> ". . . the allowable investment credit should be reflected in net income over the productive life of acquired property and not in the year in which it is placed in service."

.12 In January 1963 the Securities and Exchange Commission issued Accounting Series Release No. 96 in which it reported that in recognition of the substantial diversity of opinion among responsible persons in the matter of accounting for the investment credit the Commission would accept statements in which the credit was accounted for either as this Board concluded in Opinion No. 2 or as a reduction in taxes otherwise applicable to the year in which the credit arises. The Commission has recently reconsidered and reaffirmed that position.

.13 The Board's review of experience since the issuance of Opinion No. 2 shows that the investment credit has been treated by a significant number of companies as an increase in net income of the year in which the credit arose.

.14 The Revenue Act of 1964 eliminates the requirement imposed by the Revenue Act of 1962 that the investment credit be treated for income tax purposes as a reduction in the basis of the property to which the credit relates.

CONCLUSIONS

.15 It is the conclusion of this Board that the Revenue Act of 1964 does not change the essential nature of the investment credit and, hence, of itself affords no basis

for revising our Opinion as to the method of accounting for the investment credit.

.16 However, the authority of Opinions of this Board rests upon their general acceptability. The Board, in the light of events and developments occurring since the issuance of Opinion No. 2, has determined that its conclusions as there expressed have not attained the degree of acceptability which it believes is necessary to make the Opinion effective.

.17 In the circumstances the Board believes that, while the method of accounting for the investment credit recommended in paragraph .11 should be considered to be preferable, the alternative method of treating the credit as a reduction of Federal income taxes of the year in which the credit arises is also acceptable.

.18 The Board emphasizes that whichever method of accounting for the investment credit is adopted, it is essential that full disclosure be made of the method followed and amounts involved, when material.

.19 A number of alternative choices for recording the credit on the balance sheet has been considered. While we believe the reflection of the allowable credit as a reduction in the net amount at which the acquired property is stated (either directly or by inclusion in an offsetting account) may be preferable in many cases, we recognize as equally appropriate the treatment of the credit as deferred income, provided it is amortized over the productive life of the acquired property.

.20 We believe it preferable that the statement of income in the year in which the allowable investment credit arises should be affected only by the results which flow from the accounting for the credit set forth in paragraph .11. Nevertheless, reflection of income tax provisions, in the income statement, in the amount payable (that is, after deduction of the allowable investment credit) is appropriate provided that a corresponding charge is made to an appropriate cost or expense (for example, to the provision for depreciation) and the treatment is adequately disclosed in the financial statements of the first year of its adoption.

.21 An investment credit should be reflected in the financial statements only to the extent that it has been

 © 1974, American Institute of Certified Public Accountants, Inc.

used as an offset against income tax liability. Under the statute, unused investment credits may be carried backward or forward to other years. The amount of a carry*back* of unused investment credit may be set up as an asset (a claim for refund of income taxes) and be added to the allowable investment credit in accounting for the effect of the credit in the year in which the property is placed in service. A carry*forward* of unused investment credit should ordinarily be reflected only in the year in which the amount becomes "allowable," in which case the unused amount would not appear as an asset. Either of two treatments is acceptable in the preparation of income statements for the year in which these carry*backs* or carry*forwards* are recognized: (a) the amount of taxes estimated to be actually payable for such year may be shown in the income statement, with the amount of the tax reduction attributable to the amounts carried backward or forward indicated either in a footnote or parenthetically in the body of the income statement; or (b) the income statement may indicate the tax expense for the period without inclusion of such reduction, which reduction should be shown as a separate item in the statement of income. Material amounts of unused investment credits should be disclosed. [As amended, effective for fiscal periods beginning after December 31, 1966, by APB Opinion No. 9.]

AC Section 4095

Accounting for Income Taxes—Special Areas

[Source: APB Opinion No. 23, as amended.]

Effective for fiscal periods beginning after December 31, 1971, unless otherwise indicated

INTRODUCTION

.01 In December 1967 the Accounting Principles Board issued section 4091, *Income Taxes,* but deferred modifying the practices of accounting for income taxes in five special areas identified in paragraphs .37 through .40 of that section as requiring further study:

a. Undistributed earnings of subsidiaries
b. Intangible development costs in the oil and gas industry *
c. "General reserves" of stock savings and loan associations
d. Amounts designated as "policyholders' surplus" by stock life insurance companies
e. Deposits in statutory reserve funds by United States steamship companies.

.02 The Board has examined the characteristics of the tax consequences of transactions in the three special areas designated (a), (c), and (d) above and sets forth in this section its conclusions on appropriate accounting treatments. The Board defers conclusions on deposits in capital construction funds or statutory reserve funds by United States steamship companies until regulations covering the provisions of the Merchant Marine Act of 1970 are available; experience under the 1970 Act, which substantially modified the Merchant Marine Act of 1936, is now limited. The Board also expresses in this section its conclusions on accounting for taxes on income from investments in corporate joint ventures accounted for by the equity method in accordance with section 5131, *The Equity Method of Accounting for Investments in Common Stock.* Section 4096 covers accounting for taxes on income from invest-

* See section 4097, *Accounting for Income Taxes—Oil and Gas Producing Companies.*

ments in common stock accounted for by the equity method (other than subsidiaries and corporate joint ventures). [Amended, effective for financial statements issued on or after December 1, 1975, by FASB Statement No. 9.] (See section 4097.)

.03 This section supersedes section 2051.15, *Consolidated Financial Statements,* sections 4091.37-.38 and 4091.40, and section 5131.19j. Except as stated in the preceding sentence this section does not modify section 4091.

.04 This section applies to financial statements which purport to present financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles. It does not apply to regulated industries in those circumstances meeting the standards described in section 6011.

Discussion

.05 In section 4091 the Board defined differences between taxable income and pretax accounting income as either timing differences or permanent differences and provided criteria for distinguishing between the differences. Timing differences are "Differences between the periods in which transactions affect taxable income and the periods in which they enter into the determination of pretax accounting income. Timing differences originate in one period and reverse or 'turn around' in one or more subsequent periods." Permanent differences are "Differences between taxable income and pretax accounting income arising from transactions that, under applicable tax laws and regulations, will not be offset by corresponding differences or 'turn around' in other periods." The Board also recognized that the tax consequences of a number of other transactions are somewhat similar to those of timing differences; however, the initial differences between taxable income and pretax accounting income related to the transactions may not reverse until indefinite future periods or may never reverse.

