes.

.14 Practices vary in determining costs of inventory. For example, cost of goods produced may be determined based on standard or actual cost, while cost of inventory may be determined on an average, FIFO, or LIFO cost basis. While companies should generally use the same inventory pricing methods and make provisions for write-downs to market at interim dates on the same basis as used at annual inventory dates, the following exceptions are appropriate at interim reporting dates:

a. Some companies use estimated gross profit rates to determine the cost of goods sold during interim periods or use other methods different from those used at annual inventory dates. These companies should disclose the method used at the interim date and any significant adjustments that result from reconciliations with the annual physical inventory.

b. Companies that use the LIFO method may encounter a liquidation of base period inventories at an interim date that is expected to be replaced by the end of the annual period. In such cases the inventory at the interim reporting date should not give effect to the LIFO liquidation, and cost of sales for the interim reporting period should include the expected cost of replacement of the liquidated LIFO base.

c. Inventory losses from market declines should not be deferred beyond the interim period in which the

decline occurs. Recoveries of such losses on the same inventory in later interim periods of the same fiscal year through market price recoveries should be recognized as gains in the later interim period. Such gains should not exceed previously recognized losses. Some market declines at interim dates, however, can reasonably be expected to be restored in the fiscal year. Such *temporary* market declines need not be recognized at the interim date since no loss is expected to be incurred in the fiscal year.

d. Companies that use standard cost accounting systems for determining inventory and product costs should generally follow the same procedures in reporting purchase price, wage rate, usage or efficiency variances from standard cost at the end of an interim period as followed at the end of a fiscal year. Purchase price variances or volume or capacity cost variances that are planned and expected to be absorbed by the end of the annual period, should ordinarily be deferred at interim reporting dates. The effect of unplanned or unanticipated purchase price or volume variances, however, should be reported at the end of an interim period following the same procedures used at the end of a fiscal year.

All Other Costs and Expenses

.15 Charges are made to income for all other costs and expenses in annual reporting periods based upon (a) direct expenditures made in the period (salaries and wages), (b) accruals for estimated expenditures to be made at a later date (vacation pay) or (c) amortization of expenditures that affect more than one annual period (insurance premiums, interest, rents). The objective in all cases is to achieve a fair measure of results of operations for the annual period and to present fairly the financial position at the end of the annual period. The Board has concluded that the following standards should apply in accounting for costs and expenses other than product costs in interim periods:

a. Costs and expenses other than product costs should be charged to income in interim periods as incurred, or be allocated among interim periods based on an estimate of time expired, benefit received or activity

 © 1974, American Institute of Certified Public Accountants, Inc.

associated with the periods. Procedures adopted for assigning specific cost and expense items to an interim period should be consistent with the bases followed by the company in reporting results of operations at annual reporting dates. However, when a specific cost or expense item charged to expense for annual reporting purposes benefits more than one interim period, the cost or expense item may be allocated to those interim periods. (See paragraph .16.)

b. Some costs and expenses incurred in an interim period, however, cannot be readily identified with the activities or benefits of other interim periods and should be charged to the interim period in which incurred. Disclosure should be made as to the nature and amount of such costs unless items of a comparable nature are included in both the current interim period and in the corresponding interim period of the preceding year.

c. Arbitrary assignment of the amount of such costs to an interim period should not be made.

d. Gains and losses that arise in any interim period similar to those that would not be deferred at year end should not be deferred to later interim periods within the same fiscal year.

.16 A complete listing of examples of application of the standards set forth in paragraph .15 is not practical; however, the following examples of applications may be helpful:

a. When a cost that is expensed for annual reporting purposes clearly benefits two or more interim periods (e. g., annual major repairs), each interim period should be charged for an appropriate portion of the annual cost by the use of accruals or deferrals.

b. When quantity discounts are allowed customers based upon annual sales volume, the amount of such discounts charged to each interim period should be based on the sales to customers during the interim period in relation to estimated annual sales.

c. Property taxes (and similar costs such as interest and rent) may be accrued or deferred at annual reporting date, to achieve a full year's charge of taxes to costs and expenses. Similar procedures should be adopted at each interim reporting date to provide an appropriate cost in each period.

d. Advertising costs may be deferred within a fiscal year if the benefits of an expenditure made clearly extend beyond the interim period in which the expenditure is made. Advertising costs may be accrued and assigned to interim periods in relation to sales prior to the time the service is received if the advertising program is clearly implicit in the sales arrangement.

.17 The amounts of certain costs and expenses are frequently subjected to year-end adjustments even though they can be reasonably approximated at interim dates. To the extent possible such adjustments should be estimated and the estimated costs and expenses assigned to interim periods so that the interim periods bear a reasonable portion of the anticipated annual amount. Examples of such items include inventory shrinkage, allowance for uncollectible accounts, allowance for quantity discounts, and discretionary year-end bonuses.

Seasonal Revenue, Costs, or Expenses

.18 Revenues of certain businesses are subject to material seasonal variations. To avoid the possibility that interim results with material seasonal variations may be taken as fairly indicative of the estimated results for a full fiscal year, such businesses should disclose the seasonal nature of their activities, and consider supplementing their interim reports with information for twelve-month periods ended at the interim date for the current and preceding years.

Income Tax Provisions

.19 In reporting interim financial information, income tax provisions should be determined under the procedures set forth in sections 4091, 4095, and 4096. At the end of each interim period the company should make its best estimate of the effective tax rate expected to be applicable for

© 1974, American Institute of Certified Public Accountants, Inc.

the full fiscal year. The rate so determined should be used in providing for income taxes on a current year-to-date basis. The effective tax rate should reflect anticipated investment tax credits, foreign tax rates, percentage depletion, capital gains rates, and other available tax planning alternatives. However, in arriving at this effective tax rate no effect should be included for the tax related to significant unusual or extraordinary items that will be separately reported or reported net of their related tax effect in reports for the interim period or for the fiscal year.[2]

.20 The tax effects of losses that arise in the early portion of a fiscal year (in the event carryback of such losses is not possible) should be recognized only when realization is assured beyond any reasonable doubt (section 4091.44). An established seasonal pattern of loss in early interim periods offset by income in later interim periods should constitute evidence that realization is assured beyond reasonable doubt, unless other evidence indicates the established seasonal pattern will not prevail. The tax effects of losses incurred in early interim periods may be recognized in a later interim period of a fiscal year if their realization, although initially uncertain, later becomes assured beyond reasonable doubt. When the tax effects of losses that arise in the early portions of a fiscal year are not recognized in that interim period, no tax provision should be made for income that arises in later interim periods until the tax effects of the previous interim losses are utilized.[3] Changes resulting from new tax legislation should be reflected after the effective dates prescribed in the statutes.

Disposal of a Segment of a Business and Extraordinary, Unusual, Infrequently Occurring and Contingent Items

.21 Extraordinary items should be disclosed separately and included in the determination of net income for the interim period in which they occur. In determining materiality, extraordinary items should be related to the estimated income for the full fiscal year. Effects of disposals

[2] Disclosure should be made of the reasons for significant variations in the customary relationship between income tax expense and pretax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business (see section 4091.62).

[3] The tax benefits of interim losses accounted for in this manner would *not* be reported as extraordinary items in the results of operations of the interim period as is provided for in annual periods in section 4091.44.

of a segment of a business and unusual and infrequently occurring transactions and events that are material with respect to the operating results of the interim period but that are not designated as extraordinary items in the interim statements should be reported separately. In addition, matters such as unusual seasonal results, business combinations treated for accounting purposes as poolings of interests and acquisition of a significant business in a purchase should be disclosed to provide information needed for a proper understanding of interim financial reports. Extraordinary items, gains or losses from disposal of a segment of a business, and unusual or infrequently occurring items should not be prorated over the balance of the fiscal year.

.22 Contingencies and other uncertainties that could be expected to affect the fairness of presentation of financial data at an interim date should be disclosed in interim reports in the same manner required for annual reports.[4] Such disclosures should be repeated in interim and annual reports until the contingencies have been removed, resolved, or have become immaterial.

Accounting Changes

.23 Each report of interim financial information should indicate any change in accounting principles or practices from those applied in (a) the comparable interim period of the prior annual period, (b) the preceding interim periods in the current annual period and (c) the prior annual report.

.24 Changes in an interim or annual accounting practice or policy made in an interim period should be reported in the period in which the change is made, in accordance with the provisions of section 1051, *Accounting Changes.*

.25 Certain changes in accounting principle, such as those described in sections 1051.04 and 1051.27, require retroactive restatement of previously issued financial statements. Section 2010.25, *Reporting the Results of Operations,* requires similar treatment for prior period adjustments. Previously issued financial statements must also be restated for a change in the reporting entity (see section

---

[4] The significance of a contingency or uncertainty should be judged in relation to annual financial statements. Disclosures of such items should include, but not be limited to, those matters that form the basis of a qualification of an independent auditor's report. (See section 4311.)

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

1051.34-.35) and for correction of an error (see section 1051.36-.37). Previously issued interim financial information should be similarly restated. Sections 2010 and 1051 specify the required disclosures.

.26 The effect of a change in an accounting estimate, including a change in the estimated effective annual tax rate, should be accounted for in the period in which the change in estimate is made. No restatement of previously reported interim information should be made for changes in estimates, but the effect on earnings of a change in estimate made in a current interim period should be reported in the current and subsequent interim periods, if material in relation to any period presented and should continue to be reported in the interim financial information of the subsequent year for as many periods as necessary to avoid misleading comparisons. Such disclosure should conform with section 1051.33.

.27 [Superseded for cumulative effect type accounting changes by FASB Statement No. 3, effective for interim periods ending on or after December 31, 1974.] (See section 2072.)

.28 The Board recommends that, whenever possible, companies adopt any accounting changes during the first interim period of a fiscal year. Changes in accounting principles and practices adopted after the first interim period in a fiscal year tend to obscure operating results and complicate disclosure of interim financial information.

.29 In determining materiality for the purpose of reporting the cumulative effect of an accounting change or correction of an error, amounts should be related to the estimated income for the full fiscal year and also to the effect on the trend of earnings. Changes that are material with respect to an interim period but not material with respect to the estimated income for the full fiscal year or to the trend of earnings should be separately disclosed in the interim period.

PART II

Disclosure of Summarized Interim Financial Data by Publicly Traded Companies

.30 The Board recognizes that many publicly traded companies[6] report summarized financial information to

[6] See footnote 1.

their securityholders at periodic interim dates in considerably less detail than that provided in annual financial statements. While this information provides securityholders with more timely information than would result if complete financial statements were issued at the end of each interim period, the timeliness of presentation may be partially offset by a reduction in detail in the information provided. As a result, the Board recognizes that certain guides as to minimum disclosure are desirable. When publicly traded companies report summarized financial information to their securityholders at interim dates (including reports on fourth quarters), the following data should be reported, as a minimum:[7]

a. Sales or gross revenues, provision for income taxes, extraordinary items (including related income tax effects), cumulative effect of a change in accounting principles or practices, and net income.

b. Primary and fully diluted earnings per share data for each period presented, determined in accordance with the provisions of section 2011, *Earnings Per Share.*

c. Seasonal revenue, costs or expenses (paragraph .18).

d. Significant changes in estimates or provisions for income taxes (paragraph .19).

e. Disposal of a segment of a business and extraordinary, unusual or infrequently occurring items (paragraph .21).

f. Contingent items (paragraph .22).

g. Changes in accounting principles or estimates (paragraphs .23-.29).

h. Significant changes in financial position (paragraph .33).

When summarized financial data are regularly reported on a quarterly basis, the foregoing information with respect to the current quarter and the current year-to-date or the last

[7] It should be recognized that the minimum disclosures of summarized interim financial data required of publicly traded companies by Part II of this section do not constitute a fair presentation of financial position and results of operations in conformity with generally accepted accounting principles.

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

twelve months to date should be furnished together with comparable data for the preceding year.

.31 When interim financial data and disclosures are not separately reported for the fourth quarter, securityholders often make inferences about that quarter by subtracting data based on the third quarter interim report from the annual results. In the absence of a separate fourth quarter report or disclosure of the results (as outlined in paragraph .30) for that quarter in the annual report, disposals of segments of a business and extraordinary, unusual, or infrequently occurring items recognized in the fourth quarter, as well as the aggregate effect of year-end adjustments which are material to the results of that quarter (see paragraphs .04 and .17), and an accounting change made in the fourth quarter (see section 2072.14) should be disclosed in the annual report in a note to the annual financial statements. [As amended, effective for interim periods ending on or after December 31, 1974 by FASB Statement No. 3.]

.32 Disclosure of the impact on the financial results for interim periods of the matters discussed in paragraphs .21-.29 is desirable for as many subsequent periods as necessary to keep the reader fully informed. The Board believes there is a presumption that users of summarized interim financial data will have read the latest published annual report, including the financial disclosures required by generally accepted accounting principles and management's commentary concerning the annual financial results, and that the summarized interim data will be viewed in that context. In this connection, the Board encourages management to provide commentary relating to the effects of significant events upon the interim financial results.

.33 The Board encourages publicly traded companies to publish balance sheet and funds flow data at interim dates since these data often assist securityholders in their understanding and interpretation of the income data reported. When condensed interim balance sheet information or funds flow data are not presented at interim reporting dates, significant changes since the last reporting period with respect to liquid assets, net working capital, long-term liabilities, or stockholders' equity should be disclosed.

EFFECTIVE DATE

.34 This section shall be effective for interim financial information issued for all interim periods relating to fiscal years beginning after December 31, 1973. However, the Board encourages earlier application of the provisions of this section.

.35 When interim financial data are presented for prior interim periods for comparative purposes, these data should be restated on a basis consistent with procedures newly adopted, or the effect on the prior interim period data had the newly adopted procedures been applicable for that period should be disclosed.

AC Section 2071-1

Accounting for Income Taxes in Interim Periods: An Interpretation of Section 2071

[Source: FASB Interpretation No. 18.]

March 1977

INTRODUCTION AND BACKGROUND INFORMATION

.01 The FASB has been asked to clarify the application of *APB Opinion No. 28* [section 2071], "Interim Financial Reporting," with respect to accounting for income taxes in interim periods. In general, that Opinion requires that an estimated annual effective tax rate be used to determine interim period income tax provisions. Application of the general guideline to specific situations has resulted in differences in accounting for similar situations by different enterprises.

.02 This Interpretation describes (a) the general computation of interim period income taxes (paragraphs .08 and .09), (b) the application of the general computation to specific situations (paragraphs .10-.15), (c) the computation of interim period income taxes applicable to significant unusual or infrequently occurring items, discontinued operations, extraordinary items, and cumulative effects of changes in accounting principles (paragraphs .16-.21), (d) special computations applicable to operations taxable in multiple jurisdictions (paragraph .22), (e) guidelines for reflecting the effects of new tax legislation in interim period income tax provisions (paragraphs .23 and .24), and (f) disclosure requirements (paragraph .25). Appendix A, "Excerpts from APB Opinions," quotes from *APB Opinion No. 28* [section 2071] on accounting for income taxes in interim financial reports and from the paragraphs of *APB Opinion No. 11* [section 4091], "Accounting for Income Taxes," that prescribe the annual accounting for income taxes in certain situations. The computations described in paragraphs .10-.24 are illustrated in Appendix C, "Examples of Computations of Interim Period Income Taxes."

.03 An Exposure Draft of a proposed Interpretation on "Accounting for Income Taxes in Interim Periods" was issued

October 7, 1976. The Board received 99 letters of comment in response to the Exposure Draft. This Interpretation incorporates a number of changes suggested by those respondents. Appendix E, "Summary of Consideration of Comments on Exposure Draft," describes certain of the comments and the FASB's consideration of them.

.04 The Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'," states that "differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect . . . of the rate-making process," and discusses the application of generally accepted accounting principles to regulated industries. FASB Statements and Interpretations should therefore be applied to regulated companies that are subject to the rate-making process in accordance with the provisions of the Addendum.

INTERPRETATION

Definition of Terms

.05 As a matter of convenience of expression, certain terms are defined in this Interpretation as follows:

a. *"Ordinary" income (or loss)* refers to "income (or loss) from continuing operations before income taxes (or benefits)" excluding significant "unusual or infrequently occurring items." Extraordinary items, discontinued operations, and cumulative effects of changes in accounting principles are also excluded from this term.[1] The term is *not* used in the income tax context of ordinary income v. capital gain.

b. *Tax (or benefit)* is the total income tax expense (or benefit), including the provision (or benefit) for income taxes both currently payable and deferred.

[1] The terms used in this definition are described in *APB Opinion No. 20* [section 1051], "Accounting Changes," and in *APB Opinion No. 30* [section 2012], "Reporting the Results of Operations." See paragraph 8 of *APB Opinion No. 30* [section 2012.08] for *income (or loss) from continuing operations before income taxes (or benefits)* and *discontinued operations,* paragraph 10 [section 2012.10] for *extraordinary items,* and paragraph 26 [section 2012.26] for *unusual items* and *infrequently occurring items.* See paragraph 20 of *APB Opinion No. 20* [section 1051.20] for *cumulative effects of changes in accounting principles.*

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Concept of APB Opinion No. 28 [section 2071]

.06 *APB Opinion No. 28* [section 2071] specifies that the tax (or benefit) for an interim period shall be determined under the provisions of *APB Opinion No. 11* [section 4091], *APB Opinion No. 23* [section 4095], "Accounting for Income Taxes—Special Areas," and *APB Opinion No. 24* [section 4096], "Accounting for Income Taxes—Investments in Common Stock Accounted for by the Equity Method (Other than Subsidiaries and Corporate Joint Ventures)."[2] The tax (or benefit) related to "ordinary" income (or loss) shall be computed at an estimated annual effective tax rate and the tax (or benefit) related to all other items shall be individually computed and recognized when the items occur. Application of this general guidance to specific situations is described in the following paragraphs and illustrated in Appendix C.

Tax (or Benefit) Applicable to "Ordinary" Income (or Loss)

.07 Paragraphs .08 and .09 describe the computation of interim period tax (or benefit) related to "ordinary" income (or loss). Paragraphs .10-.15 describe the application of paragraphs .08 and .09 to specific situations. Paragraphs .14 and .15 describe special limitations that apply to the computations in paragraphs .08 and .09 if an enterprise has a year-to-date "ordinary" loss or anticipates an "ordinary" loss for the fiscal year.

.08 *Estimated annual effective tax rate.*[3] Paragraph .19 of *APB Opinion No. 28*[4] [section 2071.19] requires that an enterprise determine an estimated annual effective tax rate.[5] That rate "should reflect anticipated investment tax credits, foreign tax

---

[2] *APB Opinions No. 23 and 24* [sections 4095 and 4096] are not specifically described herein because no questions were raised regarding application of those Opinions for interim periods.

[3] See also paragraph .22 below when the enterprise has operations taxable in multiple jurisdictions.

[4] See Appendix A, paragraph .28.

[5] Enterprises in some industries report certain items of "ordinary" income net of their related tax effect. For example, the AICPA Industry Audit Guide, "Audits of Stock Life Insurance Companies," illustrates a caption "Realized investment gains and losses, net of related income taxes of $ . . ." in its suggested format of a stock life insurance company's statement of income. If an enterprise follows such an accepted industry practice, the item that will be reported net of tax and its related tax (or benefit) shall be excluded from the computation of the estimated annual effective tax rate and interim period tax (or benefit). A separate estimated annual effective tax rate shall be computed for the item, and applied to that item in accordance with paragraphs .09-.15 below.

rates, percentage depletion, capital gains rates, and other available tax planning alternatives."[6] The rate is revised, if necessary, as of the end of each successive interim period during the fiscal year to the enterprise's best *current* estimate of its annual effective tax rate. In some cases, the rate will be the statutory rate modified as may be appropriate in particular circumstances. In other cases, the rate will be the enterprise's estimate of the tax (or benefit) that will be provided for the fiscal year, stated as a percentage of its estimated "ordinary" income (or loss) for the fiscal year (see paragraphs .14 and .15 if an "ordinary" loss is anticipated for the fiscal year).[7]

.09 *Computation of interim period tax (or benefit).* The estimated annual effective tax rate, described in paragraph .08 above, shall be applied to the year-to-date "ordinary" income (or loss) at the end of each interim period to compute the year-to-date tax (or benefit) applicable to "ordinary" income (or loss).[8] The interim period tax (or benefit) related to "ordi-

---

[6] Certain investment tax credits may be excluded from the estimated annual effective tax rate. If an enterprise includes allowable investment tax credits as part of its provision for income taxes over the productive life of acquired property and not entirely in the year the property is placed in service, amortization of deferred investment tax credits need not be taken into account in estimating the annual effective tax rate; however, if the investment tax credits are taken into account in the estimated annual effective tax rate, the amount taken into account shall be the amount of amortization that is anticipated to be included in income in the current year (see paragraphs 13 and 15 of *APB Opinion No. 2* [sections 4094.11 and 4094.20]). Further, paragraphs 43 and 44 of *FASB Statement No. 13* [section 4053.043-.044], "Accounting for Leases," specify that investment tax credits related to leases that are accounted for as leveraged leases shall be deferred and accounted for as return on the net investment in the leveraged leases in the years in which the net investment is positive. Footnote 25 of Statement No. 13 [section 4053.044] explains that the use of the term "years" is not intended to preclude application of the accounting described to shorter periods. If an enterprise accounts for investment tax credits related to leveraged leases in accordance with paragraphs 43 and 44 of Statement No. 13 [section 4053.043-.044] for interim periods, those investment tax credits shall not be taken into account in estimating the annual effective tax rate.

[7] Estimates of the annual effective tax rate at the end of interim periods are, of necessity, based on evaluations of possible future events and transactions and may be subject to subsequent refinement or revision. If a reliable estimate cannot be made, the actual effective tax rate for the year-to-date may be the best estimate of the annual effective tax rate. If an enterprise is unable to estimate a part of its "ordinary" income (or loss) or the related tax (or benefit) but is otherwise able to make a reliable estimate, the tax (or benefit) applicable to the item that cannot be estimated shall be reported in the interim period in which the item is reported.

[8] One result of the year-to-date computation is that, if the tax benefit of an "ordinary" loss that occurs in the early portions of the fiscal year is

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

nary" income (or loss) shall be the difference between the amount so computed and the amounts reported for previous interim periods of the fiscal year.

"Ordinary" income anticipated for fiscal year

.10 *Year-to-date "ordinary" income.* If an enterprise has "ordinary" income for the year-to-date at the end of an interim period and anticipates "ordinary" income for the fiscal year, the interim period tax shall be computed as described in paragraph .09 above.

.11 *Year-to-date "ordinary" loss.* If an enterprise has an "ordinary" loss for the year-to-date at the end of an interim period and anticipates "ordinary" income for the fiscal year, the interim period tax benefit shall be computed as described in paragraph .09 above, except that the year-to-date tax benefit recognized shall be limited to the amount determined in accordance with paragraphs .14 and .15 below.

"Ordinary" loss anticipated for fiscal year

.12 *Year-to-date "ordinary" income.* If an enterprise has "ordinary" income for the year-to-date at the end of an interim period and anticipates an "ordinary" loss for the fiscal year, the interim period tax shall be computed as described in paragraph .09 above. The estimated tax benefit for the fiscal year, used to determine the estimated annual effective tax rate described in paragraph .08 above, shall not exceed the tax benefit determined in accordance with paragraphs .14 and .15 below.

.13 *Year-to-date "ordinary" loss.* If an enterprise has an "ordinary" loss for the year-to-date at the end of an interim period and anticipates an "ordinary" loss for the fiscal year, the interim period tax benefit shall be computed as described in paragraph .09 above. The estimated tax benefit for the fiscal year, used to determine the estimated annual effective tax rate described in paragraph .08 above, shall not exceed the tax benefit determined in accordance with paragraphs .14 and .15 below. In addition to that limitation in the effective rate computation, if the year-to-date "ordinary" loss exceeds the anticipated "ordi-

---

not recognized because realization of the tax benefit is not assured, tax is not provided for subsequent "ordinary" income until the unrecognized tax benefit of the earlier "ordinary" loss is offset (see Appendix A, paragraph .32).

nary" loss for the fiscal year, the tax benefit recognized for the year-to-date shall not exceed the tax benefit determined, based on the year-to-date "ordinary" loss, in accordance with paragraphs .14 and .15 below.

Limitations applicable to losses

.14 *Recognition of the tax benefit of a loss.* Paragraphs 44 and 45 of *APB Opinion No. 11*[9] [section 4091.43-.44] require that the tax benefit of a loss shall not be recognized until it is realized, unless future realization is assured beyond any reasonable doubt at the time the loss occurs. Therefore, the estimated tax benefit of an "ordinary" loss for the fiscal year, used to determine the estimated annual effective tax rate described in paragraph .08 above, and the year-to-date tax benefit of a loss recognized at an interim date shall be limited to the tax benefit realized or assured of future realization beyond any reasonable doubt. Paragraph 47 of *APB Opinion No. 11*[10] [section 4091.46] describes circumstances that may assure future realization of the tax benefit of a loss for a fiscal year beyond any reasonable doubt. Assurance beyond any reasonable doubt of future realization of the tax benefit of a loss at an interim date may also result from established seasonal patterns, as described in paragraph 20 of *APB Opinion No. 28*[11] [section 2071.20]. (See also paragraph .15 below.)

.15 *Reversal of net deferred tax credits.* If an enterprise anticipates an "ordinary" loss for the fiscal year or has a year-to-date "ordinary" loss in excess of the anticipated "ordinary" loss for the fiscal year and all or a part of the tax benefit of the loss will not be realized or its realization is not assured beyond any reasonable doubt, existing deferred tax credits arising from timing differences shall be adjusted as required by paragraph 48 of *APB Opinion No. 11*[12] [section 4091.47]. The amount of the adjustment shall not exceed the lower of (a) the otherwise unrecognized tax benefit of the loss or (b) the amount of the net deferred tax credits that would otherwise be amortized during the carryforward period attributable to the loss. If the adjustment relates to an estimated "ordinary" loss for the fiscal year, the amount of the adjustment shall be considered additional current year tax benefit in the determination of the esti-

mated annual effective tax rate described in paragraph .08 above.[13] If the adjustment relates to a year-to-date "ordinary" loss, the amount of the adjustment shall be considered additional tax benefit in computing the maximum tax benefit that shall be recognized for the year-to-date.[14]

Tax (or Benefit) Applicable to Significant Unusual or Infrequently Occurring Items, Discontinued Operations, or Extraordinary Items

.16 *Basis of tax provision.* Paragraph 19 of *APB Opinion No. 28*[15] [section 2071.19] excludes taxes related to "significant unusual or extraordinary items that will be separately reported or reported net of their related tax effect"[16] from the estimated annual effective tax rate calculation. Paragraph 21 of *APB Opinion No. 28*[17] [section 2071.21] requires that those items be recognized in the interim period in which they occur. Paragraph 52 of *APB Opinion No. 11*[18] [section 4091.51] describes the method of applying tax allocation within a period. Under paragraph 52 of Opinion No. 11 [section 4091.51] the difference between the tax computed on income including an item described in footnote 16 below and the tax computed on income excluding that item is the tax related to the item. This computation shall be made using the estimated fiscal year "ordinary" income and the items described in footnote 16 below for the year-to-date.

.17 *Financial statement presentation.* Extraordinary items and discontinued operations that will be presented net of related tax effects in the financial statements for the fiscal year shall be presented net of related tax effects in interim financial statements. Unusual or infrequently occurring items that will be separately disclosed in the financial statements for the fiscal year shall be separately disclosed as a component of pretax income from continuing operations, and the tax (or benefit) related to such items shall be included in the tax (or benefit)

---

[13] See Appendix A, paragraph .34.

[14] Paragraph 48 of *APB Opinion No. 11* [section 4091.47] describes the reinstatement of previously eliminated deferred tax credits when the tax benefit of the loss is subsequently realized.

[15] See Appendix A, paragraph .28.

[16] In the context of paragraph 21 of *APB Opinion No. 28* [section 2071.21] (see Appendix A, paragraph .35), which is consistent with *APB Opinion No. 30* [section 2012], this description includes unusual items, infrequently occurring items, discontinued operations, and extraordinary items.

[17] See Appendix A, paragraph .35.

[18] See Appendix A, paragraph .36.

related to continuing operations. Paragraphs .18 and .19 describe the application of the above to specific situations.

.18 *Recognition of the tax benefit of a loss.* If an enterprise has a significant unusual, infrequently occurring, or extraordinary loss or a loss from discontinued operations, the tax benefit of that loss shall not be recognized until it is realized or realization is assured beyond any reasonable doubt. Realization is assured beyond any reasonable doubt (a) by offsetting year-to-date "ordinary" income, (b) by offsetting taxable income from an unusual, infrequently occurring, or extraordinary item, or from discontinued operations, or items credited directly to stockholders' equity accounts, or (c) if the loss can be carried back (after any anticipated fiscal year "ordinary" loss is carried back). Realization beyond any reasonable doubt would also appear to be assured by future taxable income that is virtually certain to occur soon enough to provide realization during the carryforward period, including anticipated "ordinary" income for the current year expected to result from an established seasonal pattern of loss in early interim periods offset by income in later interim periods.[19] If previously recorded net deferred tax credits that would be amortized during the carryforward period of the loss are present and all or a portion of the tax benefit of the loss is not realized and future realization is not assured beyond any reasonable doubt, see paragraph .15 above. If all or a part of the tax benefit is not realized and future realization is not assured beyond any reasonable doubt in the interim period of occurrence but becomes assured beyond any reasonable doubt in a subsequent interim period of the same fiscal year, the previously unrecognized tax benefit shall be reported in that subsequent interim period in the same manner that it would have been reported if realization had been assured beyond any reasonable doubt in the interim period of occurrence, i. e., as a tax benefit relating to continuing operations, discontinued operations, or an extraordinary item.

.19 *Discontinued operations.* The computations described in paragraphs .16-.18 shall be the basis for the tax (or benefit) related to both (a) the income (or loss) from operations of the discontinued segment[20] prior to the measurement date and

[19] See paragraph 47 of *APB Opinion No. 11* [section 4091.46] (see Appendix A, paragraph .31) and paragraph 20 of *APB Opinion No. 28* [section 2071.20] (see Appendix A, paragraph .32).

[20] The term "discontinued segment" refers to a discontinued segment of the business as described in paragraph 13 of *APB Opinion No. 30* [section 2012.13].

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

(b) the gain (or loss) on disposal of discontinued operations (including any provision for operating loss subsequent to the measurement date). Income (or loss) from operations of the discontinued segment prior to the interim period in which the measurement date occurs will have been included in "ordinary" income (or loss) of prior periods and thus will have been included in the estimated annual effective tax rate and tax (or benefit) calculations described in paragraphs .08-.15 above. The *total* tax (or benefit) provided in the prior interim periods shall not be recomputed but shall be divided into two components, applicable to the remaining "ordinary" income (or loss) and to the income (or loss) from operations of the discontinued segment as follows. A revised estimated annual effective tax rate and resulting tax (or benefit) shall be computed, in accordance with paragraphs .08-.15 above, for the remaining "ordinary" income (or loss), based on the estimates applicable to such operations used in the original calculations for each prior interim period. The tax (or benefit) related to the operations of the discontinued segment shall be the total of (a) the difference between the tax (or benefit) originally computed for "ordinary" income (or loss) and the recomputed amount for the remaining "ordinary" income (or loss) and (b) the tax computed in accordance with paragraphs .16-.18 above for any unusual or infrequently occurring items of the discontinued segment.

Using a Prior Year Operating Loss Carryforward

.20 Paragraph 61 of *APB Opinion No. 11* [21] [section 4091.60] requires that the tax benefit of an operating loss carryforward recognized in a subsequent year be reported as an extraordinary item. Paragraph 19 of *APB Opinion No. 28* [22] [section 2071.19] excludes extraordinary items from the effective tax rate computation, and paragraph 21 of *APB Opinion No. 28* [23] [section 2071.21] specifies that extraordinary items should not be prorated over the balance of the year. Accordingly, the tax benefit of a prior year operating loss carryforward shall be recognized as an extraordinary item in each interim period to the extent that income in the period and for the year-to-date is available to offset the operating loss carryforward.

---

[21] See Appendix A, paragraph .38.
[22] See Appendix A, paragraph .28.
[23] See Appendix A, paragraph .35.

Cumulative Effects of Changes in Accounting Principles

.21 *FASB Statement No. 3* [section 2072], "Reporting Accounting Changes in Interim Financial Statements," specifies that the cumulative effect of a change in accounting principle on retained earnings at the beginning of the year shall be reported in the first interim period of the fiscal year. *APB Opinion No. 20* [section 1051], "Accounting Changes," specifies that the related income tax effect of a cumulative effect type accounting change shall be computed as though the new accounting principle had been applied retroactively for all prior periods that would have been affected.

Operations Taxable in Multiple Jurisdictions

.22 If an enterprise that is subject to tax in multiple jurisdictions pays taxes based on identified income in one or more individual jurisdictions, interim period tax (or benefit) related to consolidated "ordinary" income (or loss) for the year-to-date shall be computed in accordance with paragraphs .08-.15 above using one overall estimated annual effective tax rate except that:

a. If in a separate jurisdiction an enterprise anticipates an "ordinary" loss for the fiscal year or has an "ordinary" loss for the year-to-date for which, in accordance with paragraphs .14 and .15 above, no tax benefit can be recognized, the enterprise shall exclude "ordinary" income (or loss) in that jurisdiction and the related tax (or benefit) from the overall computations of the estimated annual effective tax rate and interim period tax (or benefit). A separate estimated annual effective tax rate shall be computed for that jurisdiction and applied to "ordinary" income (or loss) in that jurisdiction in accordance with paragraphs .09-.15 above.

b. If an enterprise is unable to estimate an annual effective tax rate in a foreign jurisdiction in dollars or is otherwise unable to make a reliable estimate of its "ordinary" income (or loss) or of the related tax (or benefit) for the fiscal year in a jurisdiction, the enterprise shall exclude "ordinary" income (or loss) in that jurisdiction and the related tax (or benefit) from the overall computations of the estimated annual effective tax rate and interim period tax (or benefit). The tax (or benefit) related to "ordinary" income

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

(or loss) in that jurisdiction[24] shall be recognized in the interim period in which the "ordinary" income (or loss) is reported.

Effect of New Tax Legislation

.23 Paragraph 20 of *APB Opinion No. 28*[25] [section 2071.20] states that changes resulting from new tax legislation shall be "reflected after the effective dates prescribed in the statutes." If new tax legislation prescribes changes that become effective during an enterprise's fiscal year, the tax effect of those changes shall be reflected in the computation of the estimated annual effective tax rate beginning with the first interim period that ends after the new legislation becomes effective. Paragraph .24 describes the determination of when new legislation becomes effective.

.24 *Effective date.* Legislation generally becomes effective on the date prescribed in the statutes. However, tax legislation may prescribe changes that become effective during an enterprise's fiscal year that are administratively implemented by applying a portion of the change to the full fiscal year. For example, if the statutory tax rate applicable to calendar-year corporations were increased from 48 percent to 52 percent, effective January 1, the increased statutory rate might be administratively applied to a corporation with a fiscal year ending at June 30 in the year of the change by applying a 50 percent rate to its taxable income for the fiscal year, rather than 48 percent for the first six months and 52 percent for the last six months. In that case the legislation becomes effective for that enterprise at the beginning of the enterprise's fiscal year.

Disclosure

.25 Application of the provisions of *APB Opinion No. 28* [section 2071] that are described in this Interpretation may result in a significant variation in the customary relationship between income tax expense and pretax accounting income. The reasons for significant variations in the customary relationship between income tax expense and pretax accounting

[24] The tax (or benefit) related to "ordinary" income (or loss) in a jurisdiction may not be limited to tax (or benefit) in that jurisdiction. It might also include tax (or benefit) in another jurisdiction that results from providing taxes on unremitted earnings, foreign tax credits, etc.
[25] See Appendix A, paragraph .39.

income shall be disclosed if they are not otherwise apparent from the financial statements or from the nature of the enterprise's business.[26]

Effective Date and Transition

.26 The provisions of this Interpretation shall be effective for financial statements issued after March 31, 1977 for interim periods in fiscal years beginning after December 15, 1976. Earlier application is encouraged for any interim financial statements that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued interim financial statements.

[26] See Appendix A, paragraph .37.

Appendix A

EXCERPTS FROM APB OPINIONS

.27 This Appendix contains relevant excerpts from APB Opinions that relate to this Interpretation. It repeats the general guidance of *APB Opinion No. 28* [section 2071] on accounting for income taxes in interim financial reports and the specific paragraphs of *APB Opinion No. 11* [section 4091] that prescribe the annual accounting for income taxes in certain situations.

General Guidelines

.28 Paragraph 19 of *APB Opinion No. 28* [section 2071.19] contains the following general guidelines for the computation of income tax provisions for interim periods:

> In reporting interim financial information, income tax provisions should be determined under the procedures set forth in APB Opinion Nos. 11, 23, and 24. At the end of each interim period the company should make its best estimate of the effective tax rate expected to be applicable for the full fiscal year. The rate so determined should be used in providing for income taxes on a current year-to-date basis. The effective tax rate should reflect anticipated investment tax credits, foreign tax rates, percentage depletion, capital gains rates, and other available tax planning alternatives.

The paragraph continues with the following regarding the tax effects of unusual or extraordinary items:

> However, in arriving at this effective tax rate no effect should be included for the tax related to significant unusual or extraordinary items that will be separately reported or reported net of their related tax effect in reports for the interim period or for the fiscal year. . . .

Recognition of the Tax Benefit of a Loss

.29 Paragraph 44 of *APB Opinion No. 11* [4091.43] states the following with respect to tax benefits of loss carrybacks:

> The tax effects of any realizable loss carry*backs* should be recognized in the determination of net income (loss) of the loss periods. The tax loss gives rise to a refund (or claim for refund) of past taxes, which is both measurable and currently realizable; therefore the tax effect of the loss is

properly recognizable in the determination of net income (loss) for the loss period. (Emphasis in original.)

.30 Paragraph 45 of *APB Opinion No. 11* [section 4091.44] states the following with respect to tax benefits of loss carryforwards:

> The tax effects of loss carry*forwards* also relate to the determination of net income (loss) of the loss periods. However, a significant question generally exists as to realization of the tax effects of the carry*forwards*, since realization is dependent upon future taxable income. Accordingly, the Board [APB] has concluded that the tax benefits of loss carry*forwards* should not be recognized until they are actually realized, except in unusual circumstances when realization is *assured beyond any reasonable doubt* at the time the loss carry*forwards* arise. (Emphasis in original.)

.31 Paragraph 47 of *APB Opinion No. 11* [section 4091.46] describes the circumstances that may assure future realization of the tax benefit of a loss carryforward beyond any reasonable doubt as follows:

> Realization of the tax benefit of a loss carry*forward* would appear to be assured beyond any reasonable doubt when both of the following conditions exist: (a) the loss results from an identifiable, isolated and nonrecurring cause and the company either has been continuously profitable over a long period or has suffered occasional losses which were more than offset by taxable income in subsequent years, and (b) future taxable income is virtually certain to be large enough to offset the loss carry*forward* and will occur soon enough to provide realization during the carry*forward* period. (Emphasis in original.)

.32 Paragraph 20 of *APB Opinion No. 28* [section 2071.20] states the following with respect to losses that arise in the early portion of a fiscal year:

> The tax effects of losses that arise in the early portion of a fiscal year (in the event carryback of such losses is not possible) should be recognized only when realization is assured beyond any reasonable doubt (paragraph 45 of APB Opinion No. 11). An established seasonal pattern of loss in early interim periods offset by income in later interim periods should constitute evidence that realization is assured beyond reasonable doubt, unless other evidence indicates the established seasonal pattern will not prevail. The tax effects of losses incurred in early interim periods may be recognized in a later interim period of a fiscal year if their realization, although initially uncertain, later becomes assured beyond reasonable doubt. When the tax effects of losses that arise in the early portions of a fiscal

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

> year are not recognized in that interim period, no tax provision should be made for income that arises in later interim periods until the tax effects of the previous interim losses are utilized. . . .

Reversal of Net Deferred Tax Credits

.33 Paragraph 48 of *APB Opinion No. 11* [section 4091.47] states the following with respect to reversal in a loss year of existing net deferred tax credits arising from timing differences:

> Net deferred tax credits arising from timing differences may exist at the time loss carry*forwards* arise. In the usual case when the tax effect of a loss carry*forward* is not recognized in the loss period, adjustments of the existing net deferred tax credits may be necessary in that period or in subsequent periods. In this situation net deferred tax credits should be eliminated to the extent of the lower of (a) the tax effect of the loss carry*forward*, or (b) the amortization of the net deferred tax credits that would otherwise have occurred during the carry*forward* period. (Emphasis in original.)

.34 Paragraph 46 of *APB Opinion No. 11* [section 4091.45] suggests that existing net deferred tax credits arising from timing differences that will be amortized during the carryforward period of a current year operating loss carryforward should be accounted for the same as if there were assurance of realization of the tax benefits of the loss carryforward beyond any reasonable doubt when it states:

> In those rare cases in which realization of the tax benefits of loss carry*forwards* is assured beyond any reasonable doubt, the potential benefits should be associated with the periods of loss and should be recognized in the determination of results of operations for those periods. Realization is considered to be assured beyond any reasonable doubt when conditions such as those set forth in paragraph 47 are present. (Also see paragraph 48.) (Emphasis in original.)

Tax (or Benefit) Applicable to Significant Unusual or Infrequently Occurring Items, Discontinued Operations, or Extraordinary Items

.35 Paragraph 21 of *APB Opinion No. 28* [section 2071.21] states the following with respect to significant unusual or infrequently occurring items, discontinued operations, or extraordinary items:

> Extraordinary items should be disclosed separately and included in the determination of net income for the interim period in which they occur. In determining materiality,

> extraordinary items should be related to the estimated income for the full fiscal year. Effects of disposals of a segment of a business and unusual and infrequently occurring transactions and events that are material with respect to the operating results of the interim period but that are not designated as extraordinary items in the interim statements should be reported separately. . . . Extraordinary items, gains or losses from disposal of a segment of a business, and unusual or infrequently occurring items should not be prorated over the balance of the fiscal year.

Tax Allocation within a Period

.36 Paragraph 52 of *APB Opinion No. 11* [section 4091.51] states the following concerning tax allocation within a period:

> The Board [APB] has concluded that tax allocation within a period should be applied to obtain an appropriate relationship between income tax expense and (a) income before extraordinary items, (b) extraordinary items, (c) adjustments of prior periods (or of the opening balance of retained earnings) and (d) direct entries to other stockholders' equity accounts. The income tax expense attributable to income before extraordinary items is computed by determining the income tax expense related to revenue and expense transactions entering into the determination of such income, without giving effect to the tax consequences of the items excluded from the determination of income before extraordinary items. The income tax expense attributable to other items is determined by the tax consequences of transactions involving these items. If an operating loss exists before extraordinary items, the tax consequences of such loss should be associated with the loss.

Disclosure

.37 Footnote 2 to paragraph 19 *of APB Opinion No. 28* [section 2071.19] states the following concerning the annual effective tax rate:

> Disclosure should be made of the reasons for significant variations in the customary relationship between income tax expense and pretax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business (see APB Opinion No. 11, paragraph 63).

Paragraph 63 of *APB Opinion No. 11* [section 4091.62] requires disclosure of:

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

> Reasons for significant variations in the customary relationships between income tax expense and pretax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business.

Using a Prior Year Operating Loss Carryforward

.38 Paragraph 61 of *APB Opinion No. 11* [section 4091.60] specifies:

> When the tax benefit of an operating loss carry*forward* is realized in full or in part in a subsequent period, and has not been previously recognized in the loss period, the tax benefit should be reported as an extraordinary item . . . in the results of operations of the period in which realized. (Emphasis in original.)

Effect of New Tax Legislation

.39 Paragraph 20 of *APB Opinion No. 28* [section 2071.20] also contains the following guidance with respect to the effect of new tax legislation:

> Changes resulting from new tax legislation should be reflected after the effective dates prescribed in the statutes.

Appendix B

CROSS REFERENCE TABLE

.40 This Appendix provides a cross reference from the paragraphs of this Interpretation to the paragraphs in Appendixes C and D that illustrate the application of those paragraphs.

Interpretation Paragraph Numbers		Example at Paragraph Numbers
.08	Estimated annual effective tax rate	.43, .49, .53, .54
	Changes in estimates	.48

Appendix C

EXAMPLES OF COMPUTATIONS OF INTERIM PERIOD INCOME TAXES

.41 This Appendix provides examples of application of this Interpretation for some specific situations. In general, the examples illustrate matters unique to accounting for income taxes at interim dates. The examples do not include consideration of the nature of tax credits and permanent differences or illustrate all possible combinations of circumstances.

.42 Specific situations illustrated in this Appendix are:

	Paragraph Numbers
Accounting for income taxes applicable to "ordinary" income (or loss) at an interim date if "ordinary" income is anticipated for the fiscal year:	
Facts, paragraphs .44 - .47	.43
"Ordinary" income in all interim periods	.44
"Ordinary" income and losses in interim periods:	
Year-to-date "ordinary" income	.45
Year-to-date "ordinary" losses, realization assured	.46
Year-to-date "ordinary" losses, realization not assured	.47
Changes in estimates	.48
Accounting for income taxes applicable to "ordinary" income (or loss) at an interim date if an "ordinary" loss is anticipated for the fiscal year:	
Facts, paragraphs .50 - .54	.49
Realization of the tax benefit of the loss is assured:	
"Ordinary" losses in all interim periods	.50
"Ordinary" income and losses in interim periods	.51
Realization of the tax benefit of the loss is not assured	.52
Partial realization of the tax benefit of the loss is assured:	
"Ordinary" losses in all interim periods	.53
"Ordinary" income and losses in interim periods	.54
Reversal of net deferred tax credits	.55

Paragraph Numbers

Accounting for income taxes applicable to unusual, infrequently occurring, or extraordinary items:
"Ordinary" income expected for the fiscal year:
Explanation of paragraphs .57 and .58 ... .56
Unusual, infrequently occurring, or extraordinary loss with:
Realization of the tax benefit assured at date of occurrence ... .57
Realization of the tax benefit not assured at date of occurrence ... .58
Using a prior year operating loss carryforward:
Explanation of paragraphs .60 and .61 ... .59
Loss carryforward exceeds expected "ordinary" income ... .60
Loss carryforward is less than expected "ordinary" income ... .61

Accounting for income taxes applicable to income (or loss) from discontinued operations at an interim date ... .62

Accounting for income taxes applicable to the cumulative effect of a change in accounting principle:
Cumulative effect of the change on retained earnings at the beginning of the fiscal year ... .63
Effect of the change on prechange interim periods of the current fiscal year ... .64

Accounting for income taxes applicable to "ordinary" income if an enterprise is subject to tax in multiple jurisdictions:
"Ordinary" income in all jurisdictions ... .65
"Ordinary" loss in a jurisdiction; realization of the tax benefit not assured ... .66
"Ordinary" income or tax cannot be estimated in one jurisdiction ... .67
Effect of new tax legislation:
Facts, paragraphs .69 and .70 ... .68
Legislation effective in a future interim period ... .69
Legislation effective in a previous interim period ... .70

Accounting for Income Taxes Applicable to "Ordinary" Income (or Loss) at an Interim Date If "Ordinary" Income Is Anticipated for the Fiscal Year

.43 The following assumed facts are applicable to the examples of application of this Interpretation in paragraphs .44-.47.

For the full fiscal year, an enterprise anticipates "ordinary" income of $100,000. All income is taxable in one jurisdiction at a 50 percent rate. Anticipated tax credits for the fiscal year total $10,000. No permanent differences are anticipated. No changes in estimated "ordinary" income, tax rates, or tax credits occur during the year.

Computation of the estimated annual effective tax rate applicable to "ordinary" income is as follows:

Tax at statutory rate ($100,000 at 50%)	$ 50,000
Less anticipated tax credits	(10,000)
Net tax to be provided	$ 40,000
Estimated annual effective tax rate ($40,000 ÷ $100,000)	40%

Tax credits are generally subject to limitations, usually based on the amount of tax payable before the credits. In computing the estimated annual effective tax rate, anticipated tax credits are limited to the amounts that are expected to be realized or are expected to be assured of future realization beyond any reasonable doubt at year-end. An exception to this general rule occurs in the computation of deferred taxes resulting from timing differences. If tax credits are not realized but the credits would have been realized if timing differences were not present, the credits are accounted for as a tax benefit and included in the estimated annual effective tax rate. If an enterprise is unable to estimate the amount of its tax credits for the year, see footnote 7 to paragraph .08.

.44 Assume the facts stated in paragraph .43. The enterprise has "ordinary" income in all interim periods. Quarterly tax computations are:

Reporting period	"Ordinary" income		Estimated annual effective tax rate	Tax		
	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ 20,000	$ 20,000	40%	$ 8,000	$ —	$ 8,000
Second quarter	20,000	40,000	40%	16,000	8,000	8,000
Third quarter	20,000	60,000	40%	24,000	16,000	8,000
Fourth quarter	40,000	100,000	40%	40,000	24,000	16,000
Fiscal year	$100,000					$40,000

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.45 Assume the facts stated in paragraph .43. The enterprise has "ordinary" income and losses in interim periods; there is not an "ordinary" loss for the fiscal year-to-date at the end of any interim period. Quarterly tax computations are:

Reporting period	"Ordinary" income (loss) Reporting period	"Ordinary" income (loss) Year-to-date	Estimated annual effective tax rate	Tax (or benefit) Year-to-date	Tax (or benefit) Less previously provided	Tax (or benefit) Reporting period
First quarter	$ 40,000	$ 40,000	40%	$16,000	$ —	$16,000
Second quarter	40,000	80,000	40%	32,000	16,000	16,000
Third quarter	(20,000)	60,000	40%	24,000	32,000	(8,000)
Fourth quarter	40,000	100,000	40%	40,000	24,000	16,000
Fiscal year	$100,000					$40,000

.46 Assume the facts stated in paragraph .43. The enterprise has "ordinary" income and losses in interim periods, and there is an "ordinary" loss for the year-to-date at the end of an interim period. Established seasonal patterns assure the realization of the tax benefit of the year-to-date loss and realization of anticipated tax credits beyond any reasonable doubt. Quarterly tax computations are:

	"Ordinary" income (loss)		Estimated annual effective tax rate	Tax (or benefit)		
Reporting period	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ (20,000)	$ (20,000)	40%	$ (8,000)	$ —	$ (8,000)
Second quarter	10,000	(10,000)	40%	(4,000)	(8,000)	4,000
Third quarter	15,000	5,000	40%	2,000	(4,000)	6,000
Fourth quarter	95,000	100,000	40%	40,000	2,000	38,000
Fiscal year	$100,000					$40,000

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.47 Assume the facts stated in paragraph .43. The enterprise has "ordinary" income and losses in interim periods, and there is a year-to-date "ordinary" loss during the year. There is no established seasonal pattern, and realization of the tax benefit of the year-to-date loss and realization of the anticipated tax credits are not otherwise assured beyond any reasonable doubt. Quarterly tax computations are:

	"Ordinary" income (loss)		Estimated annual effective tax rate	Tax		
Reporting period	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ (20,000)	$ (20,000)	—*	$ —	$ —	$ —
Second quarter	10,000	(10,000)	—*	—	—	—
Third quarter	15,000	5,000	40%	2,000	—	2,000
Fourth quarter	95,000	100,000	40%	40,000	2,000	38,000
Fiscal year	$100,000					$40,000

*No benefit is recognized because realization of the tax benefit of the year-to-date loss is not assured beyond any reasonable doubt.

.48 During the fiscal year, all of an enterprise's operations are taxable in one jurisdiction at a 50 percent rate. No permanent differences are anticipated. Estimates of "ordinary" income for the year and of anticipated credits at the end of each interim period are as shown below. Changes in the estimated annual effective tax rate result from changes in the ratio of anticipated tax credits to tax computed at the statutory rate. Changes consist of an unanticipated strike that reduced income in the second quarter, an increase in the capital budget resulting in an increase in anticipated investment tax credit in the third quarter, and better than anticipated sales and income in the fourth quarter. The enterprise has "ordinary" income in all interim periods. Computations of the estimated annual effective tax rate based on the estimate made at the end of each quarter are:

	Estimated, end of			Actual
	First quarter	Second quarter	Third quarter	fiscal year
Estimated "ordinary" income for the fiscal year	$100,000	$80,000	$80,000	$100,000
Tax at 50% statutory rate	$ 50,000	$40,000	$40,000	$ 50,000
Less anticipated credits	(5,000)	(5,000)	(10,000)	(10,000)
Net tax to be provided	$ 45,000	$35,000	$30,000	$ 40,000
Estimated annual effective tax rate	45%	43.75%	37.5%	40%

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Quarterly tax computations are:

Reporting period	"Ordinary" income		Estimated annual effective tax rate	Tax		
	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ 25,000	$ 25,000	45%	$11,250	$ —	$11,250
Second quarter	5,000	30,000	43.75%	13,125	11,250	1,875
Third quarter	25,000	55,000	37.5%	20,625	13,125	7,500
Fourth quarter	45,000	100,000	40%	40,000	20,625	19,375
Fiscal year	$100,000					$40,000

Accounting for Income Taxes Applicable to "Ordinary" Income (or Loss) at an Interim Date If an "Ordinary" Loss Is Anticipated for the Fiscal Year

.49 The following assumed facts are applicable to the examples of application of this Interpretation in paragraphs .50-.54.

For the full fiscal year, an enterprise anticipates an "ordinary" loss of $100,000. The enterprise operates entirely in one jurisdiction where the tax rate is 50 percent. Anticipated tax credits for the fiscal year total $10,000. No permanent differences are anticipated.

If realization of the tax benefit of the loss and realization of tax credits were assured beyond any reasonable doubt, computation of the estimated annual effective tax rate applicable to the "ordinary" loss would be as follows:

Tax benefit at statutory rate ($100,000 at 50%)	$(50,000)
Tax credits	(10,000)
Net tax benefit	$(60,000)
Estimated annual effective tax rate ($60,000 ÷ $100,000)	60%

The examples in paragraphs .50-.54 state varying assumptions with respect to assurance of realization of the components of the net tax benefit. When the realization of a component of the benefit is not assured beyond any reasonable doubt, that component is not included in the computation of the estimated annual effective tax rate.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.50 Assume the facts stated in paragraph .49. The enterprise has "ordinary" losses in all interim periods. Realization of the full tax benefit of the anticipated "ordinary" loss and realization of anticipated tax credits are assured beyond any reasonable doubt because they will be carried back. Quarterly tax computations are:

Reporting period	"Ordinary" loss		Estimated annual effective tax rate	Tax benefit		
	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ (20,000)	$ (20,000)	60%	$(12,000)	$ —	$(12,000)
Second quarter	(20,000)	(40,000)	60%	(24,000)	(12,000)	(12,000)
Third quarter	(20,000)	(60,000)	60%	(36,000)	(24,000)	(12,000)
Fourth quarter	(40,000)	(100,000)	60%	(60,000)	(36,000)	(24,000)
Fiscal year	$(100,000)					$(60,000)

The next page is 8255-31.

.51 Assume the facts stated in paragraph .49. The enterprise has "ordinary" income and losses in interim periods and for the year-to-date. Realization of the full tax benefit of the anticipated "ordinary" loss and realization of the anticipated tax credits are assured beyond any reasonable doubt because they will be carried back. Realization of the full tax benefit of the maximum year-to-date "ordinary" loss is also assured beyond any reasonable doubt. Quarterly tax computations are:

	"Ordinary" income (loss)		Estimated	Tax (or benefit)			
			annual	Year-to-date		Less	
	Reporting	Year-to-	effective			previously	Reporting
Reporting period	period	date	tax rate	Computed	Limited to	provided	period
First quarter	$ 20,000	$ 20,000	60%	$ 12,000		$ —	$ 12,000
Second quarter	(80,000)	(60,000)	60%	(36,000)		12,000	(48,000)
Third quarter	(80,000)	(140,000)	60%	(84,000)	$(80,000)*	(36,000)	(44,000)
Fourth quarter	40,000	(100,000)	60%	(60,000)		(80,000)	20,000
Fiscal year	$(100,000)						$(60,000)

*Because the year-to-date "ordinary" loss exceeds the anticipated "ordinary" loss for the fiscal year, the tax benefit recognized for the year-to-date is limited to the amount that would be recognized if the year-to-date "ordinary" loss were the anticipated "ordinary" loss for the fiscal year. The limitation is computed as follows:

Year-to-date "ordinary" loss times the statutory rate ($140,000 at 50%)	$(70,000)
Estimated tax credits for the year	(10,000)
Year-to-date benefit limited to	$(80,000)

.52 In the examples in paragraphs .50 and .51, if neither realization of the tax benefit of the anticipated loss for the fiscal year nor realization of anticipated tax credits were assured beyond any reasonable doubt, the estimated annual effective tax rate for the year would be zero and no tax (or benefit) would be recognized in any quarter. That conclusion is not affected by changes in the mix of income and loss in interim periods during a fiscal year. However, see footnote 7 to paragraph .08 above.

.53 Assume the facts stated in paragraph .49. The enterprise has an "ordinary" loss in all interim periods. Realization of the tax benefit of the loss is assured beyond any reasonable doubt only to the extent of $40,000 of prior income available to be offset by carryback ($20,000 of tax at the 50 percent statutory rate). Therefore the estimated annual effective tax rate is 20 percent ($20,000 benefit assured divided by $100,000 estimated fiscal year "ordinary" loss). Quarterly tax computations are:

	"Ordinary" loss		Estimated annual effective tax rate	Tax benefit		
Reporting period	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ (20,000)	$ (20,000)	20%	$ (4,000)	$ —	$ (4,000)
Second quarter	(20,000)	(40,000)	20%	(8,000)	(4,000)	(4,000)
Third quarter	(20,000)	(60,000)	20%	(12,000)	(8,000)	(4,000)
Fourth quarter	(40,000)	(100,000)	20%	(20,000)	(12,000)	(8,000)
Fiscal year	$(100,000)					$(20,000)

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.54 Assume the facts stated in paragraph .49. The enterprise has "ordinary" income and losses in interim periods and for the year-to-date. Realization of the tax benefit of the anticipated "ordinary" loss is assured beyond any reasonable doubt only to the extent of $40,000 of prior income available to be offset by carryback ($20,000 of tax at the 50 percent statutory rate). Therefore the estimated annual effective tax rate is 20 percent ($20,000 benefit assured divided by $100,000 estimated fiscal year "ordinary" loss), and the benefit that can be recognized for the year-to-date is limited to $20,000 (the benefit that is assured of realization). Quarterly tax computations are:

	"Ordinary" income (loss)		Estimated	Tax (or benefit)			
			annual	Year-to-date		Less	
Reporting period	Reporting period	Year-to-date	effective tax rate	Computed	Limited to	previously provided	Reporting period
First quarter	$ 20,000	$ 20,000	20%	$ 4,000		$ —	$ 4,000
Second quarter	(80,000)	(60,000)	20%	(12,000)		4,000	(16,000)
Third quarter	(80,000)	(140,000)	20%	(28,000)	$(20,000)	(12,000)	(8,000)
Fourth quarter	40,000	(100,000)	20%	(20,000)		(20,000)	—
Fiscal year	$(100,000)						$(20,000)

.55 The enterprise anticipates a fiscal year "ordinary" loss. The loss cannot be carried back, and future profits are not assured beyond any reasonable doubt. Net deferred tax credits arising from timing differences are present. A portion of the timing differences relating to those credits will reverse within the loss carryforward period. Computation of the estimated annual effective tax rate to be used is as follows:

Estimated fiscal year "ordinary" loss		$(100,000)
The tax benefit to be recognized is the lesser of:		
Tax effect of the loss carryforward ($100,000 at 50% statutory rate)	$50,000	
Amount of the net deferred tax credits that would otherwise have been amortized during the carryforward period	$24,000	
Estimated annual effective tax rate ($24,000 ÷ $100,000)		24%

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Quarterly tax computations are:

	"Ordinary" loss		Estimated annual effective tax rate	Tax benefit		
Reporting period	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ (20,000)	$ (20,000)	24%	$ (4,800)	$ —	$ (4,800)
Second quarter	(20,000)	(40,000)	24%	(9,600)	(4,800)	(4,800)
Third quarter	(20,000)	(60,000)	24%	(14,400)	(9,600)	(4,800)
Fourth quarter	(40,000)	(100,000)	24%	(24,000)	(14,400)	(9,600)
Fiscal year	$(100,000)					$(24,000)

Note: Changes in the timing of the loss by quarter would not change the above computation.

Accounting for Income Taxes Applicable to Unusual, Infrequently Occurring, or Extraordinary Items

.56 The examples of computations in paragraphs .57 and .58 illustrate the computation of the tax (or benefit) applicable to unusual, infrequently occurring, or extraordinary items when "ordinary" income is anticipated for the fiscal year. These examples are based on the facts and computations given in paragraphs .43-.47 plus additional information supplied in paragraphs .57 and .58. The computation of the tax (or benefit) applicable to the "ordinary" income is not affected by the occurrence of an unusual, infrequently occurring, or extraordinary item; therefore, each example refers to one or more of the examples of that computation in paragraphs .44-.47 and does not reproduce the computation and the facts assumed. The income statement display for tax (or benefit) applicable to unusual, infrequently occurring, or extraordinary items is illustrated in Appendix D.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.57 As explained in paragraph .56, this example is based on the computations of tax applicable to "ordinary" income that are illustrated in paragraph .44 above. In addition, the enterprise experiences a tax-deductible unusual, infrequently occurring, or extraordinary loss of $50,000 (tax benefit $25,000) in the second quarter. Because the loss can be carried back, the benefit of the loss is assured beyond any reasonable doubt at the time of occurrence. Quarterly tax provisions are:

			Tax (or benefit) applicable to	
Reporting period	"Ordinary" income	Unusual, infrequently occurring, or extraordinary loss	"Ordinary" income	Unusual, infrequently occurring, or extraordinary loss
First quarter	$ 20,000		$ 8,000	
Second quarter	20,000	$(50,000)	8,000	$(25,000)
Third quarter	20,000		8,000	
Fourth quarter	40,000		16,000	
Fiscal year	$100,000	$(50,000)	$40,000	$(25,000)

Note: Changes in assumptions would not change the timing of the recognition of the tax benefit applicable to the unusual, infrequently occurring, or extraordinary item as long as realization is assured beyond any reasonable doubt.

.58 As explained in paragraph .56, this example is based on the computations of tax applicable to "ordinary" income that are illustrated in paragraphs .44 and .45 above. In addition, the enterprise experiences a tax-deductible unusual, infrequently occurring, or extraordinary loss of $50,000 (potential benefit $25,000) in the second quarter. The loss cannot be carried back, and the current projection of "ordinary" income is not considered sufficiently reliable to assure realization of the tax benefit of the year-to-date loss beyond any reasonable doubt. As a result, realization of the tax benefit of the unusual, infrequently occurring, or extraordinary loss is not assured beyond any reasonable doubt except to the extent of offsetting "ordinary" income for the year-to-date. Quarterly tax provisions under two different assumptions for the occurrence of "ordinary" income are:

			Tax (or benefit) applicable to				
			"Ordinary" income (loss)		Unusual, infrequently occurring, or extraordinary loss		
Assumptions and reporting period	"Ordinary" income (loss)	Unusual, infrequently occurring, or extraordinary loss	Reporting period	Year-to-date	Year-to-date	Less previously provided	Reporting period
Income in all quarters:							
First quarter	$ 20,000		$ 8,000	$ 8,000			
Second quarter	20,000	$(50,000)	8,000	16,000	$(16,000)	$ —	$(16,000)
Third quarter	20,000		8,000	24,000	(24,000)	(16,000)	(8,000)
Fourth quarter	40,000		16,000	40,000	(25,000)	(24,000)	(1,000)
Fiscal year	$100,000	$(50,000)	$40,000				$(25,000)

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Income and loss quarters:							
First quarter	$ 40,000		$16,000	$16,000			
Second quarter	40,000	$(50,000)	16,000	32,000	$(25,000)	$ —	$(25,000)
Third quarter	(20,000)		(8,000)	24,000	(24,000)	(25,000)	1,000
Fourth quarter	40,000		16,000	40,000	(25,000)	(24,000)	(1,000)
Fiscal year	$100,000	$(50,000)	$40,000				$(25,000)

Using a Prior Year Operating Loss Carryforward

.59 The examples of computations in paragraphs .60 and .61 illustrate the computation of the tax benefit that results from using a prior year operating loss carryforward. The examples are based on the following assumed facts.

For the full fiscal year, an enterprise anticipates "ordinary" income of $100,000. All income is taxable in one jurisdiction at a 50 percent rate. No tax credits or permanent differences are anticipated. If an operating loss carryforward is available, the estimated tax (or benefit) applicable to "ordinary" income (or loss) for the year is divided by the estimated "ordinary" income (or loss) for the year to arrive at an estimated annual effective tax rate. That rate is 50 percent in these examples. The estimated annual effective tax rate is applied to "ordinary" income (or loss) for the year-to-date to determine the year-to-date tax (or benefit) applicable to "ordinary" income (or loss), similar to the computations that are illustrated in paragraphs .44-.47.

.60 Assume the facts stated in paragraph .59. In addition, an operating loss carryforward is available that exceeds the estimated "ordinary" income for the year. Because *APB Opinion No. 28* [section 2071] requires that an extraordinary item be recognized in the interim period of its occurrence and not spread over the year, the extraordinary credit recognized for the year-to-date at the end of each interim period is the amount that is realized by offsetting year-to-date taxable income. Quarterly tax provisions under various assumptions for the occurrence of "ordinary" income are:

		Tax (or benefit)		Extraordinary charge (or credit)*		
Assumptions and reporting period	"Ordinary" income (loss)	Reporting period	Year-to-date	Year-to-date	Less previously provided	Reporting period
Income in all quarters:						
First quarter	$ 20,000	$10,000	$10,000	$(10,000)	$ —	$(10,000)
Second quarter	20,000	10,000	20,000	(20,000)	(10,000)	(10,000)
Third quarter	20,000	10,000	30,000	(30,000)	(20,000)	(10,000)
Fourth quarter	40,000	20,000	50,000	(50,000)	(30,000)	(20,000)
Fiscal year	$100,000	$50,000				$(50,000)

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Income and loss quarters; no year-to-date losses:						
First quarter	$ 40,000	$20,000	$20,000	$(20,000)	$ —	$(20,000)
Second quarter	40,000	20,000	40,000	(40,000)	(20,000)	(20,000)
Third quarter	(20,000)	(10,000)	30,000	(30,000)	(40,000)	10,000
Fourth quarter	40,000	20,000	50,000	(50,000)	(30,000)	(20,000)
Fiscal year	$100,000	$50,000				$(50,000)

*Tax benefit resulting from using the operating loss carryforward.

Assumptions and reporting period	"Ordinary" income (loss)	Tax (or benefit)		Extraordinary charge (or credit)*		
		Reporting period	Year-to-date	Year-to-date	Less previously provided	Reporting period
Income and loss quarters and including year-to-date loss (realization of the tax benefit of the year-to-date "ordinary" loss and realization of anticipated tax credits are assured beyond any reasonable doubt by seasonal patterns):						
First quarter	$ (20,000)	$(10,000)	$(10,000)	$ —	$ —	$ —
Second quarter	10,000	5,000	(5,000)	—	—	—
Third quarter	15,000	7,500	2,500	(2,500)	—	(2,500)
Fourth quarter	95,000	47,500	50,000	(50,000)	(2,500)	(47,500)
Fiscal year	$100,000	$ 50,000				$(50,000)

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Income and loss quarters, including year-to-date loss (realization of the tax benefit of the year-to-date "ordinary" loss and realization of anticipated tax credits are not assured beyond any reasonable doubt):

First quarter	$ (20,000)	$ —	$ —	$ —	$ —	$ —
Second quarter	10,000	—	—	—	—	—
Third quarter	15,000	2,500	2,500	(2,500)	—	(2,500)
Fourth quarter	95,000	47,500	50,000	(50,000)	(2,500)	(47,500)
Fiscal year	$100,000	$ 50,000				$(50,000)

*Tax benefit resulting from using the operating loss carryforward.

.61 Assume the facts stated in paragraph .59. In addition, an operating loss carryforward of $30,000 (tax benefit $15,000 at the 50 percent statutory rate) is available. Because *APB Opinion No. 28* [section 2071] requires that an extraordinary item be recognized in the interim period of its occurrence and not spread over the year, the extraordinary credit recognized for the year-to-date at the end of each interim period is the amount that is realized by offsetting year-to-date taxable income. Quarterly tax provisions are:

		Tax provision		Extraordinary credit		
Reporting period	"Ordinary" income	Reporting period	Year-to-date	Year-to-date	Less previously provided	Reporting period
First quarter	$ 20,000	$10,000	$10,000	$(10,000)	$ —	$(10,000)
Second quarter	20,000	10,000	20,000	(15,000)	(10,000)	(5,000)
Third quarter	20,000	10,000	30,000	(15,000)	(15,000)	—
Fourth quarter	40,000	20,000	50,000	(15,000)	(15,000)	—
Fiscal year	$100,000	$50,000				$(15,000)

Note: Differing patterns of occurrence of "ordinary" income and loss would result in computations similar to those in paragraph .60.

Accounting for Income Taxes Applicable to Income (or Loss) from Discontinued Operations at an Interim Date

.62 An enterprise anticipates "ordinary" income for the year of $100,000 and tax credits of $10,000. The enterprise has "ordinary" income in all interim periods. The estimated annual effective tax rate is 40 percent, computed as follows:

Estimated pretax income	$100,000
Tax at 50% statutory rate	$ 50,000
Less anticipated credits	(10,000)
Net tax to be provided	$ 40,000
Estimated annual effective tax rate	40%

Quarterly tax computations for the first two quarters are:

	"Ordinary" income		Estimated annual effective tax rate	Tax		
Reporting period	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ 20,000	$20,000	40%	$ 8,000	$ —	$ 8,000
Second quarter	25,000	45,000	40%	18,000	8,000	10,000

In the third quarter a decision is made to discontinue the operations of Division X, a segment of the business that has recently operated at a loss (before income taxes). The pretax income (and losses) of the continuing operations of the enterprise and of Division X through the third quarter and the estimated fourth quarter results are as follows:

Reporting period	Revised "ordinary" income from continuing operations	Division X: Loss from operations	Division X: Provision for loss on disposal
First quarter	$ 25,000	$ (5,000)	
Second quarter	35,000	(10,000)	
Third quarter	50,000	(10,000)	$ (55,000)
Fourth quarter	50,000*	—	—
Fiscal year	$160,000	$ (25,000)	$ (55,000)

*Estimated

No changes have occurred in continuing operations that would affect the estimated annual effective tax rate. Anticipated annual tax credits of $10,000 included $2,000 of credits related to the operations of Division X. The revised estimated annual effective tax rate applicable to "ordinary" income from continuing operations is 45 percent, computed as follows:

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Estimated "ordinary" income from continuing operations	$160,000
Tax at 50% statutory rate	$ 80,000
Less anticipated tax credits applicable to continuing operations	(8,000)
Net tax to be provided	$ 72,000
Estimated annual effective tax rate	45%

Quarterly computations of tax applicable to "ordinary" income from continuing operations are as follows:

	"Ordinary" income		Estimated	Tax		
Reporting period	Reporting period	Year-to-date	annual effective tax rate	Year-to-date	Less previously provided	Reporting period
First quarter	$ 25,000	$ 25,000	45%	$11,250	$ —	$11,250
Second quarter	35,000	60,000	45%	27,000	11,250	15,750
Third quarter	50,000	110,000	45%	49,500	27,000	22,500
Fourth quarter	50,000	160,000	45%	72,000	49,500	22,500
Fiscal year	$160,000					$72,000

Tax benefit applicable to Division X for the first two quarters is computed as follows:

Reporting period	Tax applicable to "ordinary" income: Previously reported (A)	Tax applicable to "ordinary" income: Recomputed (above) (B)	Tax benefit applicable to Division X (A-B)
First quarter	$ 8,000	$11,250	$(3,250)
Second quarter	10,000	15,750	(5,750)
			$(9,000)

The third quarter tax benefits applicable to both the loss from operations and the provision for loss on disposal of Division X are computed based on estimated annual income with and without the effects of the Division X losses. Current year tax credits related to the operations of Division X have not been recognized. It is assumed that the tax benefit of those credits will not be realized because of the discontinuance of Division X operations. Any reduction in tax benefits resulting from recapture of previously recognized tax credits resulting from discontinuance or current year tax credits applicable to the discontinued operations would be reflected in the tax benefit recognized for the loss on disposal or loss from operations as appropriate. If, because of capital gains and losses, etc., the individually computed tax effects of the items do not equal the aggregate tax effects of the items, the aggregate tax effects are allocated to the individual items in the same manner that they will be allocated in the annual financial statements. The computations are as follows:

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

	Loss from operations of Division X	Provision for loss on disposal
Estimated annual income from continuing operations	$160,000	$160,000
Loss from Division X operations	(25,000)	
Provision for loss on disposal of Division X		(55,000)
Total	$135,000	$105,000
Tax at 50% statutory rate	$ 67,500	$ 52,500
Anticipated credits from continuing operations	(8,000)	(8,000)
Tax credits of Division X and recapture of previously recognized tax credits resulting from discontinuance	—	—
Taxes on income after effect of Division X losses	59,500	44,500
Taxes on income before effect of Division X losses — see computation above	72,000	72,000
Tax benefit applicable to the losses of Division X	(12,500)	(27,500)
Amounts previously recognized — see computation above	(9,000)	—
Tax benefit recognized in third quarter	$ (3,500)	$ (27,500)

The resulting revised quarterly tax provisions are summarized as follows:

	Pretax income (loss)			Tax (or benefit) applicable to		
Reporting period	Continuing operations	Operations of Division X	Provision for loss on disposal	Continuing operations	Operations of Division X	Provision for loss on disposal
First quarter	$ 25,000	$ (5,000)		$11,250	$ (3,250)	
Second quarter	35,000	(10,000)		15,750	(5,750)	
Third quarter	50,000	(10,000)	$(55,000)	22,500	(3,500)	$(27,500)
Fourth quarter	50,000			22,500		
Fiscal year	$160,000	$(25,000)	$(55,000)	$72,000	$(12,500)	$(27,500)

Accounting for Income Taxes Applicable to the Cumulative Effect of a Change in Accounting Principle

.63 The tax (or benefit) applicable to the cumulative effect of the change on retained earnings at the beginning of the fiscal year shall be computed the same as for the annual financial statements.