.06 A timing difference arises when the initial difference between taxable income and pretax accounting income originates in one period and predictably reverses or turns around in one or more subsequent periods. The reversal of a timing difference at some future date is definite and the

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

period of reversal is generally predictable within reasonable limits. Sometimes, however, reversal of a difference cannot be predicted because the events that create the tax consequences are controlled by the taxpayer and frequently require that the taxpayer take specific action before the initial difference reverses.

UNDISTRIBUTED EARNINGS OF SUBSIDIARIES

Discussion

.07 Section 2051.15, *Consolidated Financial Statements,* which is superseded by this section, provided guides for interperiod allocation of income taxes that will be incurred at the date that previously undistributed earnings of subsidiaries are remitted to the parent company.[1] The concept of accruing income taxes for earnings included in consolidated income in accordance with section 2051 has been applied inconsistently. Some believe that the only appropriate method is to accrue related deferred taxes substantially in accordance with sections 4091.35-.36 while others believe that under the criteria set forth in section 2051 a parent company need accrue related deferred taxes only if the transfer of earnings to the parent company in a taxable distribution is imminent or relatively certain. Disclosure of the accounting for income taxes on undistributed earnings of subsidiaries has often been inadequate. Some believe that the contingent liability for taxes that would be payable if the undistributed earnings of subsidiaries were remitted should be disclosed. In their view changing circumstances, often beyond the control of the parent company, may accelerate distribution of earnings of a subsidiary so that the parent company will incur a tax for which no provision has been made. They believe an inability to determine the exact amount of the tax that might be payable is in itself no justification for not accruing the best current

[1] Section 2051.15 stated: "When separate income tax returns are filed, income taxes usually are incurred when earnings of subsidiaries are transferred to the parent. Where it is reasonable to assume that a part or all of the undistributed earnings of a subsidiary will be transferred to the parent in a taxable distribution, provision for related income taxes should be made on an estimated basis at the time the earnings are included in consolidated income, unless these taxes are immaterial in amount when effect is given, for example, to dividend-received deductions or foreign-tax credits. There is no need to provide for income tax to the parent company in cases where the income has been, or there is evidence that it will be, permanently invested by the subsidiaries, or where the only likely distribution would be in the form of a tax-free liquidation."

estimate of the contingent liability. Others believe that instead the amount of undistributed earnings of subsidiaries for which a parent company has not accrued income taxes should be disclosed in notes to financial statements. In their view disclosure of a hypothetical tax which would be payable, assuming those earnings were distributed currently, implies a contradiction of the decision that it is not necessary to provide for income taxes on the earnings in the financial statements. They do not believe that such a hypothetical tax is normally a realistic quantification of the contingent taxes that would be incurred even if some portion of the undistributed earnings were remitted.

.08 A domestic or foreign subsidiary remits earnings to a parent company after the parties consider numerous factors, including the following:

a. Financial requirements of the parent company
b. Financial requirements of the subsidiary
c. Operational and fiscal objectives of the parent company, both long-term and short-term
d. Remittance restrictions imposed by governments
e. Remittance restrictions imposed by lease or financing agreements of the subsidiary
f. Tax consequences of the remittance.

Remittance of earnings of a subsidiary may sometimes be indefinite because of the specific long-term investment plans and objectives of the parent company. Even in the absence of long-term investment plans, the flexibility inherent in the United States Internal Revenue Code may permit a parent company to postpone income taxes on the earnings of a subsidiary for an extended period or may permit the ultimate distribution to be taxed at special rates applicable to the nature of the distribution. Other circumstances may indicate that the earnings will probably be remitted in the foreseeable future. However, the parent company may control the events that create the tax consequences in either circumstance.

Opinion

.09 The Board concludes that including undistributed earnings of a subsidiary[2] in the pretax accounting income

[2] The conclusions of the Board on undistributed earnings of a subsidiary also apply to the portion of the earnings of a Domestic International Sales Corporation (DISC) that is eligible for tax deferral.

© 1974, American Institute of Certified Public Accountants, Inc.

of a parent company, either through consolidation or accounting for the investment by the equity method, may result in a timing difference, in a difference that may not reverse until indefinite future periods, or in a combination of both types of differences, depending on the intent and actions of the parent company.

.10 *Timing difference.* The Board believes it should be presumed that all undistributed earnings of a subsidiary will be transferred to the parent company. Accordingly, the undistributed earnings of a subsidiary included in consolidated income (or in income of the parent company [3]) should be accounted for as a timing difference, except to the extent that some or all of the undistributed earnings meet the criteria in paragraph .12. Income taxes attributable to a timing difference in reporting undistributed earnings of a subsidiary should be accounted for in accordance with the provisions of section 4091 for interperiod allocation of taxes. Problems in measuring and recognizing the tax effect of a timing difference do not justify ignoring income taxes related to the timing difference. Income taxes of the parent company applicable to a timing difference in undistributed earnings of a subsidiary are necessarily based on estimates and assumptions. For example, the tax effect may be determined by assuming that unremitted earnings were distributed in the current period and that the parent company received the benefit of all available tax-planning alternatives and available tax credits and deductions.[4] The income tax expense of the parent company should also include taxes that would have been withheld if the undistributed earnings had been remitted as dividends.

.11 The tax effect of a difference between taxable income and pretax accounting income attributable to losses of a subsidiary should be accounted for in accordance with the Board's conclusions on operating losses in sections 4091.43-.49.

.12 *Indefinite reversal criteria.* The presumption that all undistributed earnings will be transferred to the parent company may be overcome, and no income taxes should be

[3] Section 5131.14.

[4] As the unused tax credits that are recognized by the parent in determining deferred income taxes on undistributed earnings of a subsidiary are subsequently realized, the initial reduction in deferred taxes should be reinstated at the then current rates in accordance with the provisions of section 4091.

accrued by the parent company, if sufficient evidence shows that the subsidiary has invested or will invest the undistributed earnings indefinitely or that the earnings will be remitted in a tax-free liquidation. A parent company should have evidence of specific plans for reinvestment of undistributed earnings of a subsidiary which demonstrate that remittance of the earnings will be postponed indefinitely. Experience of the companies and definite future programs of operations and remittances are examples of the types of evidence required to substantiate the parent company's representation of indefinite postponement of remittances from a subsidiary. If circumstances change and it becomes apparent that some or all of the undistributed earnings of a subsidiary will be remitted in the foreseeable future but income taxes have not been recognized by the parent company, it should accrue as an expense of the current period income taxes attributable to that remittance; income tax expense for such undistributed earnings should not be accounted for as an extraordinary item. If it becomes apparent that some or all of the undistributed earnings of a subsidiary on which income taxes have been accrued will not be remitted in the foreseeable future, the parent company should adjust income tax expense of the current period; such adjustment of income tax expense should not be accounted for as an extraordinary item.