.64 When an enterprise makes a cumulative effect type accounting change in other than the first interim period of the enterprise's fiscal year, paragraph 10 of *FASB Statement No. 3* [section 2072.10], "Reporting Accounting Changes in Interim Financial Statements," requires that financial information for the pre-change interim periods of the fiscal year shall be restated by applying the newly adopted accounting principle to those pre-change interim periods. The tax (or benefit) applicable to those pre-change interim periods shall be recomputed. The restated tax (or benefit) shall reflect the year-to-date amounts and annual estimates originally used for the pre-change interim periods, modified only for the effect of the change in accounting principle on those year-to-date and estimated annual amounts.

Accounting for Income Taxes Applicable to "Ordinary" Income If an Enterprise Is Subject to Tax in Multiple Jurisdictions

.65 An enterprise operates through separate corporate entities in two countries. Applicable tax rates are 50 percent in the United States and 20 percent in Country A. The enterprise has no unusual or extraordinary items during the fiscal year and anticipates no tax credits or permanent differences. (The effect of foreign tax credits and the necessity of providing tax on undistributed earnings are ignored because of the wide range of tax planning alternatives available.) For the full fiscal year the enterprise anticipates "ordinary" income of $60,000 in the United States and $40,000 in Country A. The enterprise is able to make a reliable estimate of its Country A "ordinary" income and tax for the fiscal year in dollars. Computation of the overall estimated annual effective tax rate is as follows:

Anticipated "ordinary" income for the fiscal year:	
In the U.S.	$ 60,000
In Country A	40,000
Total	$100,000
Anticipated tax for the fiscal year:	
In the U.S. ($60,000 at 50% statutory rate)	$ 30,000
In Country A ($40,000 at 20% statutory rate)	8,000
Total	$ 38,000
Overall estimated annual effective tax rate ($38,000 ÷ $100,000)	38%

Quarterly tax computations are as follows:

	"Ordinary" income				Overall estimated annual effective tax rate	Tax		
Reporting period	U.S.	Country A	Total	Year-to-date		Year-to-date	Less previously reported	Reporting period
First quarter	$ 5,000	$15,000	$ 20,000	$ 20,000	38%	$ 7,600	$ —	$ 7,600
Second quarter	10,000	10,000	20,000	40,000	38%	15,200	7,600	7,600
Third quarter	10,000	10,000	20,000	60,000	38%	22,800	15,200	7,600
Fourth quarter	35,000	5,000	40,000	100,000	38%	38,000	22,800	15,200
Fiscal year	$60,000	$40,000	$100,000					$38,000

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.66 Assume the facts stated in paragraph .65. In addition the enterprise operates through a separate corporate entity in Country B. Applicable tax rates in Country B are 40 percent. Operations in Country B have resulted in losses in recent years and an "ordinary" loss is anticipated for the current fiscal year in Country B. Realization of the tax benefit of those losses is not assured beyond any reasonable doubt; accordingly, no tax benefit is recognized for losses in Country B, and interim period tax (or benefit) is separately computed for the "ordinary" loss in Country B and for the overall "ordinary" income in the United States and Country A. The tax applicable to the overall "ordinary" income in the United States and Country A is computed as in paragraph .65. Quarterly tax provisions are as follows:

	"Ordinary" income (or loss)					Tax (or benefit)		
Reporting period	U.S.	Country A	Combined excluding Country B	Country B	Total	Overall excluding Country B	Country B	Total
First quarter	$ 5,000	$15,000	$ 20,000	$ (5,000)	$15,000	$ 7,600	$ —	$ 7,600
Second quarter	10,000	10,000	20,000	(25,000)	(5,000)	7,600	—	7,600
Third quarter	10,000	10,000	20,000	(5,000)	15,000	7,600	—	7,600
Fourth quarter	35,000	5,000	40,000	(5,000)	35,000	15,200	—	15,200
Fiscal year	$60,000	$40,000	$100,000	$(40,000)	$60,000	$38,000	$ —	$38,000

.67 Assume the facts stated in paragraph .65. In addition the enterprise operates through a separate corporate entity in Country C. Applicable tax rates in Country C are 40 percent in foreign currency. Depreciation in that country is large and exchange rates have changed in prior years. The enterprise is unable to make a reasonable estimate of its "ordinary" income for the year in Country C and thus is unable to reasonably estimate its annual effective tax rate in Country C in dollars. Accordingly, tax (or benefit) in Country C is separately computed as "ordinary" income (or loss) occurs in Country C. The tax applicable to the overall "ordinary" income in the United States and Country A is computed as in paragraph .65. Quarterly computations of tax applicable to Country C are as follows:

	Foreign currency amounts		Translated amounts in dollars	
Reporting period	"Ordinary" income in reporting period	Tax (at 40% rate)	"Ordinary" income in reporting period	Tax
First quarter	FC 10,000	FC 4,000	$12,500	$ 3,000
Second quarter	5,000	2,000	8,750	1,500
Third quarter	30,000	12,000	27,500	9,000
Fourth quarter	15,000	6,000	16,250	4,500
Fiscal year	FC 60,000	FC 24,000	$65,000	$18,000

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Quarterly tax provisions are as follows:

	"Ordinary" income					Tax		
Reporting period	U.S.	Country A	Combined excluding Country C	Country C	Total	Overall excluding Country C	Country C	Total
First quarter	$ 5,000	$15,000	$ 20,000	$12,500	$ 32,500	$ 7,600	$ 3,000	$10,600
Second quarter	10,000	10,000	20,000	8,750	28,750	7,600	1,500	9,100
Third quarter	10,000	10,000	20,000	27,500	47,500	7,600	9,000	16,600
Fourth quarter	35,000	5,000	40,000	16,250	56,250	15,200	4,500	19,700
Fiscal year	$60,000	$40,000	$100,000	$65,000	$165,000	$38,000	$18,000	$56,000

Effect of New Tax Legislation

.68 The following assumed facts are applicable to the examples of application of this Interpretation in paragraphs .69 and .70.

For the full fiscal year, an enterprise anticipates "ordinary" income of $100,000. All income is taxable in one jurisdiction at a 50 percent rate. Anticipated tax credits for the fiscal year total $10,000. No permanent differences are anticipated.

Computation of the estimated annual effective tax rate applicable to "ordinary" income is as follows:

Tax at statutory rate ($100,000 at 50%)	$ 50,000
Less anticipated tax credits	(10,000)
Net tax to be provided	$ 40,000
Estimated annual effective tax rate ($40,000 ÷ $100,000)	40%

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.69 Assume the facts stated in paragraph .68. In addition, assume that new legislation creating additional tax credits is enacted during the second quarter of the enterprise's fiscal year. The new legislation is effective on the first day of the third quarter. As a result of the estimated effect of the new legislation, the enterprise revises its estimate of its annual effective tax rate to the following:

Tax at statutory rate ($100,000 at 50%)	$ 50,000
Less anticipated tax credits	(12,000)
Net tax to be provided	$ 38,000
Estimated annual effective tax rate ($38,000 ÷ $100,000)	38%

The effect of the new legislation shall not be reflected until it is effective or administratively effective. Accordingly, quarterly tax computations are:

	"Ordinary" income		Estimated	Tax		
Reporting period	Reporting period	Year-to-date	annual effective tax rate	Year-to-date	Less previously provided	Reporting period
First quarter	$ 20,000	$ 20,000	40%	$ 8,000	$ —	$ 8,000
Second quarter	20,000	40,000	40%	16,000	8,000	8,000
Third quarter	20,000	60,000	38%	22,800	16,000	6,800
Fourth quarter	40,000	100,000	38%	38,000	22,800	15,200
Fiscal year	$100,000					$38,000

.70 Assume the facts stated in paragraph .68. In addition, assume that new legislation creating additional tax credits is enacted after the end of the third quarter of the enterprise's fiscal year but before the enterprise has reported the results of its operations for the third quarter. The new legislation is effective retroactive to the first day of the third quarter. The new legislation results in the following revised estimated annual effective tax rate:

Tax at statutory rate ($100,000 at 50%)	$ 50,000
Less anticipated tax credits	(12,000)
Net tax to be provided	$ 38,000
Estimated annual effective tax rate ($38,000 ÷ $100,000)	38%

Quarterly tax computations are:

	"Ordinary" income		Estimated annual effective tax rate	Tax		
Reporting period	Reporting period	Year-to-date		Year-to-date	Less previously provided	Reporting period
First quarter	$ 20,000	$ 20,000	40%	$ 8,000	$ —	$ 8,000
Second quarter	20,000	40,000	40%	16,000	8,000	8,000
Third quarter	20,000	60,000	38%	22,800	16,000	6,800
Fourth quarter	40,000	100,000	38%	38,000	22,800	15,200
Fiscal year	$100,000					$38,000

Appendix D

ILLUSTRATION OF INCOME TAXES IN INCOME STATEMENT DISPLAY

.71 The following illustrates the location in an income statement display of the various tax amounts computed under this Interpretation:

*Net sales		$XXXX
*Other income		XXX
		XXXX
Costs and expenses:		
*Cost of sales	$XXXX	
*Selling, general, and administrative expenses	XXXX	
*Interest expense	XXX	
*Other deductions	XX	
Unusual items	XXX	
Infrequently occurring items	XXX	XXXX
Income (loss) from continuing operations before income taxes and other items listed below		XXXX
†Provision for income taxes (benefit)		XXXX
Income (loss) from continuing operations before other items listed below		XXXX
Discontinued operations:		
Income (loss) from operations of discontinued Division X (less applicable income taxes of $XXXX)	XXXX	
Income (loss) on disposal of Division X, including provision of $XXXX for operating losses during phase-out period (less applicable income taxes of $XXXX)	XXXX	XXXX
Income (loss) before extraordinary items and cumulative effect of a change in accounting principle		XXXX
Extraordinary items (less applicable income taxes of $XXXX)		XXXX
‡Cumulative effect on prior years of a change in accounting principle (less applicable income taxes of $XXXX)		XXXX
Net income (loss)		$XXXX

*Components of "ordinary" income (loss).

†Consists of the total of income taxes (or benefit) applicable to (a) "ordinary" income, (b) unusual items, and (c) infrequently occurring items.

‡This amount is net of applicable income taxes. The amount of the applicable income taxes is usually separately disclosed but that is not required.

Appendix E

SUMMARY OF CONSIDERATION OF COMMENTS ON EXPOSURE DRAFT

.72 The "Notice of Exposure and Request for Comments" accompanying the Exposure Draft issued October 7, 1976 for this Interpretation stated:

> The Interpretation set forth in this EXPOSURE DRAFT explains, clarifies, and elaborates on the requirements of *APB Opinion No. 28*, "Interim Financial Reporting," which relies in part on *APB Opinion No. 11*, "Accounting for Income Taxes," and on other APB Opinions with respect to accounting for income taxes in interim periods.
>
> The FASB currently has on its technical agenda a project entitled Interim Financial Reporting. As part of that project, the Board will examine possible methods of accounting for income taxes in interim periods. At the completion of that project, the Board expects to issue a comprehensive Statement specifying the financial accounting and reporting standards to be applied in interim financial reporting. The Board recognizes that some might prefer methods of accounting for income taxes in interim periods other than those required by the concepts of *APB Opinion No. 28*. However, the Board is of the view that any other methods should be considered as part of the FASB's technical agenda project on Interim Financial Reporting.
>
> The FASB Rules of Procedure permit the issuance of a final Interpretation without exposure for public comment but allow public exposure prior to final issuance when the Board deems such procedure to be advisable. The Board has reached that conclusion here and has also concluded that a public comment period extending to November 15, 1976 is appropriate.

.73 In response to the request for comments on the Exposure Draft, the FASB received and considered 99 letters of comment. Certain of the comments and the FASB's consideration of them are summarized in paragraphs .74-.85.

Issuance of the Interpretation

.74 Many respondents recommended that the FASB not issue a final Interpretation on "Accounting for Income Taxes in Interim Periods" at this time. Some of those respondents recommended that the project be deferred until the FASB issues its comprehensive Statement on Interim Financial

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Reporting. Others questioned if the number of existing differences in accounting for similar situations was great enough to require an Interpretation at this time.

.75 It is not likely that a final Statement for the Board's current agenda project on Interim Financial Reporting will be issued and effective before 1979. Comments received in respect of the Exposure Draft indicate that there is, currently, diversity of practice. The Board concluded that the provisions of *APB Opinion No. 28* [section 2071] are sufficiently clear to provide a basis for an Interpretation and that a final Interpretation should be issued.

Applicability to Annual Financial Statements

.76 Some respondents stated that the proposed Interpretation and the examples in Appendix B implicitly included a number of interpretations of the application of *APB Opinion No. 11* [section 4091] to annual financial statements. They recommended that, if the Board intends to interpret Opinion No. 11 [section 4091], the intent should be stated. The Board does not intend to modify annual accounting practices in this Interpretation. Accordingly, specific guidance on those matters that appeared to imply interpretations of the application of *APB Opinion No. 11* [section 4091] to annual financial statements was deleted.

.77 Some respondents asked if the example in paragraph .49 of Appendix C of this Interpretation was intended to change the annual accounting for investment tax credits. Paragraph .49 includes "tax credits" in the computed tax benefit of an "ordinary" loss, but does not identify those "tax credits" as "investment tax credits." Various tax credits other than investment tax credits may be available to an enterprise. This Interpretation is not intended to change annual accounting for unrealized investment tax credits.

Applicability to Regulated Industries

.78 A number of respondents stated that the proposed Interpretation should not apply to regulated industries. Some respondents noted that the Addendum to *APB Opinion No. 2* [section 6011] may provide an exemption from the Interpretation for certain enterprises in regulated industries. The Board is aware that differing applications of the Addendum exist in practice and has not addressed that issue.

Amortization of Deferred Investment Tax Credits

.79 Several respondents recommended that the amortization of deferred investment tax credits be excluded from the estimated annual effective tax rate. Some stated that the rationale of *APB Opinion No. 2* [section 4094] requires those items to be allocated among interim periods on the same basis as depreciation expense for the property giving rise to the credit. Paragraph 13 of Opinion No. 2 [section 4094.11] states that "the . . . investment credit should be reflected in net income over the productive life of acquired property and not in the year in which it is placed in service."[27] Footnote 6 to paragraph .08 of this Interpretation was revised to indicate that amortization of deferred investment tax credits need not be taken into account in estimating the annual effective tax rate. However, if an enterprise elects to consider investment tax credits in estimating the annual effective tax rate, the amount to be taken into account shall be the estimated amount of the current year's amortization and not the amount that reduces income tax payable on the enterprise's tax return.

Tax Exempt Interest

.80 A number of respondents recommended that tax-exempt interest income be excluded from "ordinary" income in estimating the annual effective tax rate and in computing the year-to-date tax (or benefit). A number of them stated that the tax effect of tax-exempt interest income must be reported on a discrete period basis to reflect the economic effects of tax-exempt investments. A few respondents noted that the practice of excluding tax-exempt interest income from "ordinary" income in estimating the annual effective tax rate and in computing interim period tax (or benefit) is followed by virtually all financial institutions. The Board noted that the accounting practice described above for tax-exempt interest income in interim periods appears to be uniform and concluded that it should not address the issue in this Interpretation.

Exchange Gains and Losses

.81 Several respondents requested that the Board provide guidance on accounting for the tax effects of exchange gains

---

[27] That conclusion was amended by *APB Opinion No. 4* [section 4094], "Accounting for the 'Investment Credit'." Paragraph 10 of Opinion No. 4 [section 4094.17] permits "the alternative method of treating the credit as a reduction of Federal income taxes of the year in which the credit arises. . . ."

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

and losses in interim periods. Paragraphs 166 and 192 of *FASB Statement No. 8* [sections 1083.166 and 1083.192], "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements," indicate that it would be rare that the timing, direction, and magnitude of future exchange rate changes and the enterprise's financial position at the time of an expected future exchange rate change could each be reasonably estimated. Footnote 7 to paragraph .08 has been expanded to explain that the tax (or benefit) applicable to an item that cannot be estimated shall be reported in the interim period in which the item is reported.

Estimated Annual Effective Tax Rate

.82 Several respondents recommended that an estimated annual effective tax rate not be applied in various specific circumstances. Circumstances mentioned included (a) if the rate is extremely high or low, (b) if an "ordinary" loss is expected for the year, and (c) if an enterprise has a year-to-date "ordinary" income and anticipates an "ordinary" loss for the year. An example cited was an enterprise that experienced "ordinary" income in an early part of the year and anticipated offsetting "ordinary" losses in the balance of the year, resulting in zero estimated "ordinary" income and no tax (or benefit). Such unusual circumstances may result in significant variations in the customary relationship between income tax expense and pretax accounting income in interim periods and footnote 2 to paragraph 19 of Opinion No. 28 [section 2071.19] requires disclosure of the reasons for those variations. Footnote 7 to paragraph .08 of this Interpretation states that if a reliable estimate cannot be made the actual effective tax rate for the year-to-date may be the best estimate of the annual effective tax rate. What is and what is not a "reliable estimate" is a matter of judgment. In the break-even situation cited above, a small change in the enterprise's estimated "ordinary" income could produce a large change in the estimated annual effective tax rate. In those circumstances, a break-even estimate would not be reliable if a small change in the estimated "ordinary" income were considered likely to occur.

Operations Taxable in Multiple Jurisdictions

.83 Many respondents stated that the intent of Opinion No. 28 [section 2071] was to apply one overall estimated annual effective tax rate to "ordinary" income for the consolidated reporting entity. Several respondents stated that interrelationships between jurisdictions would make the use of separate rates impractical. Paragraph .22 was modified to indicate that one overall estimated annual effective tax rate shall be used with the two exceptions described in that paragraph and discussed further in paragraphs .84 and .85 below.

.84 If an enterprise that operates in multiple jurisdictions has losses in one or more of the jurisdictions and realization of the tax benefit of the losses is not assured beyond any reasonable doubt, use of one overall estimated annual effective tax rate can result in the recognition of tax benefits for the year-to-date for those losses. Paragraph 20 of Opinion No. 28 [section 2071.20] states that "the tax effects of losses that arise in the early portion of a fiscal year (in the event carryback of such losses is not possible) should be recognized only when realization is assured beyond any reasonable doubt. . . ." Accordingly, a separate computation is necessary for the tax (or benefit) applicable to "ordinary" income (or loss) in those jurisdictions.

.85 The effect of translating foreign currency financial statements may make it difficult to estimate an annual effective foreign currency tax rate in dollars. For example, depreciation is translated at historical exchange rates, whereas many transactions included in income are translated at current period average exchange rates. If depreciation is large in relation to earnings, a change in the estimated "ordinary" income that does not change the effective foreign currency tax rate can change the effective tax rate in the dollar financial statements. This result can occur with no change in exchange rates during the current year if there have been exchange rate changes in past years. If the enterprise is unable to estimate its annual effective tax rate in dollars or is otherwise unable to make a reliable estimate of its "ordinary" income (or loss) or of the related tax (or benefit) for the fiscal year in a jurisdiction, the tax (or benefit) applicable to "ordinary" income (or loss) in that jurisdiction shall be recognized in the interim period in which the "ordinary" income (or loss) is reported, as described in footnote 7 to paragraph .08.

AC Section 2072

Reporting Accounting Changes in Interim Financial Statements

an amendment of Section 2071
[Source: FASB Statement No. 3.]

December 1974

INTRODUCTION AND BACKGROUND INFORMATION

.01 As a result of numerous inquiries concerning the appropriate procedures for reporting a change to the LIFO method of inventory pricing in interim financial reports, the FASB has examined certain conclusions of *APB Opinion No. 28* [section 2071], "Interim Financial Reporting," with respect to two aspects of reporting accounting changes in interim financial reports:

a) Reporting a cumulative effect type accounting change (as described in *APB Opinion No. 20* [section 1051], "Accounting Changes") including a change to the LIFO method of inventory pricing for which a cumulative effect cannot be determined.

b) Reporting an accounting change made during the fourth quarter of a fiscal year by a company whose securities are publicly traded.

.02 *APB Opinion No. 28* [section 2071] became effective for interim periods relating to fiscal years beginning on or after January 1, 1974, and paragraphs 23-29 of that Opinion set forth standards for reporting accounting changes in interim financial reports. Those paragraphs provide that, in general, an accounting change made in an interim period should be reported in accordance with the provisions of *APB Opinion No. 20* [section 1051].

.03 Paragraphs 9-14 of this Statement establish standards of financial accounting and reporting that address the matters identified in paragraph 1. The Appendices to this Statement contain examples of application of *APB Opinion No. 28* [section 2071] (as amended by this Statement) and the requirements of *APB Opinion No. 20* [section 1051] as they are incorporated by reference in *APB Opinion No. 28* [section 2071].

.04 An Exposure Draft of a proposed Statement on "Reporting Accounting Changes in Interim Financial Statements" was issued on November 11, 1974. Fifty-five letters were received in response to the request for comments. This Statement incorporates a number of changes suggested by those respondents. The principal change is to require that, if an accounting change is made in other than the first interim period of an enterprise's fiscal year, the cumulative effect of the change on retained earnings at the beginning of that year shall be included in the determination of net income of the first interim period of the year of change (by restatement of that period's financial information).

.05 The Board has concluded that it can make an informed decision on the matters identified in paragraph 1 of this Statement without a public hearing. It has also concluded that the effective date in paragraph 16 of this Statement is advisable to permit application of the provisions of this Statement before divergent interpretations of *APB Opinion No. 28* [section 2071] develop in practice.

Cumulative Effect Type Accounting Changes

.06 Paragraph 27 of *APB Opinion No. 28* [section 2071.27] provides that "a change in accounting principle or practice adopted in an interim period that requires an adjustment for the cumulative effect of the change to the beginning of the current fiscal year should be reported in the interim period in a manner similar to that to be followed in the annual report. . . . The effect of the change from the beginning of the annual period to the period of change should be reported as a determinant of net income in the interim period in which the change is made." That paragraph goes on to require, however, that when information is subsequently presented for the period in which the change is made or for pre-change interim periods of that year, that information should be restated to give effect to the accounting change.

.07 As a result of those requirements, if a cumulative effect type accounting change is made, the cumulative effect of the change on retained earnings at the beginning of that fiscal year is a component of net income of the interim period in which the change is adopted. If a change is made in other than the first interim period, since the cumulative effect remains a component of that interim period's income when financial information for that period is subsequently reported, reissued pre-change interim period balance sheets would not reflect the

 Copyright © 1974, Financial Accounting Standards Board

cumulative effect of the change on retained earnings at the beginning of the fiscal year on a retroactive basis, whereas reissued pre-change interim period income statements would be restated. In addition, an enterprise may issue interim financial information knowing that the information will subsequently have to be revised. For example, during the second quarter of its fiscal year an enterprise may make an accounting change as of the beginning of that quarter. If, subsequently during that second quarter, the enterprise issues first quarter financial information (perhaps in a report to its securityholders, in a report to a bank, or in a filing with the SEC), that first quarter information would be prepared on the basis of the old accounting principle — not the newly adopted one. When that enterprise later issues second quarter information, both the cumulative effect of the change up to the beginning of the fiscal year and the effect from the beginning of the year to the beginning of the second quarter would be included in the determination of second quarter net income. However, in any subsequent report that separately presents information either for that first quarter or that second quarter, the first quarter information would be retroactively restated on the basis of the newly adopted accounting principle, and the effect of the change from the beginning of the year to the beginning of the second quarter would no longer be included in second quarter net income. Thus the enterprise issued both first and second quarter information that had to be restated in subsequent periods. A similar situation arises if the accounting change were made during the third or fourth quarters.

Fourth Quarter Accounting Changes Made by Publicly Traded Companies

.08 Paragraphs 30-33 of *APB Opinion No. 28* [section 2071.30—.33] set forth special requirements for disclosure of summarized financial data by publicly traded companies (as defined in footnote 1 to that Opinion). Some publicly traded companies are required by paragraph 31 of the Opinion to disclose certain fourth quarter information in a note to the annual financial statements. Information about the effects of an accounting change made during the fourth quarter is not explicitly identified as one of the items for which disclosure is required.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Cumulative Effect Type Accounting Changes Other Than Changes to LIFO

.09 If a cumulative effect type accounting change is made during the *first* interim period of an enterprise's fiscal year, the

cumulative effect of the change on retained earnings at the *beginning of that fiscal year* shall be included in net income of the first interim period (and in last-twelve-months-to-date financial reports that include that first interim period).

.10 If a cumulative effect type accounting change is made in *other than the first* interim period of an enterprise's fiscal year, *no* cumulative effect of the change shall be included in net income of the period of change. Instead, financial information for the pre-change interim periods of the fiscal year in which the change is made shall be restated by applying the newly adopted accounting principle to those pre-change interim periods. The cumulative effect of the change on retained earnings at the *beginning of that fiscal year* shall be included in restated net income of the first interim period of the fiscal year in which the change is made (and in any year-to-date or last-twelve-months-to-date financial reports that include the first interim period). Whenever financial information that includes those pre-change interim periods is presented, it shall be presented on the restated basis.

.11 The following disclosures about a cumulative effect type accounting change shall be made in interim financial reports:

a) In financial reports for the interim period in which the new accounting principle is adopted, disclosure shall be made of the nature of and justification for the change.

b) In financial reports for the interim period in which the new accounting principle is adopted, disclosure shall be made of the effect of the change on income from continuing operations, net income, and related per share amounts for the interim period in which the change is made. In addition, when the change is made in other than the first interim period of a fiscal year, financial reports for the period of change shall also disclose (i) the effect of the change on income from continuing operations, net income, and related per share amounts for each pre-change interim period of that fiscal year and (ii) income from continuing operations, net income, and related per share amounts for each pre-change interim period restated in accordance with paragraph 10 of this Statement.

c) In financial reports for the interim period in which the new accounting principle is adopted, disclosure shall be made of income from continuing operations, net income, and related

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

per share amounts computed on a pro forma basis for (i) the interim period in which the change is made and (ii) any interim periods of prior fiscal years for which financial information is being presented. If no financial information for interim periods of prior fiscal years is being presented, disclosure shall be made, in the period of change, of the actual and pro forma amounts of income from continuing operations, net income, and related per share amounts for the interim period of the immediately preceding fiscal year that corresponds to the interim period in which the change is made. In all cases, the pro forma amounts shall be computed and presented in conformity with paragraphs 19, 21, 22, and 25 of *APB Opinion No. 20* [sections 1051.19, 1051.21, 1051.22, and 1051.25].

d) In year-to-date and last-twelve-months-to-date financial reports that include the interim period in which the new accounting principle is adopted, the disclosures specified in the first sentence of subparagraph (b) above and in subparagraph (c) above shall be made.

e) In financial reports for a subsequent (post-change) interim period of the fiscal year in which the new accounting principle is adopted, disclosure shall be made of the effect of the change on income from continuing operations, net income, and related per share amounts for that post-change interim period.

Changes to the LIFO Method of Inventory Pricing and Similar Situations

.12 Paragraph 26 of *APB Opinion No. 20* [section 1051.26] indicates that in rare situations—principally a change to the LIFO method of inventory pricing[1]—neither the cumulative effect of the change on retained earnings at the beginning of the fiscal year in which the change is made nor the pro forma amounts can be computed. In those situations, that paragraph requires an explanation of the reasons for omitting (a) accounting for a cumulative effect and (b) disclosure of pro forma amounts for prior years. If a change of that type is made in the *first* interim period of an enterprise's fiscal year, the disclosures specified in paragraph 11 of this Statement shall be made (except the pro forma amounts for interim periods of prior fiscal years called for by paragraph 11(c) will not be disclosed).

---

[1]In making disclosures about changes to the LIFO method, enterprises should be aware of the limitations the Internal Revenue Service has placed on such disclosures.

.13 If the change is made in *other than* the first interim period of an enterprise's fiscal year, the disclosure specified in paragraph 11 of this Statement shall be made (except the pro forma amounts for interim periods of prior fiscal years called for by paragraph 11(c) will not be disclosed) and in addition, financial information for the pre-change interim periods of that fiscal year shall be restated by applying the newly adopted accounting principle to those pre-change interim periods. Whenever financial information that includes those pre-change interim periods is presented, it shall be presented on the restated basis.

Fourth Quarter Accounting Changes Made by Publicly Traded Companies

.14 When a publicly traded company that regularly reports interim information to its securityholders makes an accounting change during the fourth quarter of its fiscal year and does not report the data specified by paragraph 30 of *APB Opinion No. 28* [section 2071.30] in a separate fourth quarter report or in its annual report[2] to its securityholders, the disclosures about the effect of the accounting change on interim periods that are required by paragraphs 23-26 of *APB Opinion No. 28* [section 2071.23—.26] or by paragraphs 9-13 of this Statement, as appropriate, shall be made in a note to the annual financial statements for the fiscal year in which the change is made.

Amendments to Existing Pronouncement

.15 Paragraph 27 of *APB Opinion No. 28* [section 2071.27] is superseded by paragraphs 9-13 of this Statement. Paragraph 31 of that Opinion is amended by this Statement to require the additional disclosures set forth in paragraph 14.

Effective Date

.16 The provisions of this Statement shall apply to accounting changes made in interim periods ending on or after December 31, 1974.

The provisions of this Statement need not be applied to immaterial items.

---

[2] See footnote 1.

Appendix A

REPORTING A CUMULATIVE EFFECT TYPE ACCOUNTING CHANGE (OTHER THAN A CHANGE TO LIFO)

.17 The following are examples of application of *APB Opinion No. 28* [section 2071] (as amended by this Statement) and the requirements of *APB Opinion No. 20* [section 1051] as they are incorporated by reference in *APB Opinion No. 28* [section 2071]. The examples do not encompass all possible circumstances and are not intended to indicate the Board's preference for a particular format.

FACTS

.18 In the year 19x5, ABC Company decides to adopt the straight-line method of depreciation for plant equipment. The straight-line method will be used for new acquisitions as well as for previously acquired plant equipment for which depreciation had been provided on an accelerated method.

.19 These examples assume that the effects of the change are limited to the effect on depreciation, incentive compensation, and related income tax provisions and that the effect on inventories is not material. The pro forma amounts have been adjusted for an assumed 10% pre-tax effect of the change on the provisions for incentive compensation and an assumed 50% income tax rate. The per share amounts are computed assuming that throughout the two years 19x4 and 19x5, 1,000,000 shares of common stock were issued and outstanding with no potential dilution. Other data assumed for these examples are:

Period	Net Income on the Basis of Old Accounting Principle (Accelerated Depreciation)	Gross Effect of Change to Straight-Line Depreciation	Gross Effect Less Income Taxes	Net Effect After Incentive Compensation and Related Income Taxes
Prior to first quarter 19x4		$ 20,000	$ 10,000	$ 9,000
First quarter 19x4	$1,000,000	30,000	15,000	13,500
Second quarter 19x4	1,200,000	70,000	35,000	31,500
Third quarter 19x4	1,100,000	50,000	25,000	22,500
Fourth quarter 19x4	1,100,000	80,000	40,000	36,000
Total at beginning of 19x5	$4,400,000	$250,000	$125,000	$112,500
First quarter 19x5	$1,059,500	$ 90,000	$ 45,000	$ 40,500
Second quarter 19x5	1,255,000	100,000	50,000	45,000
Third quarter 19x5	1,150,500	110,000	55,000	49,500
Fourth quarter 19x5	1,146,000	120,000	60,000	54,000
	$4,611,000	$420,000	$210,000	$189,000

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

EXAMPLE 1

.20 The change in depreciation method is made in the first quarter of 19x5. The manner of reporting the change in the first quarter of 19x5, with comparative information for the first quarter of 19x4, is as follows:

	Three Months Ended March 31,	
	19x5	19x4
Income before cumulative effect of a change in accounting principle	$1,100,000	$1,000,000
Cumulative effect on prior years (to December 31, 19x4) of changing to a different depreciation method (Note A)	125,000	
Net income	$1,225,000	$1,000,000
Amounts per common share:		
Income before cumulative effect of a change in accounting principle	$1.10	$1.00
Cumulative effect on prior years (to December 31, 19x4) of changing to a different depreciation method (Note A)	.13	
Net income	$1.23	$1.00
Pro forma amounts assuming the new depreciation method is applied retroactively (Note A):		
Net income	$1,100,000	$1,013,500
Net income per common share	$1.10	$1.01

NOTE A: Change in Depreciation Method for Plant Equipment

In the first quarter of 19x5, the method of computing depreciation of plant equipment was changed from the . . . (state previous method) . . . used in prior years, to the straight-line method . . . (state justification for the change in method) . . . and the new method has been applied to equipment acquisitions of prior years. The $125,000 cumulative effect of the change on prior years (after reduction for income taxes of $125,000) is included in income of the first quarter of 19x5. The effect of the change on the first quarter of 19x5 was to increase income before cumulative effect of a change in accounting principle $40,500 ($.04 per share) and net income $165,500 ($.17 per share). The pro forma amounts reflect the effect of retroactive application on depreciation, the change in provisions for incentive compensation that would have been made in 19x4 had the new method been in effect, and related income taxes.

EXAMPLE 2

.21 Assume the same facts as in Example 1, except that the change is made in the third quarter of 19x5.

The manner of reporting the change in the third quarter of 19x5, with year-to-date information and comparative information for similar periods of 19x4, is as follows:

	Three Months Ended September 30,		Nine Months Ended September 30,	
	19x5	19x4	19x5	19x4
Income before cumulative effect of a change in accounting principle	$1,200,000	$1,100,000	$3,600,000	$3,300,000
Cumulative effect on prior years (to December 31, 19x4) of changing to a different depreciation method (Note A)			125,000	
Net income	$1,200,000	$1,100,000	$3,725,000	$3,300,000
Amounts per common share:				
Income before cumulative effect of a change in accounting principle	$1.20	$1.10	$3.60	$3.30
Cumulative effect on prior years (to December 31, 19x4) of changing to a different depreciation method (Note A)			.13	
Net income	$1.20	$1.10	$3.73	$3.30
Pro forma amounts assuming the new depreciation method is applied retroactively (Note A):				
Net income	$1,200,000	$1,122,500	$3,600,000	$3,367,500
Net income per common share	$1.20	$1.12	$3.60	$3.37

The next page is 8273.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

NOTE A: Change in Depreciation Method for Plant Equipment

In the third quarter of 19x5, the method of computing depreciation of plant equipment was changed from the . . . (state previous method) . . . used in prior years, to the straight-line method . . . (state justification for the change in method) . . . and the new method has been applied to equipment acquisitions of prior years. The $125,000 cumulative effect of the change on prior years (after reduction for income taxes of $125,000) is included in income of the nine months ended September 30, 19x5. The effect of the change on the three months ended September 30, 19x5 was to increase net income $49,500 ($.05 per share); the effect of the change on the nine months ended September 30, 19x5 was to increase income before cumulative effect of a change in accounting principle $135,000 ($.14 per share) and net income $260,000 ($.26 per share). The pro forma amounts reflect the effect of retroactive application on depreciation, the change in provisions for incentive compensation that would have been made in 19x4 had the new method been in effect, and related income taxes. The effect of the change on the first quarter of 19x5 was to increase income before cumulative effect of a change in accounting principle $40,500 ($.04 per share) to $1,100,000 ($1.10 per share) and net income $165,500 ($.17 per share) to $1,225,000 ($1.23 per share); the effect of the change on the second quarter was to increase net income $45,000 ($.04 per share) to $1,300,000 ($1.30 per share).

Alternatively, the last sentence of Note A could be replaced with the following tabular disclosure:

The effect of the change on the first and second quarters of 19x5 is as follows:

	Three Months Ended	
	March 31, 19x5	June 30, 19x5
Net income as originally reported*	$1,059,500	$1,255,000
Effect of change in depreciation method	40,500	45,000
Income before cumulative effect of a change in accounting principle	1,100,000	1,300,000
Cumulative effect on prior years (to December 31, 19x4) of changing to a different depreciation method	125,000	
Net income as restated	$1,225,000	$1,300,000
Per share amounts:		
Net income as originally reported*	$1.06	$1.26
Effect of change in depreciation method	.04	.04
Income before cumulative effect of a change in accounting principle	1.10	1.30
Cumulative effect on prior years (to December 31, 19x4) of changing to a different depreciation method	.13	
Net income as restated	$1.23	$1.30

* Disclosure of net income as originally reported is not required.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Appendix B

REPORTING A CHANGE TO THE LIFO METHOD OF INVENTORY PRICING

.22 The following are examples of application of *APB Opinion No. 28* [section 2071] (as amended by this Statement) and the requirements of *APB Opinion No. 20* [section 1051] as they are incorporated by reference in *APB Opinion No. 28* [section 2071]. The examples do not encompass all possible circumstances and are not intended to indicate the Board's preference for a particular format.

FACTS

.23 In the year 19x5, XYZ Company decides to change to the LIFO method of inventory pricing. These examples assume that the effects of the change are limited to the effect on inventory, incentive compensation, and related income tax provisions. A 10% pre-tax effect of the change on incentive compensation and a 50% income tax rate are assumed. The per share amounts are computed assuming that throughout 19x4 and 19x5, 1,000,000 shares of common stock were issued and outstanding with no potential dilution. Other data assumed for these examples are:

Period	Net Income on the Basis of Old Accounting Principle	Gross Effect of Change to LIFO	Net Effect After Incentive Compensation and Income Taxes
First quarter 19x5	$1,095,500	$(90,000)	$(40,500)
Second quarter 19x5	1,295,000	(100,000)	(45,000)
Third quarter 19x5	1,194,500	(110,000)	(49,500)
Fourth quarter 19x5	1,194,000	(120,000)	(54,000)
	$4,779,000	$(420,000)	$(189,000)

EXAMPLE 3

.24 The change to LIFO is made in the first quarter of 19x5. The manner of reporting the change in the first quarter of 19x5, with comparative information for the first quarter of 19x4, is as follows:

	Three Months Ended March 31,	
	19x5	19x4
Net income (Note A)	$1,055,000	$1,000,000
Net income per common share (Note A)	$1.06	$1.00

NOTE A: Change to LIFO Method of Inventory Pricing

In the first quarter of 19x5, the Company changed its method of inventory pricing from . . . (state previous method) . . . used previously to the LIFO method because . . . (state justification for change and reasons for not disclosing a cumulative effect on, and pro forma amounts for, prior periods). The effect of the change on the first quarter of 19x5 was to decrease net income $40,500 ($.04 per share).

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

EXAMPLE 4

.25 Assume the same facts as in Example 3, except that the change is made in the third quarter of 19x5.

The manner of reporting the change in the third quarter of 19x5, with year-to-date information and comparative information for similar periods of 19x4, is as follows:

	Three Months Ended September 30,		Nine Months Ended September 30,	
	19x5	19x4	19x5	19x4
Net income (Note A)	$1,145,000	$1,200,000	$3,450,000	$3,400,000
Net income per common share (Note A)	$1.15	$1.20	$3.45	$3.40

NOTE A: Change to LIFO Method of Inventory Pricing

In the third quarter of 19x5, the Company changed its method of inventory pricing from . . . (state previous method) . . . used previously to the LIFO method because . . . (state justification for change and reasons for not disclosing a cumulative effect on, and pro forma amounts for, prior periods). The effect of the change on the three months and nine months ended September 30, 19x5 was to decrease net income $49,500 ($.05 per share) and $135,000 ($.14 per share), respectively. The effect of the change on the first and second quarters of 19x5 was to decrease net income $40,500 ($.04 per share) to $1,055,000 ($1.06 per share) and $45,000 ($.05 per share) to $1,250,000 ($1.25 per share), respectively.

Alternatively, the last sentence of Note A could be replaced with the following tabular disclosure:

The effect of the change on the first and second quarters of 19x5 is as follows:

	Three Months Ended	
	March 31, 19x5	June 30, 19x5
Net income as originally reported*	$1,095,500	$1,295,000
Effect of change to LIFO method of inventory pricing	(40,500)	(45,000)
Net income as restated	$1,055,000	$1,250,000
Per share amounts:		
Net income as originally reported*	$1.10	$1.30
Effect of change to LIFO method of inventory pricing	(.04)	(.05)
Net income as restated	$1.06	$1.25

*Disclosure of net income as originally reported is not required.

AC Section 2081

*Financial Reporting for Segments of a Business Enterprise**

[Source: FASB Statement No. 14, as amended.]

December 1976

INTRODUCTION

.001 In recent years, many business enterprises have broadened the scope of their activities into different industries, foreign countries, and markets. This Statement requires that the financial statements of a business enterprise (hereinafter enterprise) include information about the enterprise's operations in different industries, its foreign operations and export sales, and its major customers. This Statement also requires that an enterprise operating predominantly or exclusively in a single industry identify that industry.

.002 Appendix A contains background information. Appendix B sets forth the basis for the Board's conclusions, including alternatives considered and reasons for accepting some and rejecting others. Appendix C describes two systems that have been developed for classifying business activities, and Appendix D describes a number of factors to be considered in grouping products and services by industry lines. An illustration of applying paragraph .015(b) is presented in Appendix E, and illustrations of the disclosures required by this Statement are presented in Appendix F.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Inclusion in Financial Statements

.003 When an enterprise issues a complete set of financial statements that present financial position at the end of the enterprise's fiscal year and results of operations and changes in financial posi-

---

* See section 2083, *Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*

tion for that fiscal year in conformity with generally accepted accounting principles, those financial statements shall include certain information relating to:

a) The enterprise's operations in different industries—paragraphs .009-.030.

b) Its foreign operations and export sales—paragraphs .031-.038.

c) Its major customers—paragraph .039.

If such statements are presented for more than one fiscal year, the information required by this Statement shall be presented for each such year, except as provided in paragraph .041.

[.004] [Superseded, effective December 1, 1977, by FASB Statement No. 18.] (See section 2082.)

Purpose of Segment Information

.005 The purpose of the information required to be reported by this Statement is to assist financial statement users in analyzing and understanding the enterprise's financial statements by permitting better assessment of the enterprise's past performance and future prospects. As noted in paragraph .076, information prepared in conformity with this Statement may be of limited usefulness for comparing a segment of one enterprise with a similar segment of another enterprise.

Accounting Principles Used in Preparing Segment Information

.006 The information required to be reported by this Statement is a disaggregation of the consolidated financial information [1] included

[1] The term "consolidated financial information" is used herein to refer to aggregate information relating to an enterprise as a whole whether or not the enterprise has consolidated subsidiaries.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

in the enterprise's financial statements. The accounting principles underlying the disaggregated information should be the same accounting principles as those underlying the consolidated information, except that most intersegment transactions that are eliminated from consolidated financial information are included in segment information (see paragraph .008). For example, a segment for which information is required to be reported by this Statement may include a consolidated subsidiary that prepares separate financial statements. Amounts reported in the subsidiary's financial statements sometimes differ from amounts included in consolidation for reasons other than intersegment transactions, for instance, because the subsidiary was acquired in a business combination accounted for by the purchase method. In that event, the segment information required to be reported by this Statement with respect to the consolidated financial statements shall be based on the amounts included in consolidation, not on the amounts reported in the subsidiary's financial statements.

.007 Enterprises are not required by this Statement to disaggregate financial information pertaining to unconsolidated subsidiaries or other unconsolidated investees. Unconsolidated subsidiaries and investments in corporate joint ventures and 50 percent or less owned companies are normally accounted for by the equity method, and financial information about equity method investees is required to be disclosed in the investor's financial statements in accordance with paragraph 20 of *APB Opinion No. 18* [section 5131.20]. "The Equity Method of Accounting for Investments in Common Stock." In addition, *ARB No. 43,* Chapter 12 [section 1081], "Foreign Operations and Foreign Exchange," requires the disclosure of certain financial information about foreign subsidiaries of an enterprise. This Statement does not amend those disclosure requirements. However, in addition to those disclosures, identification shall be made of both the industries and the geographic areas in which the equity method investees operate. Also, paragraph .027(c) of this Statement requires special disclosures with respect to an equity method investee whose operations are vertically integrated with those of a reportable segment of the enterprise. Disaggregation of financial information pertaining to unconsolidated subsidiaries and other unconsolidated equity method investees is encouraged when that is considered to be desirable for an understanding of the enterprise's operations. When a complete set of financial statements that present financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles is presented for a subsidiary, corporate joint venture,

or 50 percent or less owned investee, each such entity is considered to be an enterprise as that term is used in this Statement and thus is subject to its requirements whether those financial statements are issued separately or included in another enterprise's financial report.

.008 Transactions between a parent and its subsidiaries or between two subsidiaries are eliminated in preparing consolidated financial statements (see paragraph 6 of *ARB No. 51* [section 2051.07], "Consolidated Financial Statements"). In preparing the information required to be reported by this Statement, however, transactions between the segments of an enterprise shall be included in the segment information. Thus, for example, revenue reported for a segment includes both sales to unaffiliated customers (i.e., customers outside the enterprise) and intersegment sales or transfers. Similarly, expenses relating both to sales to unaffiliated customers and to intersegment sales or transfers are deducted in measuring a segment's profitability. Exceptions to the general rule that intersegment transactions are not eliminated from segment information are provided in paragraphs .010(c)-.010(e) for certain intersegment advances and loans and related interest revenue and expense. Paragraphs .030 and .038 require reconciliation of segment information with amounts reported in consolidated financial statements.

Information about an Enterprise's Operations in Different Industries

.009 The financial statements of an enterprise shall include certain information about the industry segments of the enterprise. Criteria for determining industry segments for which information shall be reported are in paragraphs .011-.021. The type of information to be presented for each reportable industry segment is specified in paragraphs .022-.027. Requirements for presenting that information in financial statements are in paragraphs .028-.030.

Definitions

.010 Certain terms are defined for purposes of this Statement as follows:

a) *Industry segment.*[2] A component of an enterprise engaged in providing a product or service or a group of related products

---

[2] The meaning of the term "industry segment" as it is used in this Statement is different from the use of the term "segment" in pronouncements of the Cost Accounting Standards Board.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

and services primarily to unaffiliated customers (i.e., customers outside the enterprise) for a profit.[3] By defining an industry segment in terms of products and services that are sold primarily to unaffiliated customers, this Statement does not require the disaggregation of the vertically integrated operations of an enterprise.

b) *Reportable segment.* An industry segment (or, in certain cases, a group of two or more closely related industry segments—see paragraph .019) for which information is required to be reported by this Statement.

c) *Revenue.* The revenue of an industry segment includes revenue both from sales[4] to unaffiliated customers (i.e., revenue from customers outside the enterprise as reported in the enterprise's income statement) and from intersegment sales or transfers, if any, of products and services similar to those sold to unaffiliated customers.[5] Interest from sources outside the enterprise and interest earned on intersegment trade receivables is included in revenue if the asset on which the interest is earned is included among the industry segment's identifiable assets (see paragraph .010(e)), but interest earned on advances or loans to other industry segments is not included.[6] For purposes of this Statement, revenue from intersegment sales or transfers shall be accounted for on the basis used by the enterprise to price the intersegment sales or transfers.

d) *Operating profit or loss.* The operating profit or loss of an industry segment is its revenue as defined in paragraph .010(c)

---

[3] In some industries, it is normal practice for an enterprise to purchase and sell substantially identical commodities to minimize transportation or other costs. In those situations, sales and purchases of substantially identical commodities shall be netted for the purpose of determining whether a product or service or a group of related products and services is sold primarily to unaffiliated customers. Although those sales and purchases are netted for the purpose of identifying an industry segment, it is not intended that this rule change an enterprise's accounting practice with respect to determining the revenue of the enterprise or any of its industry segments.

[4] For convenience, the term "sales" is used in this Statement to include the sale of a product, the rendering of a service, and other types of transactions by which revenue is earned.

[5] Intersegment billings for the cost of shared facilities or other jointly incurred costs do not represent intersegment sales or transfers as that term is used in this Statement.

[6] Interest earned on advances or loans to other industry segments is included in computing the operating profit or loss of an industry segment whose operations are principally of a financial nature (e.g., banking, insurance, leasing, or financing).

minus all operating expenses. As used herein, operating expenses include expenses that relate to both revenue from sales to unaffiliated customers and revenue from intersegment sales or transfers; those operating expenses incurred by an enterprise that are not directly traceable to an industry segment shall be allocated on a reasonable basis among those industry segments for whose benefit the expenses were incurred (see paragraph .024). For purposes of this Statement, intersegment purchases shall be accounted for on the same basis as intersegment sales or transfers (i.e., on the basis used by the enterprise to price the intersegment sales or transfers—see the last sentence of paragraph .010(c)). None of the following shall be added or deducted, as the case may be, in computing the operating profit or loss of an industry segment: revenue earned at the corporate level and not derived from the operations of any industry segment; general corporate expenses;[7] interest expense;[8] domestic and foreign income taxes; equity in income or loss from unconsolidated subsidiaries and other unconsolidated investees; gain or loss on discontinued operations (as defined in *APB Opinion No. 30* [section 2012], "Reporting the Results of Operations"); extraordinary items; minority interest; and the cumulative effect of a change in accounting principles (see *APB Opinion No. 20* [section 1051], "Accounting Changes").

e) *Identifiable assets.* The identifiable assets of an industry segment are those tangible and intangible enterprise assets that are used by the industry segment, including (i) assets that are used exclusively by that industry segment and (ii) an allocated portion of assets used jointly by two or more industry segments. Assets used jointly by two or more industry segments shall be allocated among the industry segments on a reasonable basis. Because the assets of an industry segment that transfers products or services to another industry segment are not used

---

[7] Some of the expenses incurred at an enterprise's central administrative office may not be general corporate expenses, but rather may be operating expenses of industry segments that should therefore be allocated to those industry segments. The nature of an expense rather than the location of its incurrence shall determine whether it is an operating expense. Only those expenses identified by their nature as operating expenses shall be allocated as operating expenses in computing an industry segment's operating profit or loss.

[8] Interest expense is deducted in computing the operating profit or loss of an industry segment whose operations are principally of a financial nature (e.g., banking, insurance, leasing, or financing).

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

in the operations of the receiving segment, no amount of those assets shall be allocated to the receiving segment. Assets that represent part of an enterprise's investment in an industry segment, such as goodwill, shall be included in the industry segment's identifiable assets.[9] Assets maintained for general corporate purposes (i.e., those not used in the operations of any industry segment) shall not be allocated to industry segments. The identifiable assets of an industry segment shall not include advances or loans to or investments in another industry segment, except that advances or loans to other industry segments shall be included in the identifiable assets of a financial segment because the income therefrom is included in computing the financial segment's operating profit or loss (see footnote 6). Asset valuation allowances such as the following shall be taken into account in computing the amount of an industry segment's identifiable assets: allowance for doubtful accounts, accumulated depreciation, and marketable securities valuation allowance.

Determining Reportable Segments

.011 The reportable segments of an enterprise shall be determined by (a) identifying the individual products and services from which the enterprise derives its revenue, (b) grouping those products and services by industry lines into industry segments (see paragraphs .012-.014), and (c) selecting those industry segments that are significant with respect to the enterprise as a whole (see paragraphs .015-.021).

Grouping Products and Services by Industry Lines

.012 Several systems have been developed for classifying business activities, such as the Standard Industrial Classification (SIC) and the Enterprise Standard Industrial Classification (ESIC). (The SIC and ESIC systems are described in Appendix C to this Statement.) The Board has examined those systems and has judged that none is, by itself, suitable to determine industry segments for purposes of this Statement. Moreover, although certain characteristics can be identified that assist in differentiating among industries (such as those discussed in Appendix D to this Statement), no single set of characteristics is universally applicable in determining the industry segments of all enterprises, nor is any single characteristic deter-

---

[9] Any related depreciation or amortization expense is deducted in determining the operating profit of the industry segment.

minative in all cases. Consequently, determination of an enterprise's industry segments must depend to a considerable extent on the judgment of the management of the enterprise.

.013 Many enterprises presently accumulate information about revenue and profitability on a less-than-total-enterprise basis for internal planning and control purposes. Frequently, that type of information is maintained by profit centers for individual products and services or for groups of related products and services, particularly with respect to an enterprise's domestic operations. The term "profit center" is used in this Statement to refer only to those components of an enterprise *that sell primarily to outside markets* and *for which information about revenue and profitability is accumulated.* An enterprise's existing profit centers—the smallest units of activity for which revenue and expense information is accumulated for internal planning and control purposes—represent a logical starting point for determining the enterprise's industry segments. If an enterprise's existing profit centers cross industry lines, it will be necessary to disaggregate its existing profit centers into smaller groups of related products and services (except as provided in paragraph .014). If an enterprise operates in more than one industry but does not presently accumulate any information on a less-than-total-enterprise basis (i.e., its only profit center is the enterprise as a whole), it shall disaggregate its operations along industry lines (except as provided in paragraph .014).

.014 Industry segmentation on a worldwide basis is a desirable objective but it may be impracticable for some enterprises. To the extent that revenue and profitability information is accumulated along industry lines for an enterprise's foreign operations, as defined in paragraph .031, or that it would be practicable to do so, industry segments shall be determined on a worldwide basis. To the extent that it is impracticable to disaggregate part or all of its foreign operations along industry lines, the enterprise shall disaggregate along industry lines its domestic operations and its foreign operations for which disaggregation is practicable and shall treat the aggregate of its foreign operations for which disaggregation is not practicable as a single industry segment. When that segment qualifies as a reportable industry segment (see paragraphs .015-.021), disclosure shall be made of the types of industry operations included in the foreign operations that have not been disaggregated.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Selecting Reportable Segments

.015 Each industry segment that is significant to an enterprise as a whole shall be identified as a reportable segment. For purposes of this Statement, an industry segment shall be regarded as significant—and therefore identified as a reportable segment (see paragraph .016)—if it satisfies one or more of the following tests. The tests shall be applied separately for each fiscal year for which financial statements are presented, except as provided in paragraph .041.

a) Its revenue (including both sales to unaffiliated customers and intersegment sales or transfers) is 10 percent or more of the combined revenue (sales to unaffiliated customers and intersegment sales or transfers) of all of the enterprise's industry segments.

b) The absolute amount of its operating profit or operating loss is 10 percent or more of the greater, in absolute amount, of:

   (i) The combined operating profit of all industry segments that did not incur an operating loss, or

   (ii) The combined operating loss of all industry segments that did incur an operating loss. (Appendix E illustrates the application of paragraph .015(b).)

c) Its identifiable assets are 10 percent or more of the combined identifiable assets of all industry segments.

Revenue, operating profit or loss, and identifiable assets relating to those foreign operations that have not been disaggregated along industry lines on grounds of impracticability (see paragraph .014) shall be included in computing the combined revenue, combined operating profit or operating loss, and combined identifiable assets of the enterprise's industry segments.

.016 The results of applying the percentage tests in paragraph .015 shall be evaluated from the standpoint of interperiod comparability before final determination of an enterprise's reportable segments is made. For instance, interperiod comparability would most likely require that an industry segment that has been significant in the past and is expected to be significant in the future be regarded as a reportable segment even though it fails to satisfy the tests in paragraph .015 in the current year. Conversely, a relatively insignificant industry segment may happen to satisfy the tests in paragraph .015 in the current fiscal year because its revenue

or operating profit or loss is abnormally high or the combined revenue or operating profit or loss of all industry segments is abnormally low. In that case, it may be inappropriate to regard it as a reportable segment. Appropriate explanation of such circumstances shall be included as a part of the enterprise's segment information.

.017 The reportable segments of an enterprise shall represent a substantial portion of the enterprise's total operations. The following test shall be applied to determine whether a substantial portion of an enterprise's operations is explained by its segment information: The combined revenue from sales to unaffiliated customers of all reportable segments (that is, revenue not including intersegment sales or transfers) shall constitute at least 75 percent of the combined revenue from sales to unaffiliated customers of all industry segments. The test shall be applied separately for each fiscal year for which financial statements are presented, except as provided in paragraph .041. Revenue relating to those foreign operations that have not been disaggregated along industry lines on grounds of impracticability shall be included in the denominator of the computation required by this paragraph and will be included in the numerator if those operations have been identified (in accordance with paragraphs .014 and .015) as a reportable segment.

.018 If the industry segments identified as reportable in accordance with paragraphs .015 and .016 do not satisfy the 75-percent test in paragraph .017, additional industry segments shall be identified as reportable segments (subject to the provisions of paragraph .019) until the 75-percent test is met.

.019 The Board recognizes the need for a practical limit to the number of industry segments for which an enterprise reports information; beyond that limit, segment information may become overly detailed. Without attempting to define that limit precisely, the Board suggests that as the number of industry segments that would be identified as reportable segments in accordance with paragraphs .015-.018 increases above 10, the question of whether a practical limit has been reached comes increasingly into consideration, and combining the most closely related industry segments into broader reportable segments may be appropriate. Combinations shall be made, however, only to the extent necessary to contain the number of reportable segments within practical limits while still meeting the 75-percent test.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.020 An enterprise may operate exclusively in a single industry or a dominant portion of an enterprise's operations may be in a single industry segment with the remaining portion in one or more other industry segments. The Board has concluded that the disclosures required by paragraphs .022-.030 of this Statement need not be applied to a dominant industry segment, except that the financial statements of an enterprise that operates predominantly or exclusively in a single industry shall identify that industry. An industry segment may be regarded as dominant if its revenue, operating profit or loss, and identifiable assets (as defined in paragraphs .010(c)-(e)) each constitute more than 90 percent of related combined totals for all industry segments, and no other industry segment meets any of the 10-percent tests in paragraph .015.

.021 Paragraphs .011-.020 and the guidelines for grouping products and services into industry segments set forth in Appendix D are not intended to prohibit a more detailed disaggregation if that is considered to be desirable for an understanding of the enterprise's operations.

Information to Be Presented

.022 The following shall be presented for each of an enterprise's reportable segments determined in accordance with paragraphs .011-.021 (including those foreign operations that have not been disaggregated along industry lines on grounds of impracticability —see paragraph .014) and in the aggregate for the remainder of the enterprise's industry segments not deemed reportable segments:

a) Revenue information as set forth in paragraph .023.
b) Profitability information as set forth in paragraphs .024 and .025.
c) Identifiable assets information as set forth in paragraph .026.
d) Other related disclosures as set forth in paragraph .027.

In addition, the types of products and services from which the revenue of each reportable segment is derived shall be identified, and the accounting policies relevant to the information reported for industry segments shall be described to the extent not adequately explained by the disclosures of the enterprise's accounting policies required by *APB Opinion No. 22* [section 2045], "Disclosure of Accounting Policies." Presentation of additional information for some or all of an enterprise's reportable segments beyond that specified in paragraphs .023-.027 may be considered to be desirable, and this Statement does not preclude those additional disclosures.

.023 *Revenue.* Sales to unaffiliated customers and sales or transfers to other industry segments of the enterprise shall be separately disclosed in presenting revenue of a reportable segment. As indicated in paragraph .010(c), for purposes of this Statement sales or transfers to other industry segments shall be accounted for on the basis used by the enterprise to price the intersegment sales or transfers. The basis of accounting for intersegment sales or transfers shall be disclosed. If the basis is changed, disclosure shall be made of the nature of the change and its effect on the reportable segments' operating profit or loss in the period of change.

.024 *Profitability.* Operating profit or loss as defined in paragraph .010(d) shall be presented for each reportable segment. As part of its segment information, an enterprise shall explain the nature and amount of any unusual or infrequently occurring items (see paragraph 26 of *APB Opinion No. 30* [section 2012.26]) reported in its consolidated income statement that have been added or deducted in computing the operating profit or loss of a reportable segment in accordance with paragraph .010(d). Methods used to allocate operating expenses among industry segments in computing operating profit or loss should be consistently applied from period to period (but, if changed, disclosure shall be made of the nature of the change and its effect on the reportable segments' operating profit or loss in the period of change).

.025 *Other profitability information.* In addition to presenting operating profit or loss as required by paragraph .024, an enterprise may choose to present some other measure of profitability for some or all of its segments. If the enterprise elects to present a measure of contribution to operating profit or loss, the enterprise shall describe the differences between contribution and operating profit or loss. If the enterprise elects to present net income or a measure of profitability between operating profit or loss and net income, the nature and amount of each category of revenue or expense that was added or deducted and the methods of allocation, if any, shall be disclosed. Those methods should be consistently applied from period to period (but, if changed, disclosure shall be made of the nature and effect of the change in the period of change).

.026 *Identifiable assets.* The aggregate carrying amount of identifiable assets as defined in paragraph .010(e) shall be presented for each reportable segment.

.027 *Other related disclosures.* Disclosures relating to the information for reportable segments shall be made as follows:

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

a) Disclosure shall be made of the aggregate amount of depreciation, depletion, and amortization expense for each reportable segment.

b) Disclosure shall be made of the amount of each reportable segment's capital expenditures, i.e., additions to its property, plant, and equipment.

c) For each reportable segment disclosure shall be made of the enterprise's equity in the net income from and investment in the net assets of unconsolidated subsidiaries and other equity method investees whose operations are vertically integrated with the operations of that segment. Disclosure shall also be made of the geographic areas in which those vertically integrated equity method investees operate.

d) Paragraph 17 of *APB Opinion No. 20* [section 1051.17] requires that the effect on income of a change in accounting principle be disclosed in the financial statements of an enterprise in the period in which the change is made. Disclosure shall also be made of the effect of the change on the operating profit of reportable segments in the period in which the change is made.[10]

Methods of Presentation

.028 Information about the reportable segments of a business enterprise shall be included in the enterprise's financial statements in any of the following ways:

a) Within the body of the financial statements, with appropriate explanatory disclosures in the footnotes to the financial statements.

b) Entirely in the footnotes to the financial statements.

c) In a separate schedule that is included as an integral part of the financial statements. If, in a report to securityholders, that schedule is located on a page that is not clearly a part of the financial statements, the schedule shall be referenced in the financial statements as an integral part thereof.

---

[10] The pro forma effects of retroactive application, which are required to be disclosed on a consolidated basis by paragraph 21 of *APB Opinion No. 20* [section 1051.21], need not be disclosed for individual reportable segments. Also, the pro forma supplemental information relating to a business combination accounted for by the purchase method required to be presented by paragraph 96 of *APB Opinion No. 16* [section 1091.96], "Business Combinations," need not be presented for individual reportable segments.

.029 Financial information such as revenue, operating profit or loss, and identifiable assets of reportable segments shall be presented as dollar amounts. Corresponding percentages may be shown in addition to dollar amounts.

.030 The information required to be presented by paragraphs .022-.027 for individual reportable segments and in the aggregate for industry segments not deemed reportable shall be reconciled to related amounts in the financial statements of the enterprise as a whole, as follows: revenue shall be reconciled to revenue reported in the consolidated income statement, and operating profit or loss shall be reconciled to pretax income from continuing operations (before gain or loss on discontinued operations, extraordinary items, and cumulative effect of a change in accounting principle) in the consolidated income statement. Also, identifiable assets shall be reconciled to consolidated total assets, with assets maintained for general corporate purposes separately identified in the reconciliation. An illustration is presented in Appendix F to this Statement.

Information about Foreign Operations and Export Sales

.031 The financial statements of an enterprise shall include information about its foreign operations. The features that identify an operation as foreign vary among enterprises. Thus, the identification of foreign operations will depend on the facts and circumstances of the particular enterprise. For purposes of this Statement, an enterprise's foreign operations include those revenue-producing operations (except for unconsolidated subsidiaries and other unconsolidated investees (see paragraph .007)) that (a) are located outside of the enterprise's home country (the United States for U. S. enterprises)[11] and (b) are generating revenue either from sales to unaffiliated customers or from intraenterprise sales or transfers between geographic areas.[12] Similarly, an enterprise's

---

[11] An enterprise whose home country is other than the United States but that prepares financial statements in conformity with U.S. generally accepted accounting principles shall classify operations outside of its home country as foreign operations.

[12] Difficulties may arise in classifying the activities of certain types of enterprises. The following examples may provide useful guidelines: (1) Determination of whether the employment of an enterprise's mobile assets, such as off-shore drilling rigs or ocean-going vessels, constitutes foreign operations should depend on whether such assets are normally identified with operations located and generating revenue from outside the home country. If they are normally identified with the enterprise's foreign operations, revenue generated from abroad would be considered foreign revenue. If they are

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

domestic operations include those revenue-producing operations of the enterprise located in the enterprise's home country that generate revenue either from sales to unaffiliated customers or from intraenterprise sales or transfers between geographic areas. Operations, either domestic or foreign (and regardless of whether part of a branch or a division of the enterprise or part of a consolidated subsidiary), should have identified with them the revenues generated by those operations, the assets employed in or associated with generating those revenues, and the costs and expenses incurred in generating those revenues or employing those assets.

.032 The information specified in paragraph .035 shall be presented for (1) an enterprise's foreign operations, either in the aggregate or, if appropriate under paragraph .033, by geographic area, and (2) its domestic operations,[13] if either of the following conditions is met:

a) Revenue generated by the enterprise's foreign operations from sales to unaffiliated customers is 10 percent or more of consolidated revenue as reported in the enterprise's income statement.

b) Identifiable assets of the enterprise's foreign operations are 10 percent or more of consolidated total assets as reported in the enterprise's balance sheet.

.033 If an enterprise's foreign operations are conducted in two or more geographic areas as defined in paragraph .034, the information specified in paragraph .035 shall be presented separately for each significant foreign geographic area, and in the aggregate for all other foreign geographic areas not deemed significant. A geographic area shall be regarded as *significant,* for the purpose of applying this paragraph, if its revenue from sales to unaffiliated customers or its identifiable assets are 10 percent or more of related consolidated amounts.

---

normally identified with the enterprise's domestic operations, revenue generated from abroad would be considered export sales; (2) Services rendered by the foreign offices of a service enterprise, such as a consulting firm, having offices or facilities located both in the home country and in foreign countries would be considered foreign operations, and the revenue should be considered foreign revenue. Revenue generated abroad from services provided by domestic offices should be considered export sales.

[13] Separate information about domestic operations need not be presented if domestic operations' revenue from sales to unaffiliated customers and domestic operations' identifiable assets are less than 10 percent of related consolidated amounts.

.034 For purposes of this Statement, foreign *geographic areas* are individual countries or groups of countries as may be determined to be appropriate in an enterprise's particular circumstances. No single method of grouping the countries in which an enterprise operates into the geographic areas can reflect all of the differences among international business environments. Each enterprise shall group its foreign operations on the basis of the differences that are most important in its particular circumstances. Factors to be considered include proximity, economic affinity, similarities in business environments, and the nature, scale, and degree of interrelationship of the enterprise's operations in the various countries.

.035 The following information shall be presented for an enterprise's foreign operations and for its domestic operations as appropriate in accordance with paragraphs .032-.034:

a) Revenue as defined in paragraph .010(c), with sales to unaffiliated customers and sales or transfers between geographic areas shown separately. For purposes of this Statement, intraenterprise sales or transfers between geographic areas shall be accounted for on the basis used by the enterprise to price the intraenterprise sales or transfers. The basis of accounting for intraenterprise sales or transfers shall be disclosed. If the basis is changed, disclosure shall be made of the nature of the change and its effect in the period of change.

b) Operating profit or loss as defined in paragraph .010(d) *or* net income *or* some other measure of profitability between operating profit or loss and net income. A common level of profitability shall be reported for all geographic areas, although an enterprise may choose to report additional profitability information for some or all of its geographic areas of operations.

c) Identifiable assets as defined in paragraph .010(e).

.036 With respect to an enterprise's *domestic* operations, sales to unaffiliated customers include both (a) sales to customers within the enterprise's home country and (b) sales to customers in foreign countries, i.e., export sales. If the amount of export sales from an enterprise's home country to unaffiliated customers in foreign countries is 10 percent or more of total revenue from sales to unaffiliated customers as reported in the enterprise's consolidated income statement, that amount shall be separately reported, in the aggregate and by such geographic areas as are considered appropriate in the circumstances. The disclosure required by this

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

paragraph shall be made even if the enterprise is not required by this Statement to report information about its operations in different industries or foreign operations.

.037 Information about the foreign operations and export sales of a business enterprise may be included in the enterprise's financial statements in any of the ways identified in paragraph .028 of this Statement. Financial information shall be presented as U.S. dollar amounts; corresponding percentages may be shown in addition to dollar amounts. The geographic areas into which an enterprise's foreign operations have been disaggregated shall be identified.

.038 The information about revenue, profitability, and identifiable assets required to be presented for foreign operations shall be reconciled to related amounts in the financial statements of the enterprise as a whole, in a manner similar to that described in paragraph .030. An illustration is presented in Appendix F to this Statement.

Information about Major Customers

.039 If 10 percent or more of the revenue of an enterprise is derived from sales to any single customer, that fact and the amount of revenue from each such customer shall be disclosed. (For this purpose, a group of customers under common control shall be regarded as a single customer.) Similarly, if 10 percent or more of the revenue of an enterprise is derived from sales to domestic government agencies in the aggregate or to foreign governments in the aggregate, that fact and the amount of revenue shall be disclosed. The identity of the industry segment or segments making the sales shall be disclosed. The disclosures required by this paragraph shall be made even if the enterprise is not required by this Statement to report information about operations in different industries or foreign operations.

Restatement of Previously Reported Segment Information

.040 When prior period information about an enterprise's reportable industry segments, its foreign operations and export sales, and its major customers is being presented with corresponding information for the current period, the prior period information shall be retroactively restated (at least as far back as the effective date of this Statement—see paragraph .041) in the following circumstances, with appropriate disclosure of the nature and effect of the restatement:

a) When the financial statements of the enterprise as a whole have been retroactively restated, for example, for a change in accounting principle of the type described in paragraphs 27 and 29 of *APB Opinion No. 20* [sections 1051.27 and 1051.29] or for a business combination accounted for by the pooling of interests method.

b) When there has been a change in the way the enterprise's products and services are grouped into industry segments or a change in the way the enterprise's foreign operations are grouped[14] into geographic areas and such changes affect the segment or geographic area information being reported.