.13 *Change in investment.* An investment in common stock of a subsidiary may change so that it is no longer a subsidiary because the parent company sells a portion of the investment, the subsidiary sells additional stock, or other transactions affect the investment. If the remaining investment in common stock should be accounted for by the equity method, the investor should recognize income taxes on its share of current earnings of the investee company in accordance with the provisions of section 4096. If a parent company did not recognize income taxes on its equity in undistributed earnings of a subsidiary for the reasons cited in paragraph .12 (and the company in which the investment is held ceases to be a subsidiary), it should accrue as a current period expense income taxes on undistributed earnings in the period that it becomes apparent[5] that any

[5] The change in the status of an investment would not by itself mean that remittance of these undistributed earnings should be considered apparent.

 © 1974, American Institute of Certified Public Accountants, Inc.

of those undistributed earnings (prior to the change in status) will be remitted; the accrual of those income taxes should not be accounted for as an extraordinary item. If a parent company recognized income taxes on its equity in undistributed earnings of a subsidiary, the amount of deferred income taxes of the parent attributable to undistributed earnings of the subsidiary should be considered in accounting for a disposition through sale or other transaction which reduces the investment.

.14 *Disclosure.* Information concerning undistributed earnings of a subsidiary for which income taxes have not been accrued that should be disclosed in notes to financial statements includes:

a. A declaration of an intention to reinvest undistributed earnings of a subsidiary to support the conclusion that remittance of those earnings has been indefinitely postponed, or a declaration that the undistributed earnings will be remitted in the form of a tax-free liquidation, and

b. The cumulative amount of undistributed earnings on which the parent company has not recognized income taxes.[6]

INVESTMENTS IN CORPORATE JOINT VENTURES

Discussion

.15 Corporate joint ventures, as defined in section 5131 are of two kinds: (1) those essentially permanent in duration and (2) those that have a life limited by the nature of the venture or other business activity. In section 5131 the Board concluded that the equity method of accounting best enables an investor in a corporate joint venture to recognize the underlying nature of the investment regardless of duration.

.16 Unless characteristics indicate a limited life, a corporate joint venture has many of the characteristics of a subsidiary. The investors usually participate in the management of the joint venture, consider the factors set forth in paragraph .08 above, and agree (frequently before form-

[6] Other disclosure requirements in sections 4091.55-.63 may also apply. Disclosure of other matters such as available tax credits and deductions may be desirable.

ing the venture) as to plans for long-term investment, for utilizing the flexibility inherent in the United States Internal Revenue Code, and for planned remittances.

Opinion

.17 The Board concludes that the principles applicable to undistributed earnings of subsidiaries (paragraphs .09, .10, .11, .12 and .13) also apply to tax effects of differences between taxable income and pretax accounting income attributable to earnings of corporate joint ventures that are essentially permanent in duration and are accounted for by the equity method.[7]

.18 *Disclosure.* The disclosure requirements set forth in paragraph .14 also apply to earnings of corporate joint ventures.

"BAD DEBT RESERVES" OF SAVINGS AND LOAN ASSOCIATIONS

Discussion

.19 Regulatory authorities require both stock and mutual savings and loan associations to appropriate a portion of earnings to general reserves[8] and to retain the reserves as a protection for depositors. Provisions of the United States Internal Revenue Code permit a savings and loan association to deduct an annual addition to a reserve for bad debts[8] in determining taxable income, subject to certain limitations. This annual addition permitted by the Code generally differs significantly from the bad debt experience upon which determination of pretax accounting income is based. Thus, taxable income and pretax accounting income of an association usually differ.

.20 Although a general reserve determined according to requirements of the regulatory authorities is not directly related to a reserve for bad debts computed according to provisions of the United States Internal Revenue Code, the purposes and restrictions of each reserve are similar.

[7] Certain corporate joint ventures have a life limited by the nature of the venture, project, or other business activity. Therefore, a reasonable assumption is that a part or all of the undistributed earnings of the venture will be transferred to the investor in a taxable distribution. Deferred taxes should be recorded, in accordance with the concepts of section 4091 at the time the earnings (or losses) are included in the investor's income.

[8] The terms *general reserves* and *reserve for bad debts* are used in the context of the special meaning these terms have in regulatory pronouncements and in the United States Internal Revenue Code.

© 1974, American Institute of Certified Public Accountants, Inc.

Amounts of bad debt deductions for income tax purposes are includable in taxable income of later years only if the bad debt reserves are used subsequently for purposes other than to absorb bad debt losses.

.21 The term *pretax accounting income,* as used in this section, represents income or loss for a period, exclusive of related income tax expense, determined in conformity with generally accepted accounting principles. The term *taxable income,* as used in this section, represents pretax accounting income (a) adjusted for reversal of provisions for estimated losses on loans and property acquired in settlement of loans, and gains or losses on the sales of such property, and adjusted for permanent differences, and (b) after giving effect to the bad debt deduction allowable by the United States Internal Revenue Code assuming the applicable tax return were to be prepared based on such adjusted pretax accounting income.

.22 Some believe that a difference between taxable income and pretax accounting income attributable to a bad debt reserve that is accounted for as part of the general reserve and undivided profits of a savings and loan association has attributes of a permanent or indefinite deferral of tax payments. In their view, a savings and loan association should not accrue income taxes on such differences. Others believe that this difference has the principal attributes of a timing difference as described in sections 4091.35-.36. In effect, they believe that this difference is a Government-sponsored deferral of tax, that the Government has an equity in the savings and loan association to the extent of the deferred tax, and that it is inappropriate to include earnings in stockholders' equity without accruing income taxes which the the association would incur if the earnings were distributed to stockholders or otherwise became subject to tax. In their view the savings and loan association should recognize deferred taxes on the difference.

Opinion

.23 The Board concludes that a difference between taxable income and pretax accounting income attributable to a bad debt reserve that is accounted for as part of the general reserves and undivided profits of a savings and

loan association[9] may not reverse until indefinite future periods or may never reverse. The association controls the events that create the tax consequence, and the association is required to take specific action before the initial difference reverses. Therefore, a savings and loan association should not provide income taxes on this difference. However, if circumstances indicate that the association is likely to pay income taxes, either currently or in later years, because of known or expected reductions in the bad debt reserve, income taxes attributable to that reduction should be accrued as tax expense of the current period; the accrual of those income taxes should not be accounted for as an extraordinary item.