Effective Date and Transition

.041 The provisions of this Statement shall be effective for financial statements for fiscal years beginning after December 15, 1976.* Earlier application is encouraged in financial statements for periods beginning before December 16, 1976 that have not previously been issued. Information of the type required by this Statement need not be included in financial statements for periods beginning before the effective date of this Statement that are being presented for comparative purposes with financial statements for periods after the effective date, but if included, that information shall be prepared and presented in conformity with the provisions of this Statement to the extent practicable with appropriate explanation if the information for periods before the effective date is not comparable to that for periods after the effective date. [As amended, effective December 1, 1977, by FASB Statement No. 18.] (See section 2082.) [As amended, effective April 30, 1978, by FASB Statement No. 21.] (See section 2083.)

The provisions of this Statement need not be applied to immaterial items.

---

[14] Restatement is not required when an enterprise's reportable segments change as a result of a change in the nature of an enterprise's operations or as a result of applying the tests in paragraphs .015-.020.

[15] Superseded for interim periods, effective December 1, 1977, by FASB Statement No. 18.

* The provisions of this Statement were suspended by *FASB Statement No. 21* [section 2083] and need not be applied by a nonpublic enterprise as defined in that Statement pending further action by the FASB.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Appendix A

BACKGROUND INFORMATION

.042 Although the authoritative accounting literature has heretofore dealt principally with financial statements prepared on a consolidated or total-enterprise basis, several pronouncements of the Accounting Principles Board and its predecessor, the Committee on Accounting Procedure, have required business enterprises to report information on a less-than-total-enterprise basis in a limited number of areas. For example, Chapter 12 of *ARB No. 43* [section 1081] requires certain disclosures related to an enterprise's foreign operations; *APB Opinion No. 18* [section 5131] requires disclosure of information about companies accounted for by the equity method; and *APB Opinion No. 30* [section 2012] requires information about the discontinued operations of a segment of a business.

.043 Starting in the mid-1960s, a number of professional organizations, including the Financial Analysts Federation, the Financial Executives Research Foundation, and the National Association of Accountants, sponsored research studies to assess the desirability and feasibility of disclosing information for line-of-business segments in external financial reports. Several professional organizations have issued pronouncements that generally support segment reporting, including the APB (its Statement No. 2, "Disclosure of Supplemental Financial Information by Diversified Companies," issued in 1967, urged companies to report segment information voluntarily), the Financial Accounting Policy Committee of the Financial Analysts Federation, the Financial Executives Institute, the Committee on Management Accounting Practices of the National Association of Accountants, and the Accountants International Study Group.

.044 In 1969, the Securities and Exchange Commission issued requirements for reporting line-of-business information in registration statements. In 1970, those requirements were extended to annual reports filed with the SEC on Form 10-K, and in October 1974 they were extended to the annual reports to securityholders of companies filing with the SEC.

.045 In 1973, the New York Stock Exchange issued a "white paper" urging that line-of-business information at least as extensive as that required in SEC Form 10-K be included in annual reports to securityholders.

.046 In 1974, the Federal Trade Commission initiated an annual line-of-business reporting program to enable it to publish aggregate data on corporations engaged in commerce in the United States. Under the FTC program, large manufacturing companies are required to report detailed financial information for each line of business as defined by the FTC.[16]

.047 In recognition of the broadened scope of operations of many business enterprises, the need for disaggregation of enterprise-wide information expressed by many financial statement users, and the variety of present reporting practices in reports to security-holders, in April 1973 the FASB placed on its technical agenda a project on Financial Reporting for Segments of a Business Enterprise.

.048 A task force of 16 persons from industry, government, public accounting, the financial community, and academe was appointed in May 1973 to counsel the Board in preparing a Discussion Memorandum analyzing issues related to the project.

.049 A considerable number of research studies and articles on the subject were available to the Board, many of which were summarized or identified in the Discussion Memorandum. In addition, two research reports were prepared by the FASB staff. One was a survey of the existing reporting practices of 100 companies disclosing segment information in annual reports to shareholders. The other, involving field interviews of corporate executives of 30 companies, was directed primarily at identifying the decision criteria used by management for purposes of internal and external segmentation. Those research reports were included as appendixes to the Discussion Memorandum.

.050 The Board issued the Discussion Memorandum on May 22, 1974 and held a public hearing on the subject on August 1 and 2, 1974. The Board received 144 position papers, letters of comment, and outlines of oral presentations in response to the Discussion Memorandum. Twenty-one presentations were made at the public hearing.

.051 An Exposure Draft of a proposed Statement on "Financial Reporting for Segments of a Business Enterprise" was issued on

---

[16] A number of companies are challenging the FTC's line-of-business reporting program through legal proceedings.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

September 30, 1975. The Board received 233 letters of comment on the Exposure Draft.

.052 In June 1976, the Organization for Economic Cooperation and Development (OECD) adopted a "Declaration on International Investment and Multinational Enterprises," recommending certain guidelines for a code of conduct for multinational corporations. Those guidelines include, but are not limited to, the following disclosures:

a) The geographical areas where operations are carried out and the principal activities carried on therein by the parent company and the main affiliates.

b) The operating results and sales by geographical area and the sales in the major lines of business for the enterprise as a whole.

c) Significant new capital investment by geographical area and, as far as practicable, by major lines of business for the enterprise as a whole.

d) The policies followed in respect of intergroup pricing.

e) The accounting policies, including those on consolidation, observed in compiling the published information.

The OECD is made up of representatives of the governments of 24 economically developed nations of Western Europe, North America, Asia, and the South Pacific.

Appendix B

BASIS FOR CONCLUSIONS

.053 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including alternatives considered and reasons for accepting some and rejecting others.

Inclusion in Financial Statements

.054 The Board concluded that information relating to an enterprise's industry segments, foreign operations, export sales, and major customers is useful to analyze and understand the financial statements of the enterprise. Reasons for that conclusion are discussed in paragraphs .055-.074.

.055 The financial statements of an enterprise are usually prepared on a consolidated or total-enterprise basis, aggregating the financial data of the various activities of the enterprise. The principal exception to the rule of consolidation is that financial subsidiaries (such as banks, insurance companies, and finance companies) of a manufacturing company usually are not consolidated (see *ARB No. 51* [section 2051], "Consolidated Financial Statements," especially paragraphs 1-5 [sections 2051.02-.06]). Another exception to the rule of consolidation is that foreign subsidiaries sometimes are not consolidated (see *ARB No. 43*, Chapter 12 [section 1081], "Foreign Operations and Foreign Exchange," especially paragraphs 8 and 9 [sections 1081.08-.09]).

.056 Investors and lenders who acquire equity interests in or extend credit to an enterprise as a whole recognize the importance of consolidated financial statements for reporting the overall performance of the enterprise. At the same time, however, investors, credit grantors, and other financial statement users have indicated that disaggregation of total-enterprise financial data to provide information about the various segments of an enterprise, in addition to aggregate data for the enterprise, is useful to them.

.057 Those financial statement users point out that the evaluation of risk and return is the central element of investment and lending decisions—the greater the perceived degree of risk associated with an investment or lending alternative, the greater is the required rate of return to the investor or lender. If return is defined as expected cash flows to the investor or creditor, the evaluation of risk

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

involves assessment of the uncertainty surrounding both the timing and the amount of the expected cash flows to the enterprise, which in turn are indicative of potential cash flows to the investor or creditor. Users of financial statements indicate that uncertainty results, in part, from factors unique to the particular enterprise in which an investment may be made or to which credit may be extended. Uncertainty also results, in part, from factors related to the industries and geographic areas in which the enterprise operates and, in part, from national and international economic and political factors. Investors and lenders analyze factors at all of those levels to evaluate the risk and return associated with an investment or lending alternative.

.058 Information contained in an enterprise's financial statements constitutes an important input to that analysis. Financial statements provide information about conditions, trends, and ratios that assist in predicting cash flows. In analyzing an enterprise, a financial statement user often compares information about the enterprise with information about other enterprises, with industry-wide information, and with national or international economic information in general. Those comparisons are helpful in determining whether a given enterprise's operations may be expected to move with, against, or independently of developments in its industry and in the economy within which it operates.

.059 The broadening of an enterprise's activities into different industries or geographic areas complicates the analysis of conditions, trends, and ratios and, therefore, the ability to predict. The various industry segments or geographic areas of operations of an enterprise may have different rates of profitability, degrees and types of risk, and opportunities for growth. There may be differences in the rates of return on the investment commitment in the various industry segments or geographic areas and in their future capital demands.

.060 Consequently, many financial statement users have said that consolidated financial information, while important, would be more useful if supplemented with disaggregated information to assist them in analyzing the uncertainties surrounding the timing and amount of expected cash flows—and, therefore, the risks—related to an investment in or a loan to an enterprise that operates in different industries or areas of the world. Since the progress and prospects of a diversified enterprise are composites of the progress and prospects of its several parts, financial statement

users regard financial information on a less-than-total-enterprise basis as also important.

.061 Although many business enterprises presently include disaggregated financial information in reports to securityholders, in filings with the Securities and Exchange Commission and in other types of reports, the nature and extent of the information disclosed and the methods of presentation vary, and that information generally is not included in the financial statements.

.062 A few respondents to the Discussion Memorandum and the Exposure Draft contended that information on a less-than-total-enterprise basis is not useful to investors and creditors. They generally argued that investors and lenders who acquire equity interests in or extend credit to an enterprise as a whole should be concerned only with overall enterprise results as reported in its consolidated financial statements. For the reasons expressed in paragraphs .055-.061, however, the Board concluded that investors and creditors find segment information to be useful in analyzing and understanding consolidated statements and therefore in analyzing overall enterprise results.

.063 Although most respondents agreed that information on a less-than-total-enterprise basis is useful for investment and credit decisions, some said that the information should not be included in the financial statements of an enterprise, principally on two grounds:

a) Some said that while segment information may indeed be useful to investors and credit grantors, it is too analytical or interpretive to be classified as accounting information and, thus, does not belong in financial statements.

b) Others said that disaggregated information is not susceptible to the same degree of verifiability as consolidated information.

.064 The Board has given careful consideration to those points of view because inclusion of segment information in financial statements is an important question to be resolved in this project. The Board does not agree that segment information of the type required to be reported by this Statement is too analytical or interpretive to be properly classified as accounting information. The information called for by this Statement is a rearrangement

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

(that is, a disaggregation) of information included in an enterprise's consolidated financial statements, as is the information required in the statement of changes in financial position a rearrangement of information reported in or underlying the balance sheet and income statement. Thus, in the Board's judgment, this Statement does not go beyond or enlarge the boundaries of accounting, as some have contended.

.065 As to the question of verifiability, the Board recognizes that disaggregated information is subject to certain limitations and that some of it may not be susceptible to the *same degree* of verifiability as some of the consolidated information. The Board believes, however, that the more critical question to be addressed is whether the disaggregated information is *sufficiently* verifiable to warrant its inclusion in an enterprise's financial statements.

.066 Verifiability is identified in *APB Statement No. 4* [sections 1021-1029], "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises," as one of the qualitative objectives of financial accounting. Paragraph 90 [section 1024.18] of that Statement says:

> Verifiable financial accounting information provides results that would be substantially duplicated by independent measurers using the same measurement methods.

That paragraph further states:

> Measurements cannot be completely free from subjective opinions and judgments. The process of measuring and presenting information must use human agents and human reasoning and therefore is not founded solely on an "objective reality." Nevertheless, the usefulness of information is enhanced if it is verifiable, that is, if the attribute or attributes selected for measurement and the measurement methods used provide results that can be corroborated by independent measurers.

.067 Other qualitative objectives set forth in paragraphs 87-93 of *APB Statement No. 4* [section 1024.15-.21] are relevance (described as "the primary qualitative objective"), understandability, neutrality, timeliness, and comparability. Paragraph 94 [section 1024.22] sets forth a final qualitative objective, completeness: "Complete financial accounting information includes all financial accounting data that reasonably fulfill the requirements of the other qualitative objectives." Paragraph 94 [section 1024.22] goes on to say that the qualitative objectives are

not absolute but, rather, must be met "in reasonable degree." That is, an appropriate balance must be maintained among the objectives. For example, some degree of verifiability might have to be sacrificed to improve the relevance of information included in financial statements. In the Board's judgment, the information required to be reported by this Statement meets the objective of verifiability in reasonable degree and is useful for analyzing and understanding an enterprise's financial statements. Moreover, consistency from period to period in the methods by which an enterprise's segment information is prepared and presented is as important as consistency in the application of the accounting principles used in preparing the enterprise's consolidated financial statements. Consistency is a quality that is comprehended by the objective of comparability and is an important aspect of segment reporting that does lend itself to objective verification. For those reasons, the Board concluded that the information required to be reported by this Statement shall be included as an integral part of an enterprise's financial statements.

.068 Some respondents contended that the costs of compiling and processing the type of information called for by this Statement would be overly burdensome to many enterprises, particularly those that are relatively small or whose securities are not publicly traded. Many enterprises, however, already accumulate information similar to the type required to be reported by this Statement for various purposes, such as inclusion in filings with the SEC or internal planning and control. Those enterprises will be able to provide the information required to be reported by this Statement by using existing records.

.069 To lessen the information processing costs to enterprises, the Board has modified the proposal in the Exposure Draft that an enterprise's industry segments be determined by grouping its products and services by industry lines on a *worldwide* basis. Some respondents to the Exposure Draft felt that disaggregation of *foreign* operations was an especially burdensome requirement. Accordingly, this Statement does not require an enterprise to disaggregate its foreign operations to the extent that it is impracticable to do so (see paragraph .014).

.070 In the Exposure Draft, the Board proposed that any requirement to include segment information in financial statements be applicable to all enterprises regardless of their size or whether their securities are publicly traded. The Board continues to believe that there are no fundamental differences in the types of

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

decisions and the decision-making processes of those who use the financial statements of smaller or privately held enterprises. Many small or privately held enterprises operate in more than one industry or country or rely significantly on a single or a few major customers or export sales. Information of the type required to be disclosed by this Statement is as important to users of the financial statements of those enterprises as it is to users of the financial statements of larger or publicly held enterprises. Accordingly, this Statement applies to all enterprises, regardless of their size or whether their securities are publicly traded. In reaching that conclusion, the Board neither rejects nor accepts the recommendations of the AICPA Committee on Generally Accepted Accounting Principles for Smaller and/or Closely Held Businesses, in its August 1976 report.*

.071 Several respondents cited harm to an enterprise's competitive position as a basis for opposing disclosures about industry segments such as this Statement requires. However, the required disclosures about an industry segment are no more detailed or specific than the disclosures typically provided by an enterprise that operates in a single industry. The information required to be reported is intended primarily to permit users to make a better assessment of the past performance and future prospects of an enterprise operating in more than one industry. In the Board's judgment, the information specified by this Statement is useful in making that assessment and, therefore, the information should be required.

.072 Some respondents recommended that the disclosure requirement of this Statement should apply only to annual financial statements and not to any interim financial statements. They said that an interim reporting requirement would be unnecessarily burdensome for many enterprises, particularly those enterprises not heretofore reporting any information of the type required by this Statement. Also, some said that for many enterprises, seasonal fluctuations could cause significant changes from quarter to quarter in the composition of an enterprise's significant industry segments, diminishing the interperiod comparability of segment information. On the other hand, some respondents took the position that segment information should be included in all interim reports,

---

* See section 2083, *Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*

including those that present only condensed financial statements or selected financial data and that do not purport to present financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles. Those respondents contended that segment information is needed on a more timely basis than annually and that the difficulties of preparing it on an interim basis can be overcome.

[.073] [Superseded, effective December 1, 1977, by FASB Statement No. 18.] (See section 2082.)

.074 A number of respondents to both the Discussion Memorandum and the Exposure Draft said that differences among enterprises in the nature of their operations and in the extent to which components of the enterprise share common facilities, equipment, materials and supplies, or labor force make unworkable the prescription of highly detailed rules and procedures that must be followed by all enterprises. Moreover, they pointed out that differences in the accounting systems of business enterprises are a practical constraint on the degree of specificity with which standards of financial accounting and reporting for disaggregated information can be established. The Board agrees, in general, with those views. In the Board's judgment, the standards set forth in this Statement are sufficiently broad that when they are applied in the context of the objective stated in paragraph .005 they will result in reporting information that is useful in analyzing and understanding the financial statements of an enterprise that operates in different industries or geographic areas or that derives significant revenue from export sales or from a single or a few major customers.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Purpose of Segment Information

.075 As stated in paragraph .005, the purpose of the information required to be disclosed by this Statement about an enterprise's operations in different industries and different areas of the world and about the extent of its reliance on export sales or major customers is to assist financial statement users in analyzing and understanding the enterprise's financial statements by permitting better assessment of the enterprise's past performance and future prospects. The standards of financial accounting and reporting set forth in paragraphs .003-.040 derive from that purpose.

.076 Information prepared in conformity with those standards may be of limited usefulness for comparing an industry segment of one enterprise with a similar industry segment of another enterprise (i.e., for interenterprise comparison). Interenterprise comparison of industry segments would require a fairly detailed prescription of the basis or bases of disaggregation to be followed by all enterprises, as well as specification of the basis of accounting for intersegment transfers and methods of allocating costs common to two or more segments. As explained in paragraph .074, the Board concluded that it is not appropriate to specify rules and procedures in that degree of detail. Moreover, differences in the bases of accounting for intersegment sales or transfers may also militate against comparison of a segment of an enterprise with extensive intersegment transactions with a similar but autonomous segment of another enterprise or with a unitary enterprise in the same industry.

Information Required to Be Presented

.077 This Statement requires that sales to outsiders be reported separately from sales or transfers to other segments because different types of uncertainties and measurement bases affect those two sources of a reportable segment's revenue. The Exposure Draft proposed that intersegment sales or transfers be accounted for at amounts that are consistent with the objective of determining segment profitability "as realistically as practicable." A number of respondents to the Exposure Draft asked the Board whether, under the draft, intersegment sales or transfers could be accounted for at other than market price, for example, at cost. The Board has concluded that for purposes of this Statement revenue from intersegment sales or transfers shall be accounted

for on whatever basis is used by the enterprise to price the intersegment sales or transfers. No single basis is prescribed or proscribed, but disclosure of the basis of accounting for intersegment sales or transfers is required.

.078 The Exposure Draft proposed that two specified levels of profitability—profit or loss contribution and operating profit or loss—be presented for each reportable segment. The former was defined as revenue less only those operating expenses that were directly traceable to the segment, and the latter was defined (as it is in paragraph .010(d) of this Statement) as revenue less all operating expenses including those allocated to segments on a reasonable basis as well as those that are directly traceable. This Statement, however, requires presentation of only operating profit or loss for reportable segments. In the Exposure Draft, the Board stated that "presenting profitability both before and after allocation of common costs and expenses highlights the extent to which the computation of operating profit or loss is affected by allocations." Although most respondents to the Exposure Draft did not disagree with the requirement that operating profit or loss be disclosed for individual reportable segments, many made the point that it is not practicable to distinguish between those operating expenses that may be said to be *directly traceable* to a segment and those that may be said only to be *allocable.* Some respondents pointed out that traceability often depends on the sophistication of an enterprise's internal recordkeeping system. They noted that traceability depends on the degree to which management of an enterprise's operations is decentralized. Some said that location of incurrence should not govern the attribution of a cost to a particular segment. In view of the problems cited by those who responded to the Exposure Draft, the Board has judged that disclosure of profit or loss contribution should not be required, although this Statement does not proscribe that disclosure if an enterprise wishes to include it.

.079 The Board continues to believe that certain items of revenue and expense either do not relate to segments or cannot *always* be allocated to segments on the basis of objective evidence, and for that reason this Statement does not require that net income be disclosed for reportable segments. Those items are revenue earned at the corporate level and not derived from operations of any industry segment, general corporate expenses, interest expense, domestic and foreign income taxes, and equity in income or loss from unconsolidated subsidiaries and other unconsolidated in-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

vestees. The Board also has not required that the following (which are normally reported net of income taxes) be allocated: extraordinary items, gain or loss on discontinued operations, minority interest, and the cumulative effect of a change in accounting principle. However, paragraph .025 permits additional disclosure of some other measure of profitability for some or all of an enterprise's reportable segments in addition to operating profit or loss, with appropriate disclosure of the nature and amount of each type of item allocated to segments and the method of allocation.

.080 Disclosure of identifiable assets is required, as proposed in the Exposure Draft, to allow financial statement users to assess the relative investment commitment in an enterprise's various segments and to assess the results obtained by the various segments in relation to the investment committed. Some respondents to the Exposure Draft stated that the definition of a segment's identifiable assets as proposed in the Exposure Draft was inconsistent with the proposed definition of a segment's operating profit or loss. They indicated that although allocation of all operating expenses common to two or more segments was required to compute operating profit or loss, allocation of all assets used jointly by two or more segments was not required. In response to that view, the definition of identifiable assets in paragraph .010(e) of this Statement requires that a portion of assets used jointly by two or more industry segments be allocated among the industry segments on a reasonable basis.

.081 To provide information useful in understanding the operating profit or loss and the identifiable assets of an industry segment, paragraph .027 requires disclosure of the aggregate amount of each reportable segment's depreciation, depletion, and amortization and of each reportable segment's capital expenditures. The Exposure Draft had identified certain additional disclosures that "may be important" in certain circumstances, including property, plant, and equipment and related accumulated depreciation, receivables and inventories, loans, deposits, or other monetary amounts, and research and development costs. A number of respondents to the Exposure Draft recommended that the final Statement not identify those disclosures as possibly "important" unless the circumstances were clearly specified. Some said the disclosures were overly detailed and would be of questionable benefit in many cases. The Board found those arguments persuasive and decided to delete them in the final Statement. As stated in paragraph .022, presentation of additional information beyond that required to be reported

by this Statement may be considered to be desirable, and this Statement does not preclude those additional disclosures.

.082 The Exposure Draft proposed that operating profit or loss and identifiable assets of an industry segment or geographic area of consolidated operations include, respectively, the income from and the investment in unconsolidated investees operating in the same industry or the same geographic area. Some respondents stated that, due to the complexity of many enterprises' unconsolidated operations, information called for by the Exposure Draft (i.e., operating profit or loss and identifiable assets) may not be available for some of those investees, especially for those investees in which the enterprise has less than a 50 percent ownership. Other respondents considered it inappropriate to combine the after-tax net income from the unconsolidated investees with operating profit of the consolidated operations. They also considered it inappropriate to combine the investment in the net assets of unconsolidated investees with identifiable assets of the consolidated operations. Such combinations, in their view, would distort the operating results and financial ratios for the industry segments and geographic areas and thereby make the reported information less useful in some cases and misleading in others. The Board found merit in those arguments and accordingly eliminated the requirement. The Board continues to believe, however, that if the operations of an unconsolidated investee are closely related with those of a reportable segment, information about the segment would be incomplete and therefore subject to possible misinterpretation without information about the relationship. For that reason, the Board concluded that disclosure should be made for each reportable segment of the enterprise's equity in the net income from and investment in the net assets of unconsolidated subsidiaries and other equity method investees whose operations are vertically integrated with the operations of that segment.[17] The Board further concluded that disclosure should also be made of the geographic areas in which those vertically integrated equity method investees operate.

Information about Foreign Operations and Export Sales

.083 Several respondents to the Exposure Draft indicated that for their particular industries the distinction between domestic and

[17] If the operations of two or more equity method investees are vertically integrated with a reportable segment, the amounts required to be disclosed may be combined respectively.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

foreign operations was very difficult to make and requested that the Board develop guidelines and allow judgment in determining the *distinction* between the two. The Board's intention had been to allow judgment and that intention is made explicit and guidelines are furnished in paragraph .031 and footnote 12 of this Statement.

.084 With respect to reporting information about an enterprise's operations in different geographic areas, some respondents to the Exposure Draft requested that the Board clarify or elaborate on a number of matters, including (a) whether the Statement would require disclosure of information on an individual country-by-country basis and (b) how should significance be determined for an enterprise's foreign operations in the aggregate or in any geographic area. The Board's conclusion on each of those matters is clarified or elaborated on in paragraphs .032 and .033 of this Statement.

.085 The Board recognized in the Exposure Draft and in this Statement that the variety of ways in which foreign operations are conducted made it impossible to define appropriate geographic areas for all enterprises. Therefore, only general guidelines for that determination are set forth in paragraph .034 of this Statement. For those enterprises conducting foreign operations in two or more geographic areas, the Board considered several methods of associating foreign revenue, a measure of profitability, and identifiable assets with a particular geographic area. Those methods include associating this information with geographic areas in terms of the location of the accounting records, the location of the assets, the location of the risks associated with the assets and liabilities, and the location of the customers. However, the Board concluded that none of those methods would necessarily correlate the profitability and identifiable assets of a geographic area in a manner consistent with the objective expressed in paragraph .031. The Board believes that the description of geographic areas of foreign operations in paragraph .034 is sufficiently broad to permit management to accomplish that objective by determining the scope of its operations in each area and then identifying (i) the revenue generated from those operations, (ii) the assets employed in or associated with generating those revenues, and (iii) the costs and expenses related to those revenues and assets. The Board believes that disclosing a measure of assets or assets and liabilities that can be related to a measure of profitability for each significant geographic area will provide users of financial statements with useful financial information about an enterprise's foreign operations consistent with the purpose set forth in paragraph .005.

.086 Some respondents to the Exposure Draft recommended that the Statement not require disclosure of operating profit or loss for each geographic area of an enterprise's operations if it is determined instead to present a level of profitability below operating profit or loss. They said that in many cases an after-tax profitability measure is more informative than a pretax measure and that because of significant differences in income tax rates among different geographic areas a pretax measure could at times be misinterpreted. They also said that many enterprises can more easily determine net income or another measure of profitability below operating profit or loss by geographic area than by industry segment. The Board found those arguments convincing, and paragraph .035(b) requires presentation of operating profit or loss, or net income, or some other measure of profitability between operating profit or loss and net income.

.087 The Board considered whether this Statement should supersede any part of *ARB No. 43,* Chapter 12 [section 1081], "Foreign Operations and Foreign Exchange," especially paragraph 9 [section 1081.09] thereof. Since paragraph 9 of Chapter 12 [section 1081.09] deals with consolidation of foreign subsidiaries which is a subject beyond the scope of this Statement, the Board concluded that it should not be superseded. However, this Statement provides definitions and guidelines that may also be useful in applying that Bulletin.

.088 The Board has determined that disclosure of working capital and property, plant, and equipment and related accumulated depreciation should not be required by geographic area. Those disclosures had been proposed in the Exposure Draft, but a number of respondents said, and the Board agreed, that the volume of detail that would be required would be excessive. However, as noted in paragraph .087, this Statement does not supersede the requirements of paragraph 9, Chapter 12, *ARB No. 43* [section 1081.09], for certain disclosures with respect to the assets and liabilities of foreign subsidiaries.

.089 A number of respondents to the Exposure Draft requested that the Board provide guidance as to when export sales should be considered significant, and paragraph .036 of this Statement provides a test of significance. The Board also was asked to clarify certain matters with respect to the disclosures about major customers, including a guideline as to significance and an elaboration on the type of information required to be presented. Paragraph .039 of this Statement reflects the appropriate revisions. Because many respondents argued that identification of the major

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

customer could be competitively harmful to either the enterprise or the customer, the proposal for disclosure of the name of the customer has been dropped.

Effective Date and Transition

.090 On considering all circumstances, the Board determined that prospective application of the standards set forth in this Statement effective for periods beginning after December 15, 1976 as stated in paragraph .041, is appropriate because enterprises may not have accumulated in prior years all of the information required to be disclosed by this Statement; the Board also determined that the effective date is advisable in the circumstances.

Appendix C

STANDARD INDUSTRIAL CLASSIFICATIONS

.091 As indicated in paragraph .012, the Board has examined several systems that have been developed for classifying business activities, such as the Standard Industrial Classification and the Enterprise Standard Industrial Classification systems and has judged that none is, by itself, suitable to determine industry segments as that term is used in this Statement. Nonetheless, those systems may provide guidance for the exercise of the judgment required to group an enterprise's products and services by industry lines.

.092 As set forth in the *Standard Industrial Classification Manual* prepared by the Statistical Policy Division of the U.S. Office of Management and Budget, SIC is a system for classifying business establishments (generally, individual plants, stores, banks, etc.) by the type of economic activity in which they are engaged. An establishment is not necessarily identical with a business enterprise, which may consist of one or more establishments.

.093 The 649-page manual contains one-digit, two-digit, three-digit, and four-digit SIC industry codes, each of which is described in detail. At the one-digit level, the SIC classifies business activities into 11 divisions:

A Agriculture, forestry, and fishing.
B Mining.
C Construction.
D Manufacturing.
E Transportation, communications, electric, gas, and sanitary services.
F Wholesale trade.
G Retail trade.
H Finance, insurance, and real estate.
I Services.
J Public administration.
K Nonclassifiable establishments.

.094 Each of those divisions is subdivided into two-digit major groups. There is a total of 84 two-digit groups. For example, the 20 major groups in manufacturing are:

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

1. Food and kindred products.
2. Tobacco manufacturers.
3. Textile mill products.
4. Apparel and other finished products made from fabrics and similar materials.
5. Lumber and wood products, except furniture.
6. Furniture and fixtures.
7. Paper and allied products.
8. Printing, publishing, and allied products.
9. Chemicals and allied products.
10. Petroleum refining and related industries.
11. Rubber and miscellaneous plastics products.
12. Leather and leather products.
13. Stone, clay, glass, and concrete products.
14. Primary metal industries.
15. Fabricated metal products, except machinery and transportation equipment.
16. Machinery, except electrical.
17. Electrical and electronic machinery, equipment, and supplies.
18. Transportation equipment.
19. Measuring, analyzing, and controlling instruments; photographic, medical, and optical goods; watches and clocks.
20. Miscellaneous manufacturing industries.

.095 Each of the two-digit SIC major groups, in turn, is further subdivided into three-digit industry groups. There are 421 three-digit industry groups. For example, the "machinery, except electrical" group includes the following industry groups:

1. Engines and turbines.
2. Farm and garden machinery and equipment.
3. Construction, mining, and materials handling machinery and equipment.
4. Metalworking machinery and equipment.
5. Special industry machinery, except metalworking machinery.
6. General industry machinery and equipment.
7. Office, computing, and accounting machines.
8. Refrigeration and service industry machinery.
9. Miscellaneous machinery, except electrical.

.096 The three-digit SIC industry groups are still further subdivided by product lines into over 1,000 narrower four-digit industry

groups. Metalworking machinery and equipment (a three-digit industry group), for example, is divided into metal cutting machine tools, metal forming machine tools, power driven hand tools, rolling mill machinery and equipment, and so on.

.097 The *Standard Industrial Classification Manual* is revised periodically, most recently in 1972. It is available for sale by the Superintendent of Documents, U.S. Government Printing Office.

.098 The *Enterprise Standard Industrial Classification Manual,* like the *SIC Manual,* is prepared by the Statistical Policy Division of the U. S. Office of Management and Budget. It classifies enterprises (companies, firms, partnerships, etc.) rather than establishments (plants, stores, banks, etc.). The structure of ESIC follows closely the structure of the SIC codes. It includes eight classes of enterprises at the one-digit level, 67 at the two-digit level, 216 at the three-digit level, and 252 at the four-digit level.

Appendix D

FACTORS TO BE CONSIDERED IN DETERMINING INDUSTRY SEGMENTS

.099 This Appendix identifies a number of factors to be considered in grouping products and services by industry lines into industry segments. As indicated in paragraph .012, although certain characteristics can be identified that assist in differentiating among industries, no single set of characteristics is universally applicable to determine the industry segments of all business enterprises. Nor is any single characteristic determinative in all cases.

.100 Among the factors that should be considered in determining whether products and services are related (and, therefore, should be grouped into a single industry segment) or unrelated (and, therefore, should be separated into two or more industry segments) are the following:

a) *The nature of the product.* Related products or services have similar purposes or end uses. Thus, they may be expected to have similar rates of profitability, similar degrees of risk, and similar opportunities for growth.

b) *The nature of the production process.* Sharing of common or interchangeable production or sales facilities, equipment, labor force, or service group or use of the same or similar basic raw materials may suggest that products or services are related. Likewise, similar degrees of labor intensiveness or similar degrees of capital intensiveness may indicate a relationship among products or services.

c) *Markets and marketing methods.* Similarity of geographic marketing areas, types of customers, or marketing methods may indicate a relationship among products or services. For instance, the use of a common or interchangeable sales force may suggest a relationship among products or services. The sensitivity of the market to price changes and to changes in general economic conditions may also indicate whether products or services are related or unrelated.

.101 Broad categories such as *manufacturing, wholesaling, retailing,* and *consumer products* are not per se indicative of the industries in which an enterprise operates, and those terms should not be used without identification of a product or service to describe an enterprise's industry segments.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Appendix E

ILLUSTRATION OF APPLYING PARAGRAPH .015(b)

.102 Under paragraph .015(b), an industry segment is to be regarded as significant if the absolute amount of its operating profit or operating loss is 10 percent or more of the greater, in absolute amount, of:

(i) The combined operating profit of all industry segments that did not incur an operating loss, or

(ii) The combined operating loss of all industry segments that did incur an operating loss.

.103 To illustrate how that paragraph is applied, assume that an enterprise has seven industry segments some of which incurred operating losses, as follows:

Industry Segment	Operating Profit or (Operating Loss)	
A	$ 100	
B	500	$1,000
C	400	
D	(295)	
E	(600)	
F	(100)	(1,100)
G	(105)	
	$(100)	

.104 The combined operating profit of all industry segments that did not incur a loss (A, B, and C) is $1,000. The absolute amount of the combined operating loss of those segments that did incur a loss (D, E, F, and G) is $1,100. Under paragraph .015(b), therefore, Industry Segments B, C, D, and E are significant because the absolute amount of their individual operating profit or operating loss equals or exceeds $110 (10 percent of $1,100). Additional industry segments might, of course, also be deemed significant under the revenue and identifiable assets tests in paragraphs .015(a) and .015(c).

Appendix F

ILLUSTRATIONS OF FINANCIAL STATEMENT DISCLOSURES

.105 This Appendix contains examples of disclosures of the type that this Statement requires to be included in the financial statements of an enterprise. The illustrations do not encompass all possible circumstances, nor do the formats used indicate a particular preference of the Board.

.106 Exhibit A presents the consolidated income statement of a hypothetical company for the year ended December 31, 1977. Exhibit B illustrates how the company might present information about its operations in different industries and its reliance on major customers. Exhibit C illustrates how the company might present information about its foreign operations in different geographic areas and its export sales.

Income from continuing operations before income taxes						$ 900
Identifiable assets at December 31, 1977	$2,000	$4,050	$6,000	$1,000	$ (50)	$13,000
Investment in net assets of Z Co.						400
Corporate assets						1,600
Total assets at December 31, 1977						$15,000

See accompanying note.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

EXHIBIT B (continued)

Note

The Company operates principally in three industries, A, B, and C. Operations in Industry A involve production and sale of (describe types of products and services). Operations in Industry B involve production and sale of (describe types of products and services). Operations in Industry C involve production and sale of (describe types of products and services). Total revenue by industry includes both sales to unaffiliated customers, as reported in the Company's consolidated income statement, and intersegment sales, which are accounted for by (describe the basis of accounting for intersegment sales).

Operating profit is total revenue less operating expenses. In computing operating profit, none of the following items has been added or deducted: general corporate expenses, interest expense, income taxes, equity in income from unconsolidated investee, loss from discontinued operations of the West Coast division (which was a part of the Company's operations in Industry B), extraordinary gain (which relates to the Company's operations in Industry A), and the cumulative effect of the change from straight-line to accelerated depreciation (of which $30 relates to the Company's operations in Industry A, $10 to Industry B, and $20 to Industry C). Depreciation for Industries A, B, and C, respectively, was $80, $100, and $150. Capital expenditures for the three industries were $100, $200, and $400, respectively.

The effect of the change from straight-line to accelerated depreciation was to reduce the 1977 operating profit of Industries A, B, and C, respectively, by $40, $30, and $20.

Identifiable assets by industry are those assets that are used in the Company's operations in each industry. Corporate assets are principally cash and marketable securities.

The Company has a 25 percent interest in Z Co., whose operations are in the United States and are vertically integrated with the Company's operations in Industry A. Equity in net income of Z Co. was $100; investment in net assets of Z Co. was $400.

To reconcile industry information with consolidated amounts, the following eliminations have been made: $700 of intersegment

sales; $40 relating to the net change in intersegment operating profit in beginning and ending inventories; and $50 intersegment operating profit in inventory at December 31, 1977.

Contracts with a U.S. government agency account for $1,100 of the sales to unaffiliated customers of Industry B.

EXHIBIT C

X Company
Information about the Company's Operations in Different Geographic Areas
Year ended December 31, 1977

	United States	Geographic Area A	Geographic Area B	Adjustments and Eliminations	Consolidated
Sales to unaffiliated customers	$3,000	$1,000	$ 700		$ 4,700
Transfers between geographic areas	1,000			$(1,000)	
Total revenue	$4,000	$1,000	$ 700	$(1,000)	$ 4,700
Operating profit	$ 800	$ 400	$ 100	$ (200)	$ 1,100
Equity in net income of Z Co.					100
General corporate expenses					(100)
Interest expense					(200)
Income from continuing operations before income taxes					$ 900
Identifiable assets at December 31, 1977	$7,300	$3,400	$2,450	$ (150)	$13,000
Investment in net assets of Z Co.					400
Corporate assets					1,600
Total assets at December 31, 1977					$15,000

See accompanying note.

EXHIBIT C (continued)

Note

Transfers between geographic areas are accounted for by (describe the basis of accounting for such transfers). Operating profit is total revenue less operating expenses. In computing operating profit, none of the following items has been added or deducted: general corporate expenses, interest expense, income taxes, equity in income from unconsolidated investee, loss from discontinued operations of West Coast division (which was part of the Company's U.S. operations), extraordinary gain (which relates to the Company's operations in Geographic Area B), and the cumulative effect of the change from straight-line to accelerated depreciation (which relates entirely to the Company's operations in the United States).

Identifiable assets are those assets of the Company that are identified with the operations in each geographic area. Corporate assets are principally cash and marketable securities.

Of the $3,000 U.S. sales to unaffiliated customers, $1,200 were export sales, principally to Geographic Area C.

AC Section 2082

Financial Reporting for Segments of a Business Enterprise—Interim Financial Statements

an amendment of section 2081

[Source: FASB Statement No. 18.]

November 1977

INTRODUCTION AND BACKGROUND INFORMATION

.01 Paragraph 4 of *FASB Statement No. 14* [section 2081.004], "Financial Reporting for Segments of a Business Enterprise," issued by the Board in December 1976, provides for the inclusion of segment information in interim financial statements as follows:

> If an enterprise issues for an interim period a complete set of financial statements that are expressly described as presenting financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles, this Statement requires that the information referred to in paragraph 3 be included in those interim financial statements. If an enterprise issues for an interim period financial statements that are not a complete set or are otherwise complete but not expressly described as presenting financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles, this Statement does not require that the information referred to in paragraph 3 be included in those interim financial statements.

The alternatives considered by the Board and the basis for its conclusions are set forth in paragraphs 72 and 73 of the Statement [section 2081.072-.073].

.02 Since the issuance of *FASB Statement No. 14* [section 2081], the Board has received a number of questions about when the information specified in the Statement is required in financial statements for interim periods. On March 2, 1977, the Board submitted a proposed interpretation of paragraph 4 of the Statement [section 2081.004] to the members of the Financial Accounting Standards Advisory Council for comment. That proposed Interpretation included examples of situations in which the "expressly described" test of paragraph 4 [section

2081.004] was met and segment information was required and other situations in which the "expressly described" test was not met and segment information was not required. A number of the comment letters received from Council members indicated that the proposed Interpretation did not provide adequate clarification and that an amendment of Statement No. 14 [section 2081] was necessary.

.03 The Board has the subject of interim financial reporting on its technical agenda. The issues addressed in that project include consideration of the type of financial information that should be reported for interim periods.

.04 The Board has reconsidered the question of whether segment information shall be included in interim financial statements and has decided to eliminate any requirement to report the information specified by *FASB Statement No. 14* [section 2081] in interim period financial statements pending completion of the interim financial reporting project.

.05 An Exposure Draft of a proposed Statement on "Financial Reporting for Segments of a Business Enterprise—Interim Financial Statements" was issued on September 20, 1977. Sixty-five letters were received in response to that Exposure Draft, virtually all of which expressed agreement.

.06 The Board concluded that on the basis of existing data it can reach an informed decision without a public hearing and that the effective date and transition specified in paragraph .09 are advisable in the circumstances.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Amendment to Section 2081

.07 The information specified in paragraph 3 of *FASB Statement No. 14* [section 2081.003] is not required in financial statements for interim periods. Accordingly, Statement No. 14 [section 2081] is amended as follows:

a. Paragraphs 4 and 73 and footnote 15 to paragraph 41 [sections 2081.004 and 2081.073 and footnote 15 to section 2081.041] are deleted.

b. The words "and for interim periods [15] within those fiscal years" are deleted from the first sentence of paragraph 41 [section 2081.041] and that sentence is modified to read as follows:

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

The provisions of this Statement shall be effective for financial statements for fiscal years beginning after December 15, 1976.

.08 Although segment information is not required in financial statements for interim periods, any segment information that is presented in interim period financial statements shall be consistent with the requirements of *FASB Statement No. 14* [section 2081].

Effective Date and Transition

.09 This amendment to *FASB Statement No. 14* [section 2081] shall be effective December 1, 1977, retroactive to the effective date of that Statement. Segment information presented in interim period financial statements issued prior to December 1, 1977 need not be included if those interim period financial statements are subsequently presented for comparative purposes after the effective date of this Statement.

The provisions of this Statement need not be applied to immaterial items.

The next page is 8295.

AC Section 2083

Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises

an amendment of sections 2011 and 2081

[Source: FASB Statement No. 21.]

April 1978

INTRODUCTION AND BACKGROUND INFORMATION

.01 The Accounting Standards Division of the AICPA began a study of the application of generally accepted accounting principles (GAAP) to smaller or closely held enterprises in 1974 and issued its report on that study in August 1976. One of the major recommendations in that report states:

> The Financial Accounting Standards Board should develop criteria to distinguish disclosures that should be required by GAAP, which is applicable to the financial statements of all entities, from disclosures that merely provide additional or analytical data. (Some of these latter disclosures may, however, still be required in certain circumstances for certain types of entities.) The criteria should then be used in a formal review of disclosures presently considered to be required by GAAP and should also be considered by the Board in any new pronouncements.

The report also recommends that the FASB amend *APB Opinion No. 15* [section 2011], "Earnings per Share," to require disclosure of earnings per share information only by enterprises whose securities are publicly traded. In addition to the recommendation contained in the AICPA report, a number of respondents to the FASB agenda project, "Conceptual Framework for Financial Accounting and Reporting: Objectives of Financial Reporting and Elements of Financial Statements of Business Enterprises," have expressed the view that the Board should distinguish between the information that should be included in financial statements and the so-called predictive, interpretive, or "soft" data that should be provided by financial reporting other than financial statements. Further, since the issuance in December 1976 of *FASB Statement No. 14* [section 2081], "Financial Reporting for Segments of a Business Enterprise," the Board has received a number of suggestions that nonpublic enterprises be exempted from the requirements of

that Statement. Others have suggested that segment information is an example of the type of interpretive or analytical information that should be presented outside the financial statements.

.02 *APB Opinion No. 15* [section 2011] requires that earnings per share data be presented on the face of an enterprise's income statement and requires certain other disclosures in specified situations. *FASB Statement No. 14* [section 2081] requires disclosure of certain information relating to (a) the operations of an enterprise in different industries, (b) its foreign operations and export sales, and (c) its major customers. In its deliberations leading to the issuance of Statement No. 14 [section 2081], the Board considered whether certain enterprises should be exempted from disclosing segment information based on the size of the enterprise or whether its securities are publicly traded and concluded, for the reasons set forth in paragraph 70 of the Statement [section 2081.070], that segment information should be included in the financial statements of all business enterprises.

.03 The members of the Financial Accounting Standards Advisory Council and the FASB Screening Committee on Emerging Problems were consulted in January 1978 about the possibility of different applications of generally accepted accounting principles to small or closely held enterprises and large or public enterprises. Many of the members of the Advisory Council and the Screening Committee who advised the Board on this matter indicated that there should be a differentiation between disclosures required of small or closely held enterprises and disclosures required of large publicly traded enterprises and recommended that the Board add a project to its agenda to develop criteria for such a differentiation. Further, many of the members of the Advisory Council and the Screening Committee who advised the Board on this matter cited earnings per share and segment information as examples of disclosures that they believe should be optional for certain enterprises.

.04 On February 23, 1978, the Board added to its agenda a major project to consider whether guidelines should be established for (a) distinguishing between information that should be disclosed in financial statements and information that should be disclosed in financial reporting otherwise and (b) distinguishing between information that all enterprises should be required to disclose and information that only designated types of enterprises should be required to disclose. Special attention will be

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

given in that project to the financial statements and financial reporting of small or closely held enterprises.

.05 In recognition of (a) the apparent pervasive public concern about the burden on small or closely held enterprises of compliance with certain financial statement disclosure requirements, (b) the recommendations of the AICPA report on "Generally Accepted Accounting Principles for Smaller and/or Closely Held Businesses," and (c) the recommendations of the members of the Board's Screening Committee on Emerging Problems and the Board's Advisory Council, the Board has concluded that application of *APB Opinion No. 15* [section 2011] and *FASB Statement No. 14* [section 2081] to nonpublic enterprises should be suspended, pending completion of the project referred to in paragraph .04. The Board will consider whether the disclosure requirements in pronouncements issued while that project is underway should be applicable to all enterprises.

.06 An Exposure Draft of a proposed Statement of Financial Accounting Standards, "Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises," was issued on February 27, 1978. The Board received 126 letters of comment in response to the Exposure Draft, most of which expressed agreement.

.07 Some respondents recommended that the Board clarify whether the definition of "nonpublic" applies to a subsidiary, corporate joint venture, or other investee. The Board has a project on its agenda addressing the question of whether a complete set of financial statements of a parent company, a subsidiary, a corporate joint venture, or other investee accounted for by the equity method should include segment information when those financial statements are presented with consolidated financial statements. That project involves a reconsideration of the requirements of the last sentence of paragraph 7 of *FASB Statement No. 14* [section 2081.007].[1] The Board concluded that it should not delay issuance of this Statement pending completion of its deliberations on that project. This Statement applies to a complete set of separately issued

[1] The last sentence of paragraph 7 of *FASB Statement No. 14* [section 2081.007] states:

> When a complete set of financial statements that present financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles is presented for a subsidiary, corporate joint venture, or 50 percent or less owned investee, each such entity is considered to be an enterprise as that term is used in this Statement and thus is subject to its requirements wheher those financial statements are issued separately or included in another enterprise's financial report.

financial statements of a subsidiary, corporate joint venture, or other investee that is nonpublic as that term is used in this Statement. This Statement does not extend to those financial statements when presented in the financial report of another enterprise, as that matter is included in the scope of the project involving reconsideration of the last sentence of paragraph 7 of Statement No. 14 [section 2081.007] referred to above. An Exposure Draft of a proposed Statement of Financial Accounting Standards addressing that matter will be issued in the near future.

.08 Some respondents noted that defining a nonpublic enterprise as an enterprise other than one whose debt or equity securities trade in a public market would exempt other kinds of enterprises with public participation from the requirements of *FASB Statement No. 14* [section 2081]. Those exempted enterprises include certain mutual associations, cooperatives, nonbusiness organizations, and partnerships that often make their financial statements available to a broad class, such as, insurance policyholders, depositors, members, contributors, or partners. The Board concluded that it should not delay the issuance of this Statement to refine the meaning of the term "nonpublic" at this time. Accordingly, the suspensions in paragraph .12 apply for the present to enterprises with a broad class of public participants that meet the "nonpublic" definition in paragraph .13. Those suspensions, however, should not be construed as an indication that the Board has decided that the information requirements for those enterprises are significantly different from those for an enterprise whose debt or equity securities are publicly traded.

.09 Some respondents stated that the requirement of paragraph 39 of *FASB Statement No. 14* [section 2081.039] to disclose information about major customers should not be suspended. Those respondents believe that disclosure is necessary if an enterprise sells much of its output to one or relatively few other enterprises. Although this Statement suspends the application of Statement No. 14 [section 2081] to the financial statements of nonpublic enterprises, the Board notes that it does not affect the disclosure of information about economic dependency when such disclosure may be necessary for a fair presentation.[2]

[2] Paragraph .05 of section 335 [AU section 335.05], "Related Party Transactions," of *Statements on Auditing Standards* states:

> An entity may be economically dependent on one or more parties with which it transacts a significant volume of business, such as a sole or major customer, supplier, franchisor, franchisee, distributor, general agent, borrower,

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

.10 Some respondents stated that the effective date and transition set forth in the Exposure Draft of the proposed Statement were too restrictive. They noted that financial statements issued prior to the effective date of this Statement may be reissued subsequent to its effective date for other than comparative purposes and recommended that disclosure of earnings per share and segment information for fiscal years ended prior to the effective date of this Statement should not be required in financial statements of nonpublic enterprises that are reissued for any reason subsequent to the effective date of this Statement. The Board accepted those views, and the provisions of this Statement are retroactive to fiscal years beginning after December 15, 1976, the effective date of *FASB Statement No. 14* [section 2081].

.11 The Board has concluded that on the basis of existing information it can reach an informed decision without a public hearing and the effective date and transition specified in paragraph .16 are advisable in the circumstances.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

.12 This Statement suspends the requirements of *APB Opinion No. 15* [section 2011][3] and *FASB Statement No. 14* [section 2081] in the financial statements of nonpublic enterprises as defined in paragraph .13. Therefore, this Statement suspends any requirement to disclose the information specified by Opinion No. 15 [section 2011] and Statement No. 14 [section 2081] in a complete set of separately issued financial statements of a subsidiary, corporate joint venture, or other investee that is a nonpublic enterprise.[4]

---

or lender. Such parties should not be considered related parties solely by virtue of economic dependency unless one of them clearly exercises significant management or ownership influence over the other. Disclosure of economic dependency may, however, be necessary for a fair presentation of financial position, results of operations, or changes in financial position in conformity with generally accepted accounting principles.

[3] This Statement does not suspend or modify other generally accepted accounting principles or practices (such as those specified in paragraph 15 of Chapter 13B, "Compensation Involved in Stock Option and Stock Purchase Plans," of *ARB No. 43* [section 4061.15] and paragraphs 10 and 11, "Liquidation Preference of Preferred Stock," of *APB Opinion No. 10* [section 5515.01-.02]) that require disclosure of information concerning the capital structure of an enterprise.

[4] As mentioned in paragraph .07, the Board has a project on its agenda addressing the question of whether a complete set of financial statements of a parent company, a subsidiary, a corporate joint venture, or other investee accounted for by the equity method should include segment information when those financial statements are presented with consolidated financial statements.

.13 For purposes of this Statement, a nonpublic enterprise is an enterprise other than one (a) whose debt or equity securities trade in a public market on a foreign or domestic stock exchange or in the over-the-counter market (including securities quoted only locally or regionally) or (b) that is required to file financial statements with the Securities and Exchange Commission. An enterprise is no longer considered a nonpublic enterprise when its financial statements are issued in preparation for the sale of any class of securities in a public market.

.14 Although the presentation of earnings per share and segment information is not required in the financial statements of nonpublic enterprises, any such information that is presented in the financial statements shall be consistent with the requirements of *APB Opinion No. 15* [section 2011] and *FASB Statement No. 14* [section 2081].

Amendments to Existing Pronouncements

.15 The following footnote is added to the end of the first sentence of paragraph 45 of *APB Opinion No. 15* [section 2011.45] and to the end of the first sentence of paragraph 41 of *FASB Statement No. 14* [section 2081.041] (as amended by *FASB Statement No. 18* [section 2082], "Financial Reporting for Segments of a Business Enterprise—Interim Financial Statements: an amendment of FASB Statement No. 14"):

> The provisions of this [Opinion/Statement] were suspended by *FASB Statement No. 21* [section 2083] and need not be applied by a nonpublic enterprise as defined in that Statement pending further action by the FASB.

Effective Date and Transition

.16 This Statement shall be effective April 30, 1978 retroactive to fiscal years beginning after December 15, 1976.

The provisions of this Statement need not be applied to immaterial items.

AC Section 4010

Unrealized Profit

[Source: ARB No. 43, Chap. 1A, Par. 1.]

Issue date, unless otherwise indicated: 1934[1]

.01 Unrealized profit should not be credited to income account of the corporation either directly or indirectly, through the medium of charging against such unrealized profits amounts which would ordinarily fall to be charged against income account. Profit is deemed to be realized when a sale in the ordinary course of business is effected, unless the circumstances are such that the collection of the sale price is not reasonably assured. An exception to the general rule may be made in respect of inventories in industries (such as packing-house industry) in which owing to the impossibility of determining costs it is a trade custom to take inventories at net selling prices, which may exceed cost. (See section 4020, *Installment Method of Accounting,* effective for fiscal periods beginning after December 31, 1966—APB Opinion No. 10.)

The next page is 8331.

[1] The above rule was adopted by the membership of the Institute in 1934. It had been recommended in 1932 to the New York Stock Exchange by the Institute's committee on cooperation with stock exchanges.

AC Section 4020

Installment Method of Accounting

[Source: APB Opinion No. 10, Par. 12.]

Effective for fiscal periods beginning after December 31, 1966

.01 Section 4010 states that "Profit is deemed to be realized when a sale in the ordinary course of business is effected, unless the circumstances are such that the collection of the sale price is not reasonably assured." The Board reaffirms this statement; it believes that revenues should ordinarily be accounted for at the time a transaction is completed, with appropriate provision for uncollectible accounts. Accordingly, it concludes that, in the absence of the circumstances[1] referred to above, the installment method of recognizing revenue is not acceptable.

The next page is 8341.

[1] The Board recognizes that there are exceptional cases where receivables are collectible over an extended period of time and, because of the terms of the transactions or other conditions, there is no reasonable basis for estimating the degree of collectibility. When such circumstances exist, and as long as they exist, either the installment method or the cost recovery method of accounting may be used. (Under the cost recovery method, equal amounts of revenue and expense are recognized as collections are made until all costs have been recovered, postponing any recognition of profit until that time.)

AC Section 4031

Long-Term Construction-Type Contracts

[Source: ARB No. 45.]

Issue date, unless otherwise indicated: October, 1955

.01 This section is directed to the accounting problems in relation to construction-type contracts in the case of commercial organizations engaged wholly or partly in the contracting business. It does not deal with cost-plus-fixed-fee contracts, which are discussed in section 4041, other types of cost-plus-fee contracts, or contracts such as those for products or services customarily billed as shipped or rendered. In general the type of contract here under consideration is for construction of a specific project. While such contracts are generally carried on at the job site, the section would also be applicable in appropriate cases to the manufacturing or building of special items on a contract basis in a contractor's own plant. The problems in accounting for construction-type contracts arise particularly in connection with long-term contracts as compared with those requiring relatively short periods for completion.

.02 Considerations other than those acceptable as a basis for the recognition of income frequently enter into the determination of the timing and amounts of interim billings on construction-type contracts. For this reason, income to be recognized on such contracts at the various stages of performance ordinarily should not be measured by interim billings.

GENERALLY ACCEPTED METHODS

.03 Two accounting methods commonly followed by contractors are the percentage-of-completion method and the completed-contract method.

Percentage-of-Completion Method

.04 The percentage-of-completion method recognizes income as work on a contract progresses. The committee

recommends that the recognized income be that percentage of estimated total income, either:

(a) that incurred costs to date bear to estimated total costs after giving effect to estimates of costs to complete based upon most recent information, or

(b) that may be indicated by such other measure of progress toward completion as may be appropriate having due regard to work performed.

Costs as here used might exclude, especially during the early stages of a contract, all or a portion of the cost of such items as materials and subcontracts if it appears that such an exclusion would result in a more meaningful periodic allocation of income.

.05 Under this method current assets may include costs and recognized income not yet billed, with respect to certain contracts; and liabilities, in most cases current liabilities, may include billings in excess of costs and recognized income with respect to other contracts.

.06 When the current estimate of total contract costs indicates a loss, in most circumstances provision should be made for the loss on the entire contract. If there is a close relationship between profitable and unprofitable contracts, such as in the case of contracts which are parts of the same project, the group may be treated as a unit in determining the necessity for a provision for loss.

.07 The principal advantages of the percentage-of-completion method are periodic recognition of income currently rather than irregularly as contracts are completed, and the reflection of the status of the uncompleted contracts provided through the current estimates of costs to complete or of progress toward completion.

.08 The principal disadvantage of the percentage-of-completion method is that it is necessarily dependent upon estimates of ultimate costs and consequently of currently accruing income, which are subject to the uncertainties frequently inherent in long-term contracts.

Completed-Contract Method

.09 The completed-contract method recognizes income only when the contract is completed, or substantially so.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Accordingly, costs of contracts in process and current billings are accumulated but there are no interim charges or credits to income other than provisions for losses. A contract may be regarded as substantially completed if remaining costs are not significant in amount.

.10 When the completed-contract method is used, it may be appropriate to allocate general and administrative expenses to contract costs rather than to periodic income. This may result in a better matching of costs and revenues than would result from treating such expenses as period costs, particularly in years when no contracts were completed. It is not so important, however, when the contractor is engaged in numerous projects and in such circumstances it may be preferable to charge those expenses as incurred to periodic income. In any case there should be no excessive deferring of overhead costs, such as might occur if total overhead were assigned to abnormally few or abnormally small contracts in process.

.11 Although the completed-contract method does not permit the recording of any income prior to completion, provision should be made for expected losses in accordance with the well established practice of making provision for foreseeable losses. If there is a close relationship between profitable and unprofitable contracts, such as in the case of contracts which are parts of the same project, the group may be treated as a unit in determining the necessity for a provision for losses.

.12 When the completed-contract method is used, an excess of accumulated costs over related billings should be shown in the balance sheet as a current asset, and an excess of accumulated billings over related costs should be shown among the liabilities, in most cases as a current liability. If costs exceed billings on some contracts, and billings exceed costs on others, the contracts should ordinarily be segregated so that the figures on the asset side include only those contracts on which costs exceed billings, and those on the liability side include only those on which billings exceed costs. It is suggested that the asset item be described as "costs of uncompleted contracts in excess of related billings" rather than as "inventory" or "work in process," and that the item on the liability side be described as "billings on uncompleted contracts in excess of related costs."

.13 The principal advantage of the completed-contract method is that it is based on results as finally determined, rather than on estimates for unperformed work which may involve unforeseen costs and possible losses.

.14 The principal disadvantage of the completed-contract method is that it does not reflect current performance when the period of any contract extends into more than one accounting period and under such circumstances it may result in irregular recognition of income.

Selection of Method

.15 The committee believes that in general when estimates of costs to complete and extent of progress toward completion of long-term contracts are reasonably dependable, the percentage-of-completion method is preferable. When lack of dependable estimates or inherent hazards cause forecasts to be doubtful, the completed-contract method is preferable. Disclosure of the method followed should be made.

COMMITMENTS

.16 In special cases disclosures of extraordinary commitments may be required, but generally commitments to complete contracts in process are in the ordinary course of a contractor's business and are not required to be disclosed in a statement of financial position. They partake of the nature of a contractor's business, and generally do not represent a prospective drain on his cash resources since they will be financed by current billings.

AC Section 4041

Cost-Plus-Fixed-Fee Contracts

[Source: ARB No. 43, Chap. 11A.]

Issue date, unless otherwise indicated: June, 1953

.01 This section deals with accounting problems arising under cost-plus-fixed-fee contracts, hereinafter referred to as CPFF contracts.

SUMMARY STATEMENT

.02 Fees under CPFF contracts may be credited to income on the basis of such measurement of partial performance as will reflect reasonably assured realization. One generally acceptable basis is delivery of completed articles. The fees may also be accrued as they are billable, under the terms of the agreements, unless such accrual is not reasonably related to the proportionate performance of the total work or services to be performed by the contractor from inception to completion.

.03 Where CPFF contracts involve the manufacture and delivery of products, the reimbursable costs and fees are ordinarily included in appropriate sales or other revenue accounts. Where such contracts involve only services, or services and the supplemental erection of facilities, only the fees should ordinarily be included in revenues.

.04 Unbilled costs and fees under such contracts are ordinarily receivables rather than advances or inventory, but should preferably be shown separately from billed accounts receivable.

.05 Offsetting of government advances on CPFF contracts by, or against, amounts due from the government on such contracts is acceptable only to the extent that the advances may under the terms of the agreement be offset in settlement, and only if that is the treatment anticipated in the normal course of business transactions under the contract. In case of offset, the amounts offset should be adequately disclosed.

DISCUSSION

.06 Contracts in the CPFF form are used (a) for the manufacture and delivery of various products, (b) for the construction of plants and other facilities, and (c) for management and other services. Under these agreements contractors are reimbursed at intervals for their expenditures and in addition are paid a specified fixed fee. Payments on account of the fees (less 10% or other amount which is withheld until completion) are made from time to time as specified in the agreements, usually subject to the approval of the contracting officer. In most cases the amount of each payment is, as a practical matter, determined by the ratio of expenditures made to the total estimated expenditures rather than on the basis of deliveries or on the percentage of completion otherwise determined.

.07 The agreements provide that title to all material applicable thereto vests in the government as soon as the contractor is reimbursed for his expenditures or, in some cases, immediately upon its receipt by the contractor at his plant even though not yet paid for. The contractor has a custodianship responsibility for these materials, but the government usually has property accountability officers at the plant to safeguard government interests.

.08 The contracts are subject to cancellation and termination by the government, in which event the contractor is entitled to reimbursement for all expenditures made and an equitable portion of the fixed fee.

.09 The government frequently makes advances of cash as a revolving fund or against the final payment due under the agreement.

Major Accounting Problems

.10 There are a number of basic accounting problems common to all CPFF contracts. This section deals with the four most important, which are:

(a) When should fees under such contracts be included in the contractor's income statement?

(b) What amounts are to be included in sales or revenue accounts?

(c) What is the proper balance-sheet classification of unbilled costs and fees?

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

(d) What is the proper balance-sheet treatment of various items, debit and credit, identified with CPFF contracts?

(a) When should fees under such contracts be included in the contractor's income statement?

.11 It is recognized that income should be recorded and stated in accordance with certain accounting principles as to time and amount; that profit is deemed to be realized when a sale in the ordinary course of business is effected unless the circumstances are such that collection of the sales price is not reasonably assured; and that delivery of goods sold under contract is normally regarded as the test of realization of profit or loss.

.12 In the case of manufacturing, construction, or service contracts, profits are not ordinarily recognized until the right to full payment has become unconditional, i.e., when the product has been delivered and accepted, when the facilities are completed and accepted, or when the services have been fully and satisfactorily rendered. This accounting procedure has stood the test of experience and should not be departed from except for cogent reasons.

.13 It is, however, a generally accepted accounting procedure to accrue revenues under certain types of contracts and thereby recognize profits, on the basis of partial performance, where the circumstances are such that total profit can be estimated with reasonable accuracy and ultimate realization is reasonably assured. Particularly where the performance of a contract requires a substantial period of time from inception to completion, there is ample precedent for pro-rata recognition of profit as the work progresses, if the total profit and the ratio of the performance to date to the complete performance can be computed reasonably and collection is reasonably assured. Depending upon the circumstances, such partial performance may be established by deliveries, expenditures, or percentage of completion otherwise determined. This rule is frequently applied to long-term construction and other similar contracts; it is also applied in the case of contracts involving deliveries in instalments or the performance of services. However, the rule should be dealt with cautiously and not applied in the case of partial deliveries and uncompleted

contracts where the information available does not clearly indicate that a partial profit has been realized after making provision for possible losses and contingencies.

.14 CPFF contracts are much like the type of contracts upon which profit has heretofore been recognized on partial performance, and accordingly have at least as much justification for accrual of fee before final delivery as those cited. The risk of loss is practically negligible, the total profit is fairly definite, and even on cancellation, pro-rata profit is still reasonably assured.

.15 The basic problem in dealing with CPFF contracts is the measure of partial performance, i.e., whether fees thereunder should be accrued under the established rules as to partial deliveries or percentage of completion otherwise determined, or whether, in view of their peculiar terms with respect to part payments, the determination of amounts billable by continuous government audit, and the minimum of risk carried by the contractor, the fees should be accrued as they are billable.

.16 Ordinarily it is acceptable to accrue the fees as they become billable. The outstanding characteristic of CPFF contracts is reimbursement for all allowable costs, plus payment of a fixed fee for the contractor's efforts. Delivery of the finished product may not have its usual legal significance because title passes to the government prior thereto and the contractor's right to partial payment becomes unconditional in advance thereof; deliveries are not necessarily, under the terms of the agreement, evidence of the progress of the work or of the contractor's performance. Amounts billable indicate reasonably assured realization, possibly subject to renegotiation, because of the absence of a credit problem and minimum risk of loss involved. The fee appears to be earned when allowable costs are incurred or paid and the fee is billable. Finally, accrual on the basis of amounts billable is ordinarily not a departure from existing rules of accrual on the basis of partial performance, but rather a distinctive application of the rule for determining percentage of completion.

.17 Judgment must be exercised in each case as to whether accrual of the fee when billable is preferable to accrual on the usual basis of delivery or of percentage of

 © 1974, American Institute of Certified Public Accountants, Inc.

completion otherwise determined. While the approval of the government as to amounts billable would ordinarily be regarded as objective evidence, factors may exist which suggest an earlier or later accrual. Such factors include indications of substantial difference between estimated and final cost, as where preparatory or tooling-up costs were much more than estimated, raw material needs were greatly and unduly anticipated by advance purchases, or delays in delivery schedules or other circumstances suggest that costs are exceeding estimates. While such factors are normally considered by the government and billings for fees may be temporarily adjusted to safeguard against too early proportionate payment, the contractor, in accruing income, should also consider them, particularly when any substantial lag exists between expenditures and billings and audit thereof. In such cases, the presumption may be that the fee will not be found to be billable when the charges are presented, and conservatism in accrual will be necessary. Excess costs may be indicated in some cases to such an extent that accrual of fee before actual production would be unwise. Where such a situation exists the usual rule of deliveries or percentage of completion may be a preferable method of accruing the fee.

.18 There are further questions as to whether the fee may be accrued as it is billed rather than as it becomes billable and whether accrual should be on the basis of the full fee or the full fee less the amount withheld. As to the first question, it seems obvious that when accrual in relation to expenditures is otherwise suitable it should be on the basis of amounts billable, since such matters as clerical delays in assembling data for billing should not affect the income statement. As to the second question, accrual on the basis of 100% of the fee is ordinarily preferable since, while payment of the balance depends on complete performance, such completion is to be expected under ordinary circumstances. Care must be exercised, of course, to provide for possible non-realization where there is doubt as to the collection of claimed costs or of the fee thereon.

(b) What amounts are to be included in sales or revenue accounts?

.19 This problem is whether sales or revenue as reported in the income statement should include reimburs-

able costs and the fee, or the fee alone. The answer to this question depends upon the terms of the contract and upon judgment as to which method gives the more useful information.

.20 Some CPFF contracts are service contracts under which the contractor acts solely in an agency capacity, whether in the erection of facilities or the management of operations. These appear to call for inclusion in the income statement of the fee alone. In the case of supply contracts, however, the contractor is more than an agent. For instance, he is responsible to creditors for materials and services purchased; he is responsible to employees for salaries and wages; he ordinarily uses his own facilities in carrying out his agreement; his position in many respects is that of an ordinary principal. In view of these facts, and the desirability of indicating the volume of his activities, it appears desirable to include reimbursable costs, as well as fees, in sales or revenues.

(c) What is the proper balance-sheet classification of unbilled costs and fee?

.21 The principal reason for the existence of unbilled costs at any date is the time usually required, after receipt of material or expenditures for labor, etc., to assemble data for billing. The right to bill usually exists upon expenditure or accrual, and that right unquestionably represents a receivable rather than an advance or inventory. There is nevertheless a difference in character between billed items and unbilled costs and distinction should be made between them on the balance sheet.

(d) What is the proper balance-sheet treatment of various items, debit and credit, identified with CPFF contracts?

.22 In statements of current assets and current liabilities, amounts due to and from the same person are ordinarily offset where, under the law, they may be offset in the process of collection or payment. An advance received on a contract is, however, usually not offset unless it is definitely regarded as a payment on account of contract work in progress, in which event it will be shown as a deduction from the related asset. An advance on a CPFF contract usually is made for the purpose of providing a revolving fund and is not ordinarily applied as a partial

 © 1974, American Institute of Certified Public Accountants, Inc.

payment until the contract is completed or nears completion. It therefore appears to be preferable to offset advances on CPFF contracts against receivables in connection with the contracts only when it is expected that the advances will be applied in payment of those particular charges. In any case, amounts offset should be clearly disclosed.

AC Section 4042

Renegotiation

[Source: ARB No. 43, Chap. 11B, as amended.]

Issue date, unless otherwise indicated: June, 1953 [1]

.01 This section [2] deals with certain aspects of the accounting for those government contracts and subcontracts which are subject to renegotiation.

.02 Where such contracts constitute a substantial part of the business done, the uncertainties resulting from the possibilities of renegotiation are usually such that appropriate indication of their existence should be given in the financial statements.

.03 It is impossible to lay down general rules which can be applied satisfactorily in all cases. Here, as elsewhere in accounting, there must be an exercise of judgment which should be based on experience and on a clear understanding of the objective to be attained. That objective is to present the fairest possible financial statements, and at the same time make clear any uncertainties that limit the significance of such statements.

.04 In keeping with the established accounting principle that provision should be made in financial statements for all liabilities, including reasonable estimates for liabilities not accurately determinable, provision should be made for probable renegotiation refunds wherever the amount of such refunds can be reasonably estimated. Thus, in cases where experience of the company or of comparable companies with renegotiation determinations is available and would make a reasonable estimate practicable, provision in the income account for an estimated refund affecting the current year's operations is called for. In cases in which a reasonable estimate cannot be made, as where the effect of a new or amended renegotiation act

[1] The material included in this section was drawn primarily from ARB 43, Chapter 11, Section B, *Renegotiation*. Paragraph 8 of that bulletin was superseded by APB Opinion No. 11, effective for fiscal periods beginning after December 31, 1967.

[2] The comments in this section are considered to be applicable also to price redetermination estimated to result in retroactive price reduction.

cannot be foretold within reasonable limits or where a company is facing renegotiation for the first time and no reliable precedent is available, disclosure of the inability, because of these circumstances, to determine renegotiation effects and of the consequent uncertainties in the financial statements is necessary.

.05 In addition to any provision made in the accounts, disclosure by footnote or otherwise may be required as to the uncertainties, their significance, and the basis used in determining the amount of the provision, such as the prior years' experience of the contractor or of similar contractors if their experience is available and is used, renegotiation discussions relating to the current year, etc. Such disclosure may be helpful in informing shareholders or other interested persons as to the company's status under the renegotiation law. It should also be recognized that, if conditions change, the results of a prior-year determination or settlement are not, in most cases, indicative of the amount probably refundable for the current year.

TREATMENT IN FINANCIAL STATEMENTS

.06 Provisions made for renegotiation refunds should be included in the balance sheet among the current liabilities.

.07 Accounting treatment in the income statement should conform to the concept that profit is deemed to be realized when a sale in the ordinary course of business is effected, unless the circumstances are such that collection of the sales price is not reasonably assured.[3] Renegotiation refunds are commonly referred to as involving a refund of "excessive profits"; realistically, however, renegotiation involves an adjustment of the original contract or selling price. Since a provision for renegotiation refund indicates that the collection, or retention, of the selling price is not reasonably assured, the provision should preferably be treated in the income statement as a deduction from sales. Because of the interrelationship of renegotiation and taxes on income, the provision for such taxes should then be computed accordingly.