.24 *Disclosure.* Information that should be disclosed in notes to financial statements of a savings and loan association concerning bad debt reserves that are accounted for as part of the general reserves and undivided profits includes:

a. The purposes for which the reserves are provided under the applicable rules and regulations and the fact that income taxes may be payable if the reserves are used for other purposes, and

b. The accumulated amount of the reserves for which income taxes have not been accrued.[10]

.25 The disclosure requirements set forth in paragraph .24 also apply to a parent company of a savings and loan association accounting for that investment either through consolidation or by the equity method.

"POLICYHOLDERS' SURPLUS" OF STOCK LIFE INSURANCE COMPANIES

Discussion

.26 The provisions of the United States Internal Revenue Code provide for the exclusion from taxable income of a stock life insurance company of amounts determined under a formula and the allocation of those amounts to

---

[9] Section 4091.37 indicated that the "general reserves" of stock savings and loan associations was a special area requiring further study. In practice the statement also has been applied to mutual savings and loan associations and mutual savings banks. The Board affirms that its conclusions in this section apply to stock and mutual savings and loan associations and mutual savings banks.

[10] Other disclosure requirements in sections 4091.55-.63 may also apply.

© 1974, American Institute of Certified Public Accountants, Inc.

policyholders' surplus until the total policyholders' surplus equals a specified maximum. The amounts excluded from taxable income and designated as policyholders' surplus are includable in taxable income of later years if the company elects to (a) distribute policyholders' surplus to stockholders as dividends, (b) transfer amounts from policyholders' surplus to shareholders' surplus designated for tax purposes as available for any business purpose, or (c) take, or if it fails to take, certain other specified actions (none of which usually occur).

.27 Some believe that a difference between taxable income and pretax accounting income attributable to amounts designated as policyholders' surplus of a stock life insurance company has attributes of a permanent or indefinite deferral of tax payments. In their view, a stock life insurance company should not accrue income taxes on the difference between taxable income and pretax accounting income related to amounts designated as policyholders' surplus unless circumstances indicate that the insurance company is likely to pay income taxes, either currently or in future years, because of known or expected reductions in policyholders' surplus. Others believe that the difference has the principal attributes of a timing difference as described in sections 4091.35-.36. In effect, they believe that the difference is a Government-sponsored deferral of tax, that the Government has an equity in the stock life insurance company to the extent of the deferred tax, and that it is inappropriate to include earnings in stockholders' equity without accruing income taxes which would be incurred by the stock life insurance company if those earnings were distributed to stockholders or otherwise became subject to tax. In their view the stock life insurance company should accrue deferred taxes on the difference.

Opinion

.28 The Board concludes that a difference between taxable income and pretax accounting income attributable to amounts designated as policyholders' surplus of a stock life insurance company may not reverse until indefinite future periods or may never reverse. The insurance company controls the events that create the tax consequences and the company is generally required to take specific ac-

tion before the initial difference reverses. Therefore, a stock life insurance company should not accrue income taxes on the difference between taxable income and pretax accounting income attributable to amounts designated as policyholders' surplus. However, if circumstances indicate that the insurance company is likely to pay income taxes, either currently or in later years, because of known or expected reductions in policyholders' surplus, income taxes attributable to that reduction should be accrued as a tax expense of the current period; the accrual of those income taxes should not be accounted for as an extraordinary item.

.29 *Disclosure.* Information concerning amounts designated as policyholders' surplus of a stock life insurance company that should be disclosed in notes to financial statements includes:

a. The treatment of policyholders' surplus under the United States Internal Revenue Code and the fact that income taxes may be payable if the company takes certain specified actions, which should be appropriately described, and

b. The accumulated amount of the policyholders' surplus for which income taxes have not been accrued.[11]

.30 The disclosure requirements set forth in paragraph .29 also apply to a parent company of a stock life insurance company accounting for that investment either through consolidation or by the equity method.

EFFECTIVE DATE

.31 This section shall be effective for all fiscal periods beginning after December 31, 1971. However, the Board encourages earlier application of the provisions of this section.

.32 The conclusions of the Board on accounting for income taxes on undistributed earnings of subsidiaries and corporate joint ventures represent a clarification of current practice. Accordingly, this section should be applied retroactively to undistributed earnings of subsidiaries included in consolidated financial statements and to undistributed earnings applicable to unconsolidated subsidiaries and investments in corporate joint ventures accounted for by the

[11] Other disclosure requirements in sections 4091.55-.63 may also apply.

 © 1974, American Institute of Certified Public Accountants, Inc.

equity method in accordance with section 5131. An adjustment resulting from a change in accounting method to comply with this section should be treated as an adjustment of prior periods, and financial statements presented for the periods affected should be restated.

.33 The conclusions of the Board on "bad debt reserves" of savings and loan associations and amounts designated as "policyholders' surplus" by stock life insurance companies agree generally with current practice. If application of this section should result in a change in accounting principle, the adjustment should be treated as an adjustment of prior periods, and financial statements presented for the periods affected should be restated.

AC Section 4096

Accounting for Income Taxes—Investments in Common Stock Accounted for by the Equity Method (other than Subsidiaries and Corporate Joint Ventures)

[Source: APB Opinion No. 24.]

Effective for fiscal periods beginning after December 31, 1971, unless otherwise indicated

INTRODUCTION

.01 In March 1971 the Accounting Principles Board issued section 5131, *The Equity Method of Accounting for Investments in Common Stock,* and stated that the guides in section 2051.15, *Consolidated Financial Statements,* should apply in accounting for income taxes on income recognized by an investor in common stock of an investee company until the APB issued an Opinion on the special areas referred to in sections 4091.37-.40, *Income Taxes.* (See section 4095, *Accounting for Income Taxes — Special Areas.*)

.02 The Board has examined the characteristics of the tax consequences of transactions in this area and sets forth in this section its conclusion on appropriate accounting for taxes on income from investments in common stock accounted for by the equity method (other than subsidiaries and corporate joint ventures) in accordance with section 5131.

.03 This section applies to financial statements which purport to present financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles. It does not apply to regulated industries in those circumstances meeting the standards described in section 6011.

DISCUSSION

.04 The Board concluded in section 5131 that an investor should follow the equity method of accounting for

an investment in common stock if the investment in voting stock gives it the ability to exercise significant influence over operating and financial policies of an investee even though the investor holds 50% or less of the voting stock.

.05 Under the equity method of accounting for investments, an investor recognizes its share of the earnings or losses of an investee in the periods for which they are reported by the investee in its financial statements rather than in the period in which an investee declares a dividend or the period in which an investor liquidates its investment. A reasonable assumption is that a part or all of the earnings of an investee ultimately transferred to the investor or realized through the sale or liquidation of the investment will be taxable to the investor. Some believe that the assumed eventual tax consequences have the essential characteristics of a timing difference, and accordingly they would require interperiod tax allocation under the provisions of section 4091.

.06 Others believe that the principles applicable to undistributed earnings of subsidiaries (paragraphs .09, .10, .11, .12, and .13) of section 4095 are equally applicable to undistributed earnings of investees (other than subsidiaries and corporate joint ventures) accounted for by the equity method and that income taxes should be provided only on the portion of undistributed earnings of an investee that represents a timing difference and not on the portion that available evidence indicates will be invested permanently or for an indefinite period. They emphasize that application of section 5131 is based on the presumption that the investor has the ability to exercise significant influence over the operating and financial policies of the investee, and accordingly they believe that the investor must necessarily be presumed to have the ability to exercise significant influence on the extent to which and manner in which the earnings of an investee will be remitted or invested. Under such circumstances, they believe that the investor is in a position to determine and substantiate the effect of probable future remittances which may require an accrual of income tax.

OPINION

.07 The Board concludes that the tax effects of differences between taxable income and pretax accounting in-

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

come attributable to an investor's share of earnings of investee companies (other than subsidiaries and corporate joint ventures) accounted for by the equity method in accordance with section 5131 are related either to probable future distributions of dividends or to anticipated realization on disposal of the investment and therefore have the essential characteristics of timing differences. The Board believes that the ability of an investor to exercise significant influence over an investee differs significantly from the ability of a parent company to control investment policies of a subsidiary and that only control can justify the conclusion that undistributed earnings may be invested for indefinite periods.

.08 The Board believes that the determination of whether an investor's equity in undistributed earnings of an investee will be realized in the form of dividends, will be realized by ultimate disposition of the investment, or a combination of both must be based on all facts and circumstances. If evidence indicates that an investor's equity in undistributed earnings of an investee will be realized in the form of dividends, an investor should recognize income taxes attributable to the timing difference as if the equity in earnings of the investee that the investor included in income were remitted as a dividend during the period, recognizing available dividend-received deductions and foreign tax credits. Income taxes of the investor company should also include taxes that would have been withheld if the undistributed earnings had been remitted as dividends. If evidence indicates that an investor's equity in undistributed earnings of an investee will be realized by ultimate disposition of the investment, an investor should accrue income taxes attributable to the timing difference at capital gains or other appropriate rates, recognizing all available deductions and credits.

.09 The tax effect of a difference between taxable income and pretax accounting income attributable to losses of an investee should be accounted for in accordance with the Board's conclusions on operating losses in sections 4091.43-.49.

.10 *Change in Investment.* An investment in common stock of an investee (other than a subsidiary or corporate

joint venture) may change so that the investee becomes a subsidiary because the investor acquires additional common stock, the investee acquires or retires common stock or other transactions affect the investment. Or, an investment in common stock of an investee may fall below the level of ownership necessary for the investor to have the ability to exercise significant influence over operating and financial policies of the investee because the investor sells a portion of the investment, the investee sells additional stock or other transactions affect the investment. If an investment in an investee increases so that it becomes a subsidiary, the deferred income taxes previously accrued by the investor in accordance with paragraphs .07 through .09 should be included in the income of the parent company only as dividends from the subsidiary are received in amounts which exceed the parent company's share of the earnings of the subsidiary subsequent to the date it became a subsidiary. Similarly, if an investment in the investee falls below the level of ownership necessary to enable the investor to follow the equity method of accounting, the deferred income taxes previously accrued by the investor should be included in the income of the former investor only as dividends from the former investee are received in amounts which exceed the former investor's allocable share of earnings of the former investee subsequent to the date it ceased to qualify as an investee. The amount of deferred income taxes of the investor attributable to its share of the equity in earnings of the investee company should be considered in accounting for a disposition through sale or other transaction that reduces the investment.

EFFECTIVE DATE

.11 This section shall be effective for all fiscal periods beginning after December 31, 1971. However, the Board encourages earlier application of the provisions of this section.

.12 The conclusions of the Board on accounting for income taxes on investments in common stock (other than subsidiaries and corporate joint ventures) represent a clarification of current practice. Accordingly, this section should be applied retroactively to undistributed earnings applicable to investments (other than subsidiaries and cor-

© 1974, American Institute of Certified Public Accountants, Inc.

porate joint ventures) accounted for by the equity method in accordance with section 5131. Adjustments resulting from a change in accounting method to comply with this section should be treated as adjustments of prior periods, and financial statements presented for the periods affected should be restated.

AC Section 4097

*Accounting for Income Taxes— Oil and Gas Producing Companies**

an amendment of sections 4091 and 4095
[Source: FASB Statement No. 9.]

October 1975

INTRODUCTION AND BACKGROUND INFORMATION

.01 *APB Opinion No. 11* [section 4091], "Accounting for Income Taxes," issued in 1967, has not required interperiod income tax allocation with respect to "intangible development costs" incurred by oil and gas producing companies. Paragraph 40 of the Opinion [section 4091.39] states:

> Intangible development costs in the oil and gas industry are commonly deducted in the determination of taxable income in the period in which the costs are incurred. Usually the costs are capitalized for financial accounting purposes and are amortized over the productive periods of the related wells. A question exists as to whether the tax effects of the current deduction of these costs for tax purposes should be deferred and amortized over the productive periods of the wells to which the costs relate. Other items have a similar, or opposite, effect because of the interaction with "percentage" depletion for income tax purposes. The Board [APB] has decided to defer any conclusion on these questions until the accounting research study on extractive industries is completed and an Opinion is issued on that subject.

.02 Paragraph 33 of *APB Opinion No. 11* [section 4091.32] cites as an example of a permanent difference (defined in paragraph 13(f) [section 4091.12(f)] of that Opinion) "the excess of statutory depletion over cost depletion."

.03 *APB Opinion No. 23* [section 4095], "Accounting for Income Taxes—Special Areas," issued in 1972, amended *APB Opinion No. 11* [section 4091] in certain respects but did not modify paragraph 40 of *APB Opinion No. 11* [section 4091.39]. Paragraph 2 of *APB Opinion No. 23* [section 4095.02] states: "The Board [APB] continues to defer conclusions on intangible development costs in the oil and gas industry pending the issuance of an Opinion on extractive industries."