[3] See section 4010.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

RENEGOTIATION REFUNDS FOR PRIOR YEARS

.08 A further question arises where a renegotiation refund applicable to a particular year is made in an amount materially different from the provision made in the financial statements originally issued for such year. The committee recommends that the difference between the renegotiation refund and the provision therefor be shown in the current income statement. (See section 2012.10-.12.) [As amended, effective for fiscal periods beginning after December 31, 1966, by APB Opinion No. 9.] [As amended, effective for events and transactions occurring after September 30, 1973, by APB Opinion No. 30.] [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.]

AC Section 4043

Terminated War and Defense Contracts

[Source: ARB No. 43, Chap. 11C.]

Issue date, unless otherwise indicated: June, 1953

.01 This section deals with problems involved in accounting for fixed-price war and defense supply contracts terminated, in whole or in part, for the convenience of the government. It does not deal specifically with terminated cost-plus-fixed-fee contracts nor with contracts for facilities or services. However, the conclusions reached herein may serve as guides for the accounting applicable to such special contracts. Terminations for default of the contractor involve problems of a different nature and are not considered here.

.02 Except where the text clearly indicates otherwise, the term *contractor* is used to denote either a prime contractor or a subcontractor, and the term *contract* to denote either a prime contract or a subcontract.

SUMMARY STATEMENT

.03 The profit of a contractor on a fixed-price supply contract terminated for the convenience of the government accrues as of the effective date of termination.

.04 Those parts of the termination claim which are reasonably determinable should be included in financial statements after termination; when the total of the undeterminable elements is believed to be material, full disclosure of the essential facts should be made, by footnote or otherwise.

.05 Under ordinary circumstances the termination claim should be classified as a current asset and unless the amount is relatively small should be separately disclosed.

.06 Advances received on the contract before its termination may be shown in financial statements after termi-

nation as a deduction from the claim receivable and should be appropriately explained. Loans negotiated on the security of the termination claim, however, should be shown as current liabilities.

.07 All of the contractor's own cost and profit elements included in the termination claim are preferably accounted for as a sale and if material in amount should be separately disclosed. The costs and expenses chargeable to the claim may then be given their usual classification in the accounts.

.08 When inventory items whose costs are included in the termination claim are subsequently reacquired by the contractor the reacquisition value of those items should be recorded as a purchase and applied, together with other disposal credits, against the termination claim receivable.

.09 So called *no-cost* settlements—those in which the contractor waives the right to make a claim—result in no transaction which could be reflected in sales. The costs applicable to the contract may be given their usual classification in the accounts; the inventory retained should not be treated as a purchase but should be accounted for according to the usual methods and standards applicable to inventories.

DISCUSSION

.10 Termination of war and defense contracts for the convenience of the government is a means of adjusting the production of materials to the varying requirements of the military services. Since terminations transfer active contracts in process of execution into claims in process of liquidation, they, like contract renegotiations and cost-plus-fixed-fee contracts, may have important effects on the financial statements of defense contractors.

When Profit Accrues

.11 An important problem involved in accounting for the effect of terminations is that of determining the time at which profit earned on the contract should be recognized. This problem is similar to that described in other sections on renegotiation and cost-plus-fixed-fee contracts in that it involves accrual at a specific date of an element of profit whose original measurement may be difficult and

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

will require informed judgment, and whose final amount may not be determined until some future period.

.12 Three dates have been mentioned as dates for the determination of profit from terminated contracts: (a) the effective date of termination; (b) the date of final settlement; and (c) some intermediate date, such as that on which the claim is finally prepared or filed. The effective date of termination is the date at which the contractor acquires the right to receive payment on the terminated portion of the contract. This date is also, of the three, the one most objectively determined.

.13 Under the accrual basis of accounting recognition is given to revenues and expenses, to the fullest extent possible, in the period to which they relate. Profit on a contract of sale is ordinarily taken into account upon delivery or performance. However, as stated in section 4041 it is a generally accepted accounting procedure to accrue revenues under certain types of contracts, and thereby recognize profits, on the basis of partial performance where the circumstances are such that total profit can be estimated with reasonable accuracy and ultimate realization is reasonably assured. Thus, the accrual of profit under a cost-plus-fixed-fee contract is recognized as the fee becomes billable rather than when it is actually billed. Upon termination of a contract the contractor acquires a claim for fair compensation; the government reserves the option of acquiring any of the inventories for which the contractor makes claim under the terminated contract. Except to effect settlements and to protect and dispose of property, the expenses of which are reimbursable, the contractor need perform no further service under a terminated contract in order to enforce his claim. It follows that any profit arising out of such a contract accrues at the effective date of termination and, if the amount can be reasonably ascertained, should be recorded at that time.

Determination of Claim

.14 Practical application of the accrual principle to the accounting for terminated war and defense contracts rests upon the possibility of making a reasonable estimate of the amount of the termination claim before its final determination by settlement. This involves two principal

considerations: (1) whether the costs of the contractor can be determined with reasonable accuracy and (2) whether the amount of profit to be realized can be estimated closely enough to justify inclusion in the accounts.

.15 The various acts and regulations, including a statement of principles for determining costs and certain termination cost memorandums, describe in general terms the costs and expenses which are to be taken into account in arriving at fair compensation, as well as certain costs which are not allowable, and establish uniform termination policies and procedures.

.16 While the total claim, and particularly the profit allowance, is subject to negotiation, the termination articles provide for a formula settlement allowing definite percentages of profit based on costs in the event of the failure of negotiations. This in effect fixes a minimum expectation of profit allowance since the formula percentages have also been recognized by regulation as a basis of negotiating settlement in the event of failure by the parties to agree on any other basis. The same regulations give other guides for estimating a fair profit allowance, which in some cases may be greater than the amount computed by the formula percentages. When the contractor, because of lack of prior negotiation experience or uncertainty as to the application of the principles of these regulations to a particular case, is unable to determine a more appropriate profit allowance, he may accrue the minimum amount determined by the formula percentages.

.17 The profit to be included in the accounts of the contractor upon termination is the difference between (a) the amount of his recorded claim and (b) the total of the inventory, deferred and capitalized items, and other costs applicable to the terminated contract as they are currently included in his accounts. This profit may exceed the amount specified as profit in the claim because costs applicable to the terminated portion of the contract may be allowable in the claim even though they may have been properly written off as incurred in prior periods.

.18 In some cases it will be impossible to make a reasonable estimate of a termination claim in time for inclu-

 © 1974, American Institute of Certified Public Accountants, Inc.

sion in the financial statements of the period in which the termination occurs. Effect may then be given in the statements to those parts of the termination claim which are determinable with reasonable certainty and disclosure made, by footnote or otherwise, of the status of the remainder.

.19 When the contractor's claim includes items of known controversial nature it should be stated at the amount estimated to be collectible. When a particular termination claim or part thereof is so uncertain in amount that it cannot be reasonably estimated, it is preferable not to give effect to that part of the claim in the financial statements; but if the total of such undeterminable elements is material, the circumstances should be disclosed in statements issued before the removal of the uncertainty. In an extreme case involving undeterminable claims, consideration should be given to delaying the issuance of financial statements until necessary data are available.

Presentation in Financial Statements

.20 Termination has the effect of converting an active contract in process into a claim, or, from an accounting standpoint, from inventories and other charges into an account receivable. This receivable arises in the regular course of business; it is part of the working capital; and in view of the provisions made for financial assistance to the contractor during the period of termination, collection in large part may be expected within a relatively short time. The termination claim should therefore be classified as a current asset, unless there is an indication of extended delay, such as serious disagreement pointing to probable litigation, which would exclude it from this classification.

.21 Although a claim may be composed of several elements representing reimbursable items of special equipment, deferred charges, inventories, and other items, as well as claims for profit, it is preferable to record the claim in one account. When the total of termination claims is material it should be disclosed separately from other receivables. It is also desirable to segregate claims directly against the government from claims against other contractors where the amounts are significant.

.22 To assure adequate financial assistance to contractors, the acts provide in some cases for partial pay-

ments and in others for such payments or guaranteed loans from the effective date of termination until final settlement. Partial payments are, of course, to be recorded as reductions of the termination claim receivable. Termination loans, on the other hand, are definite liabilities to third parties, even though guaranteed in whole or in part by the government, and accordingly should be shown in the balance sheet as liabilities, with appropriate cross-reference to the related claim or claims. When a terminated contract is one on which advance payments had previously been received, the financial statements of the contractor issued before final collection of the claim ordinarily should reflect any balance of those advances disclosed as deductions from the claim receivable.[1] Financial statements issued before the termination claim is recorded should disclose, by footnote or otherwise, the relationship of such liabilities to a possible termination claim receivable.

.23 Ordinarily, a termination will result in the cessation of a contractor's activity through which materials or services have been supplied under the contract and of the related transactions which have been reflected in the contractor's income accounts as sales and cost elements. In effect, termination policies and procedures provide a basis upon which the contractor's costs in process may become the elements of a final sale under the terminated portion of the contract. Accordingly, the amount of the contractor's termination claim representing his cost and profit elements should be treated as a sale and the costs and expenses chargeable to the claim given their usual classification in the income statement. Because these termination sales are of a special type, their financial results should not be appraised in the same manner as are those of regular sales and they should, if material in amount, be separately disclosed in the income statement. Any items which the contractor chooses to retain without claim for cost or loss are, of course, not sold but remain as inventory or deferred charges in the contractor's accounts.

Claims of Subcontractors

.24 The term *subcontractor's claims* as used in connection with terminated contracts refers to those obliga-

---

[1] See section 4041.22.

 © 1974, American Institute of Certified Public Accountants, Inc.

tions of a contractor to a subcontractor which arise from the subcontractor's costs incurred through transactions which were related to the contract terminated but did not result in the transfer of billable materials or services to the contractor before termination. Other obligations of a contractor to a subcontractor, arising through transactions by which materials or services of the subcontractor are furnished or supplied to the contractor, are considered to be liabilities incurred in the ordinary course of business and are not included in the term *claims of subcontractors.*

.25 The termination articles provide that, following the termination of a contract, the contractor shall settle, with the approval or ratification of the contracting officer when necessary, all claims of subcontractors arising out of the termination; and that the contractor shall be paid, as part of his settlement, the cost of settling and paying claims arising out of the stoppage of work under subcontracts affected by the termination. While a contractor ordinarily is liable to his subcontractors or suppliers for such obligations, the amounts due them are an element in his termination claim and often are not paid to them until after his claim has been settled. He often has no control over the filing of subcontractors' claims and may not know their amount until some time after the termination date or even until some time after he has filed and received payment for his own claim.

.26 The possibility that a contractor may suffer loss through failure to recover the amount of his liability on subcontractors' claims arises principally from overcommitments, errors in ordering, and similar causes. Provision should be made in his accounts for losses of this character which are known or believed to be probable.

.27 Although the principle that liabilities may not be offset against assets in the financial statements is generally approved by accountants, there is no general agreement as to the accounting treatment to be accorded subcontractors' claims which are expected to be fully recoverable. To the extent that a subcontractor's claim is considered to be unrecoverable no difference of opinion exists; the liability should be recorded and provision made for any contemplated loss. The difference of opinion relates to

those subcontractors' claims which are deemed to be fully recoverable.

.28 Some accountants believe that the effect of the various acts and regulations is to establish a relationship between the claims of subcontractors and the resulting right of the contractor under his own termination claim which differs from an ordinary commercial relationship and justifies their omission from the accounts. Recoverable subcontractors' claims are thus said to be in the nature of contingent liabilities, which are customarily omitted from the accounts except where a loss is expected. Contingent liabilities may be disclosed in the financial statements without recording them as assets and liabilities, and even when they are recorded it is customary accounting practice to show them on the balance sheet as deductions from the related contingent assets so that no effect upon financial ratios and relationships results.

.29 Other accountants believe that the nature of an obligation to a subcontractor is that of an ordinary liability, even though it may arise through the termination of a war or defense contract, and that the contractor's termination claim receivable, although related to the subcontractor's claim, is to be accounted for independently as an asset. This group believes that all subcontractors' claims, to the extent that they are reasonably ascertainable, should be recorded in the accounts and displayed in the contractor's balance sheet as current liabilities, and that the amounts recoverable by the contractor should be included in his termination claim receivable. To the extent that the amounts of subcontractors' claims are not reasonably determinable, disclosure by footnote or otherwise in the financial statements is believed to be adequate.

.30 Because of the merits and prevalence of these alternative views, the committee expresses no preference for either treatment and considers either to be acceptable.

Disposal Credits

.31 Disposal credits are amounts deducted from the contractor's termination claim receivable by reason of his retention, or sale to outsiders, of some or all of the termination inventory for which claim was made. In the case

 © 1974, American Institute of Certified Public Accountants, Inc.

of items retained, either as scrap or for use by the contractor, the amount of the credit is determined by agreement between the contractor and a representative of the government. The sale of inventory items by the contractor is likewise subject to approval by the government, except as permitted by regulation. Since the amount of the contractor's termination claim, as already indicated, is properly recorded as a sale, any elements included in that claim for items of inventory retained by the contractor are, in effect, reacquired by him and should be treated as purchases at the agreed value. Amounts received for items sold to others with the approval of the government are collections for the account of the government and should be applied in reduction of the claim receivable. Obviously inventories or other items that are retained by the contractor after termination without claim for loss should not be included as an element of the termination claim.

No-Cost Settlements

.32 A contractor whose contract is terminated may prefer to retain the termination inventory for use in other production or for disposal at his own risk. For these or other reasons the contractor may prefer to make no claim against the government or a higher-tier contractor. In the case of such no-cost settlements there is no sale of inventory or other items to the government and therefore no occasion to accrue any profit arising out of the termination. The costs otherwise applicable to the contract should be given their usual treatment in the accounts. Items of inventory or other property retained, having been previously recorded, will, of course, require no charge to purchases but should be treated in accordance with the usual procedures applicable to such assets.

AC Section 4053

Accounting for Leases

[Source: FASB Statement No. 13.]

November 1976

INTRODUCTION

.001 This Statement establishes standards of financial accounting and reporting for leases by lessees and lessors. For purposes of this Statement, a lease is defined as an agreement conveying the right to use property, plant, or equipment (land and/or depreciable assets) usually for a stated period of time. It includes agreements that, although not nominally identified as leases, meet the above definition, such as a "heat supply contract" for nuclear fuel.[1] This definition does not include agreements that are contracts for services that do not transfer the right to use property, plant, or equipment from one contracting party to the other. On the other hand, agreements that do transfer the right to use property, plant, or equipment meet the definition of a lease for purposes of this Statement even though substantial services by the contractor (lessor) may be called for in connection with the operation or maintenance of such assets. This Statement does not apply to lease agreements concerning the rights to explore for or to exploit natural resources such as oil, gas, minerals, and timber. Nor does it apply to licensing agreements for items such as motion picture films, plays, manuscripts, patents, and copyrights.

.002 This Statement supersedes *APB Opinion No. 5,* "Reporting of Leases in Financial Statements of Lessee"; *APB Opinion No. 7,* "Accounting for Leases in Financial Statements of Lessors"; paragraph 15 of *APB Opinion No. 18* [section 5131.15], "The Equity Method of Accounting for Investments in Common Stock"; *APB Opinion No. 27,* "Accounting for Lease Transactions by Manufacturer or Dealer Lessors"; and *APB Opinion No. 31,* "Disclosure of Lease Commitments by Lessees."

---

[1] Heat supply (also called "burn-up") contracts usually provide for payments by the user-lessee based upon nuclear fuel utilization in the period plus a charge for the unrecovered cost base. The residual value usually accrues to the lessee, and the lessor furnishes no service other than the financing.

.003 This Statement applies to regulated enterprises in accordance with the provisions of the Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'."

.004 Appendix A provides background information. Appendix B sets forth the basis for the Board's conclusions, including alternatives considered and reasons for accepting some and rejecting others. Illustrations of the accounting and disclosure requirements for lessees and lessors called for by this Statement are contained in Appendixes C and D. An example of the application of the accounting and disclosure provisions for leveraged leases is provided in Appendix E.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Definitions of Terms

.005 For purposes of this Statement, certain terms are defined as follows:

a. *Related parties in leasing transactions.* A parent company and its subsidiaries, an owner company and its joint ventures (corporate or otherwise) and partnerships, and an investor (including a natural person) and its investees, provided that the parent company, owner company, or investor has the ability to exercise significant influence over operating and financial policies of the related party, as significant influence is defined in *APB Opinion No. 18,* paragraph 17 [section 5131.17]. In addition to the examples of significant influence set forth in that paragraph, significant influence may be exercised through guarantees of indebtedness, extensions of credit, or through ownership of warrants, debt obligations, or other securities. If two or more entities are subject to the significant influence of a parent, owner company, investor (including a natural person), or common officers or directors, those entities shall be considered related parties with respect to each other.

b. *Inception of the lease.* With the exception noted below, the date of the lease agreement or commitment, if earlier. For purposes of this definition, a commitment shall be in writing, signed by the parties in interest to the transaction, and shall specifically set forth the principal terms of the transaction.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

However, if the property covered by the lease has yet to be constructed or has not been acquired by the lessor at the date of the lease agreement or commitment, the inception of the lease shall be the date that construction of the property is completed or the property is acquired by the lessor.

c. *Fair value of the leased property.* The price for which the property could be sold in an arm's-length transaction between unrelated parties. (See definition of related parties in leasing transactions in paragraph .005(a).) The following are examples of the determination of fair value:

   i. When the lessor is a manufacturer or dealer, the fair value of the property at the inception of the lease (as defined in paragraph .005(b)) will ordinarily be its normal selling price, reflecting any volume or trade discounts that may be applicable. However, the determination of fair value shall be made in light of market conditions prevailing at the time, which may indicate that the fair value of the property is less than the normal selling price and, in some instances, less than the cost of the property.

   ii. When the lessor is not a manufacturer or dealer, the fair value of the property at the inception of the lease will ordinarily be its cost, reflecting any volume or trade discounts that may be applicable. However, when there has been a significant lapse of time between the acquisition of the property by the lessor and the inception of the lease, the determination of fair value shall be made in light of market conditions prevailing at the inception of the lease, which may indicate that the fair value of the property is greater or less than its cost or carrying amount, if different. (See paragraph .006(b).)

d. *Bargain purchase option.* A provision allowing the lessee, at his option, to purchase the leased property for a price which is sufficiently lower than the expected fair value of the property at the date the option becomes exercisable that exercise of the option appears, at the inception of the lease, to be reasonably assured.

e. *Bargain renewal option.* A provision allowing the lessee, at his option, to renew the lease for a rental sufficiently lower than the fair rental[2] of the property at the date the option becomes

---

[2] "Fair rental" in this context shall mean the expected rental for equivalent property under similar terms and conditions.

exercisable that exercise of the option appears, at the inception of the lease, to be reasonably assured.

f. *Lease term.* The fixed noncancelable term of the lease plus (i) all periods, if any, covered by bargain renewal options (as defined in paragraph .005(e)), (ii) all periods, if any, for which failure to renew the lease imposes a penalty on the lessee in an amount such that renewal appears, at the inception of the lease, to be reasonably assured, (iii) all periods, if any, covered by ordinary renewal options during which a guarantee by the lessee of the lessor's debt related to the leased property is expected to be in effect, (iv) all periods, if any, covered by ordinary renewal options preceding the date as of which a bargain purchase option (as defined in paragraph .005(d)) is exercisable, and (v) all periods, if any, representing renewals or extensions of the lease at the lessor's option; however, in no case shall the lease term extend beyond the date a bargain purchase option becomes exercisable. A lease which is cancelable (i) only upon the occurrence of some remote contingency, (ii) only with the permission of the lessor, (iii) only if the lessee enters into a new lease with the same lessor, or (iv) only upon payment by the lessee of a penalty in an amount such that continuation of the lease appears, at inception, reasonably assured shall be considered "noncancelable" for purposes of this definition.

g. *Estimated economic life of leased property.* The estimated remaining period during which the property is expected to be economically usable by one or more users, with normal repairs and maintenance, for the purpose for which it was intended at the inception of the lease, without limitation by the lease term.

h. *Estimated residual value of leased property.* The estimated fair value of the leased property at the end of the lease term (as defined in paragraph .005 (f)).

i. *Unguaranteed residual value.* The estimated residual value of the leased property (as defined in paragraph .005(h)) exclusive of any portion guaranteed by the lessee[3] or by a third party unrelated to the lessor.[4]

---

[3] A guarantee by a third party related to the lessee shall be considered a lessee guarantee.

[4] If the guarantor is related to the lessor, the residual value shall be considered as unguaranteed.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

j. *Minimum lease payments.*
   i. From the standpoint of the lessee: The payments that the lessee is obligated to make or can be required to make in connection with the leased property. However, a guarantee by the lessee of the lessor's debt and the lessee's obligation to pay (apart from the rental payments) executory costs such as insurance, maintenance, and taxes in connection with the leased property shall be excluded. If the lease contains a bargain purchase option, only the minimum rental payments over the lease term (as defined in paragraph .005(f)) and the payment called for by the bargain purchase option shall be included in the minimum lease payments. Otherwise, minimum lease payments include the following:
      a. The minimum rental payments called for by the lease over the lease term.
      b. Any guarantee by the lessee[5] of the residual value at the expiration of the lease term, whether or not payment of the guarantee constitutes a purchase of the leased property. When the lessor has the right to require the lessee to purchase the property at termination of the lease for a certain or determinable amount, that amount shall be considered a lessee guarantee. When the lessee agrees to make up any deficiency below a stated amount in the lessor's realization of the residual value, the guarantee to be included in the minimum lease payments shall be the stated amount, rather than an estimate of the deficiency to be made up.
      c. Any payment that the lessee must make or can be required to make upon failure to renew or extend the lease at the expiration of the lease term, whether or not the payment would constitute a purchase of the leased property. In this connection, it should be noted that the definition of lease term in paragraph .005(f) includes "all periods, if any, for which failure to renew the lease imposes a penalty on the lessee in an amount such that renewal appears, at the inception of the lease, to be reasonably assured." If the lease term has been extended because of that provision, the related penalty shall not be included in minimum lease payments.
   ii. From the standpoint of the lessor: The payments described in (i) above plus any guarantee of the residual value or of rental payments beyond the lease term by a third party unrelated to either the lessee[6] or the lessor,[7] provided the

[5] See footnote 3.
[6] See footnote 3.
[7] See footnote 4.

third party is financially capable of discharging the obligations that may arise from the guarantee.

k. *Interest rate implicit in the lease.* The discount rate that, when applied to (i) the minimum lease payments (as defined in paragraph .005(j)), excluding that portion of the payments representing executory costs to be paid by the lessor, together with any profit thereon, and (ii) the unguaranteed residual value (as defined in paragraph .005(i)) accruing to the benefit of the lessor,[8] causes the aggregate present value at the beginning of the lease term to be equal to the fair value of the leased property (as defined in paragraph .005(c)) to the lessor at the inception of the lease, minus any investment tax credit retained by the lessor and expected to be realized by him. (This definition does not necessarily purport to include all factors that a lessor might recognize in determining his rate of return, e. g., see paragraph .044.)

l. *Lessee's incremental borrowing rate.* The rate that, at the inception of the lease, the lessee would have incurred to borrow over a similar term the funds necessary to purchase the leased asset.

m. *Initial direct costs.* Those costs incurred by the lessor that are directly associated with negotiating and consummating completed leasing transactions. Those costs include, but are not necessarily limited to, commissions, legal fees, costs of credit investigations, and costs of preparing and processing documents for new leases acquired. In addition, that portion of salespersons' compensation, other than commissions, and the compensation of other employees that is applicable to the time spent in the activities described above with respect to completed leasing transactions shall also be included in initial direct costs. That portion of salespersons' compensation and the compensation of other employees that is applicable to the time spent in negotiating leases that are not consummated shall not be included in initial direct costs. No portion of supervisory and administrative expenses or other indirect expenses, such as rent and facilities costs, shall be included in initial direct costs. [As amended, effective for leasing transactions and lease agreement revisions entered into on or after January 1, 1978, by FASB Statement No. 17.] (See section 4054.)

---

[8] If the lessor is not entitled to any excess of the amount realized on disposition of the property over a guaranteed amount, no unguaranteed residual value would accrue to his benefit.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Classification of Leases for Purposes of this Statement

.006 For purposes of applying the accounting and reporting standards of this Statement, leases are classified as follows:

a. Classifications from the standpoint of the lessee:

   i. *Capital leases.* Leases that meet one or more of the criteria in paragraph .007.

   ii. *Operating leases.* All other leases.

b. Classifications from the standpoint of the lessor:

   i. *Sales-type leases.* Leases that give rise to manufacturer's or dealer's profit (or loss) to the lessor (i.e., the fair value of the leased property at the inception of the lease is greater or less than its cost or carrying amount, if different) and that meet one or more of the criteria in paragraph .007 and both of the criteria in paragraph .008. Normally, sales-type leases will arise when manufacturers or dealers use leasing as a means of marketing their products. Leases involving lessors that are primarily engaged in financing operations normally will not be sales-type leases if they qualify under paragraphs .007 and .008, but will most often be direct financing leases, described in paragraph .006(b)(ii) below. However, a lessor need not be a dealer to realize dealer's profit (or loss) on a transaction, e. g., if a lessor, not a dealer, leases an asset that at the inception of the lease has a fair value that is greater or less than its cost or carrying amount, if different, such a transaction is a sales-type lease, assuming the criteria referred to are met. A renewal or an extension [9] of an existing sales-type or direct financing lease shall not be classified as a sales-type lease; however, if it qualifies under paragraphs .007 and .008, it shall be classified as a direct financing lease. (See paragraph .017(f).)

   ii. *Direct financing leases.* Leases other than leveraged leases that do not give rise to manufacturer's or dealer's profit (or loss) to the lessor but that meet one or more of the criteria in paragraph .007 and both of the criteria in paragraph .008. In such leases, the cost or carrying amount, if different, and fair value of the leased property are the same at the inception of the lease. An exception arises when an existing lease is renewed or extended.[10] In such cases, the fact that the carrying amount of the property at the end of the original lease term is different from its fair value at that date shall

---

[9] As used here, renewal or extension includes a new lease under which the lessee continues to use the same property.

[10] See footnote 9.

not preclude the classification of the renewal or extension as a direct financing lease. (See paragraph .017(f).)

iii. *Leveraged leases.* Leases that meet the criteria of paragraph .042.

iv. *Operating leases.* All other leases.

Criteria for Classifying Leases (Other Than Leveraged Leases)

.007 The criteria for classifying leases set forth in this paragraph and in paragraph .008 derive from the concept set forth in paragraph .060. If at its inception (as defined in paragraph .005(b)) a lease meets one or more of the following four criteria, the lease shall be classified as a capital lease by the lessee. Otherwise, it shall be classified as an operating lease. (See Appendix C for an illustration of the application of these criteria.)

a. The lease transfers ownership of the property to the lessee by the end of the lease term (as defined in paragraph .005(f)).

b. The lease contains a bargain purchase option (as defined in paragraph .005(d)).

c. The lease term (as defined in paragraph .005(f)) is equal to 75 percent or more of the estimated economic life of the leased property (as defined in paragraph .005(g)). However, if the beginning of the lease term falls within the last 25 percent of the total estimated economic life of the leased property, including earlier years of use, this criterion shall not be used for purposes of classifying the lease.

d. The present value at the beginning of the lease term of the minimum lease payments (as defined in paragraph .005(j)), excluding that portion of the payments representing executory costs such as insurance, maintenance, and taxes to be paid by the lessor, including any profit thereon, equals or exceeds 90 percent of the excess of the fair value of the leased property (as defined in paragraph .005(c)) to the lessor at the inception of the lease over any related investment tax credit retained by the lessor and expected to be realized by him. However, if the beginning of the lease term falls within the last 25 percent of the total estimated economic life of the leased property,

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

including earlier years of use, this criterion shall not be used for purposes of classifying the lease. A lessor shall compute the present value of the minimum lease payments using the interest rate implicit in the lease (as defined in paragraph .005(k)). A lessee shall compute the present value of the minimum lease payments using his incremental borrowing rate (as defined in paragraph .005(l)), unless (i) it is practicable for him to learn the implicit rate computed by the lessor and (ii) the implicit rate computed by the lessor is less than the lessee's incremental borrowing rate. If both of those conditions are met, the lessee shall use the implicit rate.

.008 From the standpoint of the lessor, if at inception a lease meets any one of the preceding four criteria and in addition meets both of the following criteria, it shall be classified as a sales-type lease or a direct financing lease, whichever is appropriate (see paragraphs .006(b)(i) and .006(b)(ii)). Otherwise, it shall be classified as an operating lease.

a. Collectibility of the minimum lease payments is reasonably predictable. A lessor shall not be precluded from classifying a lease as a sales-type lease or as a direct financing lease simply because the receivable is subject to an estimate of uncollectibility based on experience with groups of similar receivables.

b. No important uncertainties surround the amount of unreimbursable costs yet to be incurred by the lessor under the lease. Important uncertainties might include commitments by the lessor to guarantee performance of the leased property in a manner more extensive than the typical product warranty or to effectively protect the lessee from obsolescence of the leased property. However, the necessity of estimating executory costs such as insurance, maintenance, and taxes to be paid by the lessor (see paragraphs .017(a) and .018(a)) shall not by itself constitute an important uncertainty as referred to herein.

.009 If at any time the lessee and lessor agree to change the provisions of the lease, other than by renewing the lease or extending its term, in a manner that would have resulted in a different classification of the lease under the criteria in paragraphs .007 and .008 had the changed terms been in effect at the inception of the lease, the revised agreement shall be considered as a new agreement over its term, and the criteria in paragraphs .007 and

.008 shall be applied for purposes of classifying the new lease. Likewise, except when a guarantee or penalty is rendered inoperative as described in paragraphs .012 and .017(e), any action that extends the lease beyond the expiration of the existing lease term (see paragraph .005(f)), such as the exercise of a lease renewal option other than those already included in the lease term, shall be considered as a new agreement, which shall be classified according to the provisions of paragraphs .006-.008. Changes in estimates (for example, changes in estimates of the economic life or of the residual value of the leased property) or changes in circumstances (for example, default by the lessee), however, shall not give rise to a new classification of a lease for accounting purposes.

Accounting and Reporting by Lessees

Capital Leases

.010 The lessee shall record a capital lease as an asset and an obligation at an amount equal to the present value at the beginning of the lease term of minimum lease payments during the lease term, excluding that portion of the payments representing executory costs such as insurance, maintenance, and taxes to be paid by the lessor, together with any profit thereon. However, if the amount so determined exceeds the fair value of the leased property at the inception of the lease, the amount recorded as the asset and obligation shall be the fair value. If the portion of the minimum lease payments representing executory costs, including profit thereon, is not determinable from the provisions of the lease, an estimate of the amount shall be made. The discount rate to be used in determining present value of the minimum lease payments shall be that prescribed for the lessee in paragraph .007(d). (See Appendix C for illustrations.)

.011 Except as provided in paragraphs .025 and .026 with respect to leases involving land, the asset recorded under a capital lease shall be amortized as follows:

a. If the lease meets the criterion of either paragraph .007(a) or .007(b), the asset shall be amortized in a manner consistent with the lessee's normal depreciation policy for owned assets.
b. If the lease does not meet either criterion .007(a) or .007(b), the asset shall be amortized in a manner consistent with the lessee's normal depreciation policy except that the period of

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

amortization shall be the lease term. The asset shall be amortized to its expected value, if any, to the lessee at the end of the lease term. As an example, if the lessee guarantees a residual value at the end of the lease term and has no interest in any excess which might be realized, the expected value of the leased property to him is the amount that can be realized from it up to the amount of the guarantee.

.012 During the lease term, each minimum lease payment shall be allocated between a reduction of the obligation and interest expense so as to produce a constant periodic rate of interest on the remaining balance of the obligation.[11] (See Appendix C for illustrations.) In leases containing a residual guarantee by the lessee or a penalty for failure to renew the lease at the end of the lease term,[12] following the above method of amortization will result in a balance of the obligation at the end of the lease term that will equal the amount of the guarantee or penalty at that date. In the event that a renewal or other extension of the lease term or a new lease under which the lessee continues to lease the same property renders the guarantee or penalty inoperative, the asset and the obligation under the lease shall be adjusted by an amount equal to the difference between the present value of the future minimum lease payments under the revised agreement and the present balance of the obligation. The present value of the future minimum lease payments under the revised agreement shall be computed using the rate of interest used to record the lease initially. In accordance with paragraph .009, other renewals and extensions of the lease term shall be considered new agreements, which shall be accounted for in accordance with the provisions of paragraph .014. Contingent rentals,[13] including rentals based on variables such as the prime interest rate, shall be charged to expense when actually incurred.

.013 Assets recorded under capital leases and the accumulated amortization thereon shall be separately identified in the lessee's balance sheet or in footnotes thereto. Likewise, the related obliga-

---

[11] This is the "interest" method described in the first sentence of paragraph 15 of *APB Opinion No. 21* [section 4111.14], "Interest on Receivables and Payables," and in paragraphs 16 and 17 of *APB Opinion No. 12* [section 5361.01-.02], "Omnibus Opinion—1967."

[12] Residual guarantees and termination penalties that serve to extend the lease term (as defined in paragraph .005(f)) are excluded from minimum lease payments and are thus distinguished from those guarantees and penalties referred to in this paragraph.

[13] The term "contingent rentals" includes all or any portion of the stipulated rental that is contingent.

tions shall be separately identified in the balance sheet as obligations under capital leases and shall be subject to the same considerations as other obligations in classifying them with current and noncurrent liabilities in classified balance sheets. Unless the charge to income resulting from amortization of assets recorded under capital leases is included with depreciation expense and the fact that it is so included is disclosed, the amortization charge shall be separately disclosed in the financial statements or footnotes thereto.

.014 Except for a change in the provisions of a lease that results from a refunding by the lessor of tax-exempt debt, including an advance refunding, in which the perceived economic advantages of the refunding are passed through to the lessee by a change in the provisions of the lease agreement and the revised agreement is classified as a capital lease (see *FASB Statement No. 22* [section 4055]), a change in the provisions of a lease, a renewal or extension [14] of an existing lease, and a termination of a lease prior to the expiration of the lease term shall be accounted for as follows:

a. If the provisions of the lease are changed in a way that changes the amount of the remaining minimum lease payments and the change either (i) does not give rise to a new agreement under the provisions of paragraph .009 or (ii) does give rise to a new agreement but such agreement is also classified as a capital lease, the present balances of the asset and the obligation shall be adjusted by an amount equal to the difference between the present value of the future minimum lease payments under the revised or new agreement and the present balance of the obligation. The present value of the future minimum lease payments under the revised or new agreement shall be computed using the rate of interest used to record the lease initially. If the change in the lease provisions gives rise to a new agreement classified as an operating lease, the asset and obligation under the lease shall be removed, gain or loss shall be recognized for the difference, and the new lease agreement shall thereafter be accounted for as any other operating lease.

b. Except when a guarantee or penalty is rendered inoperative as described in paragraph .012, a renewal or an extension [15] of an existing lease shall be accounted for as follows:

[14] See footnote 9.

[15] See footnote 9.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

i. If the renewal or extension is classified as a capital lease, it shall be accounted for as described in subparagraph (a) above.

ii. If the renewal or extension is classified as an operating lease, the existing lease shall continue to be accounted for as a capital lease to the end of its original term, and the renewal or extension shall be accounted for as any other operating lease.

c. A termination of a capital lease shall be accounted for by removing the asset and obligation, with gain or loss recognized for the difference.

[As amended, effective July 1, 1978, by FASB Statement No. 22.] (See section 4055.)

Operating Leases

.015 Normally, rental on an operating lease shall be charged to expense over the lease term as it becomes payable. If rental payments are not made on a straight-line basis, rental expense nevertheless shall be recognized on a straight-line basis unless another systematic and rational basis is more representative of the time pattern in which use benefit is derived from the leased property, in which case that basis shall be used.

Disclosures

.016 The following information with respect to leases shall be disclosed in the lessee's financial statements or the footnotes thereto (see Appendix D for illustrations).

a. For capital leases:

i. The gross amount of assets recorded under capital leases as of the date of each balance sheet presented by major classes according to nature or function. This information may be combined with the comparable information for owned assets.

ii. Future minimum lease payments as of the date of the latest balance sheet presented, in the aggregate and for each of the five succeeding fiscal years, with separate deductions from the total for the amount representing executory

costs, including any profit thereon, included in the minimum lease payments and for the amount of the imputed interest necessary to reduce the net minimum lease payments to present value (see paragraph .010).

iii. The total of minimum sublease rentals to be received in the future under noncancelable subleases as of the date of the latest balance sheet presented.

iv. Total contingent rentals (rentals on which the amounts are dependent on some factor other than the passage of time) actually incurred for each period for which an income statement is presented.

b. For operating leases having initial or remaining noncancelable lease terms in excess of one year:

i. Future minimum rental payments required as of the date of the latest balance sheet presented, in the aggregate and for each of the five succeeding fiscal years.

ii. The total of minimum rentals to be received in the future under noncancelable subleases as of the date of the latest balance sheet presented.

c. For all operating leases, rental expense for each period for which an income statement is presented, with separate amounts for minimum rentals, contingent rentals, and sublease rentals. Rental payments under leases with terms of a month or less that were not renewed need not be included.

d. A general description of the lessee's leasing arrangements including, but not limited to, the following:

i. The basis on which contingent rental payments are determined.

ii. The existence and terms of renewal or purchase options and escalation clauses.

iii. Restrictions imposed by lease agreements, such as those concerning dividends, additional debt, and further leasing.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Accounting and Reporting by Lessors

Sales–Type Leases

.017 Sales-type leases shall be accounted for by the lessor as follows:

a. The minimum lease payments (net of amounts, if any, included therein with respect to executory costs such as maintenance, taxes, and insurance to be paid by the lessor, together with any profit thereon) plus the unguaranteed residual value (as defined in paragraph .005(i)) accruing to the benefit of the lessor shall be recorded as the gross investment in the lease.

b. The difference between the gross investment in the lease in (a) above and the sum of the present values of the two components of the gross investment shall be recorded as unearned income. The discount rate to be used in determining the present values shall be the interest rate implicit in the lease. The net investment in the lease shall consist of the gross investment less the unearned income. The unearned income shall be amortized to income over the lease term so as to produce a constant periodic rate of return on the net investment in the lease.[16] However, other methods of income recognition may be used if the results obtained are not materially different from those which would result from the prescribed method. The net investment in the lease shall be subject to the same considerations as other assets in classification as current or noncurrent assets in a classified balance sheet. Contingent rentals, including rentals based on variables such as the prime interest rate, shall be credited to income when they become receivable.

c. The present value of the minimum lease payments (net of executory costs, including any profit thereon), computed at the interest rate implicit in the lease, shall be recorded as the sales price. The cost or carrying amount, if different, of the leased property, plus any initial direct costs (as defined in paragraph .005(m)), less the present value of the unguaranteed residual value accruing to the benefit of the lessor, computed at the interest rate implicit in the lease, shall be charged against income in the same period.

---

[16] See footnote 11.

d. The estimated residual value shall be reviewed at least annually. If the review results in a lower estimate than had been previously established, a determination must be made as to whether the decline in estimated residual value is other than temporary. If the decline in estimated residual value is judged to be other than temporary, the accounting for the transaction shall be revised using the changed estimate. The resulting reduction in the net investment shall be recognized as a loss in the period in which the estimate is changed. An upward adjustment of the estimated residual value shall not be made.

e. In leases containing a residual guarantee or a penalty for failure to renew the lease at the end of the lease term,[17] following the method of amortization described in (b) above will result in a balance of minimum lease payments receivable at the end of the lease term that will equal the amount of the guarantee or penalty at that date. In the event that a renewal or other extension [18] of the lease term renders the guarantee or penalty inoperative, the existing balances of the minimum lease payments receivable and the estimated residual value shall be adjusted for the changes resulting from the revised agreement (subject to the limitation on the residual value imposed by subparagraph (d) above) and the net adjustment shall be charged or credited to unearned income.

f. Except for a change in the provisions of a lease that results from a refunding by the lessor of tax-exempt debt, including an advance refunding, in which the perceived economic advantages of the refunding are passed through to the lessee by a change in the provisions of the lease agreement and the revised agreement is classified as a direct financing lease (see *FASB Statement No. 22* [section 4055]), a change in the provisions of a lease, a renewal or extension [19] of an existing lease, and a termination of a lease prior to the expiration of the lease term shall be accounted for as follows:

   i. If the provisions of a lease are changed in a way that changes the amount of the remaining minimum lease payments and the change either (a) does not give rise to a new agreement under the provisions of paragraph .009 or (b) does give rise to a new agreement but such agreement is classified as a direct financing lease, the balance of the

[17] See footnote 12.
[18] See footnote 9.
[19] See footnote 9.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

minimum lease payments receivable and the estimated residual value, if affected, shall be adjusted to reflect the change (subject to the limitation on the residual value imposed by subparagraph (d) above), and the net adjustment shall be charged or credited to unearned income. If the change in the lease provisions gives rise to a new agreement classified as an operating lease, the remaining net investment shall be removed from the accounts, the leased asset shall be recorded as an asset at the lower of its original cost, present fair value, or present carrying amount, and the net adjustment shall be charged to income of the period. The new lease shall thereafter be accounted for as any other operating lease.

ii. Except when a guarantee or penalty is rendered inoperative as described in subparagraph (e) above, a renewal or an extension [20] of an existing lease shall be accounted for as follows:

a. If the renewal or extension is classified as a direct financing lease, it shall be accounted for as described in subparagraph f(i) above.

b. If the renewal or extension is classified as an operating lease, the existing lease shall continue to be accounted for as a sales-type lease to the end of its original term, and the renewal or extension shall be accounted for as any other operating lease.

iii. A termination of the lease shall be accounted for by removing the net investment from the accounts, recording the leased asset at the lower of its original cost, present fair value, or present carrying amount, and the net adjustment shall be charged to income of the period.

[As amended, effective July 1, 1978, by FASB Statement No. 22.] (See section 4055.)

Direct Financing Leases

.018 Direct financing leases shall be accounted for by the lessor as follows (see Appendix C for illustrations):

a. The minimum lease payments (net of amounts, if any, included therein with respect to executory costs such as maintenance, taxes, and insurance to be paid by the lessor, together with any profit thereon) plus the unguaranteed residual value accruing

---

[20] See footnote 9.

to the benefit of the lessor shall be recorded as the gross investment in the lease.

b. The difference between the gross investment in the lease in (a) above and the cost or carrying amount, if different, of the leased property shall be recorded as unearned income. The net investment in the lease shall consist of the gross investment less the unearned income. Initial direct costs (as defined in paragraph .005(m)) shall be charged against income as incurred, and a portion of the unearned income equal to the initial direct costs shall be recognized as income in the same period. The remaining unearned income shall be amortized to income over the lease term so as to produce a constant periodic rate of return on the net investment in the lease.[21] However, other methods of income recognition may be used if the results obtained are not materially different from those which would result from the prescribed method in the preceding sentence. The net investment in the lease shall be subject to the same considerations as other assets in classification as current or noncurrent assets in a classified balance sheet. Contingent rentals, including rentals based on variables such as the prime interest rate, shall be credited to income when they become receivable.

c. In leases containing a residual guarantee or a penalty for failure to renew the lease at the end of the lease term,[22] the lessor shall follow the accounting procedure described in paragraph .017(e). The accounting provisions of paragraph .017(f) with respect to renewals and extensions not dealt with in paragraph .017(e), terminations, and other changes in lease provisions shall also be followed with respect to direct financing leases.

d. The estimated residual value shall be reviewed at least annually and, if necessary, adjusted in the manner prescribed in paragraph .017(d).

Operating Leases

.019 Operating leases shall be accounted for by the lessor as follows.

a. The leased property shall be included with or near property, plant, and equipment in the balance sheet. The property shall be depreciated following the lessor's normal depreciation

[21] See footnote 11.

[22] See footnote 12.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

policy, and in the balance sheet the accumulated depreciation shall be deducted from the investment in the leased property.

b. Rent shall be reported as income over the lease term as it becomes receivable according to the provisions of the lease. However, if the rentals vary from a straight-line basis, the income shall be recognized on a straight-line basis unless another systematic and rational basis is more representative of the time pattern in which use benefit from the leased property is diminished, in which case that basis shall be used.

c. Initial direct costs shall be deferred and allocated over the lease term in proportion to the recognition of rental income. However, initial direct costs may be charged to expense as incurred if the effect is not materially different from that which would have resulted from the use of the method prescribed in the preceding sentence.

Participation by Third Parties

.020 The sale or assignment of a lease or of property subject to a lease that was accounted for as a sales-type lease or direct financing lease shall not negate the original accounting treatment accorded the lease. Any profit or loss on the sale or assignment shall be recognized at the time of the transaction except that (a) when the sale or assignment is between related parties, the provisions of paragraphs .029 and .030 shall be applied, or (b) when the sale or assignment is with recourse, the profit or loss shall be deferred and recognized over the lease term in a systematic manner (e.g., in proportion to the minimum lease payments).

.021 The sale of property subject to an operating lease, or of property that is leased by or intended to be leased by the third-party purchaser to another party, shall not be treated as a sale if the seller or any party related to the seller retains substantial risks of ownership in the leased property. A seller may by various arrangements assure recovery of the investment by the third-party purchaser in some operating lease transactions and thus retain substantial risks in connection with the property. For example, in the case of default by the lessee or termination of the lease, the arrangements may involve a formal or informal commitment by the seller to (a) acquire the lease or the property, (b) substitute an existing lease, or (c) secure a replacement lessee or a buyer for the property under a remarketing agreement. However, a remarketing agreement by itself shall not disqualify accounting for the transaction as a sale if the seller (a) will receive a reasonable fee commensurate with the effort involved at the time of securing a replacement lessee or buyer for the property and (b) is not required to give priority to the re-leasing or disposition of the

property owned by the third-party purchaser over similar property owned or produced by the seller. (For example, a first-in, first-out remarketing arrangement is considered to be a priority.)

.022 If a sale to a third party of property subject to an operating lease or of property that is leased by or intended to be leased by the third-party purchaser to another party is not to be recorded as a sale because of the provisions of paragraph .021 above, the transaction shall be accounted for as a borrowing. (Transactions of these types are in effect collateralized borrowings.) The proceeds from the "sale" shall be recorded as an obligation on the books of the "seller." Until that obligation has been amortized under the procedure described herein, rental payments made by the lessee(s) under the operating lease or leases shall be recorded as revenue by the "seller," even if such rentals are paid directly to the third-party purchaser. A portion of each rental shall be recorded by the "seller" as interest expense, with the remainder to be recorded as a reduction of the obligation. The interest expense shall be calculated by application of a rate determined in accordance with the provisions of *APB Opinion No. 21,* "Interest on Receivables and Payables," paragraphs 13 and 14 [section 4111.12-.13]. The leased property shall be accounted for as prescribed in paragraph .019(a) for an operating lease, except that the term over which the asset is depreciated shall be limited to the estimated amortization period of the obligation. The sale or assignment by the lessor of lease payments due under an operating lease shall be accounted for as a borrowing as described above.

Disclosures

.023 When leasing, exclusive of leveraged leasing, is a significant part of the lessor's business activities in terms of revenue, net income, or assets, the following information with respect to leases shall be disclosed in the financial statements or footnotes thereto (see Appendix D for illustrations):

a. For sales-type and direct financing leases:

   i. The components of the net investment in sales-type and direct financing leases as of the date of each balance sheet presented:

      a. Future minimum lease payments to be received, with separate deductions for (i) amounts representing executory costs, including any profit thereon, included in the minimum lease payments and (ii) the accumulated allowance for uncollectible minimum lease payments receivable.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

b. The unguaranteed residual values accruing to the benefit of the lessor.

c. Unearned income (see paragraphs .017(b) and .018(b)).

ii. Future minimum lease payments to be received for each of the five succeeding fiscal years as of the date of the latest balance sheet presented.

iii. The amount of unearned income included in income to offset initial direct costs charged against income for each period for which an income statement is presented. (For direct financing leases only.)

iv. Total contingent rentals included in income for each period for which an income statement is presented.

b. For operating leases:

i. The cost and carrying amount, if different, of property on lease or held for leasing by major classes of property according to nature or function, and the amount of accumulated depreciation in total as of the date of the latest balance sheet presented.

ii. Minimum future rentals on noncancelable leases as of the date of the latest balance sheet presented, in the aggregate and for each of the five succeeding fiscal years.

iii. Total contingent rentals included in income for each period for which an income statement is presented.

c. A general description of the lessor's leasing arrangements.

Leases Involving Real Estate

.024 For purposes of this Statement, leases involving real estate can be divided into four categories: (a) leases involving land only, (b) leases involving land and building(s), (c) leases involving equipment as well as real estate, and (d) leases involving only part of a building.

Leases Involving Land Only

.025 If land is the sole item of property leased and the criterion in either paragraph .007(a) or .007(b) is met, the lessee shall account for the lease as a capital lease; otherwise, as an operating lease. If the criteria set forth in paragraph .008 are also met, the lessor shall account for the lease as a sales-type or direct financing lease, whichever is appropriate (see paragraphs

.006(b)(i) and .006(b)(ii)); otherwise, as an operating lease. Criteria .007(c) and .007(d) are not applicable to land leases. Because ownership of the land is expected to pass to the lessee if either criterion .007(a) or .007(b) is met, the asset recorded under the capital lease would not normally be amortized.

Leases Involving Land and Building(s)

.026 Leases involving both land and building(s) shall be accounted for as follows:

a. Lease meets either criterion .007(a) or .007(b):

   i. Lessee's accounting: If either criterion (a) or (b) of paragraph .007 is met, the land and building shall be separately capitalized by the lessee. For this purpose, the present value of the minimum lease payments after deducting executory costs, including any profit thereon, shall be allocated between the two elements in proportion to their fair values at the inception of the lease. The building shall be amortized in accordance with the provisions of paragraph .011(a). As stated in paragraph .025, land capitalized under a lease that meets criterion (a) or (b) of paragraph .007 would not normally be amortized.

   ii. Lessor's accounting: If either criterion (a) or (b) of paragraph .007 is met and the criteria of paragraph .008 are also met, the lessor shall account for the lease as a single unit, either as a sales-type lease or as a direct financing lease as appropriate under paragraphs .006(b)(i) and .006(b)(ii). If the criteria of paragraph .008 are not met, the lessor shall account for the lease as an operating lease.

b. Lease meets neither criterion .007(a) nor .007(b):

   i. If the fair value of the land is less than 25 percent of the total fair value of the leased property at the inception of the lease: Both the lessee and the lessor shall consider the land and the building as a single unit for purposes of applying the criteria of paragraphs .007(c) and .007(d). For purposes of applying the criterion of paragraph .007(c), the estimated economic life of the building shall be considered as the estimated economic life of the unit.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

a. Lessee's accounting: If either criterion (c) or (d) of paragraph .007 is met, the lessee shall capitalize the land and building as a single unit and amortize it in accordance with the provisions of paragraph .011(b); otherwise, the lease shall be accounted for as an operating lease.

b. Lessor's accounting: If either criterion (c) or (d) of paragraph .007 and the criteria of paragraph .008 are met, the lessor shall account for the lease as a single unit, either as a sales-type lease or as a direct financing lease as appropriate under paragraphs .006(b)(i) and .006(b)(ii); otherwise, the lease shall be accounted for as an operating lease.

ii. If the fair value of the land is 25 percent or more of the total fair value of the leased property at the inception of the lease: Both the lessee and lessor shall consider the land and the building separately for purposes of applying the criteria of paragraphs .007(c) and .007(d). The minimum lease payments after deducting executory costs, including any profit thereon, applicable to the land and the building shall be separated both by the lessee and the lessor by determining the fair value of the land and applying the lessee's incremental borrowing rate to it to determine the annual minimum lease payments applicable to the land element; the remaining minimum lease payments shall be attributed to the building element.

a. Lessee's accounting: If the building element of the lease meets criterion (c) or (d) of paragraph .007, the building element shall be accounted for as a capital lease and amortized in accordance with the provisions of paragraph .011(b). The land element of the lease shall be accounted for separately as an operating lease. If the building element of the lease meets neither criterion (c) nor (d) of paragraph .007, both the building element and the land element shall be accounted for as a single operating lease.

b. Lessor's accounting: If the building element of the lease meets criterion (c) or (d) of paragraph .007 and the criteria of paragraph .008, the building element shall be accounted for as a sales-type lease or a direct financing lease as appropriate under paragraphs

.006(b)(i) and .006(b)(ii). The land element of the lease shall be accounted for separately as an operating lease. If the building element of the lease meets neither criterion (c) nor (d) of paragraph .007 or does not meet the criteria of paragraph .008, both the building element and the land element shall be accounted for as a single operating lease.

Leases Involving Equipment as Well as Real Estate

.027 If a lease involving real estate also includes equipment, the portion of the minimum lease payments applicable to the equipment element of the lease shall be estimated by whatever means are appropriate in the circumstances. The equipment shall be considered separately for purposes of applying the criteria in paragraphs .007 and .008 and shall be accounted for separately according to its classification by both lessees and lessors.

Leases Involving Only Part of a Building

.028 When the leased property is part of a larger whole, its cost (or carrying amount) and fair value may not be objectively determinable, as for example, when an office or floor of a building is leased. If the cost and fair value of the leased property are objectively determinable, both the lessee and the lessor shall classify and account for the lease according to the provisions of paragraph .026. Unless both the cost and the fair value are objectively determinable, the lease shall be classified and accounted for as follows:

a. Lessee:

   i. If the fair value of the leased property is objectively determinable, the lessee shall classify and account for the lease according to the provisions of paragraph .026.

   ii. If the fair value of the leased property is not objectively determinable, the lessee shall classify the lease according to the criterion of paragraph .007(c) only, using the estimated economic life of the building in which the leased premises are located. If that criterion is met, the leased property shall be capitalized as a unit and amortized in accordance with the provisions of paragraph .011(b).

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

b. Lessor: If either the cost or the fair value of the property is not objectively determinable, the lessor shall account for the lease as an operating lease.

Because of special provisions normally present in leases involving terminal space and other airport facilities owned by a governmental unit or authority, the economic life of such facilities for purposes of classifying the lease is essentially indeterminate. Likewise, the concept of fair value is not applicable to such leases. Since such leases also do not provide for a transfer of ownership or a bargain purchase option, they shall be classified as operating leases. Leases of other facilities owned by a governmental unit or authority wherein the rights of the parties are essentially the same as in a lease of airport facilities described above shall also be classified as operating leases. Examples of such leases may be those involving facilities at ports and bus terminals.

Leases Between Related Parties

.029 Except as noted below, leases between related parties (as defined in paragraph .005(a)) shall be classified in accordance with the criteria in paragraphs .007 and .008. Insofar as the separate financial statements of the related parties are concerned, the classification and accounting shall be the same as for similar leases between unrelated parties, except in cases where it is clear that the terms of the transaction have been significantly affected by the fact that the lessee and lessor are related. In such cases the classification and/or accounting shall be modified as necessary to recognize economic substance rather than legal form. The nature and extent of leasing transactions with related parties shall be disclosed.

.030 In consolidated financial statements or in financial statements for which an interest in an investee is accounted for on the equity basis, any profit or loss on a leasing transaction with the related party shall be accounted for in accordance with the principles set forth in *ARB No. 51* [section 2051], "Consolidated Financial Statements," or *APB Opinion No. 18* [section 5131], whichever is applicable.

.031 The accounts of subsidiaries (regardless of when organized or acquired) whose principal business activity is leasing property or facilities to the parent or other affiliated companies shall be consolidated. The equity method is not adequate for fair presentation of those subsidiaries because their assets and liabilities are significant to the consolidated financial position of the enterprise.

Sale–Leaseback Transactions

.032 Sale-leaseback transactions involve the sale of property by the owner and a lease of the property back to the seller.

.033 If the lease meets one of the criteria for treatment as a capital lease (see paragraph .007), the seller-lessee shall account for the lease as a capital lease; otherwise, as an operating lease. Except as noted below, any profit or loss on the sale shall be deferred and amortized in proportion to the amortization of the leased asset,[23] if a capital lease, or in proportion to rental payments over the period of time the asset is expected to be used, if an operating lease. However, when the fair value of the property at the time of the transaction is less than its undepreciated cost, a loss shall be recognized immediately up to the amount of the difference between undepreciated cost and fair value.

.034 If the lease meets the criteria in paragraphs .007 and .008, the purchaser-lessor shall record the transaction as a purchase and a direct financing lease; otherwise, he shall record the transaction as a purchase and an operating lease.

Accounting and Reporting for Subleases and Similar Transactions

.035 This section deals with the following types of leasing transactions:

a. The leased property is re-leased by the original lessee to a third party, and the lease agreement between the two original parties remains in effect (a sublease).

b. A new lessee is substituted under the original lease agreement. The new lessee becomes the primary obligor under the agreement, and the original lessee may or may not be secondarily liable.

c. A new lessee is substituted through a new agreement, with cancellation of the original lease agreement.

---

[23] If the leased asset is land only, the amortization shall be on a straight-line basis over the lease term.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Accounting by the Original Lessor

.036 If the original lessee enters into a sublease or the original lease agreement is sold or transferred by the original lessee to a third party, the original lessor shall continue to account for the lease as before.

.037 If the original lease agreement is replaced by a new agreement with a new lessee, the lessor shall account for the termination of the original lease as provided in paragraph .017(f) and shall classify and account for the new lease as a separate transaction.

Accounting by the Original Lessee

.038 If the nature of the transaction is such that the original lessee is relieved of the primary obligation under the original lease, as would be the case in transactions of the type described in paragraphs .035(b) and .035(c), the termination of the original lease agreement shall be accounted for as follows:

a. If the original lease was a capital lease, the asset and obligation representing the original lease shall be removed from the accounts, gain or loss shall be recognized for the difference, and, if the original lessee is secondarily liable, the loss contingency shall be treated as provided by *FASB Statement No. 5* [section 4311], "Accounting for Contingencies." Any consideration paid or received upon termination shall be included in the determination of gain or loss to be recognized.

b. If the original lease was an operating lease and the original lessee is secondarily liable, the loss contingency shall be treated as provided by *FASB Statement No. 5* [section 4311].

.039 If the nature of the transaction is such that the original lessee is not relieved of the primary obligation under the original lease, as would be the case in transactions of the type described in paragraph .035(a), the original lessee, as sublessor, shall account for the transaction as follows:

a. If the original lease met either criterion (a) or (b) of paragraph .007, the original lessee shall classify the new lease in accordance with the criteria of paragraphs .007 and .008. If the new lease meets one of the criteria of paragraph .007 and both of the criteria of paragraph .008, it shall be accounted

for as a sales-type or direct financing lease, as appropriate, and the unamortized balance of the asset under the original lease shall be treated as the cost of the leased property. If the new lease does not qualify as a sales-type or direct financing lease, it shall be accounted for as an operating lease. In either case, the original lessee shall continue to account for the obligation related to the original lease as before.

b. If the original lease met either criterion (c) or (d) but not criterion (a) or (b) of paragraph .007, the original lessee shall, with one exception, classify the new lease in accordance with the criteria of paragraphs .007(c) and .008 only. If it meets those criteria, it shall be accounted for as a direct financing lease, with the unamortized balance of the asset under the original lease treated as the cost of the leased property; otherwise, as an operating lease. In either case, the original lessee shall continue to account for the obligation related to the original lease as before. The one exception arises when the timing and other circumstances surrounding the sublease are such as to suggest that the sublease was intended as an integral part of an overall transaction in which the original lessee serves only as an intermediary. In that case, the sublease shall be classified according to the criteria of paragraphs .007(c) and .007(d), as well as the criteria of paragraph .008. In applying the criterion of paragraph .007(d), the fair value of the leased property shall be the fair value to the original lessor at the inception of the original lease.

c. If the original lease is an operating lease, the original lessee shall account for both it and the new lease as operating leases.

Accounting by the New Lessee

.040 The new lessee shall classify the lease in accordance with the criteria of paragraph .007 and account for it accordingly.

Accounting and Reporting for Leveraged Leases

.041 From the standpoint of the lessee, leveraged leases shall be classified and accounted for in the same manner as non-leveraged leases. The balance of this section deals with leveraged leases from the standpoint of the lessor.

.042 For purposes of this Statement, a leveraged lease is defined as one having all of the following characteristics:

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

a. Except for the exclusion of leveraged leases from the definition of a direct financing lease as set forth in paragraph .006(b)(ii), it otherwise meets that definition. Leases that meet the definition of sales-type leases set forth in paragraph .006(b)(i) shall not be accounted for as leveraged leases but shall be accounted for as prescribed in paragraph .017.

b. It involves at least three parties: a lessee, a long-term creditor, and a lessor (commonly called the equity participant).

c. The financing provided by the long-term creditor is nonrecourse as to the general credit of the lessor (although the creditor may have recourse to the specific property leased and the unremitted rentals relating to it). The amount of the financing is sufficient to provide the lessor with substantial "leverage" in the transaction.

d. The lessor's net investment, as defined in paragraph .043, declines during the early years once the investment has been completed and rises during the later years of the lease before its final elimination. Such decreases and increases in the net investment balance may occur more than once.

A lease meeting the preceding definition shall be accounted for by the lessor using the method described in paragraphs .043-.047; an exception arises if the investment tax credit is accounted for other than as stated in paragraphs .043 and .044,[24] in which case the lease shall be classified as a direct financing lease and accounted for in accordance with paragraph .018. A lease not meeting the definition of a leveraged lease shall be accounted for in accordance with its classification under paragraph .006(b).

.043 The lessor shall record his investment in a leveraged lease net of the nonrecourse debt. The net of the balances of the following accounts shall represent the initial and continuing investment in leveraged leases:

a. Rentals receivable, net of that portion of the rental applicable to principal and interest on the nonrecourse debt.

b. A receivable for the amount of the investment tax credit to be realized on the transaction.

---

[24] It is recognized that the investment tax credit may be accounted for other than as prescribed in this section, as provided by Congress in the Revenue Act of 1971.

c. The estimated residual value of the leased asset.

d. Unearned and deferred income consisting of (i) the estimated pretax lease income (or loss), after deducting initial direct costs, remaining to be allocated to income over the lease term and (ii) the investment tax credit remaining to be allocated to income over the lease term.

The investment in leveraged leases less deferred taxes arising from differences between pretax accounting income and taxable income shall represent the lessor's net investment in leveraged leases for purposes of computing periodic net income from the lease, as described in paragraph .044.

.044 Given the original investment and using the projected cash receipts and disbursements over the term of the lease, the rate of return on the net investment in the years[25] in which it is positive shall be computed. The rate is that rate which when applied to the net investment in the years in which the net investment is positive will distribute the net income to those years (see Appendix E, Schedule 3) and is distinct from the interest rate implicit in the lease as defined in paragraph .005(k). In each year, whether positive or not, the difference between the net cash flow and the amount of income recognized, if any, shall serve to increase or reduce the net investment balance. The net income recognized shall be composed of three elements: two, pretax lease income (or loss) and investment tax credit, shall be allocated in proportionate amounts from the unearned and deferred income included in net investment, as described in paragraph .043; the third element is the tax effect of the pretax lease income (or loss) recognized, which shall be reflected in tax expense for the year. The tax effect of the difference between pretax accounting income (or loss) and taxable income (or loss) for the year shall be charged or credited to deferred taxes. The accounting prescribed in paragraph .043 and in this paragraph is illustrated in Appendix E.

.045 If the projected net cash receipts [26] over the term of the lease are less than the lessor's initial investment, the deficiency shall be recognized as a loss at the inception of the lease. Likewise, if at

---

[25] The use of the term "years" is not intended to preclude application of the accounting prescribed in this paragraph to shorter accounting periods.

[26] For purposes of this paragraph, net cash receipts shall be gross cash receipts less gross cash disbursements exclusive of the lessor's initial investment.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

any time during the lease term the application of the method prescribed in paragraphs .043 and .044 would result in a loss being allocated to future years, that loss shall be recognized immediately. This situation might arise in cases where one of the important assumptions affecting net income is revised (see paragraph .046).

.046 Any estimated residual value and all other important assumptions affecting estimated total net income from the lease shall be reviewed at least annually. If during the lease term the estimate of the residual value is determined to be excessive and the decline in the residual value is judged to be other than temporary or if the revision of another important assumption changes the estimated total net income from the lease, the rate of return and the allocation of income to positive investment years shall be recalculated from the inception of the lease following the method described in paragraph .044 and using the revised assumption. The accounts constituting the net investment balance shall be adjusted to conform to the recalculated balances, and the change in the net investment shall be recognized as a gain or loss in the year in which the assumption is changed. An upward adjustment of the estimated residual value shall not be made. The accounting prescribed in this paragraph is illustrated in Appendix E.

.047 For purposes of presenting the investment in a leveraged lease in the lessor's balance sheet, the amount of related deferred taxes shall be presented separately (from the remainder of the net investment), as prescribed in *APB Opinion No. 11,* "Accounting for Income Taxes," paragraphs 57, 59, and 64 [sections 4091.56, 4091.58, and 4091.63]. In the income statement or the notes thereto, separate presentation (from each other) shall be made of pretax income from the leveraged lease, the tax effect of pretax income, and the amount of investment tax credit recognized as income during the period. When leveraged leasing is a significant part of the lessor's business activities in terms of revenue, net income, or assets, the components of the net investment balance in leveraged leases as set forth in paragraph .043 shall be disclosed in the footnotes to the financial statements. Appendix E contains an illustration of the balance sheet, income statement, and footnote presentation for a leveraged lease.

Effective Date and Transition

.048 The preceding paragraphs of this Statement shall be effective for leasing transactions and lease agreement revisions (see paragraph .009) entered into on or after January 1, 1977. However,

leasing transactions or revisions of agreements consummated on or after January 1, 1977 pursuant to the terms of a commitment made prior to that date and renewal options exercised under agreements existing or committed prior to that date shall not be considered as leasing transactions or lease agreement revisions entered into after January 1, 1977 if such commitment is in writing, signed by the parties in interest to the transaction, including the financing party,[27] if any, when specific financing is essential to the transaction, and specifically sets forth the principal terms of the transaction. The disclosures called for in the preceding paragraphs of this Statement shall be included in financial statements for calendar or fiscal years ending after December 31, 1976.[28] Earlier application of the preceding paragraphs of this Statement, including retroactive application to all leases regardless of when they were entered into or committed is encouraged but, until the effective date specified in paragraph .049, is not required. If applied retroactively, financial statements presented for prior periods shall be restated according to the provisions of paragraph .051.

.049 For purposes of financial statements for calendar or fiscal years beginning after December 31, 1980, paragraphs .001-.047 of this Statement shall be applied retroactively, and any accompanying financial statements presented for prior periods shall be restated as may be required by the provisions of paragraph .051.

.050 If paragraphs .001-.047 are not applied initially on a retroactive basis, as permitted by paragraph .048, those leases existing or committed at December 31, 1976 shall be subject to the following provisions until such time as paragraphs .001-.047 are applied retroactively to all leases.

a. For purposes of applying the presentation and disclosure requirements of this Statement applicable to lessees, those leases existing or committed at December 31, 1976 that are capitalized in accordance with the provisions of superseded *APB Opinion No. 5* shall be considered as capital leases, and those leases existing or committed at December 31, 1976 that are classified and accounted for as operating leases shall be con-

---

[27] For purposes of this paragraph, the term "financing party" shall include an interim lender pending long-term financing.

[28] For an enterprise having a fiscal year of 52 or 53 weeks ending in the last seven days in December or the first seven days in January, references to December 31 in paragraphs .048-.051 shall mean the date in December or January on which the fiscal year ends.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

sidered as operating leases. For those leases that are classified and accounted for as operating leases but that meet the criteria of paragraph .007 for classification as capital leases, separate disclosure of the following information shall be made for purposes of financial statements for the year ending December 31, 1977 and for years ending thereafter:

i. The amounts of the asset and the liability that would have been included in the balance sheet had those leases been classified and accounted for in accordance with the provisions of paragraphs .001-.047. This information shall also be disclosed for balance sheets as of December 31, 1976 and thereafter when such balance sheets are included in the financial statements referred to in paragraph .050(a) above.

ii. The effect on net income that would have resulted if those leases had been classified and accounted for in accordance with the provisions of paragraphs .001-.047. This information shall also be disclosed for income statements for periods beginning after December 31, 1976 when such income statements are included in the aforementioned financial statements.

b. For purposes of applying the presentation and disclosure requirements of this Statement applicable to lessors, those leases existing or committed at December 31, 1976 that are accounted for as sales, financing leases, and as operating leases in accordance with superseded *APB Opinions No. 7* and *27* shall be considered as sales-type leases, as direct financing leases, and as operating leases, respectively. (Refer to (c) below for provisions applicable to leveraged leases.) For those leases existing or committed at December 31, 1976 that are classified and accounted for as operating leases but that meet the criteria of paragraphs .007 and .008 for classification as direct financing leases or sales-type leases, separate disclosure of the following information shall be made for purposes of financial statements for the year ending December 31, 1977 and for years ending thereafter:

i. The amount of the change in net worth that would have resulted had the leases been classified and accounted for in accordance with the provisions of paragraphs .001-.047. This information shall also be disclosed for balance sheets as of December 31, 1976 and thereafter when such balance

sheets are included in the foregoing financial statements referred to in paragraph .050(b) above.

ii. The effect on net income that would have resulted if the leases had been classified and accounted for in accordance with the provisions of paragraphs .001-.047. This information shall also be disclosed for income statements for periods beginning after December 31, 1976 when such income statements are included in the aforementioned financial statements.

c. For those leases that meet the criteria of paragraph .042 (leveraged leases) but that are accounted for other than as prescribed in paragraphs .001-.047, separate disclosure of the following information shall be made for purposes of lessors' financial statements for the year ending December 31, 1977 and for years ending thereafter:

i. The amounts of the net changes in total assets and in total liabilities that would have resulted had the leases been classified and accounted for in accordance with the provisions of paragraphs .001-.047. This information shall also be disclosed for balance sheets as of December 31, 1976 and thereafter when such balance sheets are included in the financial statements referred to in paragraph .050(c) above.

ii. The effect on net income that would have resulted if the leases had been classified and accounted for in accordance with the provisions of paragraphs .001-.047. This information shall also be disclosed for income statements for periods beginning after December 31, 1976 when such income statements are included in the aforementioned financial statements.

.051 Paragraph .049 requires retroactive application of paragraphs .001-.047 for purposes of financial statements for calendar or fiscal years beginning after December 31, 1980, and paragraph .048 encourages earlier retroactive application. If after retroactive application is adopted, financial statements for earlier periods and financial summaries or other data derived from them are presented, they shall be restated in accordance with the following requirements to conform to the provisions of paragraphs .001-.047:

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

a. Such restatements shall include the effects of leases that were in existence during the periods covered by the financial statements even if those leases are no longer in existence.

b. Balance sheets presented as of December 31, 1976 and thereafter and income statements presented for periods beginning after December 31, 1976 and financial summaries and other data derived from those financial statements shall be restated to conform to the provisions of paragraphs .001-.047.

c. Balance sheets as of dates before December 31, 1976 and income statements for periods beginning before December 31, 1976 shall, when presented, be restated to conform to the provisions of paragraphs .001-.047 for as many consecutive periods immediately preceding December 31, 1976 as is practicable. Summaries or other data presented based on such balance sheets and income statements shall be treated in like manner.

d. The cumulative effect of applying paragraphs .001-.047 on the retained earnings at the beginning of the earliest period restated shall be included in determining net income of that period (see paragraph 20 of *APB Opinion No. 20* [section 1051.20], "Accounting Changes").[29] The effect on net income of applying paragraphs .001-.047 in the period in which the cumulative effect is included in determining net income shall be disclosed for that period, and the reason for not restating the prior periods presented shall be explained.