.04 Prior to the effective date of *APB Opinion No. 11* [section 4091], some oil and gas producing companies had allocated income taxes with respect to intangible drilling and development costs and some other costs associated with the exploration for and

* This section has been superseded, effective for financial statements for fiscal years beginning after December 15, 1978 by FASB Statement No. 19, *Financial Accounting and Reporting by Oil and Gas Producing Companies*. (See section 6021.)

development of oil and gas reserves that entered into the determination of taxable income and pretax accounting income in different periods. Those companies generally have continued that practice since the issuance of *APB Opinion No. 11* [section 4091].

.05 On the other hand, both before and after the effective date of *APB Opinion No. 11* [section 4091] many oil and gas producing companies have not allocated income taxes with respect to those costs. The fact that percentage depletion over the life of oil and gas properties was expected to exceed costs of that type that are capitalized and amortized in the determination of pretax accounting income (i. e., the interaction with percentage depletion described in the citation in paragraph .01 of this Statement) has generally been cited as the conceptual basis for not allocating income taxes.

.06 The Tax Reduction Act of 1975 (hereinafter sometimes referred to as the *Act*) substantially reduced or eliminated percentage depletion as a Federal income tax deduction for many oil and gas producing companies as of January 1, 1975.

.07 The Board has, among other things, (a) examined the provisions of the Act relating to percentage depletion for oil and gas production, (b) reviewed a report dated April 11, 1975 of an American Petroleum Institute survey of 25 oil and gas producing companies on interperiod tax allocation relating to the elimination of percentage depletion, and (c) reviewed the financial statements of a number of oil and gas producing companies.

.08 The Board originally concluded not to hold a public hearing on the specific issue of interperiod tax allocation related to intangible drilling and development costs and other costs associated with the exploration for and development of oil and gas reserves. An Exposure Draft of a proposed Statement on "Accounting for Income Taxes—Oil and Gas Producing Companies" was issued on April 25, 1975. Ninety-eight letters were received in response to the request for comments. Most of the respondents objected to the method of transition set forth in paragraph 15 of the Exposure Draft, but they held widely divergent views about other methods of transition. On June 26, 1975 the Board announced that it would hold a public hearing. A Notice of Public Hearing was issued on July 10, 1975 stating that the purpose of the public hearing was to provide an opportunity for the Board to receive additional information from, and to hear the views of, interested persons and groups with respect to the accounting problems and issues associated with this matter, in particular those issues discussed in paragraphs 11-17 and Appendix A of the Exposure Draft and those issues and questions set forth in Appendix 1 of the Notice of Public Hearing. The Board received 54 position papers,

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

letters of comment, and outlines of oral presentation in response to the Notice of Public Hearing. Twenty-seven presentations were made at the public hearing.

.09 The basis for the Board's conclusions, as well as alternatives considered and reasons for their rejection, are discussed in Appendix A to this Statement.

.10 This Statement applies to regulated enterprises in accordance with the provisions of the Addendum to *APB Opinion No. 2* [section 6011] "Accounting for the 'Investment Credit.'"

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Interperiod Tax Allocation

.11 Commencing January 1, 1975, interperiod tax allocation is required [1] for intangible drilling and development costs [2] and other costs [3] associated with the exploration for and development of oil and gas reserves that enter into the determination of taxable income and pretax accounting income in different periods (hereinafter referred to as *IDC financial accounting/tax differences*) pursuant to the provisions of *APB Opinion No. 11* [section 4091].

.12 An oil or gas producing company that heretofore has not allocated income taxes related to IDC financial accounting/tax differences shall, as of January 1, 1975, begin allocating income taxes on the difference (hereinafter referred to as the *net change*) between (i) IDC financial accounting/tax differences originating in the period and (ii) the reversal of similar differences during the period. *APB Opinion No. 11* [section 4091], particularly paragraphs 36-37 [section 4091.35-.36] thereof, specifies the method for computing the income tax effect [4] relating to the net change. In any period during which reversals exceed originating timing differences, the resulting income tax effect shall reduce previously deferred income taxes attributable only to the costs described in paragraph .11 and footnotes 2 and 3. If deferred income taxes have not been provided or if previously deferred income taxes are eliminated, deferred tax credits attributable to other items shall not be reduced, and the excess income tax effect shall be charged to income tax expense in the period in which the excess arises.

[1] See the exception provided by paragraph .13, however.

[2] Intangible drilling and development costs include costs incurred with respect to both producing and nonproducing wells or properties.

[3] These other costs include costs such as geological and geophysical costs, leasehold costs, delay rentals, advance or shut-in royalties, and ad valorem taxes, some of which may be charged to expense for financial accounting purposes before they are deducted for income tax purposes.

[4] The income tax effect referred to in this Statement is determined in the same manner as if income taxes had been allocated on IDC financial accounting/tax differences in the periods of their origination using the net change method as set forth in *APB Opinion No. 11* [section 4091].

.13 In making the computation of deferred income tax expense as set forth in the first sentence of paragraph .12, an oil or gas producing company with excess statutory depletion [5] may elect, but is not required, to recognize interaction with percentage depletion. If this election is made, income taxes shall be deferred on the amount by which originating timing differences exceed reversals during the period, except that the amount on which income taxes are deferred in that period shall be limited to the excess of cumulative IDC financial accounting/tax differences at the end of the period over the sum of (a) excess statutory depletion and (b) cumulative IDC financial accounting/tax differences with respect to which income taxes have been allocated. In periods in which reversals exceed originating timing differences, previously deferred income taxes attributable only to the costs described in paragraph .11 and footnotes 2 and 3 shall be reduced.[6] If at the end of the period the sum of (a) excess statutory depletion and (b) cumulative IDC financial accounting/tax differences with respect to which income taxes have been allocated is equal to or greater than cumulative IDC financial accounting/tax differences, income taxes shall not be allocated on the amount by which originating timing differences exceed reversals during the period. Previously deferred income taxes attributable to the costs described in paragraph .11 and footnotes 2 and 3 shall not be reduced unless reversals exceed originating timing differences during the period.[7] See Appendix B for examples of the application of this paragraph.

.14 Prior to January 1, 1975, certain oil and gas producing companies allocated income taxes in accordance with the provisions of *APB Opinion No. 11* [section 4091] with respect to IDC financial accounting/tax differences without recognizing interaction with percentage depletion. This method of income tax allocation shall continue as an accepted method. Accordingly, an oil or gas producing company may change to that method of accounting and, if it does, shall apply the method retroactively by restating financial statements and financial summaries or other data derived therefrom presented for prior periods (see paragraphs 18, 26, and 27 of *APB Opinion No. 9* [sections 2010.17, 2010.25, and 2010.26], "Reporting the Results of Operations"). If records are not available to make the detailed year-by-year

[5] *Excess statutory depletion* is the excess of estimated statutory depletion allowable as an income tax deduction in future years over the amount of cost depletion otherwise allowable as a tax deduction, determined on a total enterprise basis.

[6] If deferred income taxes have not been provided or if previously deferred income taxes are eliminated, deferred tax credits attributable to other items shall not be reduced, and any excess income tax effect shall be charged to income tax expense in the period in which the excess arises.

[7] See footnote 6.

Copyright © 1975 by Financial Accounting Standards Board

"with and without" computations under this method (see paragraph 36 of *APB Opinion No. 11* [section 4091.35]), reasonable approximations shall be made. Considering the unique circumstance of the question at hand, the requirement of paragraphs 15-17 of *APB Opinion No. 20* [section 1051.15-.17], "Accounting Changes," for justification of a change in accounting principle need not be met in connection with a change made in accordance with this paragraph.

Disclosure

.15 Because different methods of accounting are permitted in paragraphs .12-.14 of this Statement and because of the uncertainties involved in estimating future statutory depletion, a company that allocates income taxes in accordance with paragraph .12 or .13 shall disclose in its financial statements the amount of cumulative IDC financial accounting/tax differences at the end of the period with respect to which income taxes have not been allocated. In addition, when it becomes probable that future reversals of IDC financial accounting/tax differences will exceed future originating differences of a similar nature and that the excess income tax effect (referred to in paragraphs .12 and .13) will be charged to income tax expense, the company shall disclose that probability.

Amendments to Existing Pronouncements

.16 *APB Opinion No. 11* [section 4091] exempted "intangible development costs" from the requirement for interperiod tax allocation pending further study of the question of interaction with percentage depletion, and that exemption was continued in *APB Opinion No. 23* [section 4095]. The Board has not considered, and therefore does not in this Statement address, the question of whether interperiod tax allocation should or should not be affected by that interaction. In light of the substantial reduction in or elimination of percentage depletion for many companies resulting from the Tax Reduction Act of 1975, however, the exemption in *APB Opinions No. 11* [section 4091] and *23* [section 4095] of intangible development costs from the requirement for interperiod tax allocation is removed by this Statement. Accordingly, this Statement supersedes paragraph 40 of *APB Opinion No. 11* [section 4091.39] and the second sentence of paragraph 2 of *APB Opinion No. 23* [section 4095.02].

Effective Date

.17 This Statement shall be effective with respect to financial statements issued on or after December 1, 1975, although earlier application is encouraged.

.18 If financial statements for the fiscal year that includes January 1, 1975 have been issued prior to December 1, 1975, when those financial statements or financial summaries or other data derived therefrom are subsequently presented, they shall be restated to reflect the requirements of this Statement. Interim financial reports issued prior to December 1, 1975 that include results of operations subsequent to December 31, 1974 also shall be restated to reflect the requirements of this Statement.

The provisions of this Statement need not be applied to immaterial items.

Appendix A

BASIS FOR CONCLUSIONS

.19 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others.

.20 The scope of this Statement is limited to the question of whether, in light of the Tax Reduction Act of 1975, interperiod tax allocation is now required for IDC financial accounting/tax differences. Although the Board has not considered the question of whether interperiod tax allocation should or should not be affected by interaction with percentage depletion, it has set forth in paragraph .13 the method of computing deferred income taxes when interaction with percentage depletion is recognized.

.21 Allocation of income taxes on timing differences is the basic concept of *APB Opinion No. 11* [section 4091]. That Opinion had allowed an exemption for "intangible development costs," however, pending further study of the question of interaction with percentage depletion. Because the Tax Reduction Act of 1975 substantially reduced or eliminated percentage depletion for many companies as of January 1, 1975, the Board concluded that the exemption of intangible drilling and development costs and other costs from the provisions of *APB Opinion No. 11* [section 4091] is no longer appropriate. Accordingly, paragraph .11 of this Statement requires that beginning January 1, 1975 income taxes be deferred on IDC financial accounting/tax differences. Because the Board has not considered whether interperiod tax allocation should or should not be affected by interaction with percentage depletion, paragraph .13 permits, but does not require, companies to recognize interaction with percentage depletion.

The next page is 8959.

.22 In the Exposure Draft, the Board set forth five methods of transition that had been considered:

a) *Retroactive restatement.* Record the cumulative income tax effect that had not been deferred prior to January 1, 1975 by restating the financial statements for prior periods. Thereafter, allocate income taxes in accordance with *APB Opinion No. 11* [section 4091].

b) *Direct charge to retained earnings without restatement.* Record the cumulative income tax effect that had not been deferred prior to January 1, 1975 by a direct charge to retained earnings as of that date, with no restatement of financial statements for prior periods. Thereafter, allocate income taxes in accordance with *APB Opinion No. 11* [section 4091].

c) *Allocate taxes prospectively—gross method.* Allocate income taxes only with respect to IDC financial accounting/tax differences arising after December 31, 1974.

d) *Allocate taxes prospectively—net method.* Allocate income taxes on the net change in (i) IDC financial accounting/tax differences originating in the period and (ii) the reversal of similar differences during the period.

e) *Charge in the income statement.* Record the cumulative income tax effect that had not been deferred prior to January 1, 1975 by a charge in the income statement, with no restatement of financial statements for prior periods. Thereafter, allocate income taxes in accordance with *APB Opinion No. 11* [section 4091].

Charge in the Income Statement

.23 The method proposed in the Exposure Draft would have required an income statement charge as of January 1, 1975 for the cumulative income tax effect that had not been deferred prior to that date; the charge in the income statement would have been reported between the captions "extraordinary items" and "net income." The Board reasoned that reporting the charge separately between the captions "extraordinary items" and "net income" would have highlighted the fact that passage of the Act was a unique event of considerable impact on oil and gas producing companies and would have segregated the charge in the presentation of results of current operations. Respondents to the Exposure Draft and the Notice of Public Hearing argued that users of financial statements in general would not understand the charge in the income statement. They reasoned that, as a result of the emphasis users place on net income, comparability of financial statements would be weakened since net income for

none of the years 1974, 1975, and 1976 would be comparable. They also reasoned that to require a charge now based on a 1975 event, viz., passage of the Act, would be inconsistent with the fact that the effect of the Act is prospective in nature and that the accounting should reflect that fact. The Board took these arguments into consideration in concluding that this method of transition should not be adopted.