The provisions of this Statement need not be applied to immaterial items.

Appendix A begins on page 8429.

[29] Pro forma disclosures required by paragraphs 19(d) and 21 of *APB Opinion No. 20* [sections 1051.19(d) and 1051.21] are not applicable.

Appendix A

BACKGROUND INFORMATION

.052 The growing importance of leasing as a financing device was recognized by the accounting profession as early as 1949, when the AI[CP]A issued *Accounting Research Bulletin No. 38,* "Disclosure of Long-Term Leases in Financial Statements of Lessees." In early 1960, the newly formed APB recognized the importance of the matter by including lease accounting as one of the first five topics to be studied by the AICPA's Accounting Research Division. That project culminated in 1962 with the publication of *Accounting Research Study No. 4*, "Reporting of Leases in Financial Statements," and shortly thereafter the APB took up the subject. In all, during the ten years ending June 30, 1973, the APB issued four Opinions (No. 5, 7, 27, and 31) dealing with leases. They were supplemented by three AICPA Accounting Interpretations. The last of the APB Opinions, *APB Opinion No. 31*, "Disclosure of Lease Commitments by Lessees," as its name implies, dealt only with disclosure. The APB had previously acknowledged that certain questions remained in connection with Opinions 5 and 7 and had publicly announced its intention to give those questions further consideration. The APB decided, however, to deal only with additional disclosure requirements. In paragraph 5 of *APB Opinion No. 31,* which was approved in June 1973, the APB noted that:

> . . . disclosure of lease commitments is part of the broad subject of accounting for leases by lessees, a subject which has now been placed on the agenda of the Financial Accounting Standards Board. The Board [APB] also recognizes that the forthcoming report of the Study Group on the Objectives of Financial Statements may contain recommendations which will bear on this subject and which the FASB may consider in its deliberations. Accordingly, the Board is refraining from establishing any disclosure requirements which may prejudge or imply any bias with respect to the outcome of the FASB's undertaking, particularly in relation to the questions of which leases, if any, should be capitalized and how such capitalization may influence the income statement. Nevertheless, in the meantime the Board recognizes the need to improve the disclosure of lease commitments in order that users of financial statements may be better informed.

.053 The SEC, too, has issued a number of pronouncements on accounting for leases, including three Accounting Series Releases:

No. 132, 141, and 147, adopted on October 5, 1973. The latter Release imposes essentially the same disclosure requirements with respect to total rental expense and minimum rental commitments as *APB Opinion No. 31*. However, it makes mandatory the disclosure of the present value of certain lease commitments (defined differently from the optional present value disclosure included in *APB Opinion No. 31*). In addition, it requires disclosure of the impact on net income had "financing" leases been capitalized, a disclosure not called for by *APB Opinion No. 31*.

.054 Despite the attention that the accounting profession has given to the matter of accounting for leases, inconsistencies remain in lease accounting practices, and differences of opinion as to what should be done about them remain. In recognition of that fact, the FASB placed on its initial agenda a project on Accounting for Leases. In October 1973, a task force of 11 persons from industry, government, public accounting, the financial community, and academe was appointed to provide counsel to the Board in preparing a Discussion Memorandum analyzing issues related to the project.

.055 As indicated above, accounting for leases is a subject which has been thoroughly studied over a long period of time and on which numerous pronouncements have been made. Extensive research has been carried out; several public hearings have been held for which position papers were filed by many interested parties and groups; especially appointed committees, not only of the Accounting Principles Board, but of a number of other organizations, have analyzed and debated the issues. A considerable number of the studies and articles on lease accounting were available to the Board, many of which are summarized or identified in the Discussion Memorandum. In addition, the FASB staff surveyed the accounting and reporting practices of a number of lessee and lessor companies, the results of which are set forth in Appendix C to the Discussion Memorandum. The staff also met on a number of occasions with representatives of various organizations interested in leasing for the purpose of obtaining specialized information helpful to the Board's consideration of the various issues involved in accounting for leases.

.056 The Board issued its Discussion Memorandum on July 2, 1974, and on November 18-21, 1974 held a public hearing on the subject. The Board received 306 position papers, letters of comment, and outlines of oral presentations in response to the

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Discussion Memorandum, and 32 presentations were made at the public hearing.

.057 On August 26, 1975, the Financial Accounting Standards Board issued an Exposure Draft of a Proposed Statement of Financial Accounting Standards on Accounting for Leases that, if adopted, would have been effective for leasing transactions entered into on or after January 1, 1976. Two hundred and fifty letters of comment were received in response to that Exposure Draft. The Board announced on November 25, 1975 that, because of the need to analyze the large number of responses and the complexity of the issues involved, it would be unable to issue a final Statement in 1975 but expected to do so early in 1976. A further announcement made by the Board on June 2, 1976 stated that a number of modifications were being made to the Exposure Draft and that a second Exposure Draft would be issued for public comment preparatory to the expected issuance of a final Statement in 1976.

.058 The Board issued the second Exposure Draft of a Proposed Statement of Financial Accounting Standards on Accounting for Leases on July 22, 1976. Two hundred and eighty-two letters of comment were received in response to that Exposure Draft.

Appendix B

BASIS FOR CONCLUSIONS

.059 This Appendix discusses factors deemed significant by the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others.

.060 The provisions of this Statement derive from the view that a lease that transfers substantially all of the benefits and risks incident to the ownership of property should be accounted for as the acquisition of an asset and the incurrence of an obligation by the lessee and as a sale or financing by the lessor. All other leases should be accounted for as operating leases. In a lease that transfers substantially all of the benefits and risks of ownership, the economic effect on the parties is similar, in many respects, to that of an installment purchase. This is not to say, however, that such transactions are necessarily "in substance purchases" as that term is used in previous authoritative literature.

.061 The transfer of substantially all the benefits and risks of ownership is the concept embodied in previous practice in lessors' accounting, having been articulated in both *APB Opinion No. 7,* "Accounting for Leases in Financial Statements of Lessors," and *APB Opinion No. 27,* "Accounting for Lease Transactions by Manufacturer or Dealer Lessors," as a basis for determining whether a lease should be accounted for as a financing or sale or as an operating lease. However, a different concept has existed in the authoritative literature for lessees' accounting, as evidenced by *APB Opinion No. 5,* "Reporting of Leases in Financial Statements of Lessee." That Opinion required capitalization of those leases that are "clearly in substance installment purchases of property," which it essentially defined as those leases whose terms "result in the creation of a material equity in the property." Because of this divergence in both concept and criteria, a particular leasing transaction might be recorded as a sale or as a financing by the lessor and as an operating lease by the lessee. This difference in treatment has been the subject of criticism as being inconsistent conceptually, and some of the identifying criteria for classifying leases, particularly those applying to lessees' accounting, have been termed vague and subject to varied interpretation in practice.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.062 The Board believes that this Statement removes most, if not all, of the conceptual differences in lease classification as between lessors and lessees and that it provides criteria for such classification that are more explicit and less susceptible to varied interpretation than those in previous literature.

.063 Some members of the Board who support this Statement hold the view that, regardless of whether substantially all the benefits and risks of ownership are transferred, a lease, in transferring for its term the right to use property, gives rise to the acquisition of an asset and the incurrence of an obligation by the lessee which should be reflected in his financial statements. Those members nonetheless support this Statement because, to them, (i) it clarifies and improves the guidelines for implementing the conceptual basis previously underlying accounting for leases and (ii) it represents an advance in extending the recognition of the essential nature of leases.

Definition of a Lease

.064 Some respondents took the position that nuclear fuel leases, sometimes called "heat supply" or "burn up" contracts, should be excluded from the definition of a lease on the grounds that such agreements are of the same nature as take-or-pay contracts to supply other types of fuel such as coal or oil which are excluded. The Board's conclusion that nuclear fuel leases meet the definition of a lease as expressed in paragraph .001 is based on the fact that under present generally accepted accounting principles a nuclear fuel installation constitutes a depreciable asset. Thus, a nuclear fuel lease conveys the right to use a depreciable asset whereas contracts to supply coal or oil do not. The fact that the latter contracts may be take-or-pay, in the Board's view, is irrelevant to this central point.

Classification of Leases

.065 The Board believes that the characteristics of a leasing transaction should determine its classification in terms of the appropriate accounting treatment by both the lessee and lessor; this is to say that the characteristics that identify a lease as a capital lease, as distinct from an operating lease, from the standpoint of the lessee should, with certain exceptions identified in this Statement, be the same attributes that identify a direct financing or sales-type lease, as distinct from an operat-

ing lease, from the standpoint of the lessor. The principal exceptions referred to are those stated in paragraph .008.

.066 The Board considered and rejected, for the reason set forth in paragraph .065, the argument that the difference in the nature of the lessor's and lessee's businesses is often sufficient to warrant different classification of a lease by the two parties.

.067 Some respondents to the Discussion Memorandum and Exposure Drafts, while agreeing generally with the premise that the nature of the transaction should govern its classification by both the lessee and lessor, pointed out that there is no assurance that the transaction will be discerned identically by both parties. However, the Board believes that by adopting essentially the same criteria for classification of leases by both parties (see paragraph .065), as contrasted with the difference in criteria previously existing between *APB Opinion No. 5,* concerning lessee accounting, and *APB Opinions No. 7* and *27,* concerning lessor accounting, and, by virtue of the fact that the criteria adopted are in some respects more explicit than those referred to in those Opinions, that a significant improvement in consistency of classification can be achieved.

.068 A large number of respondents favored capitalization by lessees of only those leases that they would classify as "in substance installment purchases." A wide range of preferences was expressed as to the criteria to be used to identify such leases. Most prominent among these was the "material equity" criterion that is the basic criterion of *APB Opinion No. 5* and that is discussed in paragraph .073. Most of those favoring this concept would apply it only to the lessee rather than to both parties.

.069 The Board considered the concept for capitalization by the lessee of those leases that are "in substance installment purchases." Such leases, if identifiable, would be encompassed within the concept described in paragraph .060, but, by itself, the installment purchase concept, in the Board's view, is too limiting as a basis for lease capitalization. Taken literally, the concept would apply only to those leases that automatically transfer ownership. All other leases contain characteristics not found in installment purchases, such as the reversion of the property to the lessor at the termination of the lease.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.070 Some respondents advocated capitalization of leases that give rise to what they term "debt in a strict legal sense." A number of the respondents in this group were also represented in the group referred to in paragraph .068, indicating that they view the two concepts as not being mutually exclusive. The argument advanced is essentially that some leases contain clauses that make the lessee's obligation absolute and unconditional, and because the obligation is absolute, such clauses should be made the determinant for capitalization of leases containing them. Those advancing this view generally appeared to be focusing on the liability aspect of the transaction rather than on the nature of the corresponding asset to be recorded. Few had any comment to offer concerning cases in which the "legal debt" assumed by the lessee represents only a portion of the asset's cost; nor was it clear from the comments how, if at all, the concept of "legal debt" standing alone should affect accounting for the lease by the lessor.

.071 The Board noted that the determination of whether a lease obligation represents debt in the strict legal sense would of necessity rest primarily on court decisions, and that such decisions have arisen almost entirely from litigation involving bankruptcy, reorganization, or taxation. The Board concluded that legal distinctions of this nature were apt to be neither relevant nor practical in application to the accounting issue of lease capitalization. The Board believes further that, in most instances where the lessee has assumed an unconditional obligation that the courts might hold to be legal debt, it is reasonable to assume that he will have protected his interest through other features in the agreement that are likely to meet one or more of the criteria for capitalization stated in paragraph .007. The Board accordingly rejected the concept of "legal debt" as a determinant for lease capitalization.

Criteria for Classification

.072 The Discussion Memorandum listed 14 criteria as having some support for use in classifying leases by lessees. A number of criteria, including some of the 14, were also listed for possible use in classifying leases by lessors. Among the respondents, opinion was divided as to the criteria that identify leases that should be capitalized by the lessee as well as to those criteria that identify leases that should be recorded as sales or financing leases by lessors. The Board concluded that many of the listed criteria were overlapping, i.e., that the basic idea contained in one also was

embodied in others designed to identify the same attribute. The Board believes that the criteria stated in paragraphs .007 and .008 contain the essence of the listed criteria except those that the Board did not consider relevant or suitable. The basis for the Board's adoption or rejection of individual criteria is the concept discussed in paragraph .060, namely, the transfer of substantially all of the benefits and risks incident to the ownership of property. The following discusses the Board's conclusions with respect to each of the 14 criteria listed in the lessee section of the Discussion Memorandum together with 5 other criteria that were dealt with in the lessor section. These last 5 are discussed in paragraphs .087-.090.

.073 *Lessee builds up a material equity in the leased property.* Many of the respondents favored the material equity criterion as contained in *APB Opinion No. 5* as the principal basis for lease capitalization by the lessee. Of the criteria selected by the Board, the criterion stated in paragraph .007(b) wherein the lease contains a bargain purchase option is evidential that a material equity is being established. The criterion stated in paragraph .007(a) wherein ownership is transferred by the end of the lease term may in some circumstances be evidential that a material equity is being established. However, in relating material equity to the concept discussed in paragraph .060, the Board concluded that leases in which no material equity is established by the lessee may effectively transfer substantially all of the benefits and risks of ownership. For example, a lease whose term extends over the entire economic life of the asset and thus transfers all of the benefits and risks of ownership need not give rise to a material equity. Accordingly, the Board rejected material equity as a separate criterion and considered it too limiting to represent the central basis for lease capitalization by lessees.

.074 *Leased property is special purpose to the lessee.* The Board rejected this criterion for two reasons. First, "special purpose property" is a relative concept that is hard to define objectively. Second, the fact that the leased property is special purpose does not, of itself, evidence a transfer of substantially all of the benefits and risks of asset ownership. Although it is expected that most lessors would lease special purpose property only under terms that transfer substantially all of those benefits and risks to the lessee, nothing in the nature of special purpose property necessarily entails such lease terms. The Board concluded that, if the lease, in fact, contains such terms, it is likely that one or more of the adopted criteria in paragraph .007 would be met.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.075 *Lease term is substantially equal to the estimated useful life of the property.* This criterion was modified as adopted in criterion (c) of paragraph .007 as follows:

> The lease term (as defined in paragraph .005(f)) is equal to 75 percent or more of the estimated economic life of the leased property (as defined in paragraph .005(g)).

In the Board's view, the fact that the lease term need be for only 75 percent of the economic life of the property is not inconsistent with the concept discussed in paragraph .060 for the following reasons:

> Although the lease term may represent only 75 percent of the economic life of the property in terms of years, the lessee can normally expect to receive significantly more than 75 percent of the total economic benefit to be derived from the use of the property over its life span. This is due to the fact that new equipment, reflecting later technology and in prime condition, can be assumed to be more efficient, and hence yield proportionately more use benefit, than old equipment which has been subject to obsolescence and the wearing-out process. Moreover, that portion of use benefit remaining in the equipment after the lease term, in terms of the dollar value that may be estimated for it, when discounted to present worth, would represent a still smaller percentage of the value of the property at inception.

As a result of comments received in response to the second Exposure Draft, the following qualification has been added to paragraph .007(c):

> However, if the beginning of the lease term falls within the last 25 percent of the total estimated economic life of the leased property, including earlier years of use, this criterion shall not be used for purposes of classifying the lease.

The Board found persuasive the argument that it would be inconsistent to require that a lease covering the last few years of an asset's life be recorded as a capital lease by the lessee and as a sales-type or direct financing lease by the lessor when a lease of the asset for a similar period earlier in its life would have been classified as an operating lease. Without the above qualification, in the case of a tank car having an estimated economic life of 25

years and placed under five successive 5-year leases, the first four leases would be classified as operating leases under this criterion and the last lease would be classified as a capital lease. The Board considered such a result illogical.

.076 *Lessee pays costs normally incident to ownership.* This criterion was rejected by the Board since it can be presumed that, one way or another, the lessee bears the costs of ownership in virtually all lease agreements.

.077 *Lessee guarantees the lessor's debt with respect to the leased property.* The Board concluded that this criterion does not necessarily evidence a lease that transfers substantially all of the benefits and risks of property ownership; the amount guaranteed may represent only a portion of the fair value of the property. When there is a guarantee, the Board believes it likely that the lessee will have protected his interest through other features in the agreement that may meet one or more of the adopted criteria stated in paragraph .007. In this regard, any periods covered by renewal options in which a lessee guarantee is expected to be outstanding are to be included in the lease term, as provided by paragraph .005(f), and the corresponding renewal rentals are to be included in minimum lease payments, as provided by paragraph .005(j). Thus, such periods would be recognized in applying criterion .007(c) to the property's economic life, and both the periods and the corresponding rentals would be recognized in applying the 90 percent recovery criterion (paragraph .007(d)).

.078. *Lessee treats the lease as a purchase for tax purposes.* The Board rejected this criterion. There are many instances in which tax and financial accounting treatments diverge, and the question of a possible need for conformity between them is beyond the scope of this Statement.

.079 *Lease is between related parties.* The Board did not consider this criterion as suitable, in itself, for determining lease classification. Leases between related parties are discussed in paragraphs .029-.031.

.080 *Lease passes usual risks and rewards to lessee.* The Board considered this to be a concept rather than a criterion. It is closely related to the basic concept underlying the conclusions of this Statement, described in paragraph .060.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.081 *Lessee assumes an unconditional liability for lease rentals.* This criterion was rejected by the Board for the reasons given in paragraph .071.

.082 *Lessor lacks independent economic substance.* The Board considered the argument advanced by some that, if the lessor has no economic substance, the lessor serves merely as a conduit in that the lender looks to the lessee for payment and thus, it is asserted, the lessee is, in fact, the real debtor and purchaser. Whether the lessee is judged to be a debtor does not, in the Board's view, constitute a suitable criterion for determining lease classification for the reasons expressed in paragraph .071. The Board finds unpersuasive the argument that the lessee's accounting for a leasing transaction should be determined by the economic condition of an unrelated[30] lessor. If a lease qualifies as an operating lease because it does not meet the criteria in paragraph .007, the Board finds no justification for requiring that it be accounted for as a capital lease by the lessee simply because an unrelated lessor lacks independent economic substance. In such a case, it probably means that someone else, presumably the lender, is in substance the lessor, but this circumstance, per se, should not alter the lessee's accounting. Accordingly, the Board rejected this criterion.

.083 *Residual value at end of lease is expected to be nominal.* Some respondents recommended that such a criterion, if adopted, should be based on the present value of the residual, which, because of the long-term nature of many leases, would represent a much smaller percentage of asset value at inception than the undiscounted residual value. However, other respondents who favored the addition of a recovery criterion based on the relationship of the present value of the lease payments to the fair value of the leased property argued that a criterion based on residual value would be redundant in that it would essentially measure the complement of that relationship. Since, for the reasons set forth in paragraph .084 below, the Board favored the recovery criterion, it was adopted in lieu of a criterion based on residual values.

.084 *Lease agreement provides that the lessor will recover his investment plus a fair return (a) guaranteed by the lessee or (b) not so guaranteed.* A variation of this criterion was adopted as criterion (d) of paragraph .007. In the form adopted, the criterion is met when the present value of the minimum lease payments, de-

[30] If the lessee and the lessor are related parties, the provisions of paragraphs .029-.031 apply.

fined in paragraph .005(j), excluding executory costs, equals or exceeds 90 percent of the excess of the fair value of the leased property, defined in paragraph .005(c), to the lessor at the inception of the lease over any related investment tax credit retained by the lessor and expected to be realized by him. The Board concluded that if the present value of the contractual receipts of the lessor provide for recovery of substantially all (defined as 90 percent or more) of his net investment in the fair value of the leased asset, the lessor has transferred substantially all of the benefits and risks of asset ownership. Likewise, if the present value of the lessee's lease obligations provide for that degree of recovery by the lessor, the conclusion was that the lessee has acquired those benefits and risks. Some respondents pointed out that a recovery criterion more clearly evidences the transfer of risks than of benefits since a substantial residual value may revert to the lessor at the end of the lease term. However, the Board concluded that, in leases meeting the recovery criterion, the residual amount, when discounted to its present value at the inception of the lease, is likely to represent only a small percentage of the fair value of the property. For the reasons cited above, the Board adopted a criterion based on recovery of substantially all (defined as 90 percent or more) of the fair value of the leased property. A lessee guarantee of recovery to the lessor is recognized through inclusion in the definition of minimum lease payments. Thus, such guarantees are taken into account in the application of the 90 percent recovery criterion. As a result of comments received in response to the second Exposure Draft, the following qualification has been added to paragraph .007(d):

> However, if the beginning of the lease term falls within the last 25 percent of the total estimated economic life of the leased property, including earlier years of use, this criterion shall not be used for purposes of classifying the lease.

The above qualification is the same as that added to criterion .007(c) and the reasons are the same as those discussed in paragraph .075.

.085 *Lessee has the option at any time to purchase the asset for the lessor's unrecovered investment.* The Board concluded that the existence of a purchase option is significant only if it is a bargain purchase option as defined in paragraph .005(d) and as adopted in paragraph .007(b); otherwise, there is no presumption that the lessee will exercise the option. Accordingly, the Board rejected this criterion.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.086 *Lease agreement is noncancelable for a "long term."* This criterion was rejected by the Board in favor of criterion (c) of paragraph .007.

.087 *Lease transfers title (ownership) to the lessee by the end of the lease term.* This criterion was adopted by the Board as criterion (a) of paragraph .007. Such a provision effectively transfers all of the benefits and risks of ownership and, thus, the criterion is consistent with the concept discussed in paragraph .060.

.088 *Lease provides for a bargain purchase or a renewal option at bargain rates.* The existence of a bargain purchase option was adopted by the Board as criterion (b) of paragraph .007. Such a provision effectively transfers all of the benefits and risks of ownership and, thus, the criterion is consistent with the concept discussed in paragraph .060. The period covered by a bargain renewal option is included in the lease term, as defined in paragraph .005(f), and the option rentals are included in minimum lease payments, as defined in paragraph .005(j). Thus, a bargain renewal option enters into the determination of whether the lease meets either criterion (c) or criterion (d) of paragraph .007. Accordingly, the Board rejected the existence of a bargain renewal option as a separate criterion.

.089 *Collection of the rentals called for by the lease is reasonably assured.* This criterion relates only to lessors. It has been restated as follows and adopted by the Board as a necessary criterion (paragraph .008(a)): "Collectibility of the minimum lease payments is reasonably predictable." The wording change reflects the Board's view that lessors should not be precluded from classifying leases as direct financing or sales-type leases, when they meet one of the criteria for such classification in paragraph .007, if losses are reasonably predictable based on experience with groups of similar receivables. When other than normal credit risks are involved in a leasing transaction, it was the Board's conclusion that collectibility is not reasonably predictable and classification as a sales-type or direct financing lease, in such cases, is therefore not appropriate.

.090 *No important uncertainties surround costs yet to be incurred by lessor.* The matter of uncertainties surrounding future costs was dealt with in the Discussion Memorandum as one of the risks of ownership relevant to the classification of leases by lessors. This criterion is essentially equivalent to one of the criteria set forth in *APB Opinion No. 27*, paragraph 4, as a requirement for treating a

lease by a manufacturer or dealer lessor as a sale. In adopting this as a necessary criterion, the Board believes that if future unreimbursable costs to be incurred by the lessor under the lease are not reasonably predictable, the risks under the lease transaction may be so great that it should be accounted for as an operating lease instead of as a sales-type or direct financing lease.

Accounting by Lessees

.091 *APB Opinion No. 5,* paragraph 15, prescribed accounting for leases that were to be capitalized as "in substance installment purchases" as follows:

> Leases which are clearly in substance installment purchases of property . . . should be recorded as purchases. The property and the obligation should be stated in the balance sheet at an appropriate discounted amount of future payments under the lease agreement. . . . The method of amortizing the amount of the asset to income should be appropriate to the nature and use of the asset and should be chosen without reference to the period over which the related obligation is discharged.

As stated in paragraph .060, the concept underlying this Statement is that a lease that transfers substantially all of the benefits and risks incident to the ownership of property should be accounted for as the acquisition of an asset and the incurrence of an obligation by the lessee, and as a sale or financing by the lessor. The concept for capitalization by the lessee of only those leases that are "in substance installment purchases" was rejected by the Board as too limiting a basis for lease capitalization (see paragraph .069).

.092 Despite this difference in the concept for capitalization, the Board viewed the accounting prescribed by *APB Opinion No. 5* for capitalized leases as generally appropriate. While respondents expressed varying opinions as to the characteristics of leases that should be capitalized, there was little opposition to the method of accounting for such leases prescribed by *APB Opinion No. 5.* The accounting provisions of this Statement applicable to lessees, with the exceptions noted below, generally follow that Opinion; however, these provisions are more specific with respect to implementation.

.093 With respect to the rate of interest to be used in determining the present value of the minimum lease payments for recording the

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

asset and obligation under a capital lease, the Board concluded the rate should generally be that which the lessee would have incurred to borrow for a similar term the funds necessary to purchase the leased asset (the lessee's incremental borrowing rate). An exception to that general rule occurs when (a) it is practicable for the lessee to ascertain the implicit rate computed by the lessor and (b) that rate is less than the lessee's incremental borrowing rate; if both of those conditions are met, the lessee shall use the implicit rate. However, if the present value of the minimum lease payments, using the appropriate rate, exceeds the fair value of the leased property at the inception of the lease, the amount recorded as the asset and obligation shall be the fair value. A number of respondents pointed out that in many instances, the lessee does not know the implicit rate as computed by the lessor. Also, since the implicit rate is affected by the lessor's estimate of the residual value of the leased property in which the lessee will usually have no interest, and may also be affected by other factors extraneous to the lessee, it may, if higher than the lessee's incremental borrowing rate, produce a result that is less representative of the transfer of use benefit to the lessee than would be obtained from use of the lessee's incremental borrowing rate. For those reasons, the Board concluded that the lessee's use of the implicit rate for discounting purposes should be limited to circumstances in which he is able to ascertain that rate, as computed by the lessor, and it is less than his incremental borrowing rate. In the revised Exposure Draft, the Board had defined this rate as that which "the lessee would have incurred to borrow the funds necessary to buy the leased asset on a secured loan with repayment terms similar to the payment schedule called for in the lease." A number of respondents objected to this definition pointing out that they would not have financed the asset on a secured loan basis and, hence, would be unable to determine such a theoretical rate. Those respondents suggested that the definition be revised to allow the lessee to use a rate consistent with the type of financing that would have been used in the particular circumstances. The Board found merit in those suggestions because it intended that the rate should be both determinable and reasonable. The definition of the lessee's incremental borrowing rate has been revised accordingly. Some respondents pointed out that the use of the lessee's incremental rate, however determined, would in some cases produce an amount to be capitalized that would be greater than the known fair value of the leased asset. It was suggested that in such cases the amount to be capitalized be limited to the fair value. The Board agreed with that recommendation.

.094 The method of amortization of the capitalized asset prescribed in this Statement (see paragraph .011) differs from that called for in *APB Opinion No. 5* in that, except for those leases that meet criterion .007(a) or .007(b), the period of amortization is limited to the lease term. *APB Opinion No. 5* did not so limit the period of amortization since the leases to be capitalized were those that were considered "in substance installment purchases." The Board concluded that, for leases which are capitalized under criterion .007(c) or .007(d) of this Statement, the amortization period should be the lease term. It is presumed for accounting purposes that, in such leases, the lessee's period of use of the assset will end at the expiration of the lease term.

.095 Some respondents asked for clarification and more specific treatment in the Statement with respect to the accounting to be followed in connection with the situations referred to in paragraph .009 having to do with changes in lease provisions that would have resulted in a different classification of the lease at its inception and renewals and extensions of existing leases. The clarification requested has been incorporated in paragraph .014. Additionally, respondents asked for clarification with respect to the accounting to be followed when a guarantee or penalty provision in a lease is rendered inoperative by a renewal or extension. That clarification has been provided in paragraph .012.

Disclosure by Lessees

.096 Users of financial statements have indicated a strong desire for disclosure by lessees of information concerning leasing transactions whether leases are capitalized or not. In some cases, the information desired was similar to that now provided in accordance with *APB Opinion No. 31* or SEC *Accounting Series Release No. 147*. However, some respondents objected to the requirement to disclose future minimum rental payments by periods beyond the next succeeding five years. It was contended that any such projections are apt to be misleading since the accumulating effect of new leases and lease renewals on future payments in those periods is not reflected. In addition, some users and many other respondents opposed requiring disclosure of the estimated effect on net income had certain leases been capitalized. The Board agreed with both of those views except that during the transition period until full retroactive application of this Statement is required, the Board decided that the disclosure called for in paragraph .050 is needed by users of financial statements pending retroactive applica-

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

tion. The Board concluded that the disclosures called for in paragraph .016(a) with respect to capital leases would provide information helpful to users of financial statements in assessing the financial condition and results of operations of lessees. In the Board's view, such disclosures are consistent with the information presently required to be disclosed with respect to owned property and to long-term obligations in general. The Board further concluded that users' assessments would be facilitated by the disclosures called for in paragraphs .016(b) and .016(c) with respect to operating leases. The requirement to disclose information concerning commitments for rental payments under operating leases during the succeeding five years is consistent with the similar requirement for capital leases.

Accounting by Lessors

.097 As stated in paragraph .061, the concept underlying the accounting for leases by lessors in this Statement is essentially the same as the concept embodied in *APB Opinions No. 7 and 27*; that is, a lease that transfers substantially all of the benefits and risks incident to the ownership of property should be accounted for as a sale or financing by the lessor. Accordingly, the accounting provisions of this Statement applicable to lessors, with the principal exceptions noted below, generally follow those of the two APB Opinions.

.098 In computing the manufacturer's or dealer's profit on a sales-type lease, the cost of the property leased will be reduced by the present value of the estimated residual value. This represents a liberalization of the provisions of *APB Opinion No. 27*, which did not permit recognition of any residual value in determining manufacturer's or dealer's profit. Some respondents favored continuing the provisions of Opinion 27 in this regard. Others believed that the present value of the residual should be recognized in profit determination and that the accounting for the financing element of a leasing transaction should be essentially the same in a sales-type lease as in a direct financing lease. The Board agreed with this latter view and concluded that the difference between the estimated residual and its present value should be included in unearned income and recognized in income over the lease term.

.099 This Statement calls for the estimated residual value, along with rentals and other minimum lease payments receivable, to be included in the balance sheet presentation of the investment in

sales-type and in direct financing leases. Under *APB Opinion No. 7,* the estimated residual value was to be included with property, plant, and equipment. Several respondents contended that inclusion of the residual with depreciable assets of the lessor would blur the distinction between property on lease and property used in the lessor's internal operations. Others pointed out that, in the vast majority of leases, the estimated residual value is realized by a sale or re-lease of the property and, for that reason, the residual should be looked upon as a last payment similar to the minimum lease payments. In addition, it was contended, presentation of the estimated residual value as part of the lease investment rather than as part of property, plant, and equipment is necessary to portray the proper relationship between the gross investment in leases and the related unearned income, since a portion of the unearned income relates to the residual value. The Board agreed with those views.

.100 This Statement requires that the selling price in a sales-type lease be determined by computing the present value of payments required under the lease. In this respect, it follows Opinion 27. However, this Statement is more specific than Opinion 27 in identifying the payments that are to be included in the computation, and it requires use of the rate of interest implicit in the lease for discounting instead of an interest rate determined in accordance with the provisions of *APB Opinion No. 21* [section 4111], as called for by Opinion 27. Use of the latter rate was rejected by the Board on the grounds that it would yield an amount to be recorded as the sales price that would be at variance with the known fair value of the leased asset (after adjusting that price for the present value of any investment tax credit or residual retained).

.101 This Statement requires different treatment of initial direct costs (see paragraph .005(m)) as between sales-type leases and direct financing and leveraged leases. In the case of sales-type leases, initial direct costs are to be charged against income of the period in which the sale is recorded, which is consistent with the general practice of accounting for similar costs incurred in connection with installment sales on the basis that such costs are incurred primarily to produce sales revenue. In this respect, the Statement follows *APB Opinion No. 27,* which, although not mentioning initial direct costs specifically, in paragraph 6 called for estimated "future costs" related to leases accounted for as sales to be charged to income of the period in which the sale is recorded. The second Exposure Draft called for initial direct costs incurred in connection with di-

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

rect financing leases to be accounted for in the manner that *APB Opinion No. 7,* paragraph 11, described as preferred, that is, to be deferred and allocated to future periods in which the related financing income is reported. This requirement recognized that, unlike the initial direct costs in sales-type leases, such costs in direct financing leases are not primarily related to income of the period in which the costs are incurred. A number of respondents objected to the deferral of initial direct costs incurred in connection with direct financing leases because it is at variance with predominant industry practice and would, it was reported, necessitate a major revision of existing record systems and computer programs with no appreciable effect on net income over the lease term. The predominant industry practice as cited by those respondents consists of expensing such costs as incurred and recognizing as income in the same period a portion of unearned income equal to the amount of the costs expensed. It was pointed out that this method produces essentially the same income effect as if the initial direct costs were deferred and amortized separately, as was called for by the revised Exposure Draft, or as if these costs were charged to unearned income, as is called for in the case of leveraged leases. The Board accepted this recommendation for practical considerations and has revised the accounting prescribed for initial direct costs incurred in connection with direct financing leases accordingly. In the case of leveraged leases, the accounting for initial direct costs is consistent with the central concept underlying the accounting for leveraged leases by the investment with separate phases method, that concept being that the net income should be recognized at a level rate of return on the investment in the lease in the years in which the investment is positive.

.102 As was the case with lessee accounting, respondents requested clarification and more specific guidance as to the accounting to be followed by lessors with respect to the situations referred to in paragraph .095. The requested guidance for lessor accounting for those situations has been provided in paragraphs .017(e) and .017(f). In addition, respondents objected to the provisions of the revised Exposure Draft allowing, in some instances, gain to be recognized immediately on renewals or extensions of sales-type or direct financing leases. Those who objected contended that gain recognition in those circumstances was equivalent to allowing upward revisions of residual value estimates, a practice specifically prohibited in the Statement. The Board found those objections persuasive and, accordingly, revised the accounting for renewals or extensions of sales-type or direct financing leases to prohibit immediate recognition of gain.

Disclosure by Lessors

.103 A number of those respondents who addressed the question of what information should be disclosed by lessors thought that the disclosures called for by *APB Opinion No. 7* were adequate. Some, however, thought there should be consistency, where relevant, between the disclosure requirements for lessors and those for lessees and noted that disclosure requirements for lessees had been recently made more extensive by *APB Opinion No. 31* and SEC *Accounting Series Release No. 147*. The Board agreed with this latter view. As in the case of lessees, the Board believes that the information required to be disclosed by paragraph .023 will be helpful to users of financial statements in assessing the financial condition and results of operations of lessors. Several respondents to the second Exposure Draft objected to the limitation of lessor disclosure requirements to those lessors for which leasing is the predominant activity. It was contended that the disclosures should be required whenever leasing is a significant part of the lessor's business activities rather than only when leasing is predominant. Other respondents thought that a single test of predominance based on revenues was inappropriate and pointed to the difference in the nature of lease rentals as compared to sales revenue of a manufacturing concern. It was recommended that significance be determined in terms of revenue, net income, or assets as separate indicators. The Board found merit in these recommendations and revised the disclosure limitation accordingly.

.104 Some respondents recommended the elimination of the requirement in the Exposure Drafts that the cost or carrying amount of property on operating leases and that of property held for lease be separately disclosed. They contended that in companies having thousands of operating leases it would be difficult, if not impossible, to make such a split. Since the information would be based on one particular point in time, it may well be unrepresentative. The Board found those arguments persuasive and believes, moreover, that a better indication of the productivity of property on or held for lease is its relationship to the minimum future rentals by years and in the aggregate from noncancelable operating leases, which latter information is required by the Statement.

Leases Involving Real Estate

.105 The second Exposure Draft provided that criteria .007(c) and .007(d) were not applicable to leases of land and that, unless criterion .007(a) or .007(b) was met, leases of land should be

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

accounted for as operating leases. In a lease involving both land and building, if the land element represented 15 percent or more of the total fair value of the leased property, the land and building elements of the lease were required to be separated and each classified and accounted for as if it were a separate lease. Some respondents objected to this, contending that the recovery criterion, .007(d), should be applicable to land leases the same as to other leases. Others objected to the required separate treatment of the land and building elements in a lease involving both, contending that the property should be classified and accounted for as a unit and that to require separation would be inconsistent with the economic substance of the transaction. Some, particularly in the case of retail leases, cited the difficulties and cost involved in separating the land and building elements for companies with large numbers of such leases. They recommended that separation not be required and that all such leases be classified as operating leases. However, if separation were to continue to be required, some suggested that the 15 percent limitation be raised to permit treating as a unit a greater number of leases in which land would still not represent a major element. The Board's conclusion that, unless criterion .007(a) or .007(b) was met, leases of land should be classified as operating leases is based on the concept that such leases do not transfer substantially all the benefits and risks of ownership. Land normally does not depreciate in value over time, and rental payments for the use of land are not predicated on compensation for depreciation plus interest, as is the case with leases of depreciable assets, but are in the nature of interest only or, as some may prefer to say, interest plus whatever additional profit element may be included. The requirement for separation of the land and building elements in a lease involving both is based on this distinction. The Board found merit, however, in the recommendation that the 15 percent limitation be raised in order to reduce the practical problems involved in separating the land and building elements for large numbers of leases. The Board concluded that the 15 percent limitation established in the second Exposure Draft should accordingly be raised to 25 percent.

.106 A number of respondents pointed out that leases of facilities such as airport and bus terminals and port facilities from governmental units or authorities contain features that render the criteria of paragraph .007 inappropriate for classifying such leases. Leases of such facilities do not transfer ownership or contain bargain purchase options. By virtue of its power to abandon a facility during

the term of a lease, the governmental body can effectively control the lessee's continued use of the property for its intended purpose, thus making its economic life essentially indeterminate. Finally, since neither the leased property nor equivalent property is available for sale, a meaningful fair value cannot be determined, thereby invalidating the 90 percent recovery criterion. For those reasons, the Board concluded that such leases shall be classified as operating leases by both the lessee and lessor.

Sale–Leaseback Transactions

.107 Of those respondents who addressed the issues of accounting for sale-leaseback transactions, opinions were divided between those who favored (a) treatment as a single transaction with deferral of profit on the sale and (b) treatment as two independent transactions unless the lease meets criteria for capitalization by the lessee. Generally, those favoring treatment as a single transaction would make certain exceptions, such as "leasebacks to accommodate a short-term property requirement of the seller" and "leasebacks of only a relatively small part of the property sold." The Board noted that most sale-leasebacks are entered into as a means of financing, for tax reasons, or both and that the terms of the sale and the terms of the leaseback are usually negotiated as a package. Because of this interdependence of terms, no means could be identified for separating the sale and the leaseback that would be both practicable and objective. For that reason, the Board concluded that the present general requirement that gains and losses on sale-leaseback transactions be deferred and amortized should be retained. An exception to that requirement arises when the fair value of the property at the time of the transaction is less than its undepreciated cost. In that case, the Board decided that the loss should be recognized up to the amount of the difference between the undepreciated cost and fair value.

Accounting for Leveraged Leases by Lessors

.108 The first issue concerning leveraged leases in the Discussion Memorandum asked whether leveraged leases are unique in the sense that special standards are required to recognize their economic nature. The affirmative responses to this issue generally gave as reasons the arguments stated in the Discussion Memorandum.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

The essence of those arguments is that the combination of nonrecourse financing and a cash flow pattern that typically enables the lessor to recover his investment in the early years of the lease and thereafter affords him the temporary use of funds from which additional income can be derived produces a unique economic effect. Those respondents who did not agree that leveraged leases are unique generally cited the contra argument in the Discussion Memorandum, namely, that each of the attributes of leveraged leases that serve to support the uniqueness claim has its counterpart in other types of business transactions. Information communicated by respondents, as well as that obtained through staff investigation, indicates that the use of a variety of accounting methods for leveraged leases has grown rapidly. The methods in use generally correspond, although frequently with variations, to those illustrated in the Discussion Memorandum. The Board noted with concern the increasing disparity in practice in accounting for leveraged leases. Despite the fact that each of the attributes of a leveraged lease is found in other types of transactions, the Board believes that in a leveraged lease those attributes are combined in a manner that produces an overall economic effect that is distinct from that of other transactions. Accordingly, the Board concluded that a leveraged lease, as defined in paragraph .042, should be accounted for in a manner that recognizes this overall economic effect. However, the Board emphasizes that the qualification "as defined in paragraph .042" is an important one since the term "leveraged lease" is used by some respondents to refer to any lease involving nonrecourse debt. There is further discussion of this distinction in paragraph .110.

.109 The Discussion Memorandum described and illustrated four different methods of accounting for leveraged leases. Three of those methods are designed to recognize what their adherents see as the economic effect of a leveraged lease, while the other method, the ordinary financing lease method, is that presently prescribed for financing leases by *APB Opinion No. 7*. The Board's conclusions and the reasons therefor concerning the four methods are as follows:

a. *The ordinary financing lease method*. This accounting method makes no distinction between a leveraged lease and an ordinary two-party financing lease. Even though the debt is nonrecourse to the lessor and the lessor has no claim on the debt service payments, the transaction is recorded "gross" with the lessor's investment based on the present value of the gross rentals plus

the residual value as prescribed by *APB Opinion No. 7.* In fact, however, the lessor's real investment is not a function of the amount of the future rental payments, which amount represents neither the funds he has at risk nor the asset from which he derives earnings. Further, no recognition is given to the separate investment phases of a leveraged lease as defined in paragraph .042. This method was rejected by the Board because it is incompatible with the essential features of the transaction.

b. *The three-party financing lease method.* This method does reflect the three-party nature of the transaction in that the lessor's investment is recorded net of the nonrecourse debt, and rental receipts are reduced by the debt service payments. However, it gives no recognition to the fact that a leveraged lease has separate investment phases, which is one of the characteristics included in the definition (see paragraph .042(d)). The lessor's unrecovered investment balance declines during the early years of a leveraged lease from the strong cash inflow in that period. Typically, the cumulative cash inflow during the early years exceeds the investment, producing a negative investment balance during the middle years. The investment returns to a positive balance again in the later years as funds are reinvested and then goes to zero with realization of the residual value at the termination of the lease. This pattern of cash flow results from the fact that income tax reductions from the investment tax credit, accelerated depreciation, and greater interest deductions in earlier years are replaced by additional income taxes in the later years after the investment tax credit has been utilized and as tax benefits from depreciation and interest diminish. By ignoring these separate investment phases, the three-party financing method shows a gradually declining investment balance throughout the years of the lease, with income recognized at a level rate of return on the declining balance. The Board believes that the accounting treatment for a leveraged lease should reflect these separate investment phases, which have different economic effects, and should provide for the recognition of income in appropriate relation to them. To do otherwise, in the Board's view, is to negate the reason for having a separate standard for leveraged leases, that reason being that leveraged leases have a distinct combination of economic features that sets them apart from ordinary financing leases. While the three-party financing lease method reflects the three-party nature of the transaction, it fails to recognize the other economic features referred to above; as a consequence, it produces results that are incon-

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

sistent with the manner in which the lessor-investor views the transaction. For those reasons, the Board rejected the three-party financing lease method.

c. *The investment with separate phases method.* This method recognizes the separate investment phases and the reversing cash flow pattern of a leveraged lease. By recognizing income at a level rate of return on net investment in the years in which the net investment is positive, it associates the income with the unrecovered balance of the earning asset in a manner consistent with the investor's view of the transaction. In the middle years of the lease term, the investment balance is generally negative, indicating that the lessor has not only recovered his initial investment but has the temporary use of funds that will be reinvested in the later years. The earnings on these temporary funds are reflected in income as and if they occur in the years in which the investment is negative. The income that is recognized at a level rate of return in the years in which the net investment balance is positive consists only of the so-called "primary" earnings from the lease, as distinct from the earnings on temporary funds to be reinvested, sometimes referred to as "secondary" earnings. The lessor-investor looks upon these secondary earnings from the temporarily held funds as one of the economic benefits inherent in the transaction. The integral investment method discussed in (d) below allocates both the primary and secondary earnings to annual income on a level rate of return basis. It is asserted by some that because of this feature, the integral investment method is more consistent with the manner in which the lessor-investor views the transaction. However, this feature involves estimation of the secondary earnings and recognition of a substantial portion of them in advance of their occurrence, which the Board did not favor for reasons stated below in the discussion of the integral investment method. The Board believes that secondary earnings should be recognized in income only as they occur (in the negative investment years), and that this treatment, coupled with the recognition of primary earnings in the positive investment years, appropriately portrays the economic effects of the separate investment phases. Accordingly, the Board concluded that the investment with separate phases method as prescribed in paragraphs .043-.047 is the appropriate method for accounting for leveraged leases.

d. *The integral investment method.* Several variations of the method illustrated in Schedule 7, page 126, of the Discussion

Memorandum were suggested by respondents who supported its concept. That concept looks upon the earnings from the use of temporarily held funds (discussed in (c) above) as constituting an integral part of the lease income, rather than as secondary earnings to be accounted for as they occur (the treatment called for in the separate phases method). Advocates of the integral method point out that the equity participant (lessor) in a leveraged lease is actually buying a series of cash flows consisting not only of the equity portion of the rental payments, the investment tax credit and other tax benefits, and the amount to be realized from the sale of the residual, but also including the earnings to be obtained from the use of temporarily held funds. Failure to include the latter in the calculation and recognition of lease income, in their view, understates lease income and is inconsistent with the manner in which the lessor-investor views the transaction. In considering these arguments, the Board noted (1) that the earnings in question, in effect, represent an estimate of interest expected to be earned (or interest cost to be saved) in future years through the application of the temporarily held funds; (2) although these earnings will not be realized until future years, their inclusion in lease income under the integral investment method would result in their recognition in substantial amounts beginning with the first year of the lease; and (3) the actual occurrence and amount of those earnings cannot be verified because this would involve tracing the source of specific investment dollars, generally acknowledged to be impractical. The Board noted further that the other cash flows that constitute the source of the primary earnings, with the exception of the residual value, are either contractual or based on existing tax law and thus provide a firmer basis for income recognition than the secondary earnings. Admittedly, there is uncertainty involved in the estimate of residual value to be realized; however, the Board noted that recognition of residual value is consistent with the accounting prescribed for ordinary financing leases, whereas the anticipation of future interest on funds expected to be held temporarily has no support in present generally accepted accounting principles. For the foregoing reasons, the Board rejected the integral investment method.

.110 Some respondents who objected to the inclusion of paragraph .042(d) in the definition of a leveraged lease argued that leveraged leases can have a variety of rental payment arrangements, some of which would not produce the separate investment phases specified as part of the definition, but that, nevertheless, such leases

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

should be accorded the accounting method prescribed in the Statement. The Board did not agree with this view, since the method prescribed is designed to recognize the unique economic aspects of the separate investment phases. It concluded that leases not having this characteristic should not be accounted for as leveraged leases and that the presence of nonrecourse debt in a leasing transaction is not by itself justification for special accounting treatment. Nonrecourse debt occurs in many types of transactions other than leases and, as discussed in paragraph .108, it is only the combination of attributes, not the presence of nonrecourse debt alone, that produces an overall economic effect that is distinct from that of other transactions.

.111 Some have contended that the inclusion of deferred taxes in the determination of the lessor's unrecovered investment is what gives rise to the separate investment phases, which is then used to justify the Board's adoption of the separate phases method and its rejection of the three-party financing method. The Board believes that the essential difference between the three-party financing method and the separate phases method is that the latter method closely follows the cash flow of the transaction, whereas the former does not. The three-party financing method portrays a gradually declining investment balance over the entire lease term, thus failing to recognize the short-term nature of the lessor's initial investment, which is typically recovered through the cash flow in the early years of the lease. That this early cash flow comes in large part from tax benefits does not alter the fact that the lessor has recovered his investment and is then provided with the temporary use of funds by which additional income can be generated. It is this feature which provides much of the incentive for the lessor to enter into the transaction in the first place and, in fact, without those tax benefits some leveraged leases would yield negative results. The Board concluded that leveraged leases should be accounted for in a manner that recognizes this cash flow pattern, both in determining the lessor's unrecovered investment balance and in the allocation of income relating to it. The assertion by some that the separate phases method results in an unwarranted "front ending" of income, in the Board's view, fails to take into account that the economic benefits of the transaction are themselves "front-ended," as has been described above. It is precisely this feature and the lack of recognition given it by the three-party financing method that caused the Board to reject that method.

.112 A number of respondents to the second Exposure Draft objected to the exclusion of the 90 percent recovery criterion, .007(d), in determining whether or not a lease meets the requirement of paragraph .042(a) as part of the definition of a leveraged lease. These respondents pointed out that the majority of leveraged leases would not meet any of the other criteria of paragraph .007 and that, if criterion .007(d) was not to be applicable, few leases would meet the definition of a leveraged lease. They took exception to the Board's reasons for having excluded criterion .007(d) as expressed in the second Exposure Draft. In their view, the determination of whether the lease would qualify as a direct financing lease, as required by paragraph .042(a), should be made in the same manner as with any other lease and that the presence of nonrecourse debt should thus not enter into such determination. The Board agreed with this reasoning and has changed the requirement of paragraph .042(a) accordingly.

.113 Some respondents asked that the Board reconsider its decision reflected in the second Exposure Draft that leases meeting the definition of sales-type leases should not be accounted for as leveraged leases. The argument was advanced that manufacturers and dealers often engage in leasing transactions that, except for the exclusion of sales-type leases, would otherwise meet the definition of a leveraged lease as set forth in paragraph .042. Specifically, it was asked why should not a manufacturer record manufacturing profit for a sales-type lease and then also account for it as a leveraged lease, if it otherwise meets the definition? In the Board's view, the recognition of manufacturing profit by the lessor at the beginning of the lease is incompatible with the concept underlying the accounting method prescribed by this Statement for leveraged leases. As stated in paragraph .109(c), that method recognizes income at a level rate of return on the lessor's net investment in the years in which the net investment is positive. The annual cash flow is thus allocated between that portion recognized as income and that applied as a reduction of net investment. Net investment at any point is considered to represent the lessor's unrecovered investment. If manufacturing profit is recognized at the beginning of the lease, an element of the overall profit in the transaction has been abstracted at the outset, thus changing the pattern of income recognition contemplated. The lessor's investment as recorded after recognition of manufacturing profit would not represent his unrecovered investment. That fact plus the deferral of income taxes related to the manufacturing profit recognized would alter both the investment base and the income to be allocated, thus

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

departing from the cash flow concept on which the prescribed method is based. For these reasons, the Board did not accept the recommendation.

.114 For much the same reason, the Board concluded that if the investment tax credit is accounted for other than as described in paragraphs .043 and .044, the leveraged lease should not be accounted for by the investment with separate phases method but, instead, by the method prescribed for a direct financing lease. Accounting for the credit other than as prescribed by the investment with separate phases method would abstract an important element of the overall profit in the transaction, thereby changing the lessor's net investment and the pattern of income recognition contemplated by the investment with separate phases method and thus, in the Board's view, rendering the use of that method inappropriate.

Effective Date and Transition

.115 The Board considered three methods of transition in the application of the Statement:

a. Retroactive application with restatement of prior period financial statements

b. Retroactive application without restatement

c. Prospective application

The first alternative maximizes comparability of a company's financial statements with those of other companies and with its own statements for prior periods. However, respondents expressed concern that it would require the accumulation of a considerable amount of information about existing and expired leases and that some companies might have problems relating to restrictive covenants in loan indentures and other contracts. In addition, it requires estimates that in some cases would be made with after-the-fact knowledge. The second alternative reduces the problem of data accumulation but at the cost of impairing interperiod comparability of a company's financial statements before and after the date of retroactive application. Depending on the particular circumstances, it may or may not mitigate the possible problems relating to loan indenture covenants. The third alternative avoids most of the problems of the other two but would result in noncomparability of financial statements, both as among different com-

panies and those of the same company for different periods, for years in the future.

.116 While the majority of respondents favored prospective application, others strongly urged that the Statement be applied retroactively with restatement. The long period of time that would ensue before comparability would be achieved was given as the prime reason by those advocating retroactivity. Some preparers, on the other hand, cited problems involving loan indenture restrictions should the Statement require retroactive application. Some companies with large numbers of leases stated in their responses that the task of gathering the necessary data for retroactive application would be onerous as well as time consuming for existing leases, and that it would be more difficult, if not impossible, to obtain the information on expired leases necessary for restatement.

.117 Included in the responses was the suggestion that a transition period be established during which companies would be given time both for the purpose of accumulating the necessary data for retroactive application and for taking steps toward resolving problems that might arise in connection with restrictive clauses in loan indentures or other agreements.

.118 In considering these conflicting recommendations, the Board was sympathetic to the problems of data accumulation for companies with large numbers of leases and to the problems that some companies believe might be associated with indenture restrictions. On the other hand, the objections raised, particularly by users of financial statements, to the long period of noncomparability of financial statements that would be entailed by prospective application concerned the Board. The Board concluded that the use of a transition period at the end of which full retroactive application would be required would best meet the needs of users while at the same time giving significant recognition to the problems referred to by preparers.

.119 The procedure adopted by the Board calls for immediate prospective application of the Statement (see paragraph .048), with retroactive restatement required after a four-year transition period (see paragraph .049). Thus, companies that might have problems arising from loan indenture restrictions are given at least four full years in which, depending on the nature of the restrictions, resolution of such problems may be possible. Further, restatement is required for periods beginning before December 31, 1976 only to

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

the extent that it is practicable (see paragraph .051), in recognition of the fact that some companies may be unable to obtain or reconstruct the necessary information about leases expiring in prior years. Finally, interim disclosures (see paragraph .050) are called for to facilitate comparability before retroactive application of the Statement is required; however, since the Board recognizes that the accumulation of information to make such disclosures may require time, companies are given at least one full year before such disclosure is called for. Although the Board recognizes that the period of time provided for transition will not completely eliminate the problems of retroactive restatement, it believes that those problems will be alleviated under the method outlined above and that the benefit to be gained through comparability of financial statements is substantial.

.120 Upon consideration of the relevant circumstances, the Board concluded that the interests of users of financial statements would be best served by making the statement effective for leasing transactions and lease agreement revisions entered into on or after January 1, 1977, as provided by paragraph .048.

Appendix C

ILLUSTRATIONS OF ACCOUNTING BY LESSEES AND LESSORS

.121 This Appendix contains the following schedules illustrating the accounting requirements of this Statement as applied to a particular example (an automobile lease):

1. Lease example—terms and assumptions, Schedule 1

2. Computation of minimum lease payments (lessee and lessor) and lessor's computation of rate of interest implicit in the lease, Schedule 2

3. Classification of the lease, Schedule 3

4. Journal entries for the first month of the lease as well as for the disposition of the leased property at the end of the lease term, Schedule 4

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

SCHEDULE 1

Lease Example
Terms and Assumptions

Lessor's cost of the leased property (automobile)	$5,000
Fair value of the leased property at inception of the lease (1/1/77)	$5,000
Estimated economic life of the leased property	5 years

Lease terms and assumptions: The lease has a fixed noncancelable term of 30 months, with a rental of $135 payable at the beginning of each month. The lessee guarantees the residual value at the end of the 30-month lease term in the amount of $2,000. The lessee is to receive any excess of sales price of property over the guaranteed amount at the end of the lease term. The lessee pays executory costs. The lease is renewable periodically based on a schedule of rentals and guarantees of the residual values decreasing over time. The rentals specified are deemed to be fair rentals (as distinct from bargain rentals), and the guarantees of the residual are expected to approximate realizable values. No investment tax credit is available.

The residual value at the end of the lease term is estimated to be $2,000. The lessee depreciates his owned automobiles on a straight-line basis. The lessee's incremental borrowing rate is 10½% per year. There were no initial direct costs of negotiating and closing the transaction. At the end of the lease term the asset is sold for $2,100.

SCHEDULE 2

Computation of Minimum Lease Payments (Lessee and Lessor)

In accordance with paragraph .005(j), minimum lease payments for both the lessee and lessor are computed as follows:

Minimum rental payments over the lease term ($135 × 30 months)	$4,050
Lessee guarantee of the residual value at the end of the lease term	2,000
Total minimum lease payments	$6,050

Lessor's Computation of Rate of Interest Implicit in the Lease

In accordance with paragraph .005(k), the interest rate implicit in the lease is that rate implicit in the recovery of the fair value of the property at the inception of the lease ($5,000) through the minimum lease payments (30 monthly payments of $135 and the lessee's guarantee of the residual value in the amount of $2,000 at the end of the lease term). That rate is 12.036% (1.003% per month).

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

SCHEDULE 3

Classification of the Lease

Criteria set forth in paragraph	
.007(a)	*Not met.* The lease does not transfer ownership of the property to the lessee by the end of the lease term.
.007(b)	*Not met.* The lease does not contain a bargain purchase option.
.007(c)	*Not met.* The lease term is not equal to 75% or more of the estimated economic life of the property. (In this case, it represents only 50% of the estimated economic life of the property.)
.007(d)	*Met.* In the lessee's case, the present value ($5,120) of the minimum lease payments using his incremental borrowing rate (10½%) exceeds 90% of the fair value of the property at the inception of the lease. (See computation on next page.) Even if the lessee knows the implicit rate, he uses his incremental rate because it is lower. The lessee classifies the lease as a capital lease. In the lessor's case, the present value ($5,000) of the minimum lease payments using the implicit rate also exceeds 90% of the fair value of the property. (See computation on next page.) Having met this criterion and assuming that the criteria of paragraph .008 are also met, the lessor will classify the lease as a direct financing lease (as opposed to a sales-type lease) because the cost and fair value of the asset are the same at the inception of the lease. (See paragraph .006(b)(ii).)

SCHEDULE 3 continued

Criteria set forth in paragraph .007(d) continued	Present Values	
	Lessee's computation using his incremental borrowing rate of 10½% (.875% per month)*	Lessor's computation using the implicit interest rate of 12.036% (1.003% per month)
Minimum lease payments:		
Rental payments	$3,580	$3,517
Residual guarantee by lessee	1,540	1,483
Total	$5,120	$5,000
Fair value of the property at inception of the lease	$5,000	$5,000
Minimum lease payments as a percentage of fair value	102%	100%

* In this case, the lessee's incremental borrowing rate is used because it is lower than the implicit rate. (See paragraph .007(d).)

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

SCHEDULE 4

Journal Entries for the First Month of the Lease as Well as for the Disposition of the Leased Property at the End of the Lease Term

First Month of the Lease

LESSEE

Date	Account	Debit	Credit
1/1/77	Leased property under capital leases	5,000	
	Obligations under capital leases		5,000
	To record capital lease at the fair value of the property. (Since the present value of the minimum lease payments using the lessee's incremental borrowing rate as the discount rate (see paragraph .007(d) for selection of rate to be used) is greater than the fair value of the property, the lessee capitalizes only the fair value of the property. See paragraph .010.)		
1/1/77	Obligations under capital leases	135	
	Cash		135
	To record first month's rental payment.		

SCHEDULE 4 continued

First Month of the Lease

LESSEE continued

Date	Account / Explanation	Debit	Credit
1/31/77	Interest expense	49	
	Accrued interest on obligations under capital leases		49*
	To recognize interest expense for the first month of the lease. Obligation balance outstanding during month \$4,865 (\$5,000−\$135) × 1.003% (rate implicit in the liquidation of the \$5,000 obligation through (a) 30 monthly payments of \$135 made at the beginning of each month and (b) a \$2,000 guarantee of the residual value at the end of 30 months)=\$49. (See paragraph .012.)		
1/31/77	Depreciation expense	100	
	Leased property under capital leases		100
	To record first month's depreciation on a straight-line basis over 30 months to a salvage value of \$2,000, which is the estimated residual value to the lessee. (See paragraph .011(b).)		

---

* In accordance with paragraph .012, the February 1, 1977 rental payment of \$135 will be allocated as follows: \$86 (principal reduction) against obligations under capital leases and \$49 against accrued interest on obligations under capital leases.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

SCHEDULE 4 continued

First Month of the Lease

LESSOR

Date	Account	Debit	Credit
1/1/77	Minimum lease payments receivable	6,050	
	Automobile		5,000
	Unearned income		1,050
	To record lessor's investment in the direct financing lease. (See paragraphs .018(a) and (b).)		
1/1/77	Cash	135	
	Minimum lease payments receivable		135
	To record receipt of first month's rental payment under the lease.		
1/31/77	Unearned income	49	
	Earned income		49
	To recognize the portion of unearned income that is earned during the first month of the lease. Net investment outstanding for month $4,865 (gross investment $5,915 ($6,050−$135) less unearned income $1,050) × 1.003% (monthly implicit rate in the lease) = $49. (See paragraph .018(b).)		

SCHEDULE 4 continued

Disposition of Asset* for $2,100

LESSEE

7/1/79	Cash	100	
	Obligations under capital leases	1,980	
	Accrued interest on obligations under capital leases	20	
	Leased property under capital leases		2,000
	Gain on disposition of leased property		100

To record the liquidation of the obligations under capital leases and receipt of cash in excess of the residual guarantee through the sale of the leased property.

LESSOR

7/1/79	Cash	2,000	
	Minimum lease payments receivable		2,000

To record the receipt of the amount of the lessee's guarantee.

---

* See note on next page.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

SCHEDULE 4 continued

Note to Disposition of Asset

Had the lessee elected at July 1, 1979 to renew the lease, it would render inoperative the guarantee as of that date. For that reason, the renewal would not be treated as a new agreement, as would otherwise be the case under paragraph .009, but would instead be accounted for as provided in paragraph .012. The lessee would accordingly adjust the remaining balances of the asset and obligation from the original lease, which at June 30, 1979 were equal, by an amount equal to the difference between the present value of the future minimum lease payments under the revised agreement and the remaining balance of the obligation. The present value of the future minimum lease payments would be computed using the rate of interest used to record the lease initially.

From the lessor's standpoint, the revised agreement would be accounted for in accordance with paragraph .017(e). Accordingly, the remaining balance of minimum lease payments receivable would be adjusted to the amount of the payments called for by the revised agreement, and the adjustment would be credited to unearned income.

Appendix D

ILLUSTRATIONS OF DISCLOSURE BY LESSEES AND LESSORS

.122 This Appendix illustrates one way of meeting the disclosure requirements of this Statement, except for those relating to leveraged leases which are illustrated in Appendix E. The illustrations do not encompass all types of leasing arrangements for which disclosures are required. For convenience, the illustrations have been constructed as if the Statement had been in effect in prior years.

FOOTNOTES

Note 1—Description of Leasing Arrangements

The Company conducts a major part of its operations from leased facilities which include a manufacturing plant, 4 warehouses, and 26 stores. The plant lease, which is for 40 years expiring in 1999, is classified as a capital lease. The warehouses are under operating leases that expire over the next 7 years. Most of the leases of store facilities are classified as capital leases. All of the leases of store facilities expire over the next 15 years.

Most of the operating leases for warehouses and store facilities contain one of the following options: (a) the Company can, after the initial lease term, purchase the property at the then fair value of the property or (b) the Company can, at the end of the initial lease term, renew its lease at the then fair rental value for periods of 5 to 10 years. These options enable the Company to retain use of facilities in desirable operating areas. The rental payments under a store facility lease are based on a minimum rental plus a percentage of the store's sales in excess of stipulated amounts. Portions of store space and warehouse space are sublet under leases expiring during the next 5 years.

In addition, the Company leases transportation equipment (principally trucks) and data processing equipment under operating leases expiring during the next 3 years.

In most cases, management expects that in the normal course of business, leases will be renewed or replaced by other leases.

The plant lease prohibits the Company from entering into future lease agreements if, as a result of new lease agreements, aggregate annual rentals under all leases will exceed $XXX.

Note 2—Capital Leases

The following is an analysis of the leased property under capital leases by major classes:

Classes of Property	Asset Balances at December 31, 1976	1975
Manufacturing plant	$ XXX	$ XXX
Store facilities	XXX	XXX
Other	XXX	XXX
	XXX	XXX
Less: Accumulated amortization	(XXX)	(XXX)
	$ XXX	$ XXX

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Note 2—continued

The following is a schedule by years of future minimum lease payments under capital leases together with the present value of the net minimum lease payments as of December 31, 1976:

Year ending December 31:	
1977	$ XXX
1978	XXX
1979	XXX
1980	XXX
1981	XXX
Later years	XXX
Total minimum lease payments[1]	XXX
Less: Amount representing estimated executory costs (such as taxes, maintenance, and insurance), including profit thereon, included in total minimum lease payments	(XXX)
Net minimum lease payments	XXX
Less: Amount representing interest[2]	(XXX)
Present value of net minimum lease payments[3]	$ XXX

[1] Minimum payments have not been reduced by minimum sublease rentals of $XXX due in the future under noncancelable subleases. They also do not include contingent rentals which may be paid under certain store leases on the basis of a percentage of sales in excess of stipulated amounts. Contingent rentals amounted to $XXX in 1976 and $XXX in 1975.

[2] Amount necessary to reduce net minimum lease payments to present value calculated at the Company's incremental borrowing rate at the inception of the leases.

[3] Reflected in the balance sheet as current and noncurrent obligations under capital leases of $XXX and $XXX, respectively.

Note 3—Operating Leases

The following is a schedule by years of future minimum rental payments required under operating leases that have initial or remaining noncancelable lease terms in excess of one year as of December 31, 1976:

Year ending December 31:	
1977	$ XXX
1978	XXX
1979	XXX
1980	XXX
1981	XXX
Later years	XXX
Total minimum payments required*	$ XXX

The following schedule shows the composition of total rental expense for all operating leases except those with terms of a month or less that were not renewed:

	Year ending December 31,	
	1976	1975
Minimum rentals	$ XXX	$ XXX
Contingent rentals	XXX	XXX
Less: Sublease rentals	(XXX)	(XXX)
	$ XXX	$ XXX

* Minimum payments have not been reduced by minimum sublease rentals of $XXX due in the future under noncancelable subleases.

LESSOR'S DISCLOSURE (Other Than for Leveraged Leases)

Company X
BALANCE SHEET

ASSETS	December 31,	
	1976	1975
Current assets:		
Net investment in direct financing and sales-type leases (Note 2)	XXX	XXX
Noncurrent assets:		
Net investment in direct financing and sales-type leases (Note 2)	XXX	XXX
Property on operating leases and property held for leases (net of accumulated depreciation of $XXX and $XXX for 1976 and 1975, respectively) (Note 3)	XXX	XXX

Footnotes appear on the following pages.

FOOTNOTES

Note 1—Description of Leasing Arrangements

The Company's leasing operations consist principally of the leasing of various types of heavy construction and mining equipment, data processing equipment, and transportation equipment. With the exception of the leases of transportation equipment, the bulk of the Company's leases are classified as direct financing leases. The construction equipment and mining equipment leases expire over the next ten years and the data processing equipment leases expire over the next eight years. Transportation equipment (principally trucks) is leased under operating leases that expire during the next three years.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Note 2—Net Investment in Direct Financing and Sales-Type Leases

The following lists the components of the net investment in direct financing and sales-type leases as of December 31:

	1976	1975
Total minimum lease payments to be received*	$ XXX	$ XXX
Less: Amounts representing estimated executory costs (such as taxes, maintenance, and insurance), including profit thereon, included in total minimum lease payments	(XXX)	(XXX)
Minimum lease payments receivable	XXX	XXX
Less: Allowance for uncollectibles	(XXX)	(XXX)
Net minimum lease payments receivable	XXX	XXX
Estimated residual values of leased property (unguaranteed)	XXX	XXX
Less: Unearned income	(XXX)	(XXX)
Net investment in direct financing and sales-type leases	$ XXX	$ XXX

* Minimum lease payments do not include contingent rentals which may be received under certain leases of data processing equipment on the basis of hours of use in excess of stipulated minimums. Contingent rentals amounted to $XXX in 1976 and $XXX in 1975. At December 31, 1976, minimum lease payments for each of the five succeeding fiscal years are as follows: $XXX in 1977, $XXX in 1978, $XXX in 1979, $XXX in 1980, and $XXX in 1981.

Note 3—Property on Operating Leases and Property Held for Lease

The following schedule provides an analysis of the Company's investment in property on operating leases and property held for lease by major classes as of December 31, 1976:

Construction equipment	$ XXX
Mining equipment	XXX
Data processing equipment	XXX
Transportation equipment	XXX
Other	XXX
	XXX
Less: Accumulated depreciation	(XXX)
	$ XXX

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

Note 4—Rentals under Operating Leases

The following is a schedule by years of minimum future rentals on noncancelable operating leases as of December 31, 1976:

Year ending December 31:	
1977	$ XXX
1978	XXX
1979	XXX
1980	XXX
1981	XXX
Later years	XXX
Total minimum future rentals*	$ XXX

* This amount does not include contingent rentals which may be received under certain leases of data processing equipment on the basis of hours of use in excess of stipulated minimums. Contingent rentals amounted to $XXX in 1976 and $XXX in 1975.

Appendix E

ILLUSTRATIONS OF ACCOUNTING AND FINANCIAL STATEMENT PRESENTATION FOR LEVERAGED LEASES

.123 This Appendix illustrates the accounting requirements of this Statement and one way of meeting its disclosure requirements as applied to a leveraged lease. The illustrations do not encompass all circumstances that may arise in connection with leveraged leases; rather, the illustrations are based on a single example of a leveraged lease, the terms and assumptions for which are stated in Schedule 1. The elements of accounting and reporting illustrated for this example of a leveraged lease are as follows:

1. Leveraged lease example—terms and assumptions, Schedule 1

2. Cash flow analysis by years, Schedule 2

3. Allocation of annual cash flow to investment and income, Schedule 3

4. Journal entries for lessor's initial investment and first year of operation, Schedule 4

5. Financial statements including footnotes at end of second year

6. Accounting for a revision in the estimated residual value of the leased asset assumed to occur in the eleventh year of the lease (from $200,000 to $120,000):

   a. Revised allocation of annual cash flow to investment and income, Schedule 5

   b. Balances in investment accounts at beginning of the eleventh year before revised estimate, Schedule 6

   c. Journal entries, Schedule 7

   d. Adjustment of investment accounts, Schedule 8

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

SCHEDULE 1

Leveraged Lease Example
Terms and Assumptions

Cost of leased asset (equipment)	$1,000,000
Lease term	15 years, dating from January 1, 1975
Lease rental payments	$90,000 per year (payable last day of each year)
Residual value	$200,000 estimated to be realized one year after lease termination. In the eleventh year of the lease the estimate is reduced to $120,000.
Financing:	
Equity investment by lessor	$400,000
Long-term nonrecourse debt	$600,000, bearing interest at 9% and repayable in annual installments (on last day of each year) of $74,435.30
Depreciation allowable to lessor for income tax purposes	Seven-year ADR life using double-declining-balance method for the first two years (with the half-year convention election applied in the first year) and sum-of-years digits method for remaining life, depreciated to $100,000 salvage value
Lessor's income tax rate (federal and state)	50.4% (assumed to continue in existence throughout the term of the lease)
Investment tax credit	10% of equipment cost or $100,000 (realized by the lessor on last day of first year of lease)
Initial direct costs	For simplicity, initial direct costs have not been included in the illustration.

SCHEDULE 2

Cash Flow Analysis by Years

	1	2	3	4
Year	Gross lease rentals and residual value	Depreciation (for income tax purposes)	Loan interest payments	Taxable income (loss) (col. 1−2−3)
Initial investment	—	—	—	—
1	$ 90,000	$ 142,857	$ 54,000	$ (106,857)
2	90,000	244,898	52,161	(207,059)

$(16,869)	$600,000	$100,000	$116,601	

SCHEDULE 3

Allocation of Annual Cash Flow to Investment and Income

	1	2	3	4
		Annual Cash Flow		
Year	Lessor's net investment at beginning of year	Total (from Schedule 2, col. 8)	Allocated to investment	Allocated to income[1]
1	$400,000	$169,421	$134,833	$ 34,588
2	265,167	119,923	96,994	22,929
3	168,173	89,769	75,227	14,542
4	92,946	71,525	63,488	8,037
5	29,458	53,182	50,635	2,547
6	(21,177)	18,616	18,616	—
7	(39,793)	(9,553)	(9,553)	—
8	(30,240)	(11,108)	(11,108)	—
9	(19,132)	(12,803)	(12,803)	—
10	(6,329)	(14,649)	(14,649)	—
11	8,320	(16,663)	(17,382)	719
12	25,702	(18,857)	(21,079)	2,222
13	46,781	(21,248)	(25,293)	4,045
14	72,074	(23,856)	(30,088)	6,232
15	102,162	(26,698)	(35,532)	8,834
16	137,694	149,600	137,694	11,906
Totals		$516,601	$400,000	$116,601

[1] Lease income is recognized as 8.647% of the unrecovered investment at the beginning of each year in which the net investment is positive. The rate is that rate which when applied to the net investment in the years in which the net investment is positive will distribute the net income (net cash flow) to those years. The rate for allocation used in this Schedule is calculated by a trial and error process. The allocation is calculated based upon an initial estimate of the rate as a starting point. If the total thus allocated to income (column 4) differs under the estimated rate from the net cash flow (Schedule 2, column 8) the estimated rate is increased or decreased, as appropriate, to derive a revised allocation. This process is repeated until a rate is selected which develops a total amount allocated to income that is precisely equal to the net cash flow. As a practical matter, a computer program is used to calculate Schedule 3 under successive iterations until the correct rate is determined.

2,536	(1,278)	7,576
3,418	(1,723)	10,211
$33,470	$(16,869)	$100,000

[2] Each component is allocated among the years of positive net investment in proportion to the allocation of net income in column 4.

SCHEDULE 4

Illustrative Journal Entries for Year Ending December 31, 1975

Lessor's Initial Investment

Rentals receivable (Schedule 2, total of column 1 less residual value, less totals of columns 3 and 6)	233,470	
Investment tax credit receivable (Schedule 2, column 7)	100,000	
Estimated residual value (Schedule 1)	200,000	
Unearned and deferred income (Schedule 3, totals of columns 5 and 7)		133,470
Cash		400,000
Record lessor's initial investment		

First Year of Operation

Journal Entry 1

Cash	15,565	
Rentals receivable (Schedule 2, column 1 less columns 3 and 6)		15,565
Collection of first year's net rental		

Journal Entry 2

Cash*	100,000	
Investment tax credit receivable (Schedule 2, column 7)		100,000
Receipt of investment tax credit		

* Receipts of the investment tax credit and other tax benefits are shown as cash receipts for simplicity only. Those receipts probably would not be in the form of immediate cash inflow. Instead, they likely would be in the form of reduced payments of taxes on other income of the lessor or on the combined income of the lessor and other entities whose operations are joined with the lessor's operations in a consolidated tax return.

SCHEDULE 4 continued

Journal Entry 3

Unearned and deferred income	9,929	
Income from leveraged leases (Schedule 3, column 5)		9,929

Recognition of first year's portion of pretax income allocated in the same proportion as the allocation of total income

$$\left(\frac{34{,}588}{116{,}601} \times 33{,}470 = 9{,}929\right)$$

Journal Entry 4

Unearned and deferred income	29,663	
Investment tax credit recognized (Schedule 3, column 7)		29,663

Recognition of first year's portion of investment tax credit allocated in the same proportion as the allocation of total income

$$\left(\frac{34{,}588}{116{,}601} \times 100{,}000 = 29{,}663\right)$$

Journal Entry 5

Cash (Schedule 2, column 5)*	53,856	
Income tax expense (Schedule 3, column 6)	5,004	
Deferred taxes		58,860

To record receipt of first year's tax credit from lease operation, to charge income tax expense for tax effect of pretax accounting income, and to recognize as deferred taxes the tax effect of the difference between pretax accounting income and the tax loss for the year, calculated as follows:

Tax loss (Schedule 2, column 4)	$(106,857)
Pretax accounting income	9,929
Difference	$(116,786)
Deferred taxes ($116,786 × 50.4%)	$ 58,860

* See note on preceding page.

FOOTNOTES

Investment in Leveraged Leases

The Company is the lessor in a leveraged lease agreement entered into in 1975 under which mining equipment having an estimated economic life of 18 years was leased for a term of 15 years. The Company's equity investment represented 40 percent of the purchase price; the remaining 60 percent was furnished by third-party financing in the form of long-term debt that provides for no recourse against the Company and is secured by a first lien on the property. At the end of the lease term, the equipment is turned back to the Company. The residual value at that time is estimated to be 20 percent of cost. For federal income tax purposes, the Company receives the investment tax credit and has the benefit of tax deductions for depreciation on the entire leased asset and for interest on the long-term debt. Since during the early years of the lease those deductions exceed the lease rental income, substantial excess deductions are available to be applied against the Company's other income. In the later years of the lease, rental income will exceed the deductions and taxes will be payable. Deferred taxes are provided to reflect this reversal.

The Company's net investment in leveraged leases is composed of the following elements:

	December 31, 1976	December 31, 1975
Rentals receivable (net of principal and interest on the nonrecourse debt)	$202,340	$217,905
Estimated residual value of leased assets	200,000	200,000
Less: Unearned and deferred income	(67,632)	(93,878)
Investment in leveraged leases	334,708	324,027
Less: Deferred taxes arising from leveraged leases	(166,535)	(58,860)
Net investment in leveraged leases	$168,173	$265,167

SCHEDULE 5

Allocation of Annual Cash Flow to Investment and Income Revised to Include New Residual Value Estimate

	1	2	3	4
		Annual Cash Flow

AC Section 4053-1

Lessee Guarantee of the Residual Value of Leased Property: An Interpretation of Section 4053

[Source: FASB Interpretation No. 19.]

October 1977

INTRODUCTION

.01 The FASB has been asked to clarify whether a particular kind of lease provision constitutes a guarantee by the lessee of the residual value of leased property at the expiration of the lease term to be included in *minimum lease payments* in accordance with paragraph 5(j)(i)(b) of *FASB Statement No. 13* [section 4053.005(j)(i)(b)], "Accounting for Leases," and to clarify whether certain provisions in lease agreements and certain other circumstances limit the amount of a lessee guarantee to be included in minimum lease payments to an amount less than a stipulated residual value of the leased property at the end of the lease term. Paragraph 5(j)(i)(b) of the Statement states that minimum lease payments from the standpoint of the lessee shall include a "guarantee by the lessee . . . of the residual value at the expiration of the lease term, whether or not payment of the guarantee constitutes a purchase of the leased property. . . . When the lessee agrees to make up any deficiency below a stated amount in the lessor's realization of the residual value, the guarantee to be included in the minimum lease payments shall be the stated amount, rather than an estimate of the deficiency to be made up."

.02 Specifically, the Board has been asked the following three questions:

a. Does a lease provision requiring the lessee to make up a residual value deficiency that is attributable to damage, extraordinary wear and tear, or excessive usage (e. g., excessive mileage on a leased vehicle) constitute a lessee guarantee of the residual value such that the estimated residual value of the leased property at the end of the lease term should be included in minimum lease payments under paragraph 5(j)(i)(b) of *FASB Statement No. 13* [section 4053.005(j)(i)(b)]?

b. Some lease agreements limit the amount of a residual value deficiency that a lessee can be required to make up to an amount that is (1) less than the stipulated residual value

of the leased property at the end of the lease term but (2) clearly in excess of any reasonable estimate of a deficiency that might be expected to arise in normal circumstances. In those cases, is the amount of the lessee's guarantee to be included in minimum lease payments under paragraph 5(j)(i)(b) of *FASB Statement No. 13* [section 4053.005 (j)(i)(b)] limited to the specified maximum deficiency that the lessee can be required to make up, or is it the stipulated residual value of the leased property at the end of the lease term?

c. If a lessee who is obligated to make up a deficiency in the lessor's realization of the residual value obtains a guarantee of the residual value from an unrelated third party, may the lessee reduce the amount of his minimum lease payments under paragraph 5(j)(i)(b) of *FASB Statement No. 13* [section 4053.005(j)(i)(b)] by the amount of the third-party guarantee?

INTERPRETATION

.03 A lease provision requiring the lessee to make up a residual value deficiency that is attributable to damage, extraordinary wear and tear, or excessive usage is similar to contingent rentals in that the amount is not determinable at the inception of the lease.[1] Such a provision does not constitute a lessee guarantee of the residual value for purposes of paragraph 5(j)(i)(b) of *FASB Statement No. 13* [section 4053.005 (j)(i)(b)].

.04 If a lease limits the amount of the lessee's obligation to make up a residual value deficiency to an amount less than the stipulated residual value of the leased property at the end of the lease term, the amount of the lessee's guarantee to be included in minimum lease payments under paragraph 5(j) (i)(b) of *FASB Statement No. 13* [section 4053.005(j)(i)(b)] shall be limited to the specified maximum deficiency the lessee can be required to make up. In other words, the "stated amount" referred to in the last sentence of paragraph 5(j)(i)(b) is the specified maximum deficiency that the lessee is obligated to make up. If that maximum deficiency clearly exceeds any reasonable estimate of a deficiency that might be expected to arise in normal circumstances, the lessor's risk associated with

[1] Contingent rentals are not included in *minimum lease payments* as defined in paragraph 5(j) of *FASB Statement No. 13* [section 4053.005(j)]. Contingent rentals are to be recognized as period costs when incurred (or revenue when receivable). (See paragraphs 12, 17(b), and 18(b) of Statement No. 13 [sections 4053.012, 4053.017(b), and 4053.018(b)].)

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

the portion of the residual in excess of the maximum may appear to be negligible. However, the fact remains that the lessor must look to the resale market or elsewhere rather than to the lessee to recover the unguaranteed portion of the stipulated residual value of the leased property. The lessee has not guaranteed full recovery of the residual value, and the parties should not base their accounting on the assumption that the lessee has guaranteed it. The 90 percent test specified in criterion (d) of paragraph 7 of Statement No. 13 [section 4053.007(d)] is stated as a lower limit rather than as a guideline.

.05 A guarantee of the residual value obtained by the lessee from an unrelated third party for the benefit of the lessor shall not be used to reduce the amount of the lessee's minimum lease payments under paragraph 5(j)(i)(b) of *FASB Statement No. 13* [section 4053.005(j)(i)(b)] except to the extent that the lessor explicitly releases the lessee from obligation, including secondary obligation if the guarantor defaults, to make up a residual value deficiency. Amounts paid in consideration for a guarantee by an unrelated third party are executory costs and are not included in the lessee's minimum lease payments.

EFFECTIVE DATE AND TRANSITION

.06 The provisions of this Interpretation shall be effective for leasing transactions and lease agreement revisions (see paragraph 9 of *FASB Statement No. 13* [section 4053.009]) entered into on or after January 1, 1978. Earlier application is encouraged. In addition, the provisions of this Interpretation shall be applied retroactively at the same time and in the same manner as the provisions of *FASB Statement No. 13* [section 4053] are applied retroactively (see paragraphs 49 and 51 of the Statement [sections 4053.049 and 4053.051]). Enterprises that have already applied the provisions of Statement No. 13 [section 4053] retroactively and have published financial statements based on the retroactively adjusted accounts before the effective date of this Interpretation may, but are not required to, apply the provisions of this interpretation retroactively.

AC Section 4053-2

Accounting for Leases in a Business Combination: An Interpretation of Section 4053

[Source: FASB Interpretation No. 21.]

April 1978

INTRODUCTION AND BACKGROUND INFORMATION

.01 The FASB has been asked to clarify the application of *FASB Statement No. 13* [section 4053], "Accounting for Leases," in business combinations. Specifically, this involves the following questions:

a. Does the consummation of a business combination require the combined enterprise to treat leases of the combining companies as new leases to be classified according to the criteria set forth in Statement No. 13 [section 4053], based on conditions as of the date of the combination?

b. If the consummation of a business combination does not require enterprises to treat leases of the combining companies as new leases as of the date of the combination, how should Statement No. 13 [section 4053] be applied [1] to the leases of the combined enterprise?

c. How do the requirements of *APB Opinion No. 16* [section 1091], "Business Combinations," for assigning amounts to the assets acquired and liabilities assumed in a business combination that is accounted for by the purchase method affect the application of Statement No. 13 [section 4053] by the combined enterprise to leases of the acquired company?

.02 Paragraph 40 of *FASB Statement No. 13* [section 4053.040] requires the new lessee under a sublease or similar transaction to classify the lease in accordance with the criteria in Statement No. 13 [section 4053] and to account for it as a new lease. Subparagraphs (b) and (c) of paragraph 35 of Statement No. 13 [section 4053.035(b) and (c)] describe the transactions similar to subleases that are subject to the requirements of paragraph 40 [section 4053.040] of the Statement as follows:

b. A new lessee is substituted under the original lease agreement. The new lessee becomes the primary obligor under

[1] See paragraphs 49 and 51 of *FASB Statement No. 13* [sections 4053.049 and 4053.051] regarding retroactive application of Statement No. 13 [section 4053].

the agreement, and the original lessee may or may not be secondarily liable.

c. A new lessee is substituted through a new agreement, with cancellation of the original lease agreement.

The question has been raised as to whether the provisions of paragraphs 35 and 40 [sections 4053.035 and 4053.040] ever require that leases in a business combination be treated as new leases by the combined enterprise.

.03 In connection with a business combination, changes may be made in the provisions of existing leases of a combining enterprise. Paragraph 9 of *FASB Statement No. 13* [section 4053.009] discusses changes in the provisions of leases as follows:

> If at any time the lessee and lessor agree to change the provisions of the lease, other than by renewing the lease or extending its term, in a manner that would have resulted in a different classification of the lease under the criteria in paragraphs 7 and 8 had the changed terms been in effect at the inception of the lease, the revised agreement shall be considered as a new agreement over its term, and the criteria in paragraphs 7 and 8 shall be applied for purposes of classifying the new lease. Likewise, except when a guarantee or penalty is rendered inoperative as described in paragraphs 12 and 17(e), any action that extends the lease beyond the expiration of the existing lease term (see paragraph 5(f)), such as the exercise of a lease renewal option other than those already included in the lease term, shall be considered as a new agreement, which shall be classified according to the provisions of paragraphs 6-8. Changes in estimates (for example, changes in estimates of the economic life or of the residual value of the leased property) or changes in circumstances (for example, default by the lessee), however, shall not give rise to a new classification of a lease for accounting purposes.

.04 Paragraph 88 of *APB Opinion No. 16* [section 1091.88] provides "general guides for assigning amounts to the individual assets acquired and liabilities assumed, except goodwill . . ." in a business combination that is accounted for by the purchase method. The guides in subparagraphs of paragraph 88 [section 1091.88] indicate the method of valuation to be used for various types of assets and liabilities. The concepts underlying *FASB Statement No. 13* [section 4053] that govern classification of leases differ in some respects from the concepts of prior APB Opinions on accounting for leases. Thus, the subparagraphs of paragraph 88 of Opinion No. 16 [section 1091.88] that were applied prior to Statement No. 13 [section 4053] may not be the appropriate subparagraphs to be applied under Statement No. 13 [section 4053]. In addition, some provisions of Statement No. 13 [section 4053] (e.g., interest rates used) may suggest that certain of the general guidelines in paragraph 88

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

[section 1091.88] should be applied differently from the way they may have been applied in the past.

.05 An Exposure Draft of a proposed Interpretation on "Accounting for Leases in a Business Combination" was issued on December 19, 1977. The Board received 27 letters of comment in response to the Exposure Draft. Certain of those comments and the Board's consideration of them are discussed in paragraphs .06-.10 below.

.06 One respondent requested that the Interpretation provide for circumstances in which determinations at the inception of the lease are not possible. The Board is aware that in some cases it is difficult to obtain accurate data relating to the remote past of an acquired enterprise but believes that reasonable estimates can be derived based on the information that is available.

.07 Some respondents expressed the belief that the concept of purchase accounting in *APB Opinion No. 16* [section 1091] requires the acquiring enterprise to classify the acquired enterprise's leases as new leases at the date of a business combination that is accounted for by the purchase method and stated that the acquiring enterprise should apply the criteria of *FASB Statement No. 13* [section 4053] for classifying the acquired leases at the date of the acquisition. The Board does not believe that Opinion No. 16 [section 1091] requires reconsideration of the classification of existing leases that are already classified in conformity with Statement No. 13 [section 4053]; rather, the Board views Opinion No. 16 [section 1091] as requiring valuation of the existing assets and obligations of the acquired company, including assets and obligations pertaining to leases, and allocation of cost to those assets and obligations. Also, the Board views the procedures suggested as contrary to Statement No. 13 [section 4053]. Paragraph .08 below describes the basis for classification of a lease under Statement No. 13 [section 4053].

.08 Paragraph 7 of *FASB Statement No. 13* [section 4053.007] states that "the criteria for classifying leases set forth in this paragraph and in paragraph 8 derive from the concept set forth in paragraph 60." Paragraph 60 of Statement No. 13 [section 4053.060] describes the underlying concept as follows:

> The provisions of this Statement derive from the view that a *lease that transfers* substantially all of the benefits and risks incident to the ownership of property should be accounted for as the acquisition of an asset and the incurrence of an obligation by the lessee and as a sale or financing by the lessor. All other leases should be accounted for as operating leases. . . . [Emphasis added.]

Statement No. 13 [section 4053] requires that the classification of a lease (an agreement between a lessee and a lessor) be determined at the inception of *the lease.* Once that determination is made, the classification of the lease is not reexamined unless either (a) both parties to the lease agree to a revision that would have resulted in a different classification of the lease had the changed terms been in effect at the inception of the lease or (b) the lease is extended or renewed. Paragraphs 36-40 of Statement No. 13 [section 4053.036-.040] apply similar procedures with respect to classification to the parties affected by a sublease, as follows:

a. *The original lessor* retains the classification of the original lease unless it is replaced by a new agreement.

b. *The original lessee* retains the original classification of the original lease unless the original lessee is relieved of the primary obligation. (If the lessee is relieved of the primary obligation, the original lessor will have agreed to a revision.)

c. *The new lessee* has agreed to the terms of a lease, either with the original lessee (in effect, a sublease) or with the original lessor (a new lease). Accordingly, the new lessee is required to classify the new lease at the date of the new agreement.

Statement No. 13 [section 4053] applies the same rationale to an enterprise that purchases the lessor's interest in an existing lease from the original lessor. The Statement does not permit an enterprise that purchases property from a lessor while the property is leased to a third party lessee to classify the acquired lease as a new lease at the acquisition date. The lessee is not a party to the transaction and the original lessor ceases to be a party to the lease; thus, there has been no new agreement between a lessee and a lessor and the purchase date is not the inception of a new lease requiring classification at that date. The Board views the substance of a business combination that is accounted for under the purchase method to be the purchase of the lessor's or lessee's interest in an existing lease. The original lessor or lessee does not become a party to a new agreement; accordingly, there is no new agreement to be classified, and Statement No. 13 [section 4053] does not permit reclassification of the existing lease unless the provisions of the lease are modified. The Board is aware that the identity of a party to a lease may change in a business combination and that the lease may be modified to reflect that change. If the provisions of the lease are not changed (see paragraph .03 above), the modification does not represent a new agreement

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

between the lessee and lessor in substance, and the lease should not be reclassified.

.09 Some respondents suggested that the Board expand the scope of this Interpretation to address asset acquisitions that are not business combinations. As explained in paragraph .08 above, the Board believes that *FASB Statement No. 13* [section 4053] provides adequate guidance for those transactions.

.10 Some enterprises have already applied the provisions of *FASB Statement No. 13* [section 4053] retroactively and have published financial statements based on the retroactively adjusted accounts. The Exposure Draft proposed that those enterprises would be permitted, but not required, to apply the provisions of this Interpretation retroactively. Some respondents' comments indicated that they interpreted the reference to "published financial statements" in the Exposure Draft to include financial summaries of interim results. The Board had intended the reference to "published financial statements" to exclude those summaries. Upon further consideration, the Board modified the wording of paragraph .18 to "published *annual* financial statements."

.11 This Interpretation applies to the accounting for leases by combined enterprises at the date of and subsequent to a business combination.

INTERPRETATION

Summary

.12 The classification of a lease in accordance with the criteria of *FASB Statement No. 13* [section 4053] shall not be changed as a result of a business combination unless the provisions of the lease are modified. (See paragraph .13.)

Changes in the Provisions of the Lease

.13 If in connection with a business combination, whether accounted for by the purchase method or by the pooling of interests method, the provisions of a lease are modified in a way that would require the revised agreement to be considered a new agreement under paragraph 9 of *FASB Statement No. 13* [section 4053.009], the new lease shall be classified by the combined enterprise according to the criteria set forth in Statement No. 13 [section 4053], based on conditions as of the date of the modification of the lease.

Application of Section 4053 in a Pooling of Interests

.14 In a business combination that is accounted for by the pooling of interests method, each lease shall retain its previous

classification under *FASB Statement No. 13* [section 4053] unless the provisions of the lease are modified as indicated in paragraph .13 above and shall be accounted for by the combined enterprise in the same manner that it would have been classified and accounted for by the combining enterprise.

Application of Section 4053 in a Purchase Combination

.15 In a business combination that is accounted for by the purchase method, the acquiring enterprise shall retain the previous classification in accordance with *FASB Statement No. 13* [section 4053] for the leases of an acquired enterprise unless the provisions of the lease are modified as indicated in paragraph .13 above.[2] The amounts assigned to individual assets acquired and liabilities assumed at the date of the combination shall be determined in accordance with the general guides for that type of asset or liability in paragraph 88 of *APB Opinion No. 16* [section 1091.88]. Subsequent to the recording of the amounts called for by Opinion No. 16 [section 1091], the leases shall thereafter be accounted for in accordance with Statement No. 13 [section 4053].[3] Paragraph .16 below explains the application of this paragraph to a leveraged lease by an enterprise that acquires a lessor.

.16 In a business combination that is accounted for by the purchase method, the acquiring enterprise shall apply the following procedures to the acquired enterprise's investment as a lessor in a leveraged lease. The acquiring enterprise shall retain the classification of a leveraged lease at the date of the combination. The acquiring enterprise shall assign an amount to the acquired net investment in the leveraged lease in accordance with the general guides in paragraph 88 of *APB Opinion No. 16* [section 1091.88], based on the remaining future cash flows and giving appropriate recognition to the estimated future tax effects of those cash flows. Once determined, that net investment shall be broken down into its component parts, namely, net rentals receivable, estimated residual value, and unearned income including discount to adjust other components to present value. The acquiring enterprise thereafter shall account for that investment in a leveraged lease in ac-

---

[2] If the acquired enterprise has not applied *FASB Statement No. 13* [section 4053] retroactively at the date of the business combination, the acquiring enterprise shall classify the leases of the acquired enterprise as they would have been classified if the acquired enterprise had applied Statement No. 13 [section 4053] retroactively at that date.

[3] *FASB Statement No. 13* [section 4053] does not address the subsequent accounting for amounts recorded for favorable or unfavorable operating leases. Accordingly, present practice is not changed with respect to the amortization of those amounts.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

cordance with the provisions of *FASB Statement No. 13* [section 4053]. Appendix A illustrates the application of this paragraph.

.17 When an enterprise that has acquired another enterprise in a business combination accounted for by the purchase method prior to the effective date of this Interpretation applies the provisions of *FASB Statement No. 13* [section 4053] retroactively, leases acquired in the business combination shall be classified as they would have been classified if the acquired enterprise had applied Statement No. 13 [section 4053] retroactively at the date of the business combination. The amounts retroactively recorded for those leases shall be the amounts that would have been allocated under *APB Opinion No. 16* [section 1091] by the acquiring enterprise at the purchase date if the leases had been classified in accordance with the provisions of Statement No. 13 [section 4053] at that date. The following examples illustrate the application of this paragraph:

a. In the case of a lease for which the lessee's classification is changed by the retroactive application of Statement No. 13 [section 4053] from an operating lease to a capital lease, the favorable or unfavorable amount recorded under Opinion No. 16 [section 1091] at the date of the combination shall be restated to record an asset and a liability, each to be assigned an amount in accordance with Opinion No. 16 [section 1091]. The net of the restated asset and liability may equal the amount previously recorded for a favorable or unfavorable operating lease. However, if the net of the restated asset and liability differs from the amount that was originally recorded under Opinion No. 16 [section 1091] for that lease, the difference is a retroactive adjustment of the allocation of the cost of the acquired enterprise with an offsetting retroactive adjustment, usually to goodwill.

b. In the case of a lease for which the lessor's classification is changed by the retroactive application of Statement No. 13 [section 4053] from an operating lease to a direct financing lease, the carrying amount of the leased asset and any favorable or unfavorable amount recorded under Opinion No. 16 [section 1091] at the date of the combination shall be restated to record a net investment in the direct financing lease determined in accordance with Opinion No. 16 [section 1091] and consisting of the gross receivable, residual value, and unearned income. If the restated amount allocated to the net investment in the direct financing lease differs from the net amount that was originally recorded for that lease, the difference is a retro-

active adjustment of the allocation of the cost of the acquired enterprise with an offsetting retroactive adjustment, usually to goodwill.

Effective Date and Transition

.18 The provisions of this Interpretation shall be effective for business combinations that are initiated[4] on or after May 1, 1978. Earlier application is encouraged. In addition, the provisions of this Interpretation shall be applied retroactively at the same time and in the same manner as the provisions of *FASB Statement No. 13* [section 4053] are applied retroactively (see paragraphs 49 and 51 of Statement No. 13 [sections 4053.049 and 4053.051]). Enterprises that have already applied the provisions of Statement No. 13 [section 4053] retroactively and have published annual financial statements based on the retroactively adjusted accounts before the effective date of this Interpretation may, but are not required to, apply the provisions of this Interpretation retroactively.

The next page is 8449-11.

[4] See paragraph 46(a) of *APB Opinion No. 16* [section 1091.46(a)] for the definition of "initiated."

Appendix A

ILLUSTRATION OF THE ACCOUNTING FOR A LEVERAGED LEASE IN A PURCHASE COMBINATION

.19 This Appendix illustrates one way that a lessor's investment in a leveraged lease might be valued by the acquiring enterprise in a business combination accounted for by the purchase method and the subsequent accounting for the investment in accordance with *FASB Statement No. 13* [section 4053]. The elements of accounting and reporting illustrated for this example are as follows:

1. Leveraged lease example—terms and assumptions, Schedule 1
2. Acquiring enterprise's cash flow analysis by years, Schedule 2
3. Acquiring enterprise's valuation of investment in the leveraged lease, Schedule 3
4. Acquiring enterprise's allocation of annual cash flow to investment and income, Schedule 4
5. Journal entry for recording allocation of purchase price to net investment in the leveraged lease, Schedule 5
6. Journal entries for the year ending December 31, 1984 (year 10 of the lease), Schedule 6

SCHEDULE 1

Leveraged Lease Example
Term and Assumptions

Cost of leased asset (equipment)	$1,000,000
Lease term	15 years, dating from January 1, 1975
Lease rental payments	$90,000 per year (payable last day of each year)
Residual value	$200,000 estimated to be realized one year after lease termination
Financing:	
Equity investment by lessor	$400,000
Long-term nonrecourse debt	$600,000, bearing interest at 9% and repayable in annual installments (on last day of each year) of $74,435.30
Depreciation allowable to lessor for income tax purposes	Seven-year ADR life using double-declining-balance method for the first two years (with the half-year convention election applied in the first year) and sum-of-years digits method for remaining life, depreciated to $100,000 salvage value
Lessor's income tax rate (federal and state)	50.4% (assumed to continue in existence throughout the term of the lease)
Investment tax credit	10% of equipment cost or $100,000 (realized by the lessor on last day of first year of lease)
Initial direct costs	For simplicity, initial direct costs have not been included in the illustration.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

SCHEDULE 1 continued

Date of business combination	January 1, 1982
Tax status of business combination	Non-taxable transaction
Appropriate interest rate for valuing net-of-tax return on investment	4½%

SCHEDULE 2

Acquiring Enterprise's Cash Flow Analysis by Years

	1	2	3
Year	Gross lease rentals and residual value	Depreciation (for income tax purposes)	Loan interest payments
8	$ 90,000	—	$ 37,079
9	90,000	—	33,717
10	90,000	—	30,052
11	90,000	—	26,058
12	90,000	—	21,704
13	90,000	—	16,957
14	90,000	—	11,785
15	90,000	—	6,145
16	200,000	$100,000	—
Totals	$920,000	$100,000	$183,497

100,000	(50,400)	—	149,600
$636,503	$(320,797)	$411,988	$ 3,718

→ *The next page is 8449-17.* ←

SCHEDULE 3

Acquiring Enterprise's Valuation of Investment in the Leveraged Lease

Cash flow	Present value at 4½% net-of-tax rate
1. Rentals receivable (net of principal and interest on the nonrecourse debt) ($15,564.70 at the end of each year for 8 years)	$102,663
2. Estimated residual value ($200,000 realizable at the end of 9 years)	134,581
3. Future tax payments (various amounts payable over 9 years — see Schedule 2)	(253,489)
Net present value	$ (16,245)

SCHEDULE 4

Acquiring Enterprise's Allocation of Annual Cash Flow to Investment and Income

	1	2	3	4
		Annual Cash Flow		
Year	Net investment at beginning of year	Total from Schedule 2, col. 7	Allocated to investment	Allocated to income[1]
8	$ (16,245)	$ (11,108)	$(11,108)	—
9	(5,137)	(12,803)	(12,803)	—
10	7,666	(14,649)	(14,973)	$ 324
11	22,639	(16,663)	(17,621)	958
12	40,260	(18,857)	(20,561)	1,704
13	60,821	(21,248)	(23,822)	2,574
14	84,643	(23,856)	(27,439)	3,583
15	112,082	(26,698)	(31,443)	4,745
16	143,525	149,600	143,525	6,075
Totals		$ 3,718	$(16,245)	$19,963

[1] Lease income is recognized as 4.233% of the unrecovered investment at the beginning of each year in which the net investment is positive. The rate is that rate which when applied to the net investment in the years in which the net investment is positive will distribute the net income (net cash flow) to those years. The rate for allocation used in this Schedule is calculated by a trial and error process. The allocation is calculated based upon an initial estimate of the rate as a starting point. If the total thus allocated to income (column 4) differs under the estimated rate from the net cash flow (column 2 less column 3) the estimated rate is increased or decreased, as appropriate, to derive a revised allocation. This process is repeated until a rate is selected which develops a total amount allocated to income that is precisely equal to the net cash flow. As a practical matter, a computer program is used to calculate Schedule 4 under successive iterations until the correct rate is determined.

SCHEDULE 4 continued

5	6
Components of Income[2]	
Pretax income	Tax effect of pretax income
—	—
—	—
$ 5,530	$ (5,206)
16,353	(15,395)
29,087	(27,383)
43,937	(41,363)
61,160	(57,577)
80,995	(76,250)
103,698	(97,623)
$340,760	$(320,797)

[2] Each component is allocated among the years of positive net investment in proportion to the allocation of net income in column 4. Journal Entry 2 in Schedule 6 of this Appendix includes an example of this computation.

SCHEDULE 5

Illustrative Journal Entry for Recording Allocation of Purchase Price to Net Investment in the Leveraged Lease

Rentals receivable (Schedule 2, total of column 1 less residual value, less totals of columns 3 and 6)	$124,515	
Estimated residual value (Schedule 1)	200,000	
Purchase price allocation clearing account (Schedule 3, present value)	16,245	
Unearned and deferred income (Schedule 3, present value, less total of rentals receivable and estimated residual value)		$340,760

AC Section 4054

Accounting for Leases— Initial Direct Costs

an amendment of section 4053

[Source: FASB Statement No. 17.]

November 1977

INTRODUCTION AND BACKGROUND INFORMATION

.01 *FASB Statement No. 13* [section 4053], "Accounting for Leases," issued by the Board in November 1976, defined *initial direct costs* in paragraph 5(m) [section 4053.005(m)] as follows:

> Those incremental direct costs incurred by the lessor in negotiating and consummating leasing transactions (e. g., commissions and legal fees).

.02 Since issuance of *FASB Statement No. 13* [section 4053] the Board has received a number of requests to interpret the definition of *initial direct costs,* specifically to clarify the meaning of "incremental direct costs." On April 7, 1977, the Board submitted a proposed Interpretation of the definition to the members of the Financial Accounting Standards Advisory Council for comment. The proposed Interpretation stated that *direct* referred to those costs that are incurred in connection with specific leasing transactions and *incremental* limited such costs to those that vary directly with the number or dollar amount of leasing transactions, as distinct from ongoing, recurring expenses that ordinarily do not vary with the number or dollar amount of leasing transactions. Twenty-five letters of comment were received from Council members and from others representing businesses that would be affected by the Interpretation. Many respondents to the proposed Interpretation urged the Board to include in the definition of initial direct costs sales salaries and other costs that do not vary directly with specific leasing transactions but that do vary with the general level of leasing business acquired. The Board concluded that it should amend the definition of initial direct costs to encompass costs that are directly related to consummated leasing transactions and that vary either with specific

leasing transactions or with the general level of leasing business acquired.

.03 An Exposure Draft of a proposed Statement on "Accounting for Leases—Initial Direct Costs" was issued on August 8, 1977. The Board received 42 letters of comment in response to the Exposure Draft. Certain of those comments and the Board's consideration of them are discussed in paragraphs .04-.06 below.

.04 Some respondents recommended that the Board conform the accounting for initial direct costs of leases to the existing practices for other financing activities of finance companies; other respondents recommended that the Board conform the accounting for initial direct costs of leases to the existing practices for other financing activities of banks. The *AICPA Industry Audit Guide,* "Audits of Finance Companies," permits the use of any of three overall methods of recognizing finance income. All of the methods require that direct and indirect acquisition costs applicable to loans be charged to operations when incurred. Two of the methods require that an amount of deferred finance income equal to estimated acquisition costs be transferred to operations in the same period; such a transfer is prohibited under the other permitted method. Banks often charge all loan origination costs to expense without offsetting revenue recognition. Conforming the accounting for initial direct costs of leases to the accounting for initial direct costs of other financing activities of various types of enterprises would require alternative methods of accounting for similar leasing transactions. Still other respondents recommended that the Board permit the option of charging initial direct costs to expense without offsetting revenue recognition. The Board concluded that it should not prescribe alternative methods of accounting for similar leasing transactions.

.05 Some respondents to the Exposure Draft stated that the cost of identifying the portion of salespersons' salaries that relates to specific completed leasing transactions would be excessive. The Board believes that salespersons can estimate the portion of their time that results in completed leases and the portion spent in negotiations for leases that were not consummated and in other activities and that reasonable allocations of other costs can be made based on similar estimates. In some enterprises, the determinations can be made by periodic statistical samples. The Board believes that enterprises can perform the required allocations without excessive cost.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.06 Some respondents to the Exposure Draft asked if the Board intended that a provision for bad debts be included in initial direct costs. The Board does not intend that initial direct costs, as defined, include a provision for bad debts. Accounting for bad debts that are expected to result from leases and other financing activities is a pervasive issue that the Board did not address in *FASB Statement No. 13* [section 4053]. The Board has not studied that question and did not intend that Statement No. 13 [section 4053] would change existing practices in accounting for bad debts.

.07 The Board concluded that on the basis of existing data it could make an informed decision on the matter addressed in this Statement without a public hearing and that the effective date and transition prescribed in paragraph .09 are advisable.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Amendment to Section 4053

.08 Paragraph 5(m) of *FASB Statement No. 13* [section 4053.005(m)] is superseded by the following:

> *Initial direct costs.* Those costs incurred by the lessor that are directly associated with negotiating and consummating completed leasing transactions. Those costs include, but are not necessarily limited to, commissions, legal fees, costs of credit investigations, and costs of preparing and processing documents for new leases acquired. In addition, that portion of salespersons' compensation, other than commissions, and the compensation of other employees that is applicable to the time spent in the activities described above with respect to completed leasing transactions shall also be included in initial direct costs. That portion of salespersons' compensation and the compensation of other employees that is applicable to the time spent in negotiating leases that are not consummated shall not be included in initial direct costs. No portion of supervisory and administrative expenses or other indirect expenses, such as rent and facilities costs, shall be included in initial direct costs.

Effective Date and Transition

.09 The provisions of this amendment to *FASB Statement No. 13* [section 4053] shall be effective for leasing transactions and lease agreement revisions (see paragraph 9 of Statement No. 13 [section 4053.009]) entered into on or after January 1, 1978. Earlier application is encouraged. In addition, the provisions of this Statement shall be applied retroactively at the same time and in the same manner as the provisions of Statement No. 13 [section 4053] are applied retroactively (see paragraphs 49 and 51 of Statement No. 13 [sections 4053.049 and 4053.051]). Enterprises that have already applied the provisions of Statement No. 13 [section 4053] retroactively and have published financial statements based on the retroactively adjusted accounts before the effective date of this Statement may, but are not required to, apply the provisions of this Statement retroactively.

The provisions of this Statement need not be applied to immaterial items.

AC Section 4055

Changes in the Provisions of Lease Agreements Resulting from Refundings of Tax-Exempt Debt

an amendment of section 4053
[Source: FASB Statement No. 22.]

June 1978

INTRODUCTION AND BACKGROUND INFORMATION

.01 The FASB has been asked to reconcile an apparent inconsistency between *FASB Statement No. 13* [section 4053], "Accounting for Leases," and *APB Opinion No. 26* [section 5362], "Early Extinguishment of Debt," arising from refundings of tax-exempt debt, including advance refundings [1] that are accounted for as early extinguishments of debt. In some situations tax-exempt debt is issued to finance construction of a facility, such as a plant or hospital, that is transferred to a user of the facility by either lease or sale. A lease or, in the case of sale, a mortgage note generally serves as collateral for the guarantee of payments equivalent to those required to service the tax-exempt debt. Payments required by the terms of the lease or mortgage note are essentially the same, as to both amount and timing, as those required by the tax-exempt debt. In practice, a liability equivalent to the amount of the tax-exempt debt often has been included in the accounts of the lessee or the mortgagor. Some issuers of tax-exempt debt recently have entered into refundings and, concurrently, the terms of the related lease or mortgage note have been changed to conform with the terms of the refunding issue. If a refunding of tax-exempt debt results in a change in the provisions of a lease and the revised lease is classified as a capital lease by a lessee or a direct financing lease by a lessor, gain or loss is not recognized

[1] An advance refunding involves the issuance of new debt to replace existing debt with the proceeds from the new debt placed in trust or otherwise restricted to retire the existing debt at a determinable future date or dates. Descriptions of advance refundings that are and are not accounted for as early extinguishments of debt are presented in the AICPA Statement of Position on "Accounting for Advance Refundings of Tax-Exempt Debt."

under Statement No. 13 [section 4053] (see paragraphs 14(a) and 17(f)(i) [sections 4053.014(a) and 4053.017(f)(i)] of the Statement). If a refunding of tax-exempt debt results in a change in the terms of a mortgage note, any gain or loss arising from the transaction because of the change in the carrying amount of the debt would be recognized currently in accordance with the provisions of Opinion No. 26 [section 5362].

Lessee Accounting

.02 Paragraph 14(a) of *FASB Statement No. 13* [section 4053.014(a)] sets forth the accounting by a lessee for a change in the provisions, a renewal, or an extension of an existing lease if the revised lease agreement is classified as a capital lease as follows:

> If the provisions of the lease are changed in a way that changes the amount of the remaining minimum lease payments and the change either (i) does not give rise to a new agreement . . . or (ii) does give rise to a new agreement but such agreement is also classified as a capital lease, the present balances of the asset and the obligation shall be adjusted by an amount equal to the difference between the present value of the future minimum lease payments under the revised or new agreement and the present balance of the obligation. The present value of the future minimum lease payments under the revised or new agreement shall be computed using the rate of interest used to record the lease initially.

.03 In accounting for an early extinguishment of debt, paragraph 20 of *APB Opinion No. 26* [section 5362.20] requires that "a difference between the reacquisition price and the net carrying amount of the extinguished debt should be recognized currently in income of the period of extinguishment as losses or gains. . . ." In this regard, paragraph 8 of *FASB Statement No. 4* [section 2013.08], "Reporting Gains and Losses from Extinguishment of Debt," requires that "gains and losses from extinguishment of debt that are included in the determination of net income shall be aggregated and, if material, . . . classified as an extraordinary item, net of related income tax effect."

.04 If a refunding of tax-exempt debt results in a change in the provisions of a capital lease that passes the perceived economic advantages of the refunding through to the lessee, paragraph 14(a) of *FASB Statement No. 13* [section 4053.014(a)] requires the lessee to adjust both the asset and related obligation for any difference caused by a change in the provisions of a lease. If the perceived economic advantages of the same refunding had been passed through by a change in the terms of a mortgage note, the accounting specified by *APB Opinion No. 26* [section 5362] would result in the recognition of a gain or loss.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

.05 The Board considered the possibility of amending *APB Opinion No. 26* [section 5362] to defer recognition of gain or loss. That would not completely eliminate the inconsistency unless the gain or loss were included as an adjustment to the cost of the related property, because *FASB Statement No. 13* [section 4053] specifies that any difference resulting from a change in the provisions of a capital lease should be accounted for as an adjustment of the leased asset. In the interest of a timely resolution of the conflict, the Board decided that paragraph 14 of Statement No. 13 [section 4053.014] should be amended so that the accounting will be compatible with that specified by Opinion No. 26 [section 5362].

Lessor Accounting

.06 Paragraph 17(f)(i) of *FASB Statement No. 13* [section 4053.017(f)(i)] specifies the accounting by a lessor for a change in the provisions, a renewal, or an extension of an existing lease if the revised lease agreement is classified as a direct financing lease as follows:

> If the provisions of a lease are changed in a way that changes the amount of the remaining minimum lease payments and the change either (a) does not give rise to a new agreement . . . or (b) does give rise to a new agreement but such agreement is classified as a direct financing lease, the balance of the minimum lease payments receivable and the estimated residual value, if affected, shall be adjusted to reflect the change . . . and the net adjustment shall be charged or credited to unearned income.

.07 If a refunding of tax-exempt debt results in a change in the provisions of a lease that passes the perceived economic advantages of the refunding through to the lessee and the revised agreement is classified as a direct financing lease, paragraphs 18(c) and 17(f)(i) of *FASB Statement No. 13* [sections 4053.018(c) and 4053.017(f)(i)] require the lessor to adjust the balance of the minimum lease payments receivable and unearned income. The lessor, on the other hand, would look to *APB Opinion No. 26* [section 5362] for guidance in accounting for a refunding. That Opinion requires recognition of a gain or loss concurrent with early extinguishments of debt. The Board has concluded that the accounting for changes in the provisions of a lease in connection with a refunding of tax-exempt debt should be compatible with the accounting for the refunding of the debt itself. The Board has, therefore, decided to amend paragraph 17(f) of Statement No. 13 [section 4053.017(f)] so that any gain or loss resulting from a change in the provisions of a lease agreement in con-

nection with a refunding of tax-exempt debt is recognized when the tax-exempt debt is considered to have been extinguished.

Other Matters

.08 An Exposure Draft of a proposed Statement on "Accounting for Leases: Changes in the Provisions of Lease Agreements Resulting from Refundings of Tax-Exempt Debt" was issued on December 19, 1977. The Board received 26 letters of comment in response to the Exposure Draft, most of which expressed general agreement.

.09 Several respondents recommended that the final Statement should apply to all types of refundings and not be limited to refundings involving only tax-exempt debt. The Board noted that, typically, lessors in tax-exempt debt refundings are governmental or quasi-governmental agencies that are not affected by state or federal income tax regulations. For the most part, the governmental lessor's borrowing serves only to obtain necessary financing for the construction of the leased facilities. Refundings that do not involve tax-exempt debt may involve considerations beyond those normally present in the lessor/lessee relationship discussed above. The Board considered these recommendations and concluded that further consideration of the subject of refundings should not delay the issuance of this Statement.

.10 The Board has concluded that on the basis of existing information it can reach an informed decision without a public hearing, and the effective date and transition specified in paragraph .16 are advisable in the circumstances.

.11 The addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'," states that "differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect in regulated businesses of the rate-making process" and discusses the application of generally accepted accounting principles to regulated industries. Accordingly, the provisions of the Addendum shall govern the application of this Statement to those operations of a company that are regulated for rate-making purposes on an individual-company-cost-of-service basis.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

.12 If prior to the expiration of the lease term a change in the provisions of a lease results from a refunding by the lessor

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

of tax-exempt debt, including an advance refunding,[2] in which the perceived economic advantages of the refunding are passed through to the lessee and the revised agreement is classified as a capital lease by the lessee or a direct financing lease by the lessor, the change shall be accounted for as follows:

a. Lessee accounting:

  i. If a change in the provisions of a lease results from a refunding by the lessor of tax-exempt debt, including an advance refunding that is accounted for as an early extinguishment of debt, the lessee shall adjust the lease obligation to the present value of the future minimum lease payments under the revised lease using the effective interest rate applicable to the revised agreement and shall recognize any resulting gain or loss currently as a gain or loss on early extinguishment of debt. Any gain or loss so determined shall be classified in accordance with *FASB Statement No. 4* [section 2013].

  ii. If the provisions of a lease are changed in connection with an advance refunding by the lessor of tax-exempt debt that is not accounted for as an early extinguishment of debt at the date of the advance refunding and the lessee is obligated to reimburse the lessor for any costs related to the debt to be refunded that have been or will be incurred, such as unamortized discount or issue costs or a call premium, the lessee shall accrue those costs by the "interest" method [3] over the period from the date of the advance refunding to the call date of the debt to be refunded.

b. Lessor accounting: [4]

  i. If a change in the provisions of a lease results from a refunding of tax-exempt debt, including an advance refunding that is accounted for as an early extinguishment of debt, the lessor shall adjust the balance of the minimum lease payments receivable and the estimated residual value, if affected (i. e., the gross investment in the lease) in accordance with the requirements of para-

---

[2] See footnote 1.
[3] See paragraph 12 of *FASB Statement No. 13* [section 4053.012] and footnote 11 thereto.
[4] This paragraph prescribes the accounting for a direct financing lease by governmental units that classify and account for leases of that kind.

graphs 18(c) and 17(f)(i) of *FASB Statement No. 13* [sections 4053.018(c) and 4053.017(f)(i)]. The adjustment of unearned income shall be the amount required to adjust the net investment in the lease to the sum of the present values of the two components of the gross investment based on the interest rate applicable to the revised lease agreement. The combined adjustment resulting from applying the two preceding sentences shall be recognized as a gain or loss in the current period.

ii. If a change in the provisions of a lease results from an advance refunding that is not accounted for as an early extinguishment of debt at the date of the advance refunding, the lessor shall systematically recognize, as revenue, any reimbursements to be received from the lessee for costs related to the debt to be refunded, such as unamortized discount or issue costs or a call premium, over the period from the date of the advance refunding to the call date of the debt to be refunded.

.13 The accounting prescribed in subparagraphs .12(a)(i) and .12(b)(i) for a refunding of tax-exempt debt is illustrated in Appendix A.

Amendments to Section 4053

.14 The introduction to paragraph 14 of *FASB Statement No. 13* [section 4053.014] is amended to read as follows:

> Except for a change in the provisions of a lease that results from a refunding by the lessor of tax-exempt debt, including an advance refunding, in which the perceived economic advantages of the refunding are passed through to the lessee by a change in the provisions of the lease agreement and the revised agreement is classified as a capital lease (see *FASB Statement No. 22* [section 4055]), a change in the provisions of a lease, a renewal or extension [14] of an existing lease, and a termination of a lease prior to the expiration of the lease term shall be accounted for as follows:

.15 The introduction to paragraph 17(f) of *FASB Statement No. 13* [section 4053.017(f)] is amended to read as follows:

> Except for a change in the provisions of a lease that results from a refunding by the lessor of tax-exempt debt, including an advance refunding, in which the perceived economic advantages of the refunding are passed through to the lessee by a change in the provisions of the lease agreement and the revised agreement is classified as a direct financing lease (see *FASB Statement No. 22* [section 4055]), a change in the provisions of a lease, a renewal or extension [19] of an existing lease, and a termination of a lease prior to the expiration of the lease term shall be accounted for as follows:

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Effective Date and Transition

.16 This Statement shall be effective for lease agreement revisions entered into on or after July 1, 1978. Earlier application is encouraged. In addition, the provisions of this Statement shall be applied retroactively at the same time and in the same manner as the provisions of *FASB Statement No. 13* [section 4053] are applied retroactively (see paragraphs 49 and 51 of Statement No. 13 [sections 4053.049 and 4053.051]). Enterprises that have already applied the provisions of Statement No. 13 [section 4053] retroactively and have published annual financial statements based on the retroactively adjusted accounts before the effective date of this Statement may, but are not required to, apply the provisions of this Statement retroactively.

The provisions of this Statement need not be applied to immaterial items.

The next page is 8457.

Appendix A

ILLUSTRATION OF LESSOR AND LESSEE ACCOUNTING REQUIRED BY PARAGRAPH .12 OF THIS STATEMENT

.17 The following example illustrates the application of the requirements of subparagraphs .12(a)(i) and .12(b)(i) of this Statement when a refunding of tax-exempt debt results in a change in the provisions of a lease agreement and the revised lease is classified as a direct financing lease by the lessor and as a capital lease by the lessee.

Computation Information

The following table summarizes the total debt service requirements of the serial obligation to be refunded and of the refunding obligation. It is presumed that the perceived economic advantages of the refunding results from the lower interest rate applicable to the refunding obligation. The resulting reduction in total debt service requirements will be passed through to the lessee by changing the terms of the related lease to conform with the debt service requirements of the refunding obligation. All costs that have been or that will be incurred by the lessor in connection with the refunding transaction will be passed through to the lessee.

Fifteen Year Serial Debt Service Requirements ($000 omitted):

Obligation to Be Refunded			Refunding Obligation*			
Face Amount	Interest 7%	Total	Face Amount	Interest 5%	Total	Difference
$50,000	$32,300	$82,300	$52,000	$23,150	$75,150	$7,150

* The face amount of the refunding obligation ($52,000,000) is equal to the face amount of the obligation to be refunded ($50,000,000) plus the redemption premium applicable to the obligation to be refunded ($1,500,000) and the costs of issuance ($500,000).

LESSOR ACCOUNTING

Computation of Required Adjustments to Reflect Changes in the Terms of a Lease Resulting from a Refunding of Tax-Exempt Debt

Adjustment to Balance of Minimum Lease Payments Receivable:

Present balance of minimum lease payments receivable (equal to debt service requirements of obligation to be refunded)	$82,300,000
Minimum lease payments receivable under revised agreement (equal to debt service requirements of refunding obligation)	75,150,000
Adjustment to reflect reduction in minimum lease payments receivable	$ 7,150,000

Adjustment to Unearned Income:

Change in the sum of the present value of the two components of the gross investment using the interest rate applicable to each agreement	$ 2,000,000
Change in the balance of minimum lease payments receivable	7,150,000
Adjustment to reflect reduction in balance of unearned income	$ 9,150,000

Summary of Adjustments ($000 omitted):

	Minimum Lease Payments Receivable	Unearned Income	Net Investment
Balance before Refunding	$82,300	$32,300	$50,000
Adjustment	(7,150)	(9,150)	2,000
Balance after Refunding	$75,150	$23,150	$52,000

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Journal Entries to Record the Refunding and the Changes in the Terms of the Lease Resulting from the Refunding of Tax-Exempt Debt

Recoverable deferred issue costs	500,000	
Loss resulting from refunding of tax-exempt debt	1,500,000	
7% Outstanding obligation	50,000,000	
5% Refunding obligation		52,000,000

To record loss from refunding $50,000,000 - 7% obligation with $52,000,000 - 5% refunding obligation in accordance with the provisions of *APB Opinion No. 26*

Unearned income	9,150,000	
Minimum lease payments receivable		7,150,000
Gain resulting from adjustment of lease terms		1,500,000
Recoverable deferred issue costs		500,000

To adjust unearned income by the amount required to adjust the net investment in the lease to the sum of the present values of the two components of the gross investment based on the interest rate applicable to the revised lease agreement in accordance with *FASB Statement No. 22.*

LESSEE ACCOUNTING

Computation of Required Adjustment to Lease Obligation to Reflect Changes in the Terms of the Lease Resulting from a Refunding of Tax-Exempt Debt

Adjustment to Balance of Lease Obligation:

Present balance of lease obligation under original agreement	$50,000,000
Present value of future minimum lease payments under revised agreement	51,500,000
Adjustment to lease obligation	$ 1,500,000

Journal Entry to Record Adjustment to Lease Obligation Resulting from a Refunding of Tax-Exempt Debt

Loss resulting from revision to lease agreement	1,500,000	
Obligation under capital lease		1,500,000

To record the loss resulting from changes in the lease terms resulting from a refunding of tax-exempt debt. For purposes of calculating the present value of the future minimum lease payments, deferred issue costs were considered as additional interest in determining the effective interest rate applicable to the revised agreement. (The loss shall be classified in accordance with *FASB Statement No. 4.*)

AC Section 4061

Compensation Involved in Stock Option and Stock Purchase Plans

[Source: ARB No. 43, Chap. 13B, as amended.]

Issue date, unless otherwise indicated: June, 1953[1]

.01 The practice of granting to officers and other employees options to purchase or rights to subscribe for shares of a corporation's capital stock has been followed by a considerable number of corporations over a period of many years. To the extent that such options and rights involve a measurable amount of compensation, this cost of services received should be accounted for as such. The amount of compensation involved may be substantial and omission of such costs from the corporation's accounting may result in overstatement of net income to a significant degree. Accordingly, consideration is given herein to the accounting treatment of compensation represented by stock options or purchase rights granted to officers and other employees.[1]

.02 For convenience, this section will discuss primarily the problems of compensation raised by stock option plans. However, the committee feels that substantially the same problems may be encountered in connection with stock purchase plans made available to employees, and the discussion below is applicable to such plans also.

[1] Bulletin 37, "Accounting for Compensation in the Form of Stock Options," was issued in November, 1948. Issuance of a revised bulletin in 1953 and its expansion to include stock purchase plans were prompted by the very considerable increase in the use of certain types of option and purchase plans following the enactment in 1950 of Section 130A of the Internal Revenue Code. This section granted specialized tax treatment to employee stock options if certain requirements were met as to the terms of the option, as to the circumstances under which the option was granted and could be exercised and as to the holding and disposal of the stock acquired thereunder. In general, the effect of Section 130A was to eliminate or minimize the amount of income taxable to the employee as compensation and to deny to the issuing corporation any tax deduction in respect of such restricted options. In 1951, Federal Salary Stabilization Board issued rules and regulations relating to stock options and purchase rights granted to employees whereby options generally comparable in nature to the restricted stock options specified in Section 130A might be considered for its purposes not to involve compensation, or to involve compensation only in limited amounts. [Ed. note: changed to past tense.]

RIGHTS INVOLVING COMPENSATION

.03 Stock options involving an element of compensation usually arise out of an offer or agreement by an employer corporation to issue shares of its capital stock to one or more officers or other employees (hereinafter referred to as grantees) at a stated price. The grantees are accorded the right to require issuance of the shares either at a specified time or during some determinable period. In some cases the grantee's options are exercisable only if at the time of exercise certain conditions exist, such as that the grantee is then or until a specified date has been an employee. In other cases, the grantees may have undertaken certain obligations, such as to remain in the employment of the corporation for at least a specified period, or to take the shares only for investment purposes and not for resale.

RIGHTS NOT INVOLVING COMPENSATION [2]

.04 Stock option plans in many cases may be intended not primarily as a special form of compensation but rather as an important means of raising capital, or as an inducement to obtain greater or more widespread ownership of the corporation's stock among its officers and other employees. In general, the terms under which such options are granted, including any conditions as to exercise of the options or disposal of the stock acquired, are the most significant evidence ordinarily available as to the nature and purpose of a particular stock option or stock option plan. In practice, it is often apparent that a particular option or plan involves elements of two or more of the above purposes. Where the inducements are not larger per share than would reasonably be required in an offer of shares to all shareholders for the purpose of raising an equivalent amount of capital, no compensation need be presumed to be involved.

.05 Stock purchase plans also are frequently an integral part of a corporation's program to secure equity capital or to obtain widespread ownership among employees, or both. In such cases, no element of compensation need be considered to be present if the purchase price is not

[2] Four essential characteristics of a noncompensatory plan are described in section 4062.07.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

lower than is reasonably required to interest employees generally or to secure the contemplated funds.

TIME OF MEASUREMENT OF COMPENSATION

.06 In the case of stock options involving compensation, the principal problem is the measurement of the compensation. This problem involves selection of the date as of which measurement of any element of compensation is to be made and the manner of measurement. The date as of which measurement is made is of critical importance since the fair value of the shares under option may vary materially in the often extended period during which the option is outstanding. There may be at least six dates to be considered for this purpose: (a) the date of the adoption of an option plan, (b) the date on which an option is granted to a specific individual, (c) the date on which the grantee has performed any conditions precedent to exercise of the option, (d) the date on which the grantee may first exercise the option, (e) the date on which the option is exercised by the grantee, and (f) the date on which the grantee disposes of the stock acquired.

.07 Of the six dates mentioned two are not relevant to the question considered in this section—cost to the corporation which is granting the option. The date of adoption of an option plan clearly has no relevance, inasmuch as the plan per se constitutes no more than a proposed course of action which is ineffective until options are granted thereunder. The date on which a grantee disposes of the shares acquired under an option is equally immaterial since this date will depend on the desires of the individual as a shareholder and bears no necessary relation to the services performed.[3]

.08 The date on which the option is exercised has been advocated as the date on which a cost may be said to have been incurred. Use of this date is supported by the argument that only then will it be known whether or not the option will be exercised. However, beginning with the time at which the grantee may first exercise the op-

---

[3] This was the date on which income or gain taxable to the grantee might arise under Section 130A. Use of this date for tax purposes was doubtless based on considerations as to the ability of the optionee to pay taxes prior to sale of the shares. [Ed. note: changed to past tense.]

tion he is in effect speculating for his own account. His delay has no discernible relation to his status as an employee but reflects only his judgment as an investor.

.09 The date on which the grantee may first exercise the option will generally coincide with, but in some cases may follow, the date on which the grantee will have performed any conditions precedent to exercise of the option. Accordingly this date presents no special problems differing from those to be discussed in the next paragraph.

.10 There remain to be considered the date on which an option is granted to a specific individual and the date on which the grantee has fulfilled any conditions precedent to exercise of the option. When compensation is paid in a form other than cash the *amount* of compensation is ordinarily determined by the fair value of the property which was agreed to be given in exchange for the services to be rendered. The time at which such fair value is to be determined may be subject to some difference of opinion but it appears that the date on which an option is granted to a specific individual would be the appropriate point at which to evaluate the cost to the employer, since it was the value at that date which the employer may be presumed to have had in mind. In most of the cases under discussion, moreover, the only important contingency involved is the continuance of the grantee in the employment of the corporation, a matter very largely within the control of the grantee and usually the main objective of the grantor. Under such circumstances it may be assumed that if the stock option were granted as a part of an employment contract, both parties had in mind a valuation of the option at the date of the contract; and accordingly, value at that date should be used as the amount to be accounted for as compensation. If the option were granted as a form of supplementary compensation otherwise than as an integral part of an employment contract, the grantor is nevertheless governed in determining the option price and the number of shares by conditions then existing. It follows that it is the value of the option at that time, rather than the grantee's ultimate gain or loss on the transaction, which for accounting purposes constitutes whatever compensation the grantor intends to pay. The committee

 © 1974, American Institute of Certified Public Accountants, Inc.

therefore concludes that in most cases, including situations where the right to exercise is conditional upon continued employment, valuation should be made of the option as of the date of grant.

.11 The date of grant also represents the date on which the corporation foregoes the principal alternative use of the shares which it places subject to option, i.e., the sale of such shares at the then prevailing market price. Viewed in this light, the *cost* of utilizing the shares for purposes of the option plan can best be measured in relation to what could then have been obtained through sale of such shares in the open market. However, the fact that the grantor might, as events turned out, have obtained at some later date either more or less for the shares in question than at the date of the grant does not bear upon the measurement of the compensation which can be said to have been in contemplation of the parties at the date the option was granted.[4]

MANNER OF MEASUREMENT

.12 Freely exercisable option rights, even at prices above the current market price of the shares, have been traded in the public markets for many years, but there is no such objective means for measuring the value of an option which is not transferable and is subject to such other restrictions as are usually present in options of the nature here under discussion. Although there is, from the standpoint of the grantee, a value inherent in a restricted future right to purchase shares at a price at or even above the fair value of shares at the grant date, the committee believes it is impracticable to measure any such value. As to the grantee any positive element may, for practical purposes, be deemed to be largely or wholly offset by the negative effect of the restrictions ordinarily present in options of the type under discussion. From the viewpoint of the grantor corporation no measurable cost can be said to have been incurred because it could not at the grant date have realized more than the *fair value* of the optioned shares, the concept of fair value as here used encompassing the possibility and prospect of future developments. On the other hand, it follows in the opinion of the committee that

[4] Also see section 4062.10b for the definition of the *measurement date*.

the value to the grantee and the related cost to the corporation of a restricted right to purchase shares at a price *below* the fair value of the shares at the grant date may for the purposes here under discussion be taken as the excess of the then fair value of the shares over the option price.[5]

.13 While market quotations of shares are an important and often a principal factor in determining the fair value of shares, market quotations at a given date are not necessarily conclusive evidence.[6] Where significant market quotations cannot be obtained, other recognized methods of valuation have to be used. Furthermore, in determining the fair value [7] of shares for the purpose of measuring the cost incurred by a corporation in the issuance of an option, it is appropriate to take into consideration such modifying factors as the range of quotations over a reasonable period and the fact that the corporation by selling shares pursuant to an option may avoid some or all of the expenses otherwise incurred in a sale of shares. The absence of a ready market, as in the case of shares of closely-held corporations, should also be taken into account and may require the use of other means of arriving at fair value than by reference to an occasional market quotation or sale of the security.[8]

OTHER CONSIDERATIONS

.14 If the period for which payment for services is being made by the issuance of the stock option is not specifically indicated in the offer or agreement, the value of the option should be apportioned over the period of service for which the payment of the compensation seems appropriate in the existing circumstances. Accrual of the compensation over the period selected should be made by means of charges against the income account.[9] Upon exer-

---

[5] Section 4062.10 states that "Compensation for services that a corporation receives as consideration for stock issued through employee stock option, purchase, and award plans should be measured by the quoted market price of the stock at the measurement date less the amount, if any, that the employee is required to pay." [As amended by APB Opinion No. 25, effective after December 31, 1972.]

[6] Whether treasury or unissued shares are to be used to fulfill the obligation is not material to a determination of value. (However, see section 4062.11a.)

[7] See section 4062.10 in which *quoted market price* is substituted for *fair value*.

[8] See section 4062.10a.

[9] See sections 4062.12-.15.

 © 1974, American Institute of Certified Public Accountants, Inc.

cise of an option the sum of the cash received and the amount of the charge to income should be accounted for as the consideration received on issuance of the stock.

.15 In connection with financial statements, disclosure should be made as to the status of the option or plan at the end of the period of report, including the number of shares under option, the option price, and the number of shares as to which options were exercisable. As to options exercised during the period, disclosure should be made of the number of shares involved and the option price thereof.

AC Section 4062

Accounting for Stock Issued to Employees

[Source: APB Opinion No. 25.]

Effective for all stock option, purchase, award, and bonus rights granted after December 31, 1972, unless otherwise indicated [1]

INTRODUCTION

Scope of Section

.01 Many corporations have adopted various plans, contracts, and agreements to compensate officers and other employees by issuing to them stock of the employer corporation. Under traditional stock option and stock purchase plans an employer corporation grants options to purchase a fixed number of shares of stock of the corporation at a stated price during a specified period or grants rights to purchase shares of stock of the corporation at a stated price, often at a discount from the market price of the stock at the date the rights are granted. Stock options and purchase rights are normally granted for future services of employees. Section 4061, *Compensation Involved in Stock Option and Stock Purchase Plans* (1953), contains the principles of accounting for those plans.

.02 Among traditional plans not described in section 4061 are plans in which an employer corporation awards to employees shares of stock of the corporation for current or future services. Some corporations have replaced or supplemented traditional plans with more complex plans, contracts, and agreements for issuing stock. An arrangement may be based on variable factors that depend on future events; for example, a corporation may award a variable number of shares of stock or may grant a stock option with a variable option price. Other arrangements combine the characteristics of two or more types of plans, and some give an employee an election.

---

[1] See paragraph .20.

.03 Accounting for employee services received as consideration for stock issued is included in Accounting Research Study No. 15, *Stockholders' Equity.*[2]

.04 This section deals with some aspects of accounting for stock issued to employees through both noncompensatory and compensatory plans (a plan is any arrangement to issue stock to officers and employees, as a group or individually). Section 4061 remains in effect for traditional stock option and stock purchase plans except that the measure of compensation is redefined in this section. This section recognizes certain practices that evolved after section 4061 was adopted and applies the principles of that section to other plans in which the number of shares of stock that may be acquired by or awarded to an employee and the option or purchase price, if any, are known or determinable at the date of grant or award. It also specifies the accounting for (a) plans in which either the number of shares of stock or the option or purchase price depends on future events and (b) income tax benefits related to stock issued to employees through stock option, purchase, and award plans. Section 4062A illustrates measuring and accounting for compensation under typical plans.

Differing Views

.05 Some accountants believe that compensation cost for all compensatory plans should be recorded at the date of grant or not later than the date of exercise. They believe that past experience and outside evidence of values can overcome difficulties in measuring compensation. Other accountants believe that compensation need not be recorded if an employee pays an amount that is at least equal to the market price of the stock at the date of grant and that problems in accounting for compensation plans pertain to plans in which the number of shares of stock or the option or purchase price cannot be determined until after the date of grant or award. Still other accountants, although they agree in principle with the first group, believe that progress will result from specifying the accounting for plans with variable factors but leaving section 4061 in effect with modifications while the entire topic of accounting for compensation involving stock is studied.

---

[2] Accounting research studies are not pronouncements of the Board or of the Institute but are published for the purpose of stimulating discussion on important accounting matters.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.06 Some accountants believe that a tax benefit attributable to compensation that is deductible in computing taxable income but is not recorded as an expense of any period results from a permanent difference. The benefit should therefore be recorded under section 4091.32-.33, *Accounting for Income Taxes*, as a reduction of income tax expense for the period that the benefit is received. Other accountants believe that the tax benefit results from issuing stock and should be accounted for as an adjustment of capital in addition to par or stated value of capital stock in accordance with section 4091.51.

OPINION

Noncompensatory Plans

.07 Sections 4061.04-.05 describe stock option and stock purchase plans that may not be intended primarily to compensate employees. An employer corporation recognizes no compensation for services in computing consideration received for stock that is issued through noncompensatory plans. The Board concludes that at least four characteristics are essential in a noncompensatory plan: (a) substantially all full-time employees meeting limited employment qualifications may participate (employees owning a specified percent of the outstanding stock and executives may be excluded), (b) stock is offered to eligible employees equally or based on a uniform percentage of salary or wages (the plan may limit the number of shares of stock that an employee may purchase through the plan), (c) the time permitted for exercise of an option or purchase right is limited to a reasonable period, and (d) the discount from the market price of the stock is no greater than would be reasonable in an offer of stock to stockholders or others. An example of a noncompensatory plan is the "statutory" employee stock purchase plan that qualifies under Section 423 of the Internal Revenue Code.

Compensatory Plans

.08 Plans that do not possess the four characteristics of noncompensatory plans are classified as compensatory plans. Since the major principles of section 4061 are not

changed, classification as a compensatory plan does not necessarily require that compensation cost be recognized.[3]

.09 *Services as Consideration for Stock Issued.* The consideration that a corporation receives for stock issued through a stock option, purchase, or award plan consists of cash or other assets, if any, plus services received from the employee.

.10 *Measuring Compensation for Services.* Compensation for services that a corporation receives as consideration for stock issued through employee stock option, purchase, and award plans should be measured by the quoted market price of the stock at the measurement date less the amount, if any, that the employee is required to pay. That is the principle in section 4061 with two modifications: (a) the meaning of fair value of stock for compensatory plans is narrowed and (b) the measurement date for plans with a variable number of shares of stock or a variable option or purchase price is different.

a. *Quoted market price* is substituted for *fair value.* The Board acknowledges the conclusion in section 4061 that "market quotations at a given date are not necessarily conclusive evidence" of fair value of shares of stock but concludes that, for purposes of this section, the unadjusted quoted market price of a share of stock of the same class that trades freely in an established market should be used in measuring compensation. An employee's right to acquire or receive shares of stock is presumed to have a value and that value stems basically from the value of the stock to be received under the right. However, the value of the right is also affected by various other factors, some of which tend to diminish its value and some of which tend to enhance it. Those opposing factors include a known future purchase price (or no payment), restrictions on the employee's right to receive stock, absence of commissions on acquisition, different risks as compared

[3] All compensation arrangements involving stock, regardless of the name given, should be accounted for according to their substance. For example, an arrangement in which the consideration for stock issued to an employee is a nonrecourse note secured by the stock issued may be in substance the same as the grant of a stock option and should be accounted for accordingly. The note should be classified as a reduction of stockholders' equity rather than as an asset.

 © 1974, American Institute of Certified Public Accountants, Inc.

with those of a stockholder, tax consequences to the employee, and restrictions on the employee's ability to transfer stock issued under the right. The effects of the opposing factors are difficult to measure, and a practical solution is to rely on quoted market price to measure compensation cost related to issuing both restricted (or letter) and unrestricted stock through stock option, purchase, or award plans. If a quoted market price is unavailable, the best estimate of the market value of the stock should be used to measure compensation.

b. *The measurement date* for determining compensation cost in stock option, purchase, and award plans is the first date on which are known both (1) the number of shares that an individual employee is entitled to receive and (2) the option or purchase price, if any. That date for many or most plans is the date an option or purchase right is granted or stock is awarded to an individual employee and is therefore unchanged from section 4061. However, the measurement date may be later than the date of grant or award in plans with variable terms that depend on events after date of grant or award.

Thus a corporation recognizes compensation cost for stock issued through compensatory plans unless the employee pays an amount that is at least equal to the quoted market price of the stock at the measurement date.

.11 *Applying the measurement principle*—The following supplements paragraph .10 for special situations in some plans.

a. Measuring compensation by the cost to an employer corporation of reacquired (treasury) stock that is distributed through a stock option, purchase, or award plan is not acceptable practice. The only exception is that compensation cost under a plan with all the provisions described in paragraph .11(c) may be measured by the cost of stock that the corporation (1) reacquires during the fiscal period for which the stock is to be awarded and (2) awards shortly thereafter to employees for services during that period.

b. The measurement date is not changed from the grant or award date to a later date solely by provisions that termination of employment reduces the number of shares of stock that may be issued to an employee.

c. The measurement date of an award of stock for current service may be the end of the fiscal period, which is normally the effective date of the award, instead of the date that the award to an employee is determined if (1) the award is provided for by the terms of an established formal plan, (2) the plan designates the factors that determine the total dollar amount of awards to employees for the period (for example, a percent of income), although the total amount or the individual awards may not be known at the end of the period, and (3) the award pertains to current service of the employee for the period.

d. Renewing a stock option or purchase right or extending its period establishes a new measurement date as if the right were newly granted.

e. Transferring stock or assets to a trustee, agent, or other third party for distribution of stock to employees under the terms of an option, purchase, or award plan does not change the measurement date from a later date to the date of transfer unless the terms of the transfer provide that the stock (1) will not revert to the corporation, (2) will not be granted or awarded later to the same employee on terms different from or for services other than those specified in the original grant or award, and (3) will not be granted or awarded later to another employee.

f. The measurement date for a grant or award of convertible stock or (stock that is otherwise exchangeable for other securities of the corporation) is the date on which the ratio of conversion (or exchange) is known unless other terms are variable at that date (paragraph .10b). The higher of the quoted market price at the measurement date of (1) the convertible stock granted or awarded or (2) the securities into which the original grant or award

 © 1974, American Institute of Certified Public Accountants, Inc.

is convertible should be used to measure compensation.

g. Cash paid to an employee to settle an earlier award of stock or to settle a grant of option to the employee should measure compensation cost. If the cash payment differs from the earlier measure of the award of stock or grant of option, compensation cost should be adjusted (paragraph .15). The amount that a corporation pays to an employee to purchase stock previously issued to the employee through a compensation plan is "cash paid to an employee to settle an earlier award of stock or to settle a grant of option" if stock is reacquired shortly after issuance. Cash proceeds that a corporation receives from sale of awarded stock or stock issued on exercise of an option and remits to the taxing authorities to cover required withholding of income taxes on an award is not "cash paid to an employee to settle an earlier award of stock or to settle a grant of option" in measuring compensation cost.

h. Some plans are a combination of two or more types of plans. An employer corporation may need to measure compensation for the separate parts. Compensation cost for a combination plan permitting an employee to elect one part should be measured according to the terms that an employee is most likely to elect based on the facts available each period.

.12 *Accruing Compensation Cost.* Compensation cost in stock option, purchase, and award plans should be recognized as an expense of one or more periods in which an employee performs services and also as part or all of the consideration received for stock issued to the employee through a plan. The grant or award may specify the period or periods during which the employee performs services, or the period or periods may be inferred from the terms or from the past pattern of grants or awards (section 4061.14; section 4064.01).

.13 An employee may perform services in several periods before an employer corporation issues stock to him for those services. The employer corporation should accrue compensation expense in each period in which the services

are performed. If the measurement date is later than the date of grant or award, an employer corporation should record the compensation expense each period from date of grant or award to date of measurement based on the quoted market price of the stock at the end of each period.

.14 If stock is issued in a plan before some or all of the services are performed,[4] part of the consideration recorded for the stock issued is unearned compensation and should be shown as a separate reduction of stockholders' equity. The unearned compensation should be accounted for as expense of the period or periods in which the employee performs service.

.15 Accruing compensation expense may require estimates, and adjustment of those estimates in later periods may be necessary (section 1051.31-.33, *Accounting Changes*). For example, if a stock option is not exercised (or awarded stock is returned to the corporation) because an employee fails to fulfill an obligation, the estimate of compensation expense recorded in previous periods should be adjusted by decreasing compensation expense in the period of forfeiture.

.16 *Accounting for Income Tax Benefits.* An employer corporation may obtain an income tax benefit related to stock issued to an employee through a stock option, purchase, or award plan. A corporation is usually entitled to a deduction for income tax purposes of the amount that an employee reports as ordinary income, and the deduction is allowable to the corporation in the year in which the amount is includable in the gross income of the employee. Thus, a deduction for income tax purposes may differ from the related compensation expense that the corporation recognizes,[5] and the deduction may be allowable in a period that differs from the one in which the corporation recognizes compensation expense in measuring net income.

.17 An employer corporation should reduce income tax expense for a period by no more of a tax reduction under a stock option, purchase, or award plan than the proportion of the tax reduction that is related to the compensation expense for the period. Compensation expenses that are

---

[4] State law governs the issuance of a corporation's stock including the acceptability of issuing stock for future services.

[5] A corporation may be entitled to a deduction for income tax purposes even though it recognizes no compensation expense in measuring net income.

 © 1974, American Institute of Certified Public Accountants, Inc.

deductible in a tax return in a period different from the one in which they are reported as expenses in measuring net income are timing differences (section 4091.33-.36), and deferred taxes should be recorded. The remainder of the tax reduction, if any, is related to an amount that is deductible for income tax purposes but does not affect net income. The remainder of the tax reduction should not be included in income but should be added to capital in addition to par or stated value of capital stock in the period of the tax reduction. Conversely, a tax reduction may be less than if recorded compensation expenses were deductible for income tax purposes. If so, the corporation may deduct the difference from additional capital in the period of the tax reduction to the extent that tax reductions under the same or similar compensatory stock option, purchase, or award plans have been included in additional capital.

.18 A corporation may, either by cash payment or otherwise—for example, by allowing a reduction in the purchase price of stock—reimburse an employee for his action related to a stock option, purchase, or award plan that results in a reduction of income taxes of the corporation. The corporation should include the reimbursement in income as an expense.

.19 *Disclosure.* Section 4061.15 specifies the disclosures related to stock option and stock purchase plans that should be made in financial statements.[6]

EFFECTIVE DATE

.20 This section applies to all stock option, purchase, award, and bonus rights granted by an employer corporation to an individual employee after December 31, 1972 under both existing and new arrangements and to reductions of income taxes resulting from deductions as of a date after December 31, 1972 that are related to stock option, purchase, award, and bonus rights granted before as well as after the effective date of this section.

[6] Other disclosure requirements are in Regulation S-X for financial statements filed with the Securities and Exchange Commission and in listing agreements of the stock exchanges for financial statements included in annual reports to stockholders.

AC Section 4062A

Accounting for Stock Issued to Employees—Appendix A

MEASURING AND ACCOUNTING FOR COMPENSATION UNDER TYPICAL PLANS (FOR ILLUSTRATION ONLY)

.01 Corporations issue stock to officers and other employees through plans with a variety of names and a multiplicity of terms. Plans in which employees pay cash, either directly or through payroll withholding, as all or a significant part of the consideration for stock they receive, are commonly designated by names such as stock option, stock purchase, or stock thrift or savings plans. Plans in which employees receive stock for current or future services without paying cash (or with a nominal payment) are commonly designated by names such as stock bonus or stock award plans. Stock bonus and award plans are invariably compensatory. Stock thrift and savings plans are compensatory to the extent of contributions of an employer corporation. Stock option and purchase plans may be either compensatory or noncompensatory. The combination of terms in some plans tend to make various types of plans shade into one another, and an assigned name may not describe the nature of a plan.

.02 This section is organized according to the most vital distinction in section 4062—compensatory plans are divided between plans in which the cost of compensation is measured at the date of grant or award and those in which the cost of compensation depends on events after the date of grant or award. Combination plans are described briefly in a final section.

Compensation Cost Measured at Date of Grant or Award

.03 *Accounting.* Total compensation cost is measured by the difference between the quoted market price of the stock at the date of grant or award and the price, if any, to be paid by an employee and is recognized as expense over the period the employee performs related services. The sum of compensation and cash paid by the employee is the consideration received for the stock issued. Compensation cost

related to an award of stock may be adjusted for a later cash settlement (section 4062.11(g)).

.04 *Typical Plans with Fixed and Determinable Terms.* The characteristic that identifies plans in this group is that the terms fix and provide means for determining at the date of grant or award both the number of shares of stock that may be acquired by or awarded to an employee and the cash, if any, to be paid by the employee. Plans usually presume or provide that the employee perform current or future services. The right to transfer stock received is sometimes restricted for a specified period.

.05 *Stock option and stock purchase plans*—Typical terms provide for an employer corporation to grant to an employee the right to purchase a fixed number of shares of stock of the employer corporation at a stated price during a specified period.

.06 *Stock bonus or award plans*—Typical terms provide for an employer corporation to award to an employee a fixed number of shares of stock of the employer corporation without a cash payment (or with a nominal cash payment) by the employee. Often the award is specified as a fixed dollar amount but is distributable in stock with the number of shares determined by the quoted market price of the stock at the date of award, the effective date of award (section 4062.11(c)), or the date treasury stock is acquired (section 4062.11(a)).

Compensation Cost Measured at Other Than Date of Grant or Award

.07 *Accounting.* Compensation cost is accounted for the same as for plans in the first group with one exception. The quoted market price used in the measurement is not the price at date of grant or award but the price at the date on which both the number of shares of stock that may be acquired by or awarded to an individual employee and the option or purchase price are known. Total compensation cost is measured by the difference between that quoted market price of the stock and the amount, if any, to be paid by an employee and is recognized as expense over the period the employee performs related services. The sum of compensation and cash paid by the employee is the consideration received for the stock issued. Compensation cost re-

© 1974, American Institute of Certified Public Accountants, Inc.

lated to an award of stock may be adjusted for a later cash settlement (section 4062.11(g)).

.08 Estimates of compensation cost are recorded before the measurement date based on the quoted market price of the stock at intervening dates. Recorded compensation expense between the date of grant or award and the measurement date may either increase or decrease because changes in quoted market price of the stock require recomputations of the estimated compensation cost.

.09 *Typical Plans with Variable Terms.* The characteristic that identifies plans in this group is that the terms prevent determining at the date of grant or award either the number of shares of stock that may be acquired by or awarded to an employee or the price to be paid by the employee, or both. The indeterminate factors usually depend on events that are not known or determinable at the date of grant or award. Plans usually presume or provide that the employee perform current or future services. The right to transfer stock received is sometimes restricted for a specified period.

.10 *Stock option and stock purchase plans*—Some terms provide for an employer corporation to grant to an employee the right to purchase shares of stock of the employer corporation during a specified period. The number of shares of stock, the option or purchase price, or both may vary depending on various factors during a specified period, such as market performance of the stock, equivalents of dividends distributed, or level of earnings of the employer corporation.

.11 *Stock bonus or award plans*—Some terms provide for an employer corporation to award to an employee the right to receive shares of stock of the employer corporation but the number of shares is not determinable at the date of award. Often the award is specified as a fixed dollar amount but is distributable in stock with the number of shares of stock determined by the market price of the stock at the date distributed, or the award may be of an undesignated number of shares of stock and that number is to be determined by variable factors during a specified period.

.12 The terms of some plans, often called *phantom stock* or *shadow stock* plans, base the obligations for com-

pensation on increases in market price of or dividends distributed on a specified or variable number of shares of stock of the employer corporation but provide for settlement of the obligation to the employee in cash, in stock of the employer corporation, or a combination of cash and stock.

Combination and Elective Plans

.13 *Accounting.* In general, compensation is measured for the separate parts of combination or elective plans. Compensation expense is the sum of the parts that apply. An employer corporation may need to measure compensation at various dates as the terms of separate parts become known. For example, if an employee is entitled to dividend equivalents, compensation cost is the sum of the costs measured at the dates the dividends are credited to the employee in accordance with the terms of the plan. If an employee may choose between alternatives, compensation expense is accrued for the alternative that the employee is most likely to elect based on the facts available at the date of accrual.

.14 *Typical Combination and Elective Plans.* Some plans provide for an employer corporation to grant or award to an employee rights with more than one set of terms. Often an employee may elect the right to be exercised. The combination of rights may be granted or awarded simultaneously or an employee who holds a right may subsequently be granted or awarded a second but different right. The rights may run concurrently or for different periods. An illustration is: an employee holding an option to purchase a fixed number of shares of stock at a fixed price during a specified period is granted an alternative option to purchase the same number of shares at a different price or during a different specified period. Instead of a second option, the award may be the right to elect to receive cash or shares of stock without paying cash. Often the election to acquire or receive stock under either right decreases the other right. Plans combining rights are often called *tandem stock* or *alternate stock* plans; the second right may be of the type that is sometimes called a *phantom stock* plan.

AC Section 4063

Accounting for the Cost of Pension Plans

[Source: APB Opinion No. 8.]

Effective for fiscal periods beginning after December 31, 1966, unless otherwise indicated

INTRODUCTION

.01 Pension plans have developed in an environment characterized by a complex array of social concepts and pressures, legal considerations, actuarial techniques, income tax laws and regulations, business philosophies, and accounting concepts and practices. Each plan reflects the interaction of the environment with the interests of the persons concerned with its design, interpretation and operation. From these factors have resulted widely divergent practices in accounting for the cost of pension plans.

.02 An increased significance of pension cost in relation to the financial position and results of operations of many businesses has been brought about by the substantial growth of private pension plans, both in numbers of employees covered and in amounts of retirement benefits. The assets accumulated and the future benefits to employees under these plans have reached such magnitude that changes in actuarial assumptions concerning pension fund earnings, employee mortality and turnover, retirement age, etc., and the treatment of differences between such assumptions and actual experience, can have important effects on the pension cost recognized for accounting purposes from year to year.

.03 In Accounting Research Bulletin No. 47, *Accounting for Costs of Pension Plans,* the committee on accounting procedure stated its preferences that "costs based on current and future services should be systematically accrued during the expected period of active service of the covered employees" and that "costs based on past services should be charged off over some reasonable period, provided the

allocation is made on a systematic and rational basis and does not cause distortion of the operating results in any one year.'' In recognition of the divergent views then existing, however, the committee also said ''as a minimum, the accounts and financial statements should reflect accruals which equal the present worth, actuarially calculated, of pension commitments to employees to the extent that pension rights have vested in the employees, reduced, in the case of the balance sheet, by any accumulated trusteed funds or annuity contracts purchased.'' The committee did not explain what was meant by the term ''vested'' and did not make any recommendations concerning appropriate actuarial cost methods or recognition of actuarial gains and losses.

.04 Despite the issuance of Accounting Research Bulletin No. 47, accounting for the cost of pension plans has varied widely among companies and has sometimes resulted in wide year-to-year fluctuations in the provisions for pension cost of a single company. Generally, companies have provided pension cost equivalent to the amounts paid to a pension fund or used to purchase annuities. In many cases such payments have included amortization of past service cost (and prior service cost arising on amendment of a plan) over periods ranging from about ten to forty years; in other cases the payments have not included amortization but have included an amount equivalent to interest (see definition of *interest* in section 4063B.27) on unfunded prior service cost. In some cases payments from year to year have varied with fluctuations in company earnings or with the availability of funds. In other cases payments have been affected by the Federal income tax rates in effect at a particular time. The recognition of actuarial gains and losses in the year of their determination, or intermittently, has also caused year-to-year variations in such payments.

.05 Because of the increasing importance of pensions and the variations in accounting for them, the Accounting Principles Board authorized Accounting Research Study No. 8, *Accounting for the Cost of Pension Plans* (referred to hereinafter as the ''Research Study''). The Research Study was published in May 1965 by the American Institute

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

of Certified Public Accountants and has been widely distributed. The Board has carefully examined the recommendations of the Research Study and considered many comments and articles about it. The Board's conclusions agree in most respects with, but differ in some from, those in the Research Study.

.06 The Board has concluded that this section is needed to clarify the accounting principles and to narrow the practices applicable to accounting for the cost of pension plans.

.07 The computation of pension cost for accounting purposes requires the use of actuarial techniques and judgment. Generally pension cost should be determined from a study by an actuary, giving effect to the conclusions set forth in this section. It should be noted that the actuarial cost methods and their application for accounting purposes may differ from those used for funding purposes. A discussion of actuarial valuations, assumptions and cost methods is included in section 4063A. The terminology used in this section to describe pension cost and actuarial cost methods is consistent with that generally used by actuaries and others concerned with pension plans. A Glossary of such terminology is included in section 4063B.

PENSION PLANS COVERED BY THIS SECTION

.08 For the purposes of this section, a pension plan is an arrangement whereby a company undertakes to provide its retired employees with benefits that can be determined or estimated in advance from the provisions of a document or documents or from the company's practices. Ordinarily, such benefits are monthly pension payments but, in many instances, they include death and disability payments. However, death and disability payments under a separate arrangement are not considered in this section. The section applies both to written plans and to plans whose existence may be implied from a well-defined, although perhaps unwritten, company policy. A company's practice of paying retirement benefits to selected employees in amounts determined on a case-by-case basis at or after retirement does not constitute a pension plan under this section. The section applies to pension cost incurred outside the United States under plans that are reasonably

similar to those contemplated by this section, when included in financial statements intended to conform with generally accepted accounting principles in the United States. The section applies to unfunded plans as well as to insured plans and trust fund plans. It applies to defined-contribution plans as well as to defined-benefit plans. It applies also to deferred compensation contracts with individual employees if such contracts, taken together, are equivalent to a pension plan. It does not apply to deferred profit-sharing plans except to the extent that such a plan is, or is part of, an arrangement that is in substance a pension plan.

BASIC ACCOUNTING METHOD

Discussion

.09 This section is concerned with the determination of the amount of pension cost for accounting purposes. In considering the discussions and conclusions in this section, it is important to keep in mind that the annual pension cost to be charged to expense ("the provision for pension cost") is not necessarily the same as the amount to be funded for the year. The determination of the amount to be funded is a financial matter not within the purview of this section.

.10 The pension obligations assumed by some companies are different from those assumed by other companies. In some plans the company assumes direct responsibility for the payment of benefits described in the plan. In these cases, if the pension fund is inadequate to pay the benefits to which employees are entitled, the company is liable for the deficiency. In contrast, the terms of most funded plans limit the company's legal obligation for the payment of benefits to the amounts in the pension fund. In these cases, if the pension fund is inadequate to pay the benefits to which employees are otherwise entitled, such benefits are reduced in a manner stated in the plan and the company has no further legal obligation.

.11 There is broad agreement that pension cost, including related administrative expense, should be accounted for on the accrual basis. There is not general agreement, however, about the nature of pension cost. Some view pensions solely as a form of supplemental benefit to employees in service at a particular time. Others see a broader purpose in pensions; they consider pensions to be in large part

 © 1974, American Institute of Certified Public Accountants, Inc.

(a) a means of promoting efficiency by providing for the systematic retirement of older employees or (b) the fulfillment of a social obligation expected of business enterprises, the cost of which, as a practical matter, constitutes a business expense that must be incurred. Those who hold this second viewpoint associate pension cost, to a large extent, with the plan itself rather than with specific employees. In addition, the long-range nature of pensions causes significant uncertainties about the total amount of pension benefits ultimately to be paid and the amount of cost to be recognized. These differences in viewpoint concerning the nature of pension cost, the uncertainties regarding the amount of the estimates, and the use of many actuarial approaches, compound the difficulty in reaching agreement on the total amount of pension cost over a long period of years and on the time to recognize any particular portion applicable to an employee or group of employees. It is only natural, therefore, that different views exist concerning the preferable way to recognize pension cost. The major views are described in the following four paragraphs.

.12 One view is that periodic pension cost should be provided on an actuarial basis that takes into account all estimated prospective benefit payments under a plan with respect to the existing employee group, whether such payments relate to employee service rendered before or after the plan's adoption or amendment, and that no portion of the provision for such payments should be indefinitely deferred or treated as though, in fact, it did not exist. Those holding this view believe that the recurring omission of a portion of the provision, because of the time lag between making the provision and the subsequent benefit payments under a plan, is a failure to give accrual accounting recognition to the cost applicable to the benefits accrued over the service lives of all employees. Among those holding this view there is general agreement that cost relating to service following the adoption or amendment of a plan should be recognized ratably over the remaining service lives of employees. There is some difference of opinion, however, concerning the period of time to use in allocating that portion of the cost which the computations under some actuarial methods assign to employee service rendered before a plan's adoption or amendment. As to this cost, (a) those

viewing pensions as relating solely to the existing employee group believe that it should be accounted for over the remaining service lives of those in the employ of the company at the time of the plan's adoption or amendment, whereas (b) some of those holding the broader view of pensions, referred to in paragraph .11, believe that this cost is associated to a large extent with the plan itself and hence that the period of providing for it need not be limited to the remaining service lives of a particular group of employees but may be extended somewhat beyond that period. However, this difference of opinion relates only to the period of time over which such cost should be provided.

.13 An opposing view stresses that pension cost is related to the pension benefits to be paid to the continuing employee group as a whole. Those holding this view emphasize that, in the application of accrual accounting, charges against income must be based on actual transactions and events—past, present or reasonably anticipated. They stress the long-range nature of pensions, referred to in paragraph .11, and emphasize the uncertainties concerning the total cost of future benefits. They point out that, in the great majority of cases, provision for normal cost plus an amount equivalent to interest on unfunded prior service cost will be adequate to meet, on a continuing basis, all benefit payments under a plan. Those holding this view believe that following the view expressed in paragraph .12 can result, over a period of years, in charging income with, and recording a balance-sheet accrual for, amounts that will not be paid as benefits. They see no reason therefore to urge employers to provide more than normal cost plus an amount equivalent to interest on unfunded prior service cost in these circumstances, because additional amounts never expected to be paid by a going concern are not corporate costs, and thus are not appropriate charges against income. They acknowledge, however, that corporations can and do make payments to pension funds for past and prior service cost, with the result that reductions will be effected in future charges for the equivalent of interest on unfunded amounts, but they consider this to be solely a matter of financial management rather than a practice dictated by accounting considerations.

 © 1974, American Institute of Certified Public Accountants, Inc.

.14 In many pension plans, cost recorded on the basis described in paragraph .13 will accumulate an amount (whether funded or not) at least equal to the actuarially computed value of vested benefits (see definition of *vested benefits* in section 4063B.43). However, this result might not be achieved in some cases (for example, if the average age of the employee group is high in relation to that of expected future employee groups, or if benefits vest at a relatively early age). Some hold the view that when periodic provisions are based on normal cost plus an amount equivalent to interest such periodic provisions should be increased if they will not, within a reasonable period of time, accumulate an amount (whether funded or not) at least equal to the actuarially computed value of vested benefits. Others would require the increases in provisions only if the company has a legal obligation for the payment of such benefits.

.15 Another view is that, if the company has no responsibility for paying benefits beyond the amounts in the pension fund, pension cost is discretionary and should be provided for a particular accounting period only when the company has made or has indicated its intent to make a contribution to the pension fund for the period. Others believe that pension cost is discretionary even if the company has a direct responsibility for the payment of benefits described in the plan.

Opinion

.16 The Board recognizes that a company may limit its legal obligation by specifying that pensions shall be payable only to the extent of the assets in the pension fund. Experience shows, however, that with rare exceptions pension plans continue indefinitely and that termination and other limitations of the liability of the company are not invoked while the company continues in business. Consequently, the Board believes that, in the absence of convincing evidence that the company will reduce or discontinue the benefits called for in a pension plan, the cost of the plan should be accounted for on the assumption that the company will continue to provide such benefits. This assumption implies a long-term undertaking, the cost of which should be recognized annually whether or not funded.

Therefore, accounting for pension cost should not be discretionary.

.17 All members of the Board believe that the entire cost of benefit payments ultimately to be made should be charged against income subsequent to the adoption or amendment of a plan and that no portion of such cost should be charged directly against retained earnings. Differences of opinion exist concerning the measure of the cost of such ultimate payments. The Board believes that the approach stated in paragraph .12 is preferable for measuring the cost of benefit payments ultimately to be made. However, some members of the Board believe that the approach stated in paragraph .13, in some cases with the modifications described in paragraph .14, is more appropriate for such measurement. The Board has concluded, in the light of such differences in views and of the fact that accounting for pension cost is in a transitional stage, that the range of practices would be significantly narrowed if pension cost were accounted for at the present time within limits based on paragraphs .12, .13 and .14. Accordingly, the Board believes that the annual provision for pension cost should be based on an accounting method that uses an acceptable actuarial cost method (as defined in paragraphs .23 and .24) and results in a provision between the minimum and maximum stated below. The accounting method and the actuarial cost method should be consistently applied from year to year.

a. *Minimum.* The annual provision for pension cost should not be less than the total of (1) normal cost, (2) an amount equivalent to interest on any unfunded prior service cost and (3) if indicated in the following sentence, a provision for vested benefits. A provision for vested benefits should be made if there is an excess of the actuarially computed value of vested benefits (see definition of *vested benefits* in section 4063 B.43) [1] over the total of (1) the pension fund and (2) any balance-sheet pension accruals, less (3) any balance-sheet pension prepayments or deferred charges, at the end of the year, and such excess is not at least 5 per cent less than the comparable excess

[1] The actuarially computed value of vested benefits would ordinarily be based on the actuarial valuation used for the year even though such valuation would usually be as of a date other than the balance sheet date.

 © 1974, American Institute of Certified Public Accountants, Inc.

at the beginning of the year. The provision for vested benefits should be the lesser of (A) the amount, if any, by which 5 per cent of such excess at the beginning of the year is more than the amount of the reduction, if any, in such excess during the year or (B) the amount necessary to make the aggregate annual provision for pension cost equal to the total of (1) normal cost, (2) an amount equivalent to amortization, on a 40-year basis, of the past service cost (unless fully amortized), (3) amounts equivalent to amortization, on a 40-year basis, of the amounts of any increases or decreases in prior service cost arising on amendments of the plan (unless fully amortized) and (4) interest equivalents under paragraph .42 or .43 on the difference between provisions and amounts funded.[2]

b. *Maximum.* The annual provision for pension cost should not be greater than the total of (1) normal cost, (2) 10 per cent of the past service cost (until fully amortized), (3) 10 per cent of the amounts of any increases or decreases in prior service cost arising on amendments of the plan (until fully amortized) and (4) interest equivalents under paragraph .42 or .43 on the difference between provisions and amounts funded. The 10 per cent limitation is considered necessary to prevent unreasonably large charges against income during a short period of years.

.18 The difference between the amount which has been charged against income and the amount which has been paid should be shown in the balance sheet as accrued or prepaid pension cost. If the company has a legal obligation for pension cost in excess of amounts paid or accrued, the excess should be shown in the balance sheet as both a liability and a deferred charge. Except to the extent indicated in the preceding sentences of this paragraph, unfunded prior service cost is not a liability which should be shown in the balance sheet.

ACTUARIAL COST METHODS

Discussion

.19 A number of actuarial cost methods have been developed to determine pension cost. These methods are designed primarily as funding techniques, but many of them

[2] For purposes of this sentence, amortization should be computed as a level annual amount, including the equivalent of interest.

are also useful in determining pension cost for accounting purposes. Pension cost can vary significantly, depending on the actuarial cost method selected; furthermore, there are many variations in the application of the methods, in the necessary actuarial assumptions concerning employee turnover, mortality, compensation levels, pension fund earnings, etc., and in the treatment of actuarial gains and losses.

.20 The principal actuarial cost methods currently in use are described in section 4063A. These methods include an accrued benefit cost method and several projected benefit cost methods.

a. Under the accrued benefit cost method (unit credit method), the amount assigned to the current year usually represents the present value of the increase in present employees' retirement benefits resulting from that year's service. For an individual employee, this method results in an increasing cost from year to year because both the present value of the annual increment in benefits and the probability of reaching retirement increase as the period to retirement shortens; also, in some plans, the retirement benefits are related to salary levels, which usually increase during the years. However, the aggregate cost for a total work force of constant size tends to increase *only* if the average age or average compensation of the entire work force increases.

b. Under the projected benefit cost methods (entry age normal, individual level premium, aggregate and attained age normal methods), the amount assigned to the current year usually represents the level amount (or an amount based on a computed level percentage of compensation) that will provide for the estimated projected retirement benefits over the service lives of either the individual employees or the employee group, depending on the method selected. Cost computed under the projected benefit cost methods tends to be stable or to decline year by year, depending on the method selected. Cost computed under the entry age normal method is usually more stable than cost computed under any other method.

.21 Some actuarial cost methods (individual level premium and aggregate methods) assign to subsequent

 © 1974, American Institute of Certified Public Accountants, Inc.

years the cost arising at the adoption or amendment of a plan. Other methods (unit credit, entry age normal and attained age normal methods) assign a portion of the cost to years prior to the adoption or amendment of a plan, and assign the remainder to subsequent years. The portion of cost assigned to each subsequent year is called *normal cost.* At the adoption of a plan, the portion of cost assigned to prior years is called *past service cost.* At any later valuation date, the portion of cost assigned to prior years (which includes any remaining past service cost) is called *prior service cost.* The amount assigned as past or prior service cost and the amount assigned as normal cost vary depending on the actuarial cost method. The actuarial assignment of cost between past or prior service cost and normal cost is not indicative of the periods in which such cost should be recognized for accounting purposes.

.22 In some cases, past service cost (and prior service cost arising on amendment of a plan) is funded in total; in others it is funded in part; in still others it is not funded at all. In practice, the funding of such cost is influenced by the Federal income tax laws and related regulations, which generally limit the annual deduction for such cost to 10 per cent of the initial amount. There is no tax requirement that such cost be funded, but there are requirements that effectively prohibit the unfunded cost from exceeding the total of past service cost and prior service cost arising on amendment of the plan. The practical effect of the tax requirements is that on a cumulative basis normal cost plus an amount equivalent to the interest on any unfunded prior service cost must be funded. Funding of additional amounts is therefore discretionary for income tax purposes. However, neither funding nor the income tax laws and related regulations are controlling for accounting purposes.

Opinion

.23 To be acceptable for determining cost for accounting purposes, an actuarial cost method should be rational and systematic and should be consistently applied so that it results in a reasonable measure of pension cost from year to year. Therefore, in applying an actuarial cost method that separately assigns a portion of cost as past or prior

service cost, any amortization of such portion should be based on a rational and systematic plan and generally should result in reasonably stable annual amounts. The equivalent of interest on the unfunded portion may be stated separately or it may be included in the amortization; however, the total amount charged against income in any one year should not exceed the maximum amount described in paragraph .17.

.24 Each of the actuarial cost methods described in section 4063A, except terminal funding, is considered acceptable when the actuarial assumptions are reasonable and when the method is applied in conformity with the other conclusions of this Opinion. The terminal funding method is not acceptable because it does not recognize pension cost prior to retirement of employees. For the same reason, the pay-as-you-go method (which is not an actuarial cost method) is not acceptable. The acceptability of methods not discussed herein should be determined from the guidelines in this and the preceding paragraph.

ACTUARIAL GAINS AND LOSSES

Discussion

.25 Actuarial assumptions necessarily are based on estimates of future events. Actual events seldom coincide with events estimated; also, as conditions change, the assumptions concerning the future may become invalid. Adjustments may be needed annually therefore to reflect actual experience, and from time to time to revise the actuarial assumptions to be used in the future. These adjustments constitute actuarial gains and losses. They may be regularly recurring (for example, minor deviations between experience and actuarial assumptions) or they may be unusual or recurring at irregular intervals (for example, substantial investment gains or losses, changes in the actuarial assumptions, plant closings, etc.).

.26 In dealing with actuarial gains and losses, the primary question concerns the timing of their recognition in providing for pension cost. In practice, three methods are in use; immediate-recognition, spreading and averaging. Under the immediate-recognition method (not ordinarily used at present for net losses), net gains are applied to reduce pension cost in the year of occurrence or the

 © 1974, American Institute of Certified Public Accountants, Inc.

following year. Under the spreading method, net gains or losses are applied to current and future cost, either through the normal cost or through the past service cost (or prior service cost on amendment). Under the averaging method, an average of annual net gains and losses, developed from those that occurred in the past with consideration of those expected to occur in the future, is applied to the normal cost.

.27 The use of the immediate-recognition method sometimes results in substantial reductions in, or the complete elimination of, pension cost for one or more years. For Federal income tax purposes, when the unit credit actuarial cost method is used, and in certain other instances, actuarial gains reduce the maximum pension-cost deduction for the year of occurrence or the following year.

.28 Unrealized appreciation and depreciation in the value of investments in a pension fund are forms of actuarial gains and losses. Despite short-term market fluctuations, the overall rise in the value of equity investments in recent years has resulted in the investments of pension funds generally showing net appreciation. Although appreciation is not generally recognized at present in providing for pension cost, it is sometimes recognized through the interest assumption or by introducing an assumed annual rate of appreciation as a separate actuarial assumption. In other cases, appreciation is combined with other actuarial gains and losses and applied on the immediate-recognition, spreading or averaging method.

.29 The amount of any unrealized appreciation to be recognized should also be considered. Some actuarial valuations recognize the full market value. Others recognize only a portion (such as 75 per cent) of the market value or use a moving average (such as a five-year average) to minimize the effects of short-term market fluctuations. Another method used to minimize such fluctuations is to recognize appreciation annually based on an expected long-range growth rate (such as 3 per cent) applied to the cost (adjusted for appreciation previously so recognized) of common stocks; when this method is used, the total of cost and recognized appreciation usually is not permitted to exceed a specified percentage (such as 75 per cent) of the market value. Unrealized depreciation is recognized in

full or on a basis similar to that used for unrealized appreciation.

Opinion

.30 The Board believes that actuarial gains and losses, including realized investment gains and losses, should be given effect in the provision for pension cost in a consistent manner that reflects the long-range nature of pension cost. Accordingly, except as otherwise indicated in paragraphs .31 and .33, actuarial gains and losses should be spread over the current year and future years or recognized on the basis of an average as described in paragraph .26. If this is not accomplished through the routine application of the method (for example, the unit credit method—see paragraph .27), the spreading or averaging should be accomplished by separate adjustments of the normal cost resulting from the routine application of the method. Where spreading is accomplished by separate adjustments, the Board considers a period of from 10 to 20 years to be reasonable. Alternatively, an effect similar to spreading or averaging may be obtained by applying net actuarial gains as a reduction of prior service cost in a manner that reduces the annual amount equivalent to interest on, or the annual amount of amortization of, such prior service cost, and does not reduce the period of amortization.

.31 Actuarial gains and losses should be recognized immediately if they arise from a single occurrence not directly related to the operation of the pension plan and not in the ordinary course of the employer's business. An example of such occurrences is a plant closing, in which case the actuarial gain or loss should be treated as an adjustment of the net gain or loss from that occurrence and not as an adjustment of pension cost for the year. Another example of such occurrences is a merger or acquisition accounted for as a purchase, in which case the actuarial gain or loss should be treated as an adjustment of the purchase price.[8] However, if the transaction is accounted for as a pooling of interests, the actuarial gain or loss should generally be treated as described in paragraph .30.

.32 The Board believes unrealized appreciation and depreciation should be recognized in the determination of the provision for pension cost on a rational and systematic

[8] See section 1091.88h.

 © 1974, American Institute of Certified Public Accountants, Inc.

basis that avoids giving undue weight to short-term market fluctuations (as by using a method similar to those referred to in paragraph .29). Such recognition should be given either in the actuarial assumptions or as described in paragraph .30 for other actuarial gains and losses. Ordinarily appreciation and depreciation need not be recognized for debt securities expected to be held to maturity and redeemed at face value.

.33 Under variable annuity and similar plans the retirement benefits vary with changes in the value of a specified portfolio of equity investments. In these cases, investment gains or losses, whether realized or unrealized, should be recognized in computing pension cost only to the extent that they will not be applied in determining retirement benefits.

EMPLOYEES INCLUDED IN COST CALCULATIONS

Discussion

.34 Under some plans employees become eligible for coverage when they are employed; other plans have requirements of age or length of service or both. Some plans state only the conditions an employee must meet to receive benefits but do not otherwise deal with coverage. Ordinarily actuarial valuations exclude employees likely to leave the company within a short time after employment. This simplifies the actuarial calculations. Accordingly, actuarial calculations ordinarily exclude employees on the basis of eligibility requirements and, in some cases, exclude covered employees during the early years of service.

.35 If provisions are not made for employees from the date of employment, pension cost may be understated. On the other hand, the effect of including all employees would be partially offset by an increase in the turnover assumption; therefore, the inclusion of employees during early years of service may expand the volume of the calculations without significantly changing the provisions for pension cost.

Opinion

.36 The Board believes that all employees who may reasonably be expected to receive benefits under a pension plan should be included in the cost calculations, giving ap-

propriate recognition to anticipated turnover. As a practical matter, however, when the effect of exclusion is not material it is appropriate to omit certain employees from the calculations.

COMPANIES WITH MORE THAN ONE PLAN

Opinion

.37 A company that has more than one pension plan need not use the same actuarial cost method for each one; however, the accounting for each plan should conform to this Opinion. If a company has two or more plans covering substantial portions of the same employee classes and if the assets in any of the plans ultimately can be used in paying present or future benefits of another plan or plans, such plans may be treated as one plan for purposes of determining pension cost.

DEFINED-CONTRIBUTION PLANS

Opinion

.38 Some defined-contribution plans state that contributions will be made in accordance with a specified formula and that benefit payments will be based on the amounts accumulated from such contributions. For such a plan the contribution applicable to a particular year should be the pension cost for that year.

.39 Some defined-contribution plans have defined benefits. In these circumstances, the plan requires careful analysis. When the substance of the plan is to provide the defined benefits, the annual pension cost should be determined in accordance with the conclusions of this Opinion applicable to defined-benefit plans.

INSURED PLANS

Opinion

.40 Insured plans are forms of funding arrangements and their use should not affect the accounting principles applicable to the determination of pension cost. Cost under individual policy plans is ordinarily determined by the individual level premium method, and cost under group deferred annuity contracts is ordinarily determined by the unit credit method. Cost under deposit administration contracts, which operate similarly to trust-fund plans, may be

 © 1974, American Institute of Certified Public Accountants, Inc.

determined on any of several methods. Some elements of pension cost, such as the application of actuarial gains (dividends, termination credits, etc.), may at times cause differences between the amounts being paid to the insurance company and the cost being recognized for accounting purposes. The Board believes that pension cost under insured plans should be determined in conformity with the conclusions of this section.

.41 Individual annuity or life insurance policies and group deferred annuity contracts are often used for plans covering small employee groups. Employers using one of these forms of funding exclusively do not ordinarily have ready access to actuarial advice in determining pension cost. Three factors to be considered in deciding whether the amount of net premiums paid is the appropriate charge to expense are dividends, termination credits and pension cost for employees not yet covered under the plan. Usually, the procedures adopted by insurance companies in arriving at the amount of dividends meet the requirements of paragraph .30; consequently, in the absence of wide year-to-year fluctuations such dividends should be recognized in the year credited. Termination credits should be spread or averaged in accordance with paragraph .30. Unless the period from date of employment to date of coverage under the plan is so long as to have a material effect on pension cost, no provision need be made for employees expected to become covered under the plan. If such a provision is made, it need not necessarily be based on the application of an actuarial cost method.

EFFECT OF FUNDING

Opinion

.42 This section is written primarily in terms of pension plans that are funded. The accounting described applies also to plans that are unfunded. In unfunded plans, pension cost should be determined under an acceptable actuarial cost method in the same manner as for funded plans; however, because there is no fund to earn the assumed rate of interest, the pension-cost provision for the current year should be increased by an amount equivalent to the interest that would have been earned in the current year if the prior-year provisions had been funded.

.43 For funded plans, the amount of the pension cost determined under this section may vary from the amount funded. When this occurs, the pension-cost provision for the year should be increased by an amount equivalent to interest on the prior-year provisions not funded or be decreased by an amount equivalent to interest on prior-year funding in excess of provisions.

.44 A pension plan may become overfunded (that is, have fund assets in excess of all prior service cost assigned under the actuarial method in use for accounting purposes) as a result of contributions or as a result of actuarial gains. In determining provisions for pension cost, the effects of such overfunding are appropriately recognized in the current and future years through the operation of paragraph .30 or .43. As to a plan that is overfunded on the effective date of this section see paragraph .48.

INCOME TAXES

Opinion

.45 When pension cost is recognized for tax purposes in a period other than the one in which recognized for financial reporting, appropriate consideration should be given to allocation of income taxes among accounting periods. (See section 4091.)

DISCLOSURE

Opinion

.46 The Board believes that pension plans are of sufficient importance to an understanding of financial position and results of operations that the following disclosures should be made in financial statements or their notes:

1. A statement that such plans exist, identifying or describing the employee groups covered.
2. A statement of the company's accounting and funding policies.
3. The provision for pension cost for the period.
4. The excess, if any, of the actuarially computed value of vested benefits over the total of the pension fund and any balance-sheet pension accruals, less any pension prepayments or deferred charges.

 © 1974, American Institute of Certified Public Accountants, Inc.

5. Nature and effect of significant matters affecting comparability for all periods presented, such as changes in accounting methods (actuarial cost method, amortization of past and prior service cost, treatment of actuarial gains and losses, etc.), changes in circumstances (actuarial assumptions, etc.), or adoption or amendment of a plan.

An example of what the Board considers to be appropriate disclosure is as follows:

> The company and its subsidiaries have several pension plans covering substantially all of their employees, including certain employees in foreign countries. The total pension expense for the year was $........................, which includes, as to certain of the plans, amortization of prior service cost over periods ranging from 25 to 40 years. The company's policy is to fund pension cost accrued. The actuarially computed value of vested benefits for all plans as of December 31, 19......, exceeded the total of the pension fund and balance-sheet accruals less pension prepayments and deferred charges by approximately $........................ A change during the year in the actuarial cost method used in computing pension cost had the effect of reducing net income for the year by approximately $........................

CHANGES IN ACCOUNTING METHOD

Opinion

.47 On occasion a company may change its method of accounting for pension cost from one acceptable method under this section to another. Such a change might be a change in the actuarial cost method, in the amortization of past and prior service cost, in the treatment of actuarial gains and losses, or in other factors. When such a change is made subsequent to the effective date of this section, a question arises about the accounting for the difference between the cost actually provided under the old method and the cost that would have been provided under the new method. The Board believes that pension cost provided under an acceptable method of accounting in prior periods should not be changed subsequently. Therefore, the effect on prior-year cost of a change in accounting method should be applied prospectively to the cost of the current year and

future years, in a manner consistent with the conclusions of this section, and not retroactively as an adjustment of retained earnings or otherwise. The change and its effect should be disclosed as indicated in paragraph .46.

TRANSITION TO RECOMMENDED PRACTICES

Opinion

.48 For purposes of this section, any unamortized prior service cost (computed under the actuarial cost method to be used for accounting purposes in the future) on the effective date of this section may be treated as though it arose from an amendment of the plan on that date rather than on the actual dates of adoption or amendment of the plan. If the pension plan is overfunded (see paragraph .44) on the effective date of this section, the amount by which it is overfunded (computed under the actuarial cost method to be used for accounting purposes in the future) should be treated as an actuarial gain realized on that date and should be accounted for as described in paragraph .30.

.49 The effect of any changes in accounting methods made as a result of the issuance of this section should be applied prospectively to the cost of the current year and future years in a manner consistent with the conclusions of this section, and not retroactively by an adjustment of retained earnings or otherwise. The change and its effect should be disclosed as indicated in paragraph .46.

AC Section 4063A

Accounting for the Cost of Pension Plans— Appendix A

ACTUARIAL VALUATIONS, ASSUMPTIONS AND COST METHODS

ACTUARIAL VALUATIONS

.01 An actuarial valuation of a pension plan is the process used by actuaries for determining the amounts an employer is to contribute (pay, fund) under a pension plan (except where an insured arrangement calls for payment of specified premiums). A valuation is made as of a specific date, which need not coincide with the end of the period for which a payment based on the valuation will be made. Indeed, it is uncommon for such a coincidence of dates to exist. Among other factors, a time lag is necessary in order to compile the data and to permit the actuary to make the necessary calculations. Although annual valuations are, perhaps, the rule, some employers have valuations made at less frequent intervals, in some cases as infrequently as every five years. The calculations are made for a closed group — ordinarily, employees presently covered by the plan, former employees having vested rights and retired employees currently receiving benefits.

.02 An initial step in making a valuation is to determine the present value on the valuation date of benefits to be paid over varying periods of time in the future to employees after retirement (plus any other benefits under the plan). An actuarial cost method (see description in a later section of this Appendix) is then applied to this present value to determine the contributions to be made by the employer.

.03 The resulting determinations are estimates, since in making a valuation a number of significant uncertainties concerning future events must be resolved by making several actuarial assumptions.

NOTE: For further discussion see Appendix C of Accounting Research Study No. 8, *Accounting for the Cost of Pension Plans* by Ernest L. Hicks, CPA, published by the American Institute of Certified Public Accountants in 1965.

ACTUARIAL ASSUMPTIONS

.04 The uncertainties in estimating the cost of a pension plan relate to (1) interest (return on funds invested), (2) expenses of administration and (3) the amounts and timing of benefits to be paid with respect to presently retired employees, former employees whose benefits have vested and present employees.

Interest (Return on Funds Invested)

.05 The rate of interest used in an actuarial valuation is an expression of the average rate of earnings that can be expected on the funds invested or to be invested to provide for the future benefits. Since in most instances the investments include equity securities as well as debt securities, the earnings include dividends as well as interest; gains and losses on investments are also a factor. For simplicity, however, the rate is ordinarily called the interest rate.

Expenses of Administration

.06 In many instances the expenses of administering a pension plan—for example, fees of attorneys, actuaries and trustees, and the cost of keeping pension records—are borne directly by the employer. In other cases, such expenses, or some of them, are paid by a trust or insurance company from funds contributed by the employer. In the latter cases, expenses to be incurred in the future must be estimated in computing the employer's pension cost.

Benefits

.07 Several assumptions must be made as to the amounts and timing of the future benefits whose present value is used in expressing the cost of a pension plan. The principal assumptions are as follows:

a. *Future compensation levels.* Benefits under some pension plans depend in part on future compensation levels. Under plans of this type, an estimate is ordinarily made of normal increases expected from the progression of employees through the various earnings-rate categories, based on the employer's experience. General earnings-level increases, such as those which may result from inflation, are usually excluded from this actuarial assumption.

 © 1974, American Institute of Certified Public Accountants, Inc.

b. *Cost-of-living.* To protect the purchasing power of retirement benefits, some plans provide that the benefits otherwise determined will be adjusted from time to time to reflect variations in a specific index, such as the Consumer Price Index of the United States Bureau of Labor Statistics. In estimating the cost of such a plan, expected future changes in the cost-of-living index may be included in the actuarial assumptions.

c. *Mortality.* The length of time an employee covered by a pension plan will live is an important factor in estimating the cost of the benefit payments he will receive. If an employee dies before he becomes eligible for pension benefits, he receives no payments, although in some plans his beneficiaries receive lump-sum or periodic benefits. The total amount of pension benefits for employees who reach retirement is determined in large part by how long they live thereafter. Estimates regarding mortality are based on mortality tables.

d. *Retirement age.* Most plans provide a normal retirement age, but many plans permit employees to work thereafter under certain conditions. Some plans provide for retirement in advance of the normal age in case of disability, and most plans permit early retirement at the employee's option under certain conditions. When there are such provisions, an estimate is made of their effect on the amount and timing of the benefits which will ultimately be paid.

e. *Turnover.* In many plans, some employees who leave employment with the employer before completing vesting requirements forfeit their rights to receive benefits. In estimating the amount of future benefits, an allowance for the effect of turnover may be made.

f. *Vesting.* Many plans provide that after a stated number of years of service an employee becomes entitled to receive benefits (commencing at his normal retirement age and usually varying in amount with his number of years of service) even though he leaves the company for a reason other than retirement. This is taken into consideration in estimating the effect of turnover.

g. *Social security benefits.* For plans providing for a reduction of pensions by all or part of social security

benefits, it is necessary in estimating future pension benefits to estimate the effect of future social security benefits. Ordinarily, this estimate is based on the assumption that such benefits will remain at the level in effect at the time the valuation is being made.

Actuarial Gains and Losses

.08 The likelihood that actual events will coincide with each of the assumptions used is so remote as to constitute an impossibility. As a result, the actuarial assumptions used may be changed from time to time as experience and judgment dictate. In addition, whether or not the assumptions as to events in the future are changed, it is often necessary to recognize in the calculations the effect of differences between actual prior experience and the assumptions used in the past.

ACTUARIAL COST METHODS

.09 Actuarial cost methods have been developed by actuaries as funding techniques to be used in actuarial valuations. As indicated in paragraph .19 of section 4063, many of the actuarial cost methods are also useful for accounting purposes. The following discussion of the principal methods describes them as funding techniques (to simplify the discussion, references to prior service cost arising on amendment of a plan have been omitted; such cost would ordinarily be treated in a manner consistent with that described for past service cost). Their application for accounting purposes is described in section 4063.

Accrued Benefit Cost Method—Unit Credit Method

.10 Under the unit credit method, future service benefits (pension benefits based on service after the inception of a plan) are funded as they accrue—that is, as each employee works out the service period involved. Thus, the normal cost under this method for a particular year is the present value of the units of future benefit credited to employees for service in that year (hence unit credit). For example, if a plan provides benefits of $5 per month for each year of credited service, the normal cost for a particular employee for a particular year is the present value (adjusted for mortality and usually for turnover) of an

 © 1974, American Institute of Certified Public Accountants, Inc.

annuity of $5 per month beginning at the employee's anticipated retirement date and continuing throughout his life.

.11 The past service cost under the unit credit method is the present value at the plan's inception date of the units of future benefit credited to employees for service prior to the inception date.

.12 The annual contribution under the unit credit method ordinarily comprises (1) the normal cost and (2) an amount for past service cost. The latter may comprise only an amount equivalent to interest on the unfunded balance or may also include an amount intended to reduce the unfunded balance.

.13 As to an individual employee, the annual normal cost for an equal unit of benefit each year increases because the period to the employee's retirement continually shortens and the probability of reaching retirement increases; also, in some plans, the retirement benefits are related to salary levels, which usually increase during the years. As to the employees collectively, however, the step-up effect is masked, since older employees generating the highest annual cost are continually replaced by new employees generating the lowest. For a mature employee group, the normal cost would tend to be the same each year.

.14 The unit credit method is almost always used when the funding instrument is a group annuity contract and may also be used in trusteed plans and deposit administration contracts where the benefit is a stated amount per year of service. This method is not frequently used where the benefit is a fixed amount (for example, $100 per month) or where the current year's benefit is based on earnings of a future period.

Projected Benefit Cost Methods

.15 As explained above, the accrued benefit cost method (unit credit method) recognizes the cost of benefits only when they have accrued (in the limited sense that the employee service on which benefits are based has been rendered). By contrast, the projected benefit cost methods look forward. That is, they assign the entire cost of an employee's *projected* benefits to past, present and future periods. This is done in a manner not directly related to the

periods during which the service on which the benefits are based has been or will be rendered. The principal projected benefit cost methods are discussed below.

.16 *Entry age normal method.* Under the entry age normal method, the normal costs are computed on the assumption (1) that every employee entered the plan (thus, entry age) at the time of employment or at the earliest time he would have been eligible if the plan had been in existence and (2) that contributions have been made on this basis from the entry age to the date of the actuarial valuation. The contributions are the level annual amounts which, if accumulated at the rate of interest used in the actuarial valuation, would result in a fund equal to the present value of the pensions at retirement for the employees who survive to that time.

.17 Normal cost under this method is the level amount to be contributed for each year. When a plan is established after the company has been in existence for some time, past service cost under this method at the plan's inception date is theoretically the amount of the fund that would have been accumulated had annual contributions equal to the normal cost been made in prior years.

.18 In theory, the entry age normal method is applied on an individual basis. It may be applied, however, on an aggregate basis, in which case separate amounts are not determined for individual employees. Further variations in practice often encountered are (1) the use of an average entry age, (2) the use, particularly when benefits are based on employees' earnings, of a level percentage of payroll in determining annual payments and (3) the computation of past service cost as the difference between the present value of employees' projected benefits and the present value of the employer's projected normal cost contributions. In some plans, the normal cost contribution rate may be based on a stated amount per employee. In other plans the normal cost contribution itself may be stated as a flat amount.

.19 In valuations for years other than the initial year the past service cost may be frozen (that is, the unfunded amount of such cost is changed only to recognize payments and the effect of interest). Accordingly, actuarial gains and losses are spread into the future, entering into the normal

 © 1974, American Institute of Certified Public Accountants, Inc.

cost for future years. If past service cost is not frozen, the unfunded amount includes the effects of actuarial gains and losses realized prior to the date of the valuation being made.

.20 The annual contribution under the entry age normal method ordinarily comprises (1) the normal cost and (2) an amount for past service cost. The latter may comprise only an amount equivalent to interest on the unfunded balance or may also include an amount intended to reduce the unfunded balance.

.21 The entry age normal method is often used with trusteed plans and deposit administration contracts.

.22 *Individual level premium method.* The individual level premium method assigns the cost of each employee's pension in level annual amounts, or as a level percentage of the employee's compensation, over the period from the inception date of a plan (or the date of his entry into the plan, if later) to his retirement date. Thus, past service cost is not determined separately but is included in normal cost.

.23 The most common use of the individual level premium method is with funding by individual insurance or annuity policies. It may be used, however, with trusteed plans and deposit administration contracts.

.24 In plans using individual annuity policies, the employer is protected against actuarial losses, since premiums paid are not ordinarily subject to retroactive increases. The insurance company may, however, pass part of any actuarial gains along to the employer by means of dividends. Employee turnover may be another source of actuarial gains under such insured plans, since all or part of the cash surrender values of policies previously purchased for employees leaving the employer for reasons other than retirement may revert to the company (or to the trust). Dividends and cash surrender values are ordinarily used to reduce the premiums payable for the next period.

.25 The individual level premium method generates annual costs which are initially very high and which ultimately drop to the level of the normal cost determined under the entry age normal method. The high initial costs

arise because the past service cost (although not separately identified) for employees near retirement when the plan is adopted is in effect amortized over a very short period.

.26 *Aggregate method.* The aggregate method applies on a collective basis the principle followed for individuals in the individual level premium method. That is, the entire unfunded cost of future pension benefits (including benefits to be paid to employees who have retired as of the date of the valuation) is spread over the average future service lives of employees who are active as of the date of the valuation. In most cases this is done by the use of a percentage of payroll.

.27 The aggregate method does not deal separately with past service cost (but includes such cost in normal cost). Actuarial gains and losses enter into the determination of the contribution rate and, consequently, are spread over future periods.

.28 Annual contributions under the aggregate method decrease, but the rate of decrease is less extreme than under the individual level premium method. The aggregate cost method amortizes past service cost (not separately identified) over the average future service lives of employees, thus avoiding the very short individual amortization periods of the individual level premium method.

.29 The aggregate method may be modified by introducing past service cost. If the past service cost is determined by the entry age normal method, the modified aggregate method is the same as the entry age normal method applied on the aggregate basis. If the past service cost is determined by the unit credit method, the modified aggregate method is called the attained age normal method (discussed below).

.30 The aggregate method is used principally with trusteed plans and deposit administration contracts.

.31 *Attained age normal method.* The attained age normal method is a variant of the aggregate method or individual level premium method in which past service cost, determined under the unit credit method, is recognized separately. The cost of each employee's benefits assigned to years after the inception of the plan is spread

 © 1974, American Institute of Certified Public Accountants, Inc.

over the employee's future service life. Normal cost contributions under the attained age normal method, usually determined as a percentage of payroll, tend to decline but less markedly than under the aggregate method or the individual level premium method.

.32 As with the unit credit and entry age normal methods, the annual contribution for past service cost may comprise only an amount equivalent to interest on the unfunded balance or may also include an amount intended to reduce the unfunded balance.

.33 The attained age normal method is used with trusteed plans and deposit administration contracts.

Terminal Funding

.34 Under terminal funding, funding for future benefit payments is made only at the end of an employee's period of active service. At that time the employer either purchases a single-premium annuity which will provide the retirement benefit or makes an actuarially equivalent contribution to a trust. (Note—This method is not acceptable for determining the provision for pension cost under section 4063.)

The next page is 8571.

AC Section 4063B

Accounting for the Cost of Pension Plans—Appendix B

GLOSSARY

.01 **Accrue (Accrual).** When *accrue (accrual)* is used in accounting discussions in section 4063, it has the customary accounting meaning. When used in relation to actuarial terms or procedures, however, the intended meaning differs somewhat. When actuaries say that pension benefits, actuarial costs or actuarial liabilities have *accrued,* they ordinarily mean that the amounts are associated, either specifically or by a process of allocation, with years of employee service before the date of a particular valuation of a pension plan. Actuaries do not ordinarily intend their use of the word *accrue* to have the more conclusive accounting significance.

.02 **Accrued Benefit Cost Method.** An *actuarial cost method.* See section 4063A.

.03 **Actuarial Assumptions.** Factors which actuaries use in tentatively resolving uncertainties concerning future events affecting pension cost; for example, mortality rate, employee turnover, compensation levels, investment earnings, etc. See section 4063A.

.04 **Actuarial Cost Method.** A particular technique used by actuaries for establishing the amount and incidence of the annual actuarial cost of pension plan benefits, or benefits and expenses, and the related actuarial liability. Sometimes called *funding method.* See section 4063A.

.05 **Actuarial Gains (Losses).** The effects on actuarially calculated pension cost of (a) deviations between actual prior experience and the actuarial assumptions used or (b) changes in actuarial assumptions as to future events.

.06 **Actuarial Liability.** The excess of the present value, as of the date of a pension plan valuation, of pro-

spective pension benefits and administrative expenses over the sum of (1) the amount in the pension fund and (2) the present value of future contributions for normal cost determined by any of several actuarial cost methods. (Sometimes referred to as *unfunded actuarial liability.*)

.07 **Actuarial Valuation.** The process by which an actuary estimates the present value of benefits to be paid under a pension plan and calculates the amounts of employer contributions or accounting charges for pension cost. See section 4063A.

.08 **Actuarially Computed Value.** See *present value.*

.09 **Actuarially Computed Value of Vested Benefits.** See *vested benefits.*

.10 **Actuary.** There are no statutory qualifications required for actuaries. Membership in the American Academy of Actuaries, a comprehensive organization of the profession in the United States, is generally considered to be acceptable evidence of professional qualification.

.11 **Aggregate Method.** An *actuarial cost method.* See section 4063A.

.12 **Assumptions.** See *actuarial assumptions.*

.13 **Attained Age Normal Method.** An *actuarial cost method.* See section 4063A.

.14 **Benefits (Pension Benefits) (Retirement Benefits).** The pensions and any other payments to which employees or their beneficiaries may be entitled under a pension plan.

.15 **Contribute (Contribution).** When used in connection with a pension plan, *contribute* ordinarily is synonymous with pay.

.16 **Deferred Compensation Plan.** An arrangement whereby specified portions of the employee's compensation are payable in the form of retirement benefits.

.17 **Deferred Profit-Sharing Plan.** An arrangement whereby an employer provides for future retirement benefits for employees from specified portions of the earnings of the business; the benefits for each employee are usually the amounts which can be provided by accumulated amounts specifically allocated to him.

© 1974, American Institute of Certified Public Accountants, Inc.

.18 Defined-Benefit Plan. A pension plan stating the benefits to be received by employees after retirement, or the method of determining such benefits. The employer's contributions under such a plan are determined actuarially on the basis of the benefits expected to become payable.

.19 Defined-Contribution Plan. A pension plan which (a) states the benefits to be received by employees after retirement or the method of determining such benefits (as in the case of a defined-benefit plan) and (b) accompanies a separate agreement that provides a formula for calculating the employer's contributions (for example, a fixed amount for each ton produced or for each hour worked, or a fixed percentage of compensation). Initially, the benefits stated in the plan are those which the contributions expected to be made by the employer can provide. If later the contributions are found to be inadequate or excessive for the purpose of funding the stated benefits on the basis originally contemplated, either the contributions or the benefits, or both, may be subsequently adjusted. In one type of defined-contribution plan (money-purchase plan) the employer's contributions are determined for, and allocated with respect to, specific individuals, usually as a percentage of compensation; the benefits for each employee are the amounts which can be provided by the sums contributed for him.

.20 Deposit Administration Contract. A funding instrument provided by an insurance company under which amounts contributed by an employer are not identified with specific employees until they retire. When an employee retires, the insurance company issues an annuity which will provide the benefits stipulated in the pension plan and transfers the single premium for the annuity from the employer's accumulated contributions.

.21 Entry Age Normal Method. An *actuarial cost method.* See section 4063A.

.22 Fund. Used as a verb, *fund* means to pay over to a funding agency. Used as a noun, *fund* refers to assets accumulated in the hands of a funding agency for the purpose of meeting retirement benefits when they become due.

.23 **Funded.** The portion of pension cost that has been paid to a funding agency is said to have been *funded.*

.24 **Funding Agency.** An organization or individual, such as a specific corporate or individual trustee or an insurance company, which provides facilities for the accumulation of assets to be used for the payment of benefits under a pension plan; an organization, such as a specific life insurance company, which provides facilities for the purchase of such benefits.

.25 **Funding Method.** See *actuarial cost method.*

.26 **Individual Level Premium Method.** An *actuarial cost method.* See section 4063A.

.27 **Interest.** The return earned or to be earned on funds invested or to be invested to provide for future pension benefits. In calling the return *interest,* it is recognized that in addition to interest on debt securities the earnings of a pension fund may include dividends on equity securities, rentals on real estate, and realized and unrealized gains or (as offsets) losses on fund investments. See section 4063A.

.28 **Mortality Rate.** Death rate—the proportion of the number of deaths in a specified group to the number living at the beginning of the period in which the deaths occur. Actuaries use mortality tables, which show death rates for each age, in estimating the amount of future retirement benefits which will become payable. See section 4063A.

.29 **Normal Cost.** The annual cost assigned, under the actuarial cost method in use, to years subsequent to the inception of a pension plan or to a particular valuation date. See *past service cost, prior service cost.*

.30 **Past Service Cost.** Pension cost assigned, under the actuarial cost method in use, to years prior to the inception of a pension plan. See *normal cost, prior service cost.*

.31 **Pay-As-You-Go.** A method of recognizing pension cost only when benefits are paid to retired employees. (Note—This is not an acceptable method for accounting purposes under section 4063.)

 © 1974, American Institute of Certified Public Accountants, Inc.

.32 **Pension Fund.** See *fund.*

.33 **Present Value (Actuarially Computed Value).** The current worth of an amount or series of amounts payable or receivable in the future. *Present value* is determined by discounting the future amount or amounts at a predetermined rate of interest. In pension plan valuations, actuaries often combine arithmetic factors representing probability (e.g., mortality, withdrawal, future compensation levels) with arithmetic factors representing discount (interest). Consequently, to actuaries, determining the present value of future pension benefits may mean applying factors of both types.

.34 **Prior Service Cost.** Pension cost assigned, under the actuarial cost method in use, to years prior to the date of a particular actuarial valuation. *Prior service cost* includes any remaining past service cost. See *normal cost, past service cost.*

.35 **Projected Benefit Cost Method.** A type of *actuarial cost method.* See section 4063A.

.36 **Provision (Provide).** An accounting term meaning a charge against income for an estimated expense, such as pension cost.

.37 **Service.** Employment taken into consideration under a pension plan. Years of employment before the inception of a plan constitute an employee's past service; years thereafter are classified in relation to the particular actuarial valuation being made or discussed. Years of employment (including past service) prior to the date of a particular valuation constitute prior service; years of employment following the date of the valuation constitute future service.

.38 **Terminal Funding.** An *actuarial cost method.* See section 4063A. (Note—This is not an acceptable *actuarial cost method* for accounting purposes under section 4063.)

.39 **Trust Fund Plan.** A pension plan for which the funding instrument is a trust agreement.

.40 **Turnover.** Termination of employment for a reason other than death or retirement. See *withdrawal,* section 4063A.

.41 Unit Credit Method. An *actuarial cost method.* See section 4063A.

.42 Valuation. See *actuarial valuation,* section 4063A.

.43 Vested Benefits. Benefits that are not contingent on the employee's continuing in the service of the employer. In some plans the payment of the benefits will begin only when the employee reaches the normal retirement date; in other plans the payment of the benefits will begin when the employee retires (which may be before or after the normal retirement date). The *actuarially computed value of vested benefits,* as used in section 4063, represents the present value, at the date of determination, of the sum of (a) the benefits expected to become payable to former employees who have retired, or who have terminated service with vested rights, at the date of determination; and (b) the benefits, based on service rendered prior to the date of determination, expected to become payable at future dates to present employees, taking into account the probable time that employees will retire, at the vesting percentages applicable at the date of determination. The determination of vested benefits is not affected by other conditions, such as inadequacy of the pension fund, which may prevent the employee from receiving the vested benefits.

.44 Withdrawal. The removal of an employee from coverage under a pension plan for a reason other than death or retirement. See *turnover.*

AC Section 4063-1

Accounting for the Cost of Pension Plans Subject to the Employee Retirement Income Security Act of 1974: An Interpretation of Section 4063

[Source: FASB Interpretation No. 3.]

December 1974

INTRODUCTION

.01 The Employee Retirement Income Security Act of 1974 (commonly referred to as the Pension Reform Act) became law on September 2, 1974. It is principally concerned with the funding of pension plans, the conditions for employee participation and for vesting of benefits, and the safeguarding of employees' pension rights. Pension plans adopted after January 1, 1974 are subject to the participation, vesting, and funding requirements of the Act for plan years beginning after September 2, 1974. Pension plans in existence on January 1, 1974 are not subject to those requirements until plan years beginning after December 31, 1975, unless earlier compliance is elected.

.02 The Financial Accounting Standards Board has analyzed the Act to determine whether there is a need to reconsider *APB Opinion No. 8* [section 4063] "Accounting for the Cost of Pension Plans." As a result of that analysis, the Board has placed the overall subject of pension accounting, including accounting and reporting by pension trusts, on its technical agenda. Pending completion of that project, the Board is issuing this Interpretation to clarify the accounting for the cost of pension plans covered by the Act.

INTERPRETATION

.03 A fundamental concept of *APB Opinion No. 8* [section 4063] is that the annual pension cost to be charged to expense for financial accounting purposes is not necessarily determined by the funding of a pension plan. Therefore, no change in the minimum and maximum limits for the annual provision for pension cost set forth in paragraph 17 of *APB Opinion No. 8* [section 4063.17] is required as a result of the Act. Compliance with the Act's participation, vesting, or funding requirements may result, however, in a change in the amount of pension cost to be charged to expense periodically for financial accounting

purposes even though no change in accounting methods is made. Paragraph 17 of *APB Opinion No. 8* [section 4063.17] requires that "the entire cost of benefit payments ultimately to be made should be charged against income subsequent to the adoption or amendment of a plan." Consistent with that requirement and within the minimum and maximum limits of paragraph 17 of *APB Opinion No. 8* [section 4063.17], any change in pension cost resulting from compliance with the Act shall enter into the determination of periodic provisions for pension expense *subsequent* to the date a plan becomes subject to the Act's participation, vesting, and funding requirements. That date will be determined either by the effective dates prescribed by the Act or by an election of earlier compliance with the requirements of the Act.

.04 If, *prior* to the date a plan becomes subject to the Act's participation, vesting, and funding requirements, it appears likely that compliance will have a significant effect in the future on the amount of an enterprise's (a) periodic provision for pension expense, (b) periodic funding of pension costs, or (c) unfunded vested benefits, this fact and an estimate of the effect shall be disclosed in the notes to the financial statements.[1]

.05 Based on an analysis of information presently available, the Board does not believe that the Act creates a legal obligation for unfunded pension costs that warrants accounting recognition as a liability pursuant to paragraph 18 of *APB Opinion No. 8* [section 4063.18] except in the following two respects. First, an enterprise with a plan subject to the Act must fund a minimum amount annually unless a waiver is obtained from the Secretary of the Treasury. If a waiver is not obtained, the amount currently required to be funded shall be recognized as a liability by a charge to pension expense for the period, by a deferred charge, or by a combination of both, whatever is appropriate under *APB Opinion No. 8* [section 4063]. Second, in the event of the termination of a pension plan, the Act imposes a liability on an enterprise. When there is convincing evidence that a pension plan will be terminated, evidenced perhaps by a formal commitment by management to terminate the plan, and the liability on termination will exceed fund assets and related prior accruals, the excess liability shall be accrued. If the amount of the excess liability cannot be reasonably determined, disclosure of the circumstances shall be made in the notes to the financial statements, including an estimate of the possible range of the liability.

---

[1] The Board recognizes that actuarial computations or other information may not be available in time to permit disclosure of an estimate of the effect in notes to financial statements for fiscal periods ending in 1974 or early in 1975. If an estimate cannot be furnished, an explanation shall be provided.

AC Section 4064

Deferred Compensation Contracts

[Source: APB Opinion No. 12, Pars. 6-8.]

Effective for fiscal periods beginning after December 31, 1967, unless otherwise indicated

.01 Section 4063, *Accounting for the Cost of Pension Plans,* applies to deferred compensation contracts with individual employees if such contracts, taken together, are equivalent to a pension plan. The Board believes that other deferred compensation contracts should be accounted for individually on an accrual basis. Such contracts customarily include certain requirements such as continued employment for a specified period and availability for consulting services and agreements not to compete after retirement, which, if not complied with, remove the employer's obligations for future payments. The estimated amounts[1] to be paid under each contract should be accrued in a systematic and rational manner over the period of active employment from the time the contract is entered into, unless it is evident that future services expected to be received by the employer are commensurate with the payments or a portion of the payments to be made. If elements of both current and future services are present, only the portion applicable to the current services should be accrued.

.02 Some deferred compensation contracts provide for periodic payments to employees or their surviving spouses for life with provisions for a minimum lump-sum settlement in the event of the early death of one or all of the beneficiaries. The estimated amount[1] of future payments to be made under such contracts should be accrued over the period of active employment from the time the contract is entered into. Such estimates should be based on the life expectancy of each individual concerned (based on the most

---

[1] The amounts to be accrued periodically should result in an accrued amount at the end of the term of active employment which is not less than the then present value of the estimated payments to be made.

recent mortality tables available) or on the estimated cost of an annuity contract rather than on the minimum payable in the event of early death.

.03 At the effective date of this section, amounts[2] pertaining to deferred compensation contracts with employees actively employed, which amounts have not been accrued in a manner consistent with the provisions of the section, should be accrued over the employee's remaining term of active employment. For purposes of transition, these amounts may be accrued over a period of up to ten years if the remaining term of active employment is less than ten years.

AC Section 4071

Depreciation and High Costs[1]

[Source: ARB No. 43, Chap. 9A.]

Issue date, unless otherwise indicated: June, 1953

.01 In December, 1947, the committee issued Accounting Research Bulletin No. 33, dealing with the subject of depreciation and high costs. In October, 1948, it published a letter to the membership reaffirming the opinion expressed in the bulletin.

.02 The subject is one of continuing importance. The committee once more expresses its approval of the basic conclusions asserted in both publications, but in view of the many requests received for further consideration of various aspects of the problem has placed the subject on its agenda for further study.

.03 Accounting Research Bulletin No. 33 read as follows:

.04 "The American Institute of Accountants committee on accounting procedure has given extensive consideration to the problem of making adequate provision for the replacement of plant facilities in view of recent sharp increases in the price level. The problem requires consideration of charges against current income for depreciation of facilities acquired at lower price levels.

.05 "The committee recognizes that business management has the responsibility of providing for replacement of plant and machinery. It also recognizes that, in reporting profits today, the cost of material and labor is reflected in terms of 'inflated' dollars while the cost of productive facilities in which capital was invested at a lower price level is reflected in terms of dollars whose purchasing power was much greater. There is no doubt that in considering depreciation in connection with product costs, prices, and business policies, management must take into consideration the probability that plant and machinery will have to be

[1] See section 1071, *Financial Statements Restated for General Price-Level Changes.*

replaced at costs much greater than those of the facilities now in use.

.06 "When there are gross discrepancies between the cost and current values of productive facilities, the committee believes that it is entirely proper for management to make annual appropriations of net income or surplus in contemplation of replacement of such facilities at higher price levels.

.07 "It has been suggested in some quarters that the problem be met by increasing depreciation charges against current income. The committee does not believe that this is a satisfactory solution at this time. It believes that accounting and financial reporting for general use will best serve their purposes by adhering to the generally accepted concept of depreciation on cost, at least until the dollar is stabilized at some level. An attempt to recognize current prices in providing depreciation, to be consistent, would require the serious step of formally recording appraised current values for all properties, and continuous and consistent depreciation charges based on the new values. Without such formal steps, there would be no objective standard by which to judge the propriety of the amounts of depreciation charges against current income, and the significance of recorded amounts of profit might be seriously impaired.

.08 "It would not increase the usefulness of reported corporate income figures if some companies charged depreciation on appraised values while others adhered to cost. The committee believes, therefore, that consideration of radical changes in accepted accounting procedure should not be undertaken, at least until a stable price level would make it practicable for business as a whole to make the change at the same time.

.09 "The committee disapproves immediate write-downs of plant cost by charges against current income in amounts believed to represent excessive or abnormal costs occasioned by current price levels. However, the committee calls attention to the fact that plants expected to have less than normal useful life can properly be depreciated on a systematic basis related to economic usefulness."

.10 The letter of October 14, 1948, was addressed to the members of the Institute and read as follows:

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

.11 "The committee on accounting procedure has reached the conclusion that no basic change in the accounting treatment of depreciation of plant and equipment is practicable or desirable under present conditions to meet the problem created by the decline in the purchasing power of the dollar.

.12 "The committee has given intensive study to this problem and has examined and discussed various suggestions which have been made to meet it. It has solicited and considered hundreds of opinions on this subject expressed by businessmen, bankers, economists, labor leaders, and others. While there are differences of opinion, the prevailing sentiment in these groups is against any basic change in present accounting procedures. The committee believes that such a change would confuse readers of financial statements and nullify many of the gains that have been made toward clearer presentation of corporate finances.

.13 "Should inflation proceed so far that original dollar costs lose their practical significance, it might become necessary to restate all assets in terms of the depreciated currency, as has been done in some countries. But it does not seem to the committee that such action should be recommended now if financial statements are to have maximum usefulness to the greatest number of users.

.14 "The committee, therefore, reaffirms the opinion it expressed in Accounting Research Bulletin No. 33, December, 1947.

.15 "Any basic change in the accounting treatment of depreciation should await further study of the nature and concept of business income.

.16 "The immediate problem can and should be met by financial management. The committee recognizes that the common forms of financial statements may permit misunderstanding as to the amount which a corporation has available for distribution in the form of dividends, higher wages, or lower prices for the company's products. When prices have risen appreciably since original investments in plant and facilities were made, a substantial proportion of net income as currently reported must be reinvested in the business in order to maintain assets at the same level of productivity at the end of a year as at the beginning.

.17 "Stockholders, employees, and the general public should be informed that a business must be able to retain out of profits amounts sufficient to replace productive facilities at current prices if it is to stay in business. The committee therefore gives its full support to the use of supplementary financial schedules, explanations or footnotes by which management may explain the need for retention of earnings."

AC Section 4072

Depreciation on Appreciation

[Source: APB Opinion No. 6, Par. 17.]

Effective for fiscal periods beginning after December 31, 1965, unless otherwise indicated

.01 The Board is of the opinion that property, plant and equipment should not be written up by an entity to reflect appraisal, market or current values which are above cost to the entity. This statement is not intended to change accounting practices followed in connection with quasi-reorganizations [1] or reorganizations. This statement may not apply to foreign operations under unusual conditions such as serious inflation or currency devaluation. However, when the accounts of a company with foreign operations are translated into United States currency for consolidation, such write-ups normally are eliminated. Whenever appreciation has been recorded on the books, income should be charged with depreciation computed on the written up amounts.

The next page is 8681.

AC Section 4073

Emergency Facilities— Depreciation and Amortization

[Source: ARB No. 43, Chap. 9C, as amended.]

Issue date, unless otherwise indicated: June, 1953 [1]

CERTIFICATES OF NECESSITY

.01 Section 124A of the Internal Revenue Code, which was added by the Revenue Act of 1950, provides for the issuance of certificates of necessity under which all or part of the cost of so-called *emergency facilities* may be amortized over a period of 60 months for income tax purposes. In many cases, the amounts involved are material, and companies are faced with the problem of deciding whether to adopt the 60-month period over which the portions of the cost of the facilities covered by certificates of necessity may be amortized for income tax purposes as the period over which they are to be depreciated in the accounts.

.02 Thinking on this question apparently has become confused because many so-called *percentage certificates* have been issued covering less than the entire cost of the facility. This fact, together with the fact that the probable economic usefulness of the facility after the close of the five-year amortization period is considered by the certifying authority in determining the percentage covered by these certificates, has led many to believe that the percentage used represents the government's conclusion as to the proportion of the cost of the facility that is not expected to have usefulness at the end of five years.

.03 In some cases, it is apparent that the probable lack of economic usefulness of the facility after the close of the amortization period must constitute the principal if not the sole basis for determining the percentage to be

[1] The material included in this section is from ARB 43, Chapter 9, Section C. Paragraphs 11-13 of that Bulletin were superseded by APB Opinion No. 11, effective for fiscal periods beginning after December 31, 1967.

included in the certificate. However, it must be recognized that the certifying authority has acted under orders to give consideration also to a variety of other factors to the end that the amount certified may be the minimum amount necessary to secure expansion of industrial capacity in the interest of national defense during the emergency period. Among the factors required to be considered in the issuance of these certificates, in addition to loss of useful value, are (a) character of business, (b) extent of risk assumed (including the amount and source of capital employed, and the potentiality of recovering capital or retiring debt through tax savings or pricing), (c) assistance to small business and promotion of competition, (d) compliance with government policies (e.g., dispersal for security), and (e) other types of incentives provided by government, such as direct government loans, guaranties, and contractual arrangements.

DEPRECIATION CONSIDERATIONS

.04 The argument has been advanced from time to time that, since the portion of the cost of properties covered by certificates of necessity is amortized over a five-year period for income tax purposes, it is necessary to follow the same procedure in the accounts. Sound financial accounting procedures do not necessarily coincide with the rules as to what shall be included in "gross income," or allowed as a deduction therefrom, in arriving at taxable net income. It is well recognized that such rules should not be followed for financial accounting purposes if they do not conform to generally accepted accounting principles. However, where the results obtained from following income tax procedures do not materially differ from those obtained where generally accepted accounting principles are followed, there are practical advantages in keeping the accounts in agreement with the income tax returns.

.05 The cost of a productive facility is one of the costs of the services it renders during its useful economic life. Generally accepted accounting principles require that this cost be spread over the expected useful life of the facility in such a way as to allocate it as equitably as possible to the periods during which services are obtained from the use of the facility. This procedure is known as depreciation accounting, a system of accounting which aims to distribute

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

the cost or other basic value of tangible capital assets, less salvage (if any), over the estimated useful life of the unit (which may be a group of assets) in a systematic and rational manner. It is a process of allocation, not of valuation.

.06 The committee is of the opinion that from an accounting standpoint there is nothing inherent in the nature of emergency facilities which requires the depreciation or amortization of their cost for financial accounting purposes over either a shorter or a longer period than would be proper if no certificate of necessity had been issued. Estimates of the probable useful life of a facility by those best informed in the matter may indicate either a shorter or a longer life than the statutory 60-month period over which the certified portion of its cost is deductible for income tax purposes.

.07 In determining the proper amount of annual depreciation with respect to emergency facilities for financial accounting purposes, it must be recognized that a great many of these facilities are being acquired primarily for what they can produce during the emergency period. To whatever extent it is reasonable to expect the useful economic life of a facility to end with the close of the amortization period, the cost of the facility is a proper cost of operation during that period.

.08 In determining the prospective usefulness of such facilities it will be necessary to consider their adaptability to post-emergency use, the effect of their use upon economic utilization of other facilities, the possibility of excessive costs due to expedited construction or emergency conditions, and the fact that no deductions for depreciation of the certified portion will be allowable for income tax purposes in the post-amortization years if the company elects to claim the amortization deduction. The purposes for which emergency facilities are acquired in a great many cases are such as to leave major uncertainties as to the extent of their use during the amortization period and as to their subsequent usefulness—uncertainties which are not normally encountered in the acquisition and use of operating facilities.

.09 Consideration of these factors, the committee believes, will in many cases result in the determination of de-

preciation charges during the amortization period in excess of the depreciation that would be appropriate if these factors were not involved. Frequently they will be so compelling as to indicate the need for recording depreciation of the cost of emergency facilities in the accounts in conformity with the amortization deductions allowable for income tax purposes. However, the committee believes that when the amount allowed as amortization for income tax purposes is materially different from the amount of the estimated depreciation, the latter should be used for financial accounting purposes.[2]

.10 In some cases, certificates of necessity cover facilities which the owner expects to use after the emergency period in lieu of older facilities. As a result the older facilities may become unproductive and obsolete before they are fully depreciated on the basis of their previously expected life. In such situations, the committee believes depreciation charges to income should be determined in relation to the total properties, to the end that sound depreciation accounting may be applied to the property accounts as a whole.

AC Section 4074

Declining-Balance Depreciation

[Source: ARB No. 44 (Revised), as amended.]

Issue date, unless otherwise indicated: July, 1958[1]

.01 The declining-balance method of estimating periodic depreciation has a long history of use in England and in other countries including, to a limited extent, the United States. Interest in this method has been increased by its specific recognition for income tax purposes in the Internal Revenue Code of 1954.

.02 The declining-balance method is one of those which meets the requirements of being "systematic and rational."[2] In those cases where the expected productivity or revenue-earning power of the asset is relatively greater during the earlier years of its life, or where maintenance charges tend to increase during the later years, the declining-balance method may well provide the most satisfactory allocation of cost. The conclusions of this section also apply to other methods, including the "sum-of-the-years-digits" method, which produce substantially similar results.

.03 When a change to the declining-balance method is made for general accounting purposes, and depreciation is a significant factor in the determination of net income, the change in method, including the effect thereof, should be disclosed in accordance with section 1051, *Accounting Changes*. [As amended, effective for fiscal periods beginning after July 31, 1971 by APB Opinion No. 20.]

.04 There may be situations in which the declining-balance method is adopted for income tax purposes but other appropriate methods are used for financial accounting purposes. In such cases, accounting recognition should be given to deferred income taxes (see definition in section

---

[1] The material included in this section is partially from ARB 44 (Revised). Paragraphs 7 and 10 of that Bulletin were superseded by APB Opinion No. 11, effective for fiscal periods beginning after December 31, 1967.

[2] Accounting Terminology Bulletin No. 1, paragraph 56.

4091.34), if the amounts thereof are material, except in the cases mentioned in paragraph .07, where there are special circumstances which may make such procedure inappropriate. The foregoing provision as to accounting recognition of deferred income taxes applies to a single asset, or to a group of assets which are expected to be retired from service at about the same time; in this case an excess of depreciation taken for income tax purposes during the earlier years would be followed by the opposite condition in later years, and there would be a tax deferment for a definite period. It applies also to a group of assets consisting of numerous units which may be of differing lengths of life and which are expected to be continually replaced; in this case an excess of depreciation taken for income tax purposes during the earlier years would be followed in later years by substantial equality between the annual depreciation for income tax purposes and that for accounting purposes, and a tax deferment would be built up during the earlier years which would tend to remain relatively constant thereafter. It applies further to a gradually expanding plant; in this case an excess of depreciation taken for income tax purposes may exist each year during the period of expansion in which event there would be a tax deferment which might increase as long as the period of expansion continued. [As amended, effective for fiscal periods beginning after December 31, 1967, by APB Opinion No. 11.]

.05 Where it may reasonably be presumed that the accumulative difference between taxable income and financial income will continue for a long or indefinite period, it is not appropriate to recognize the related tax effect as additional amortization or depreciation applicable to such assets in recognition of the loss of future deductibility for income tax purposes. [As amended, effective for fiscal periods beginning after December 31, 1967, by APB Opinion No. 11.]

DISCUSSION

.06 Following the passage of the Internal Revenue Act of 1954 in August of that year, permitting the use of declining-balance and similar accelerated depreciation methods for federal income tax purposes, the committee anticipated that many companies would be considering whether such methods should be adopted for general ac-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

counting purposes. In October of that year, Accounting Research Bulletin No. 44 was issued in which the committee stated that such accelerated methods met the requirement of being "systematic and rational." The committee also stated that when such methods were adopted for general accounting purposes, appropriate disclosure of the change should be made whenever depreciation was a significant factor in the determination of net income. (Refer to section 1051, *Accounting Changes.*)

.07 Many regulatory authorities permit recognition of deferred income taxes for accounting and/or rate-making purposes, whereas some do not. The committee believes that they should permit the recognition of deferred income taxes for both purposes. However, where charges for deferred income taxes are not allowed for rate-making purposes, accounting recognition need not be given to the deferment of taxes if it may reasonably be expected that increased future income taxes, resulting from the earlier deduction of declining-balance depreciation for income tax purposes only, will be allowed in future rate determinations.

.08 When a company subject to rate-making processes adopts the declining-balance method of depreciation for income tax purposes but adopts other appropriate methods for financial accounting purposes in the circumstances described in paragraph .07, and does not give accounting recognition to deferred income taxes, disclosure should be made of this fact. [As amended, effective for fiscal periods beginning after December 31, 1965, by APB Opinion No. 6.]

AC Section 4081

Accounting for Real and Personal Property Taxes

[Source: ARB No. 43, Chap. 10A, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 The purpose of this section is to draw attention to the problems involved in accounting for real and personal property taxes and to present some of the considerations which enter into a determination of their accounting treatment.

LEGAL LIABILITY FOR PROPERTY TAXES AND TREATMENT FOR INCOME TAX PURPOSES

.02 Unlike excise, income, and social security taxes, which are directly related to particular business events, real and personal property taxes are based upon the assessed valuation of property (tangible and intangible) as of a given date, as determined by the laws of a state or other taxing authority. For this reason the legal liability for such taxes is generally considered as accruing at the moment of occurrence of some specific event, rather than over a period of time. Whether such legal accrual should determine the accounting treatment is a question to be discussed later. Tax laws, opinions of attorneys, income tax regulations, and court decisions have mentioned various dates on which certain property taxes are said to accrue legally. Among them are the following:

(a) Assessment date,
(b) Beginning of taxing authority's fiscal year,
(c) End of taxing authority's fiscal year,
(d) Date on which tax becomes a lien on the property,
(e) Date tax is levied,
(f) Date or dates tax is payable,
(g) Date tax becomes delinquent,
(h) Tax period appearing on tax bill.

.03 Most of the foregoing dates are mentioned in tax laws. In a given case several of these dates may coincide.

.04 The date to be applied in a particular case necessarily requires reference to the law and court decisions of the state concerned. Where the matter has been litigated, it has often been held that property taxes become a liability at the point of time when they become a lien. The general rule, however, is that such taxes accrue as of the date on which they are assessed. The position of the Bureau of Internal Revenue is that generally property taxes accrue on the assessment date, even if the amount of the tax is not determined until later.

.05 A practical aspect of the legal liability for property taxes must be considered when title to property is transferred during the taxable year. As stated above, the assessment date generally determines accrual. But as between vendor and vendee, the Supreme Court[1] has laid down the rule that the lien date, or the date of personal obligation, controls and that where a transfer occurs after either of those dates, the purchaser is not entitled to deduct the taxes for income-tax purposes.

.06 Adjustments on account of property taxes paid or accrued are frequently incorporated in agreements covering the sale of real estate, which determine the question for the individual case as between the buyer and seller, though they are not necessarily controlling for income tax purposes.

.07 Although pro-rata accrual of property taxes has been permitted by some courts, the generally accepted rule seems to be that such taxes accrue in a lump sum on one date and not ratably over the year.

ACCOUNTING FOR PROPERTY TAXES

Accrual Accounting

.08 Accounting questions arise as to (1) when the liability for real and personal property taxes should be recorded on the books of a taxpayer keeping his accounts on the accrual basis and (2) the amounts to be charged against the income of respective periods. Here again, the decision is influenced by the particular circumstances of each tax. Such terms as *assessment date* and *levy date* vary in meaning in the different jurisdictions; and while there is sufficient agreement about assessment date to furn-

[1] Magruder v. Supplee, 316 U. S. 394 (1942). [Ed. Note: Subsequent changes in tax law are not indicated in this Reporter.]

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

ish a basis for the general legal rule already mentioned, it does not necessarily follow that the legal rule should determine the accounting treatment.

.09 Determination of the liability for the tax often proceeds by degrees, the several steps being taken at appreciable intervals of time. For example, while it is known that the owner of real property is liable, with respect to each tax period, for a tax on property owned on the assessment date, the amount of the tax may not be fixed until much later. There is sometimes reluctance toward recording liabilities of indeterminate amount, especially such items as property taxes, and a preference for recording them when the amount can be computed with certainty. While this consideration is one which occasionally leads to the mention of taxes in footnotes as contingent liabilities, the inability to determine the exact amount of taxes is in itself no justification for failure to recognize an existing tax liability.

.10 In practice, real and personal property taxes have been charged against the income of various periods, as indicated below:

(a) Year in which paid (cash basis),
(b) Year ending on assessment (or lien) date,
(c) Year beginning on assessment (or lien) date,
(d) Calendar or fiscal year of taxpayer prior to assessment (or lien) date,
(e) Calendar or fiscal year of taxpayer including assessment (or lien) date,
(f) Calendar or fiscal year of taxpayer prior to payment date,
(g) Fiscal year of governing body levying the tax,
(h) Year appearing on tax bill.

.11 Some of these periods may coincide, as when the fiscal year of the taxing body and that of the taxpayer are the same. The charge to income is sometimes made in full at one time, sometimes ratably on a monthly basis, sometimes on the basis of prior estimates, adjusted during or after the period.

.12 The various periods mentioned represent varying degrees of conservatism in accrual accounting. Some jus-

tification may be found for each usage, but all the circumstances relating to a particular tax must be considered before a satisfactory conclusion is reached.

.13 Consistency of application from year to year is the important consideration and selection of any of the periods mentioned is a matter for individual judgment.

Basis Considered Most Acceptable

.14 Generally, the most acceptable basis of providing for property taxes is monthly accrual on the taxpayer's books during the fiscal period of the taxing authority for which the taxes are levied. The books will then show, at any closing date, the appropriate accrual or prepayment.

.15 It may be argued that the entire amount of tax should logically be accrued by the lien date. Advocates of this procedure vary from those who would accrue the tax by charges to income during the year ending on the lien date, to those who urge setting up the full tax liability on the lien date and charging the amount thereof to income during the subsequent year. However, the basis described in the preceding paragraph is held by the majority of accountants to be practical and satisfactory so long as it is consistently followed.

TREATMENT IN FINANCIAL STATEMENTS

Balance Sheet

.16 An accrued liability for real and personal property taxes, whether estimated or definitely known, should be included among the current liabilities. Where estimates are subject to a substantial measure of uncertainty the liability should be described as estimated.

Income Statement

.17 While it is sometimes proper to capitalize in property accounts the amount of real estate taxes applicable to property which is being developed for use or sale, these taxes are generally regarded as an expense of doing business. They may be (a) charged to operating expenses; (b) shown as a separate deduction from income; or (c) distributed among the several accounts to which they are deemed to apply, such as factory overhead, rent income, and selling or general expenses.

 © 1974, American Institute of Certified Public Accountants, Inc.

.18 In condensed income statements appearing in published reports, the amounts of real and personal property taxes, however charged in the accounts, are rarely shown separately. They are frequently combined with other taxes but not with taxes on income.

.19 Since the liability for property taxes must frequently be estimated at the balance-sheet date, it is often necessary to adjust the provision for taxes of a prior year when their amount has been ascertained. These adjustments should be made through the income statement, either in combination with the current year's provision or as a separate item. [As amended, effective for fiscal periods beginning after December 31, 1966, by APB Opinion No. 9.] [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.]

AC Section 4091

Accounting for Income Taxes

[Source: APB Opinion No. 11, as amended.]

Effective for fiscal periods beginning after December 31, 1967, unless otherwise indicated

INTRODUCTION

.01 This section sets forth the Board's conclusions on some aspects of accounting for income taxes. These conclusions include significant modifications of views previously expressed by the Committee on Accounting Procedure and by the Board.

.02 *Discounting.* The Board's Opinion on "Tax Allocation Accounts—Discounting," as expressed in section 4092, continues in effect pending further study of the broader aspects of discounting as it is related to financial accounting in general.

.03 *Investment Credits.* The Board is continuing its study on accounting for "Investment Credits" and intends to issue a new Opinion on the subject as soon as possible. In the meantime section 4094, *Accounting for the Investment Credit,* remains in effect.

.04 Certain aspects of tax allocation, including illustrations of procedures and an extended discussion of alternative approaches to allocation, are presented in Accounting Research Study No. 9, *Interperiod Allocation of Corporate Income Taxes,* by Homer A. Black, published by the American Institute of Certified Public Accountants in 1966.[1] The Board has considered the Study and the comments received on it. The conclusions in this section vary in some important respects from those reached in the Study.

APPLICABILITY

.05 This section applies to financial statements which purport to present financial position and results of operations in conformity with generally accepted accounting

[1] Accounting Research Studies are not statements of this Board, or of the Institute, but are published for the purpose of stimulating discussion on important accounting issues.

principles. It does not apply (a) to regulated industries in those circumstances where the standards described in section 6011 (which remains in effect) are met and (b) to special areas requiring further study as specifically indicated in paragraphs .37-.40 of this section. The Board has deferred consideration of the special problems of allocation among components of a business enterprise pending further study and the issuance of Opinions on the applicability of generally accepted accounting principles to these statements. (As amended, effective after December 31, 1973, by APB Opinion No. 28.) (See section 2071.)

.06 The Board emphasizes that this section, as in the case of all other sections, is not intended to apply to immaterial items.

SUMMARY OF PROBLEMS

.07 The principal problems in accounting for income taxes arise from the fact that some transactions [2] affect the determination of net income for financial accounting purposes in one reporting period and the computation of taxable income and income taxes payable in a different reporting period. The amount of income taxes determined to be payable for a period does not, therefore, necessarily represent the appropriate income tax expense applicable to transactions recognized for financial accounting purposes in that period. A major problem is, therefore, the measurement of the tax effects of such transactions and the extent to which the tax effects should be included in income tax expense in the same periods in which the transactions affect pretax accounting income.

.08 The United States Internal Revenue Code permits a "net operating loss" of one period to be deducted in determining taxable income of other periods. This leads to the question of whether the tax effects of an operating loss should be recognized for financial accounting purposes in the period of loss or in the periods of reduction of taxable income.

.09 Certain items includable in taxable income receive special treatment for financial accounting purposes, even though the items are reported in the same period in which

[2] The term *transactions* refers to all transactions and other events requiring accounting recognition. As used in this section, it relates either to individual events or to groups of similar events.

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

they are reported for tax purposes. A question exists, therefore, as to whether the tax effects attributable to extraordinary items, adjustments of prior periods (or of the opening balance of retained earnings), and direct entries to other stockholders' equity accounts should be associated with the particular items for financial reporting purposes.[3]

.10 Guidelines are needed for balance sheet and income statement presentation of the tax effects of timing differences, operating losses and similar items.

SUMMARY OF CONCLUSIONS

.11 The Board's conclusions on some of the problems in accounting for income taxes are summarized as follows:

a. Interperiod tax allocation is an integral part of the determination of income tax expense, and income tax expense should include the tax effects of revenue and expense transactions included in the determination of pretax accounting income.

b. Interperiod tax allocation procedures should follow the deferred method,[4] both in the manner in which tax effects are initially recognized and in the manner in which deferred taxes are amortized in future periods.

c. The tax effects of operating loss carry*backs* should be allocated to the loss periods. The tax effects of operating loss carry*forwards* [5] usually should not be recognized until the periods of realization.

d. Tax allocation within a period should be applied to obtain fair presentation of the various components of results of operations.

e. Financial statement presentations of income tax expense and related deferred taxes should disclose (1) the composition of income tax expense as between amounts currently payable and amounts representing tax effects allocable to the period and (2) the classification of deferred taxes into a net current amount and a net noncurrent amount.

---

[3] See sections 2010, 2012 and 2014.

[4] See paragraph .18.

[5] The term "loss carry*forwards*" is used in this section to mean "loss carryovers" as referred to in the United States Internal Revenue Code.

DEFINITIONS AND CONCEPTS

.12 Terminology relating to the accounting for income taxes is varied; some terms have been used with different meanings. Definitions of certain terms used in this section are therefore necessary.

a. *Income taxes.* Taxes based on income determined under provisions of the United States Internal Revenue Code and foreign, state and other taxes (including franchise taxes) based on income.

b. *Income tax expense.* The amount of income taxes (whether or not currently payable or refundable) allocable to a period in the determination of net income.

c. *Pretax accounting income.* Income or loss for a period, exclusive of related income tax expense.

d. *Taxable income.* The excess of revenues over deductions or the excess of deductions over revenues to be reported for income tax purposes for a period.[6]

e. *Timing differences.* Differences between the periods in which transactions affect taxable income and the periods in which they enter into the determination of pretax accounting income. Timing differences originate in one period and reverse or "turn around" in one or more subsequent periods. Some timing differences reduce income taxes that would otherwise be payable currently; others increase income taxes that would otherwise be payable currently.

f. *Permanent differences.* Differences between taxable income and pretax accounting income arising from transactions that, under applicable tax laws and regulations, will not be offset by corresponding differences or "turn around" in other periods.[7]

g. *Tax effects.* Differentials in income taxes of a period attributable to (1) revenue or expense transactions which enter into the determination of pretax accounting income in one period and into the deter-

---

[6] For the purposes of this definition "deductions" do not include reductions in taxable income arising from net operating loss carry*backs* or carry*forwards*.

[7] See paragraph .32.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

mination of taxable income in another period, (2) deductions or credits that may be carried backward or forward for income tax purposes and (3) adjustments of prior periods (or of the opening balance of retained earnings) and direct entries to other stockholders' equity accounts which enter into the determination of taxable income in a period but which do not enter into the determination of pretax accounting income of that period. A permanent difference does not result in a "tax effect" as that term is used in this Opinion.

h. *Deferred taxes.* Tax effects which are deferred for allocation to income tax expense of future periods.

i. *Interperiod tax allocation.* The process of apportioning income taxes among periods.

j. *Tax allocation within a period.* The process of apportioning income tax expense applicable to a given period between income before extraordinary items and extraordinary items, and of associating the income tax effects of adjustments of prior periods (or of the opening balance of retained earnings) and direct entries to other stockholders' equity accounts with these items.

.13 Certain general concepts and assumptions are recognized by the Board to be relevant in considering the problems of accounting for income taxes.

a. The operations of an entity subject to income taxes are expected to continue on a going concern basis, in the absence of evidence to the contrary, and income taxes are expected to continue to be assessed in the future.

b. Income taxes are an expense of business enterprises earning income subject to tax.

c. Accounting for income tax expense requires measurement and identification with the appropriate time period and therefore involves accrual, deferral and estimation concepts in the same manner as these concepts are applied in the measurement and time period identification of other expenses.

d. Matching is one of the basic processes of income determination; essentially it is a process of deter-

mining relationships between costs (including reductions of costs) and (1) specific revenues or (2) specific accounting periods. Expenses of the current period consist of those costs which are identified with the revenues of the current period and those costs which are identified with the current period on some basis other than revenue. Costs identifiable with future revenues or otherwise identifiable with future periods should be deferred to those future periods. When a cost cannot be related to future revenues or to future periods on some basis other than revenues, or it cannot reasonably be expected to be recovered from future revenues, it becomes, by necessity, an expense of the current period (or of a prior period).

TIMING DIFFERENCES

Discussion

Nature of Timing Differences

.14 Four types of transactions are identifiable which give rise to timing differences; that is, differences between the periods in which the transactions affect taxable income and the periods in which they enter into the determination of pretax accounting income.[8] Each timing difference originates in one period and reverses in one or more subsequent periods.

a. Revenues or gains are included in taxable income later than they are included in pretax accounting income. For example, gross profits on installment sales are recognized for accounting purposes in the period of sale but are reported for tax purposes in the period the installments are collected.

b. Expenses or losses are deducted in determining taxable income later than they are deducted in determining pretax accounting income. For example, estimated costs of guarantees and of product warranty contracts are recognized for accounting purposes in the current period but are reported for tax purposes in the period paid or in which the liability becomes fixed.

[8] Accounting Research Study No. 9, *Interperiod Allocation of Corporate Income Taxes,* pages 2-3 and 8-10.

© 1974, American Institute of Certified Public Accountants, Inc.

c. Revenues or gains are included in taxable income earlier than they are included in pretax accounting income. For example, rents collected in advance are reported for tax purposes in the period in which they are received but are deferred for accounting purposes until later periods when they are earned.

d. Expenses or losses are deducted in determining taxable income earlier than they are deducted in determining pretax accounting income. For example, depreciation is reported on an accelerated basis for tax purposes but is reported on a straight-line basis for accounting purposes.

Additional examples of each type of timing difference are presented in Appendix A to this section (section 4091A).

.15 The timing differences of revenue and expense transactions entering into the determination of pretax accounting income create problems in the measurement of income tax expense for a period, since the income taxes payable for a period are not always determined by the same revenue and expense transactions used to determine pretax accounting income for the period. The amount of income taxes determined to be payable for a period does not, therefore, necessarily represent the appropriate income tax expense applicable to transactions recognized for financial accounting purposes in that period.

.16 Interperiod tax allocation procedures have been developed to account for the tax effects of transactions which involve timing differences. Interperiod allocation of income taxes results in the recognition of tax effects in the same periods in which the related transactions are recognized in the determination of pretax accounting income.

Differing Viewpoints

.17 Interpretations of the nature of timing differences are diverse, with the result that three basic methods of interperiod allocation of income taxes have developed and been adopted in practice. The three concepts and their applications are described and evaluated in Chapters 2, 3 and 4 of *Accounting Research Study No. 9*. A brief description of each method follows.

.18 Interperiod tax allocation under the *deferred method* is a procedure whereby the tax effects of current

timing differences are deferred currently and allocated to income tax expense of future periods when the timing differences reverse. The deferred method emphasizes the tax effects of timing differences on income of the period in which the differences originate. The deferred taxes are determined on the basis of the tax rates in effect at the time the timing differences originate and are not adjusted for subsequent changes in tax rates or to reflect the imposition of new taxes. The tax effects of transactions which reduce taxes currently payable are treated as deferred credits; the tax effects of transactions which increase taxes currently payable are treated as deferred charges. Amortization of these deferred taxes to income tax expense in future periods is based upon the nature of the transactions producing the tax effects and upon the manner in which these transactions enter into the determination of pretax accounting income in relation to taxable income.

.19 Interperiod tax allocation under the *liability method* is a procedure whereby the income taxes expected to be paid on pretax accounting income are accrued currently. The taxes on components of pretax accounting income may be computed at different rates, depending upon the period in which the components were, or are expected to be, included in taxable income. The differences between income tax expense and income taxes payable in the periods in which the timing differences originate are either liabilities for taxes payable in the future or assets for prepaid taxes. The estimated amounts of future tax liabilities and prepaid taxes are computed at the tax rates expected to be in effect in the periods in which the timing differences reverse. Under the liability method the initial computations are considered to be tentative and are subject to future adjustment if tax rates change or new taxes are imposed.

.20 Interperiod tax allocation under the *net of tax method* is a procedure whereby the tax effects (determined by either the deferred or liability methods) of timing differences are recognized in the valuation of assets and liabilities and the related revenues and expenses. The tax effects are applied to reduce specific assets or liabilities on the basis that tax deductibility or taxability are factors in their valuation.

 © 1974, American Institute of Certified Public Accountants, Inc

.21 In addition to the different methods of applying interperiod tax allocation, differing views exist as to the extent to which interperiod tax allocation should be applied in practice.

.22 Some transactions result in differences between pretax accounting income and taxable income which are permanent[9] because under applicable tax laws and regulations the current differences will not be offset by corresponding differences in later periods. Other transactions, however, result in differences between pretax accounting income and taxable income which reverse or turn around in later periods; these differences are classified broadly as timing differences. The tax effects of certain timing differences often are offset in the reversal or turnaround period by the tax effects of similar differences originating in that period. Some view these differences as essentially the same as permanent differences because, in effect, the periods of reversal are indefinitely postponed. Others believe that differences which originate in a period and differences which reverse in the same period are distinguishable phases of separate timing differences and should be considered separately.

.23 In determining the accounting recognition of the tax effects of timing differences, the first question is whether there should be any tax allocation. One view holds that interperiod tax allocation is never appropriate. Under this concept, income tax expense of a period equals income taxes payable for that period. This concept is based on the presumption that income tax expense of a period should be measured by the amount determined to be payable for that period by applying the laws and regulations of the governmental unit, and that the amount requires no adjustment or allocation. This concept has not been used widely in practice and is not supported presently to any significant extent.

.24 The predominant view holds that interperiod tax allocation is appropriate. However, two alternative concepts exist as to the extent to which it should be applied: partial allocation and comprehensive allocation.

---

[9] See paragraph .32.

Partial Allocation

.25 Under partial allocation the general presumption is that income tax expense of a period for financial accounting purposes should be the tax payable for the period. Holders of this view believe that when recurring differences between taxable income and pretax accounting income give rise to an indefinite postponement of an amount of tax payments or to continuing tax reductions, tax allocation is not required for these differences. They believe that amounts not reasonably expected to be payable to, or recoverable from, a government as taxes should not affect net income. They point out in particular that the application of tax allocation procedures to tax payments or recoveries which are postponed indefinitely involves contingencies which are at best remote and thus, in their opinion, may result in an overstatement or understatement of expenses with consequent effects on net income. An example of a recurring difference not requiring tax allocation under this view is the difference that arises when a company having a relatively stable or growing investment in depreciable assets uses straight-line depreciation in determining pretax accounting income but an accelerated method in determining taxable income. If tax allocation is applied by a company with large capital investments coupled with growth in depreciable assets (accentuated in periods of inflation) the resulting understatement of net income from using tax allocation is magnified.

.26 Holders of the view expressed in paragraph .25 believe that the only exceptions to the general presumption stated therein should be those instances in which specific nonrecurring differences between taxable income and pretax accounting income would lead to a material misstatement of income tax expense and net income. If such nonrecurring differences occur, income tax expense of a period for financial accounting purposes should be increased (or decreased) by income tax on differences between taxable income and pretax accounting income provided the amount of the increase (or decrease) can be reasonably expected to be paid as income tax (or recovered as a reduction of income taxes) within a relatively short period not exceeding, say, five years. An example would be an isolated install-

 © 1974, American Institute of Certified Public Accountants, Inc.

ment sale of a productive facility in which the gross profit is reported for financial accounting purposes at the date of sale and for tax purposes when later collected. Thus, tax allocation is applicable only when the amounts are reasonably certain to affect the flow of resources used to pay taxes in the near future.

.27 Holders of this view state that comprehensive tax allocation, as opposed to partial allocation, relies on the so-called "revolving" account approach which seems to suggest that there is a similarity between deferred tax accruals and other balance sheet items, like accounts payable, where the individual items within an account turn over regularly although the account balance remains constant or grows. For these other items, the turnover reflects actual, specific transactions—goods are received, liabilities are recorded and payments are subsequently made. For deferred tax accruals on the other hand, no such transactions occur—the amounts are not owed to anyone; there is no specific date on which they become payable, if ever; and the amounts are at best vague estimates depending on future tax rates and many other uncertain factors. Those who favor partial allocation suggest that accounting deals with actual events, and that those who would depart from the fact of the tax payment should show that the modification will increase the usefulness of the reports to management, investors or other users. To do this requires a demonstration that the current lower (or higher) tax payments will result in higher (or lower) cash outflows for taxes within a span of time that is of significant interest to readers of the financial statements.

Comprehensive Allocation

.28 Under comprehensive allocation, income tax expense for a period includes the tax effects of transactions entering into the determination of pretax accounting income for the period even though some transactions may affect the determination of taxes payable in a different period. This view recognizes that the amount of income taxes payable for a given period does not necessarily measure the appropriate income tax expense related to transactions for that period. Under this view, income tax expense encompasses any accrual, deferral or estimation

necessary to adjust the amount of income taxes payable for the period to measure the tax effects of those transactions included in pretax accounting income for that period. Those supporting comprehensive allocation believe that the tax effects of initial timing differences should be recognized and that the tax effects should be matched with or allocated to those periods in which the initial differences reverse. The fact that when the initial differences reverse other initial differences may offset any effect on the amount of taxable income does not, in their opinion, nullify the fact of the reversal. The offsetting relationships do not mean that the tax effects of the differences cannot be recognized and measured. Those supporting comprehensive allocation state that the makeup of the balances of certain deferred tax amounts "revolve" as the related differences reverse and are replaced by similar differences. These initial differences do reverse, and the tax effects thereof can be identified as readily as can those of other timing differences. While new differences may have an offsetting effect, this does not alter the fact of the reversal; without the reversal there would be different tax consequences. Accounting principles cannot be predicated on reliance that offsets will continue. Those supporting comprehensive allocation conclude that the fact that the tax effects of two transactions happen to go in opposite directions does not invalidate the necessity of recognizing separately the tax effects of the transactions as they occur.

.29 Under comprehensive allocation, material tax effects are given recognition in the determination of income tax expense, and the tax effects are related to the periods in which the transactions enter into the determination of pretax accounting income. The tax effects so determined are allocated to the future periods in which the differences between pretax accounting income and taxable income reverse. Those supporting this view believe that comprehensive allocation is necessary in order to associate the tax effects with the related transactions. Only by the timely recognition of such tax effects is it possible to associate the tax effects of transactions with those transactions as they enter into the determination of net income. The need exists to recognize the tax effects of initial differences because only by doing so will the income tax expense in

 © 1974, American Institute of Certified Public Accountants, Inc.

the periods of initial differences include the tax effects of transactions of those periods.

.30 Those who support comprehensive allocation believe that the partial allocation concept in stressing cash outlays represents a departure from the accrual basis of accounting. Comprehensive allocation, in their view, results in a more thorough and consistent association in the matching of revenues and expenses, one of the basic processes of income determination.

.31 These differences in viewpoint become most significant with respect to the tax effects of transactions of a recurring nature—for example, depreciation of machinery and equipment using the straight-line method for financial accounting purposes and an accelerated method for income tax purposes. Under partial allocation the tax effects of these timing differences would not be recognized under many circumstances; under comprehensive allocation the tax effects would be recognized beginning in the periods of the initial timing differences. Under partial allocation, the tax effects of these timing differences would not be recognized so long as it is assumed that similar timing differences would arise in the future creating tax effects at least equal to the reversing tax effects of the previous timing differences. Thus, under partial allocation, so long as the amount of deferred taxes is estimated to remain fixed or to increase, no need exists to recognize the tax effects of the initial differences because they probably will not "reverse" in the foreseeable future. Under comprehensive allocation tax effects are recognized as they occur.

Permanent Differences

.32 Some differences between taxable income and pretax accounting income are generally referred to as permanent differences. Permanent differences arise from statutory provisions under which specified revenues are exempt from taxation and specified expenses are not allowable as deductions in determining taxable income. (Examples are interest received on municipal obligations and premiums paid on officers' life insurance.) Other permanent differences arise from items entering into the determination of taxable income which are not components of pretax accounting income

in any period. (Examples are the special deduction for certain dividends received and the excess of statutory depletion over cost depletion.)

Opinion

.33 The Board has considered the various concepts of accounting for income taxes and has concluded that comprehensive interperiod tax allocation is an integral part of the determination of income tax expense. Therefore, income tax expense should include the tax effects of revenue and expense transactions included in the determination of pretax accounting income. The tax effects of those transactions which enter into the determination of pretax accounting income either earlier or later than they become determinants of taxable income should be recognized in the periods in which the differences between pretax accounting income and taxable income arise and in the periods in which the differences reverse. Since permanent differences do not affect other periods, interperiod tax allocation is not appropriate to account for such differences.

.34 The Board has concluded that the deferred method[10] of tax allocation should be followed since it provides the most useful and practical approach to interperiod tax allocation and the presentation of income taxes in financial statements.

.35 The tax effect of a timing difference should be measured by the differential between income taxes computed with and without inclusion of the transaction creating the difference between taxable income and pretax accounting income. The resulting income tax expense for the period includes the tax effects of transactions entering into the determination of results of operations for the period. The resulting deferred tax amounts reflect the tax effects which will reverse in future periods. The measurement of income tax expense becomes thereby a consistent and integral part of the process of matching revenues and expenses in the determination of results of operations.

.36 In computing the tax effects referred to in paragraph .35 timing differences may be considered individually or similar timing differences may be grouped. The net

[10] See paragraph .18.

 © 1974, American Institute of Certified Public Accountants, Inc.

change in deferred taxes for a period for a group of similar timing differences may be determined on the basis of either (a) a combination of amounts representing the tax effects arising from timing differences originating in the period at the current tax rates and reversals of tax effects arising from timing differences originating in prior periods at the applicable tax rates reflected in the accounts as of the beginning of the period; or (b) if the applicable deferred taxes have been provided in accordance with this section on the cumulative timing differences as of the beginning of the period, the amount representing the tax effects at the current tax rates of the net change during the period in the cumulative timing differences. If timing differences are considered individually, or if similar timing differences are grouped, no recognition should be given to the reversal of tax effects arising from timing differences originating prior to the effective date of this section unless the applicable deferred taxes have been provided for in accordance with this section, either during the periods in which the timing differences originated or, retroactively, as of the effective date of this section. The method or methods adopted should be consistently applied.

OPERATING LOSSES

Discussion

.41 An operating loss arises when, in the determination of taxable income, deductions exceed revenues. Under

applicable tax laws and regulations, operating losses of a period may be carried backward or forward for a definite period of time to be applied as a reduction in computing taxable income, if any, in those periods. When an operating loss is so applied, pretax accounting income and taxable income (after deducting the operating loss carry*back* or carry*forward*) will differ for the period to which the loss is applied.

.42 If operating losses are carried backward to earlier periods under provisions of the tax law, the tax effects of the loss carry*backs* are included in the results of operations of the loss period, since realization is assured. If operating losses are carried forward under provisions of the tax law, the tax effects usually are not recognized in the accounts until the periods of realization, since realization of the benefits of the loss carry*forwards* generally is not assured in the loss periods. The only exception to that practice occurs in unusual circumstances when realization is assured beyond any reasonable doubt in the loss periods. Under an alternative view, however, the tax effects of loss carry*forwards* would be recognized in the loss periods unless specific reasons exist to question their realization.

Opinion

.43 The tax effects of any realizable loss carry*backs* should be recognized in the determination of net income (loss) of the loss periods. The tax loss gives rise to a refund (or claim for refund) of past taxes, which is both measurable and currently realizable; therefore the tax effect of

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

the loss is properly recognizable in the determination of net income (loss) for the loss period. Appropriate adjustments of existing net deferred tax credits may also be necessary in the loss period.

.44 The tax effects of loss carry*forwards* also relate to the determination of net income (loss) of the loss periods. However, a significant question generally exists as to realization of the tax effects of the carry*forwards,* since realization is dependent upon future taxable income. Accordingly, the Board has concluded that the tax benefits of loss carry*forwards* should not be recognized until they are actually realized, except in unusual circumstances when realization is *assured beyond any reasonable doubt* at the time the loss carry*forwards* arise. When the tax benefits of loss carry*forwards* are not recognized until realized in full or in part in subsequent periods, the tax benefits should be reported in the results of operations of those periods as extraordinary items.[11]

.45 In those rare cases in which realization of the tax benefits of loss carry*forwards* is assured beyond any reasonable doubt, the potential benefits should be associated with the periods of loss and should be recognized in the determination of results of operations for those periods. Realization is considered to be assured beyond any reasonable doubt when conditions such as those set forth in paragraph .46 are present. (Also see paragraph .47.) The amount of the asset (and the tax effect on results of operations) recognized in the loss period should be computed at the rates expected [12] to be in effect at the time of realization. If the applicable tax rates change from those used to measure the tax effect at the time of recognition, the effect of the rate change should be accounted for in the period of the change as an adjustment of the asset account and of income tax expense.

[11] See section 2012.07, *Reporting the Results of Operations.*

[12] The rates referred to here are those rates which, at the time the loss carry *forward* benefit is recognized for financial accounting purposes, have been enacted to apply to appropriate future periods.

.46 Realization of the tax benefit of a loss carry*forward* would appear to be assured beyond any reasonable doubt when both of the following conditions exist: (a) the loss results from an identifiable, isolated and nonrecurring cause and the company either has been continuously profitable over a long period or has suffered occasional losses which were more than offset by taxable income in subsequent years, and (b) future taxable income is virtually certain to be large enough to offset the loss carry*forward* and will occur soon enough to provide realization during the carry*forward* period.

.47 Net deferred tax credits arising from timing differences may exist at the time loss carry*forwards* arise. In the usual case when the tax effect of a loss carry*forward* is not recognized in the loss period, adjustments of the existing net deferred tax credits may be necessary in that period or in subsequent periods. In this situation net deferred tax credits should be eliminated to the extent of the lower of (a) the tax effect of the loss carry*forward,* or (b) the amortization of the net deferred tax credits that would otherwise have occurred during the carry*forward* period. If the loss carry*forward* is realized in whole or in part in periods subsequent to the loss period, the amounts eliminated from the deferred tax credit accounts should be reinstated (at the then current tax rates) on a cumulative basis as, and to the extent that, the tax benefit of the loss carry*forward* is realized. In the unusual situation in which the tax effect of a loss carry*forward* is recognized as an asset in the loss year,[13] the deferred tax credit accounts would be amortized in future periods as indicated in paragraph .18.

.48 The tax effects of loss carry*forwards* of purchased subsidiaries (if not recognized by the subsidiary prior to purchase) should be recognized as assets at the date of purchase only if realization is assured beyond any reasonable doubt. Otherwise they should be recognized only when the tax benefits are actually realized and should be re-

---

[13] See paragraph .45.

© 1974, American Institute of Certified Public Accountants, Inc.

corded as retroactive adjustments[14] of the purchase transactions and treated in accordance with the procedures described in section 1091.88. Retroactive adjustments of results of operations for the periods subsequent to purchase may also be necessary if the balance sheet items affected have been subject to amortization in those periods.

.49 Tax effects of loss carry*forwards* arising prior to a quasi-reorganization (including for this purpose the application of a deficit in retained earnings to contributed capital) should, if not previously recognized, be recorded as assets at the date of the quasi-reorganization only if realization is assured beyond any reasonable doubt. If not previously recognized and the benefits are actually realized at a later date, the tax effects should be added to contributed capital because the benefits are attributable to the loss periods prior to the quasi-reorganization.

TAX ALLOCATION WITHIN A PERIOD

Discussion

.50 The need for tax allocation within a period arises because items included in the determination of taxable income may be presented for accounting purposes as (a) extraordinary items, (b) adjustments of prior periods (or of the opening balance of retained earnings) or (c) as direct entries to other stockholders' equity accounts.

Opinion

.51 The Board has concluded that tax allocation within a period should be applied to obtain an appropriate relationship between income tax expense and (a) income before extraordinary items, (b) extraordinary items, (c) adjustments of prior periods (or of the opening balance of retained earnings) and (d) direct entries to other stockholders' equity accounts. The income tax expense attributable to income before extraordinary items is computed by determining the income tax expense related to revenue and expense transactions entering into the determination of such income, without giving effect to the tax consequences of the items excluded from the determination of income before extraordinary items. The income tax ex-

[14] See section 2010, *Reporting the Results of Operations.*

pense attributable to other items is determined by the tax consequences of transactions involving these items. If an operating loss exists before extraordinary items, the tax consequences of such loss should be associated with the loss.

OTHER UNUSED DEDUCTIONS AND CREDITS

Opinion

.52 The conclusions of this section, including particularly the matters discussed in paragraphs .41-.49 on tax reductions resulting from operating losses, also apply to other unused deductions and credits for tax purposes that may be carried backward or forward in determining taxable income (for example, capital losses, contribution carryovers, and foreign tax credits).

FINANCIAL REPORTING

Discussion

Balance Sheet

.53 Interperiod tax allocation procedures result in the recognition of several deferred tax accounts. Classification of deferred taxes in the balance sheet has varied in practice, with the accounts reported, alternatively, as follows:

a. *Separate current and noncurrent amounts.* In this form of presentation all balance sheet accounts resulting from income tax allocation are classified into four separate categories—current assets, noncurrent assets, current liabilities and noncurrent liabilities.

b. *Net current and net noncurrent amounts.* In this form of presentation all balance sheet accounts resulting from income tax allocation are classified into two categories—net current amount and net noncurrent amount.

c. *Single amount.* In this form of presentation all balance sheet accounts resulting from income tax allocation are combined in a single amount.

d. *Net of tax presentation.* Under this approach each balance sheet tax allocation account (or portions thereof) is reported as an offset to, or a valuation of, the asset or liability that gave rise to the tax effect. Net of tax presentation is an extension of a valuation concept and treats the tax effects as valu-

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

ation adjustments of the related assets and liabilities.

Income Statement

.54 Interperiod tax allocation procedures result in income tax expense generally different from the amount of income tax payable for a period. Three alternative approaches have developed for reporting income tax expense:

a. *Combined amount.* In this presentation income tax expense for the period is reported as a single amount, after adjustment of the amount of income taxes payable for the period for the tax effects of those transactions which had different effects on pretax accounting income and on taxable income. This form of presentation emphasizes that income tax expense for the period is related to those transactions entering into the determination of pretax accounting income.

b. *Combined amount plus disclosure (or two or more separate amounts).* In this presentation the amount of income taxes reported on the tax return is considered significant additional information for users of financial statements. The amount of taxes payable (or the effect of tax allocation for the period) is, therefore, disclosed parenthetically or in a note to the financial statements. Alternatively, income tax expense may be disclosed in the income statement by presenting separate amounts—the taxes payable and the effects of tax allocation.

c. *''Net of tax'' presentation.* Under the ''net of tax'' concept the tax effects recognized under interperiod tax allocation are considered to be valuation adjustments to the assets or liabilities giving rise to the adjustments. For example, depreciation deducted for tax purposes in excess of that recognized for financial accounting purposes is held to reduce the future utility of the related asset because of a loss of a portion of future tax deductibility. Thus, depreciation expense, rather than income tax expense, is adjusted for the tax effect of the difference between the depreciation amount used in the determination of taxable income and

that used in the determination of pretax accounting income.

Opinion

Balance Sheet

.55 Balance sheet accounts related to tax allocation are of two types:

a. Deferred charges and deferred credits relating to timing differences; and

b. Refunds of past taxes or offsets to future taxes arising from the recognition of tax effects of carry*backs* and carry*forwards* of operating losses and similar items.

.56 Deferred charges and deferred credits relating to timing differences represent the cumulative recognition given to their tax effects and as such do not represent receivables or payables in the usual sense. They should be classified in two categories—one for the net current amount and the other for the net noncurrent amount. This presentation is consistent with the customary distinction between current and noncurrent categories and also recognizes the close relationship among the various deferred tax accounts, all of which bear on the determination of income tax expense. The current portions of such deferred charges and credits should be those amounts which relate to assets and liabilities classified as current. Thus, if installment receivables are a current asset, the deferred credits representing the tax effects of uncollected installment sales should be a current item; if an estimated provision for warranties is a current liability, the deferred charge representing the tax effect of such provision should be a current item.

.57 Refunds of past taxes or offsets to future taxes arising from recognition of the tax effects of operating loss carry*backs* or carry*forwards* should be classified either as current or noncurrent. The current portion should be determined by the extent to which realization is expected to occur during the current operating cycle as defined in section 2031.

.58 Deferred taxes represent tax effects recognized in the determination of income tax expense in current and

 © 1974, American Institute of Certified Public Accountants, Inc.

prior periods, and they should, therefore, be excluded from retained earnings or from any other account in the stockholders' equity section of the balance sheet.

Income Statement

.59 In reporting the results of operations the components of income tax expense for the period should be disclosed, for example:

a. Taxes estimated to be payable

b. Tax effects of timing differences

c. Tax effects of operating losses.

These amounts should be allocated to (a) income before extraordinary items and (b) extraordinary items and may be presented as separate items in the income statement or, alternatively, as combined amounts with disclosure of the components parenthetically or in a note to the financial statements.

.60 When the tax benefit of an operating loss carry*forward* is realized in full or in part in a subsequent period, and has not been previously recognized in the loss period, the tax benefit should be reported as an extraordinary item [15] in the results of operations of the period in which realized.

.61 Tax effects attributable to adjustments of prior periods (or of the opening balance of retained earnings) and direct entries to other stockholders' equity accounts should be presented as adjustments of such items with disclosure of the amounts of the tax effects.[15]

General

.62 Certain other disclosures should be made in addition to those set forth in paragraphs .55-.61:

a. Amounts of any operating loss carry*forwards* not recognized in the loss period, together with expiration dates (indicating separately amounts which, upon recognition, would be credited to deferred tax accounts);

b. Significant amounts of any other unused deductions or credits, together with expiration dates; and

c. Reasons for significant variations in the customary relationships between income tax expense and pre-

---

[15] See section 2012.07, *Reporting the Results of Operations.*

tax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business.

The Board recommends that the nature of significant differences between pretax accounting income and taxable income be disclosed.

.63 The "net of tax" form of presentation of the tax effects of timing differences should not be used for financial reporting. The tax effects of transactions entering into the determination of pretax accounting income for one period but affecting the determination of taxable income in a different period should be reported in the income statement as elements of income tax expense and in the balance sheet as deferred taxes and not as elements of valuation of assets or liabilities.

EFFECTIVE DATE

.64 This section shall be effective for all fiscal periods that begin after December 31, 1967. However, the Board encourages earlier application of the provisions of this section.

.65 Accordingly, the tax allocation procedures set forth in this section should be applied to timing differences occurring after the effective date. (See paragraph .36 for treatment of timing differences originating prior to the effective date.) Balance sheet accounts which arose from interperiod tax allocation and accounts stated on a net of tax basis prior to the effective date of this section should be presented in the manner set forth in this section.

.66 The Board recognizes that companies may apply this section retroactively to periods prior to the effective date to obtain comparability in financial presentations for the current and future periods. If the procedures are applied retroactively, they should be applied to all material items of those periods insofar as the recognition of prior period tax effects of timing differences, operating losses and other deductions or credits is concerned. Any adjustments made to give retroactive effect to the conclusions stated in this section should be considered adjustments of prior periods and treated accordingly.[16]

AC Section 4091 A

Accounting for Income Taxes— Appendix A

EXAMPLES OF TIMING DIFFERENCES

.01 The following examples of timing differences are taken from Accounting Research Study No. 9, *Interperiod Allocation of Corporate Income Taxes,* by Homer A. Black, pages 8-10. They are furnished for illustrative purposes only without implying approval by the Board of the accounting practices described.

.02 (A) *Revenues or gains are taxed after accrued for accounting purposes:*

Profits on installment sales are recorded in accounts at date of sale and reported in tax returns when later collected.

Revenues on long-term contracts are recorded in accounts on percentage-of-completion basis and reported in tax returns on a completed-contract basis.

Revenue from leasing activities is recorded in a lessor's accounts based on the financing method of accounting and exceeds rent less depreciation reported in tax returns in the early years of a lease.

Earnings of foreign subsidiary companies are recognized in accounts currently and included in tax returns when later remitted.

.03 (B) *Expenses or losses are deducted for tax purposes after accrued for accounting purposes:*

Estimated costs of guarantees and product warranty contracts are recorded in accounts at date of sale and deducted in tax returns when later paid.

Expenses for deferred compensation, profit-sharing, bonuses, and vacation

and severance pay are recorded in accounts when accrued for the applicable period and deducted in tax returns when later paid.

Expenses for pension costs are recorded in accounts when accrued for the applicable period and deducted in tax returns for later periods when contributed to the pension plan.

Current expenses for self-insurance are recorded in accounts based on consistent computations for the plan and deducted in tax returns when losses are later incurred.

Estimated losses on inventories and purchase commitments are recorded in accounts when reasonably anticipated and deducted in tax returns when later realized.

Estimated losses on disposal of facilities and discontinuing or relocating operations are recorded in accounts when anticipated and determinable and deducted in tax returns when losses or costs are later incurred.

Estimated expenses of settling pending lawsuits and claims are recorded in accounts when reasonably ascertainable and deducted in tax returns when later paid.

Provisions for major repairs and maintenance are accrued in accounts on a systematic basis and deducted in tax returns when later paid.

Depreciation recorded in accounts exceeds that deducted in tax returns in early years because of:

accelerated method of computation for accounting purposes

shorter lives for accounting purposes

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

Organization costs are written off in accounts as incurred and amortized in tax returns.

.04 (C) *Revenues or gains are taxed before accrued for accounting purposes:*

Rent and royalties are taxed when collected and deferred in accounts to later periods when earned.

Fees, dues, and service contracts are taxed when collected and deferred in accounts to later periods when earned.

Profits on intercompany transactions are taxed when reported in separate returns, and those on assets remaining within the group are eliminated in consolidated financial statements.

Gains on sales of property leased back are taxed at date of sale and deferred in accounts and amortized during the term of lease.

Proceeds of sales of oil payments or ore payments are taxed at date of sale and deferred in accounts and recorded as revenue when produced.

.05 (D) *Expenses or losses are deducted for tax purposes before accrued for accounting purposes:*

Depreciation deducted in tax returns exceeds that recorded in accounts in early years because of:

accelerated method of computation for tax purposes

shorter guideline lives for tax purposes

amortization of emergency facilities under certificates of necessity

Unamortized discount, issue cost and redemption premium on bonds refunded are deducted in tax returns and deferred and amortized in accounts.

Research and developments costs are deducted in tax returns when incurred and deferred and amortized in accounts.

Interest and taxes during construction are deducted in tax returns when incurred and included in the cost of assets in accounts.

Preoperating expenses are deducted in tax returns when incurred and deferred and amortized in accounts.

AC Section 4091-1

Applicability of Indefinite Reversal Criteria to Timing Differences: An Interpretation of Sections 4091 and 4095

[Source: FASB Interpretation No. 22.]

April 1978

INTRODUCTION AND BACKGROUND INFORMATION

.01 The FASB has been asked to clarify whether the indefinite reversal criteria described in *APB Opinion No. 23* [section 4095], "Accounting for Income Taxes—Special Areas," are applicable beyond the four special areas addressed by that Opinion, for example, in connection with the costs of railroad gradings and tunnel bores that are reported differently for financial statement purposes and income tax purposes.

.02 Paragraph 13 of *APB Opinion No. 11* [section 4091.12], "Accounting for Income Taxes," defines differences between taxable income and pretax accounting income as either timing differences or permanent differences and provides criteria for distinguishing between the differences. Timing differences are "differences between the periods in which transactions affect taxable income and the periods in which they enter into the determination of pretax accounting income. Timing differences originate in one period and reverse or 'turn around' in one or more subsequent periods." Permanent differences are "differences between taxable income and pretax accounting income arising from transactions that, under applicable tax laws and regulations, will not be offset by corresponding differences or 'turn around' in other periods." Opinion No. 11 [section 4091] recognizes five special areas with unique aspects in which reversal of the tax consequences of some timing differences may be indefinite and defers any conclusion as to whether interperiod tax allocation should be required in those areas. The five special areas are:

a. Undistributed earnings of subsidiaries.
b. Intangible development costs in the oil and gas industry.
c. "General reserves" of stock savings and loan associations.
d. Amounts designated as "policyholders' surplus" by stock life insurance companies.
e. Deposits in statutory reserve funds by United States steamship companies.

Except for those special areas, Opinion No. 11 [section 4091] requires interperiod income tax allocation under the comprehensive allocation view adopted in the Opinion for timing differences.

.03 *APB Opinion No. 23* [section 4095] addresses three of the special areas identified in *APB Opinion No. 11* [section 4091]: undistributed earnings of subsidiaries,[1] "general reserves" of stock savings and loan associations, and amounts designated as "policyholders' surplus" by stock life insurance companies and also addresses undistributed earnings of corporate joint ventures. Opinion No. 23 [section 4095] concludes that because of special provisions of the United States Internal Revenue Code that are unique to the four special areas addressed, an enterprise might postpone indefinitely the payment of income taxes on certain differences between pretax accounting income and taxable income that would otherwise require tax allocation for financial reporting purposes. The Opinion further indicates that an enterprise must take specific action for income tax purposes before taxes on those timing differences become payable and the taxes may never become payable unless the enterprise takes those actions. However, if circumstances indicate that the enterprise is likely to pay taxes on those differences, either currently or in later years because of known or expected actions, income taxes should be accrued as tax expense of the current period. Further, the Opinion indicates that there is a presumption that interperiod income tax allocation applies to timing differences in the four special areas addressed even though the presumption may be overcome in each case.

.04 Paragraphs 5 and 6 of *APB Opinion No. 23* [section 4095.05-.06] discuss permanent and timing differences. Paragraph 6 [section 4095.06] states:

> A timing difference arises when the initial difference between taxable income and pretax accounting income originates in one period and predictably reverses or turns around in one or more subsequent periods. The reversal of a timing difference at some future date is definite and the period of reversal is generally predictable within reasonable limits. Sometimes, however, reversal of a difference cannot be predicted because the events that create the tax consequences are controlled by the taxpayer and frequently require that the taxpayer take specific action before the initial difference reverses.

---

[1] Footnote 2 of Opinion No. 23 [section 4095.09] states that the conclusions on undistributed earnings of a subsidiary also apply to the portion of the earnings of a Domestic International Sales Corporation (DISC) that is eligible for tax deferral.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

Some have suggested that the discussion of timing differences in Opinion No. 23 [section 4095] amends the definition of timing differences in *APB Opinion No. 11* [section 4091] (see paragraph .02 above).

.05 *APB Opinion No. 24* [section 4096], "Accounting for Income Taxes—Investments in Common Stock Accounted for by the Equity Method (Other than Subsidiaries and Corporate Joint Ventures)," which was issued concurrently with *APB Opinion No. 23* [section 4095], requires tax allocation for an investor's equity in the undistributed earnings of an investee other than a subsidiary or corporate joint venture, both of which are addressed by Opinion No. 23 [section 4095].

.06 *FASB Statement No. 19* [section 6021], "Financial Accounting and Reporting by Oil and Gas Producing Companies," which supersedes *FASB Statement No. 9* [section 4097], "Accounting for Income Taxes—Oil and Gas Producing Companies," addresses income tax allocation for intangible development costs in the oil and gas industry. Statement No. 19 [section 6021] requires comprehensive interperiod income tax allocation by oil and gas producing companies and prohibits "interaction" of book/tax timing differences (see paragraphs 60-62 and 260-264 of that Statement [sections 6021.060-.062 and 6021.260-.264]).

.07 This Interpretation does not modify *APB Opinion No. 17* [section 5141], "Intangible Assets," or the AICPA Industry Audit Guide, "Audits of Stock Life Insurance Companies." This Interpretation does not apply to deposits in capital construction funds or statutory reserve funds by United States steamship companies, for which *APB Opinions No. 11* [section 4091] and *23* [section 4095] did not reach a conclusion as to whether interperiod tax allocation should be required.

.08 The Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'," states that "differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect in regulated businesses of the rate-making process" and discusses the application of generally accepted accounting principles to regulated industries. Accordingly, the provisions of the Addendum shall govern the application of this Interpretation to those operations of a company that are regulated for rate-making purposes on an individual-company-cost-of-service basis.

.09 Although *APB Opinion No. 23* [section 4095] discusses criteria for identifying a special category of timing differences

involving indefinite reversal, it carefully limited the application of those criteria to specified transactions and only under certain circumstances. The Board believes that Opinion No. 23 [section 4095] was not intended to establish general criteria applicable beyond the specified areas. The Board recognizes that the income tax benefits resulting from amortization and depreciation of railroad gradings and tunnel bores, and possibly other transactions, have characteristics that might be considered similar in some respects to the four special areas addressed in Opinion No. 23 [section 4095]. However, the Board is engaged in other studies which may lead to a comprehensive reexamination of tax allocation concepts and believes that it should not reopen the matter of tax allocation at this time or extend the range of exceptions to *APB Opinion No. 11* [section 4091]. Accordingly, the Board reaffirms the applicability of Opinion No. 11 [section 4091], which requires comprehensive interperiod tax allocation for timing differences unless specifically exempted by other APB Opinions or FASB Statements.

INTERPRETATION

.10 *APB Opinion No. 23* [section 4095] acknowledges that reversal of some timing differences cannot be predicted because of special provisions in the tax law that allow a taxpayer to control the events that control the tax consequences in certain areas. Opinion No. 23 [section 4095] does not require interperiod tax allocation for timing differences in the four special areas addressed in that Opinion except in specified circumstances, and the indefinite reversal criteria of that Opinion apply only to the four special areas addressed. *APB Opinion No. 11* [section 4091] as amended to date requires interperiod tax allocation under the comprehensive allocation view adopted in that Opinion except for the four special areas addressed in Opinion No. 23 [section 4095] and for the areas described in paragraph .07 of this Interpretation.

.11 The income tax benefits resulting from amortization and depreciation of railroad gradings and tunnel bores for income tax reporting purposes are timing differences for which comprehensive interperiod income tax allocation is required. The provisions of *APB Opinion No. 23* [section 4095] do not apply to those timing differences.

EFFECTIVE DATE AND TRANSITION

.12 The provisions of this Interpretation shall be applied prospectively for timing differences occurring in fiscal years beginning after June 15, 1978. Timing differences that result

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

from depreciation or amortization reported in fiscal years beginning after June 15, 1978, shall be subject to the provisions of this Interpretation. Earlier application is encouraged in financial statements for fiscal years beginning before June 16, 1978, that have not been previously issued.

.13 If early application is adopted in financial reports for interim periods of a fiscal year beginning before June 16, 1978, previously issued financial information for any interim periods of that fiscal year that precede the period of adoption shall be restated to give effect to the provisions of this Interpretation and any subsequent presentation of that information shall be on the restated basis.

AC Section 4092

Tax Allocation Accounts—Discounting

[Source: APB Opinion No. 10, Par. 6.]

Effective for fiscal periods beginning after December 31, 1966, unless otherwise indicated

.01 Accounting Research Study No. 9, *Interperiod Allocation of Corporate Income Taxes,*[1] deals with the allocation of income taxes among accounting periods when revenues and expenses are reported for financial accounting purposes in different periods than they are for income tax purposes. The Board is presently giving attention to this general subject with a view to issuing an Opinion on it.[2] One of the questions now being considered is whether certain long-term tax allocation accounts should be determined on a discounted basis as recommended in the Study. Pending further consideration of this subject and the broader aspects of discounting as it is related to financial accounting in general and until the Board reaches a conclusion on this subject, it is the Board's opinion that, except for applications existing on the exposure date of this section (September 26, 1966) with respect to transactions consummated prior to that date, deferred taxes should not be accounted for on a discounted basis.

The next page is 8881.

---

[1] Accounting Research Studies are not statements of this Board or of the American Institute of Certified Public Accountants, but are published for the purpose of stimulating discussion on important accounting issues.

[2] APB Opinion No. 11 was issued effective for fiscal periods beginning after December 31, 1967. See section 4091.

AC Section 4093

New Depreciation Guidelines and Rules

[Source: APB Opinion No. 1, as amended.]

Issue date, unless otherwise indicated: November, 1962

.01 Accounting problems may arise in connection with the Depreciation Guidelines and Rules issued by the United States Treasury Department Internal Revenue Service as Revenue Procedure 62-21, effective July 12, 1962. [As amended, effective for fiscal periods beginning after December 31, 1967, by APB Opinion No. 11.]

.02 The service lives suggested in the Guidelines for broad classes of depreciable assets are, in general, appreciably shorter than the individual lives given in Bulletin "F," which was previously used as a guide in the determination of deductible depreciation for income tax purposes. The Guidelines purport to bring the lives used for income tax purposes into line with the actual experience of taxpayers, and thereby reduce the areas of controversy as to the amount of deductible depreciation, but not to provide another type of accelerated depreciation.

.03 For the first three years, either the new Guideline lives, or lives longer than the Guideline lives, may be used for income tax purposes without challenge. Lives shorter than those found in the Guidelines may be used if they have previously been established or are justifiable as reflecting the taxpayer's existing or intended retirement and replacement practices. If the "reserve ratio" tests provided in the Procedure subsequently indicate that the lives used for income tax purposes are not in accordance with actual retirement and replacement practices, the lives may be lengthened in accordance with the "life adjustment" tables provided in the Procedure. If the adjustment is not sufficient to bring tax and actual lives into line, the adjusted lives will then be replaced by lives determined in accordance with all of the facts and circumstances.

.04 A taxpayer should carefully review the estimates of useful life of depreciable property adopted for financial accounting purposes, with the objective of conforming them with Guideline lives to the extent that the latter fall within a reasonable range of estimated useful lives applicable in his business.

.05 With exceptions such as those discussed in paragraphs .06 and .07, net income for the period should not be *increased* as the result of the adoption of Guideline lives for income tax purposes only. Accordingly, where Guideline lives shorter than the lives used for financial accounting purposes are adopted for income tax purposes, provision for deferred income taxes should be made in the manner provided by section 4091. [As amended effective for fiscal periods beginning after December 31, 1967, by APB Opinion No. 11.]

.06 It may happen that a company has used shorter lives for accounting purposes than for tax purposes in the past, and now finds that these lives are longer than the new Guideline lives. If the lives previously used for accounting purposes are still considered reasonable, they presumably will be continued, but Guideline lives might be adopted for tax purposes. Tax-effect accounting should be introduced in this type of case in conformity with section 4091. [As amended, effective for fiscal periods beginning after December 31, 1967, by APB Opinion No. 11.]

.07 It may develop that some regulatory authorities having jurisdiction over regulated businesses will prescribe the manner in which the tax effect of the adoption of Guideline lives for income tax purposes only is to be dealt with for rate-making purposes. Where this is done, the principles set forth in section 4074.07-.08 are applicable.

The next page is 8901.

AC Section 4094

Accounting for the Investment Credit

[Source: APB Opinion Nos. 2 and 4, as amended.]

This is a combination of APB Opinion No. 2, issued December, 1962, and APB Opinion No. 4 (Amending No. 2), issued March, 1964, unless otherwise indicated

.01 The Internal Revenue Code of 1954, as amended, provides for an "investment credit" which, in general, is equal to a specified percentage of the cost of certain depreciable assets acquired and placed in service after 1961. It is subject to certain statutory limitations and the amount available in any one year is used to reduce the amount of income tax payable for that year. An investment credit once allowed is subject to recapture under certain circumstances set forth in the statute.

.02 Some decision as to the nature of the investment credit, i.e., as to the *substance* of its essential characteristics, if not indispensable, is of great significance in a determination of its accounting treatment.

.03 Three concepts as to the substance of the investment credit have been considered by the Board: (a) subsidy by way of a contribution to capital; (b) reduction in taxes otherwise applicable to the income of the year in which the credit arises; and (c) reduction in a cost otherwise chargeable in a greater amount to future accounting periods.

.04 There is no significant disagreement with the view that the investment credit is a factor which influences the determination of net income. The basic accounting issue before us therefore is not whether the investment credit increases net income but, rather, the accounting period(s) during which it should be reflected in the operating statement. Resolution of the accounting issue, in large part, rests upon the accounting principles relative to the realiza-

tion of income. This is true for both regulated and non-regulated companies. (See paragraph .22 of this section.)

.05 **Subsidy by way of a contribution to capital.** This concept, in our opinion, is the least rational because it runs counter to the conclusion that the investment credit increases the net income of some accounting period(s).

.06 **Tax reduction.** The argument for this concept essentially is that since the investment credit is made available by the Internal Revenue Code of 1954, as amended, it is in substance a selective reduction in taxes related to the taxable income of the year in which the credit arises.

.07 The General Rule of Section 38(a) of the Internal Revenue Code of 1954, as amended, provides that:

> There shall be allowed, as a credit against the tax imposed by this chapter, the amount determined under sub-part B of this part.

The tax code has traditionally distinguished between exclusions from taxable income (which affect the computation of taxes payable on taxable income of the period) and credits to be applied to reduce taxes otherwise applicable to such taxable income (which do not enter into such computation). In our view the relevant materials support the interpretation that the investment credit is an administrative procedure to permit the taxpayer to withhold the cash equivalent of the credit from taxes otherwise payable and that it is not an element entering into the computation of taxes related to income of the period.

.08 **Cost reduction.** We believe that the interpretation of the investment credit as a reduction in or offset against a cost otherwise chargeable in a greater amount to future accounting periods is supported by the weight of the pertinent factors and is based upon existing accounting principles.

.09 In reaching this conclusion we have evaluated the pertinent portions of the legislative history of the investment credit, which we regard as significant but not decisive. We also evaluated the pertinent provisions of the tax code which contain recapture and other provisions the effect of which is to make realization of the credit dependent to some degree on future events.

.10 In concluding that the cost reduction concept is based upon existing accounting principles we attach sub-

stantial weight to two points in particular. First, in our opinion, earnings arise from the use of facilities, not from their acquisition. Second, the ultimate realization of the credit is contingent to some degree on future developments. Where the incidence of realization of income is uncertain, as in the present circumstances, we believe the record does not support the treatment of the investment credit as income at the earliest possible point of time. In our opinion the alternative choice of spreading the income in some rational manner over a series of future accounting periods is more logical and supportable.

.11 In December 1962 the Board stated (in APB Opinion No. 2):