Allocate Taxes Prospectively—Net Method

.24 The Board originally rejected the prospective net method because it appeared inconsistent with the rationale underlying paragraph 37 of *APB Opinion No. 11* [section 4091.36]. That paragraph states that the net change method is permitted only "if the applicable deferred taxes have been provided in accordance with this Opinion on the cumulative timing differences as of the beginning of the period." Certain respondents to the Exposure Draft and the Notice of Public Hearing argued that they had provided *applicable* deferred income taxes in prior years with respect to IDC financial accounting/tax differences in accordance with *APB Opinion No. 11* [section 4091], either on the basis of interaction with percentage depletion or because of the exemption referred to in paragraph 40 [section 4091.39] of that Opinion, and that, therefore, use of the net change method on a prospective basis is appropriate and consistent with prior accounting. In addition, certain of those respondents suggested that the prospective net method would result in income statement presentations after 1974 that would facilitate comparisons of results of operations of oil and gas producing companies. Other respondents pointed out that considering the unique circumstance of the question at hand existing accounting pronouncements are ambiguous with respect to the proper method of transition and that conceptual support is not limited to any one method of transition. They concluded that the prospective net method represents a practical solution to a unique and complex problem. The Board took these arguments into consideration in concluding that the prospective net method together with the disclosures required by paragraph .15 represent a practical and reasonable solution to the problem.

Retroactive Restatement

.25 One question that arises in connection with retroactive restatement of prior year financial statements concerns the feasibility of making the computations for individual prior years, because of the detailed information that might be required in making the year-by-year "with and without" computations under paragraph 36 of *APB Opinion No. 11* [section 4091.35]. Some respond-

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

ents indicated that the computations would be impossible or extremely difficult because, in certain cases, records are not available or were not kept on a basis suitable for that purpose. Other respondents indicated, however, that the retroactive restatement could be computed on a reasonable basis. The Board notes that some oil and gas producing companies have been allocating income taxes on IDC financial accounting/tax differences, and have been doing so without recognizing interaction with percentage depletion. Some respondents reasoned that this method would result in greater comparability of financial statements of an individual company among years, as well as among oil and gas producing companies in general, than would any of the other methods considered. After considering all of the circumstances, the Board decided that retroactive restatement should not be required but should be permitted. The Board concluded, therefore, that it would be appropriate for a company to change its method of accounting to that of allocating income taxes without recognizing interaction with percentage depletion and, if it does, financial statements presented for prior periods should be restated.

Direct Charge to Retained Earnings without Restatement

.26 Direct charges or credits to retained earnings without restatement of prior period financial statements are prohibited by *APB Opinion No. 9* [section 2010]. Consequently, the Board concluded that it would be inappropriate to record the cumulative income tax effect at January 1, 1975 by a direct charge to retained earnings as of that date. To do so would be in conflict with the basic concepts underlying *APB Opinion No. 9* [section 2010].

Allocate Taxes Prospectively—Gross Method

.27 Allocation of income taxes only with respect to IDC financial accounting/tax differences arising after December 31, 1974 would result in substantial variations in the ratio of income tax expense to pretax accounting income reported in financial statements for periods ending after that date. Costs unamortized for financial accounting purposes as of January 1, 1975 but previously deducted for income tax purposes would be amortized in determination of pretax accounting income after December 31, 1974 with no corresponding reversal of deferred income taxes because none would have been recorded. As a result, a company's effective income tax rate might appear to be abnormally high. Moreover, the degree of "abnormality" could vary significantly among companies depending on the extent of IDC financial accounting/tax differences at January 1, 1975. Further, practical difficulties exist in applying this method because of the need to identify separately

certain pre-1975 and post-1974 information. Accordingly, the Board rejected this method.

Other Matters

.28 The Exposure Draft proposed disclosure of the amount of additional income taxes paid or payable for the first full fiscal year beginning on or after January 1, 1975 as a result of the reduction or elimination of percentage depletion. Certain respondents argued that this would be a burdensome, hypothetical calculation and that the disclosures required by paragraph 63(c) of *APB Opinion No. 11* [section 4091.62(c)] will reflect the result of the reduction or elimination of percentage depletion caused by the Act. The Board found merit in these arguments and as a result concluded that this additional disclosure should not be required.

.29 The Notice of Public Hearing included a question concerning what difficulties, if any, exist with respect to net operating loss carryforwards, investment tax credit carryforwards, and foreign tax credit carryforwards in the application of the transition method(s) preferred. Those respondents who addressed this point indicated that accounting for those carryforwards could be accommodated by the provisions of *APB Opinion No. 11* [section 4091].

.30 Several respondents commented that the recognition of interaction with percentage depletion should not be permitted. The Board concluded that interaction with percentage depletion should continue to be permitted as set forth by paragraph .13 of this Statement because to do otherwise would require examination of the conceptual basis of interaction. As stated in paragraph .16 of this Statement, the Board has not considered the question of whether interperiod tax allocation should or should not be affected by that interaction.

.31 The Board has concluded it advisable that this Statement be effective as set forth in paragraph .17.

Appendix B

EXAMPLES OF APPLICATION OF PARAGRAPH .13

.32 The following examples illustrate the computation of deferred income taxes under the election permitted by paragraph .13 of this Statement. It should be recognized that these examples do not comprehend all possible circumstances and do not include the disclosures required by paragraph .15.

General Assumptions

.33 The assumptions on which the examples are based are as follows:

Copyright © 1975 by Financial Accounting Standards Board

a) The company's fiscal year-end is December 31.

b) The rate for deferring income taxes resulting from applying the computation required by paragraph .12 is 48 percent.

c) Excess statutory depletion:

January 1, 1975	$ 505,000
December 31, 1975	400,000
December 31, 1976	650,000
December 31, 1977	860,000
December 31,1978	1,020,000
December 31, 1979	1,000,000
December 31, 1980	800,000

d) Cumulative IDC financial accounting/tax differences:

January 1, 1975	$ 500,000
December 31, 1975	600,000
December 31, 1976	760,000
December 31, 1977	930,000
December 31, 1978	1,010,000
December 31, 1979	990,000
December 31, 1980	960,000

December 31, 1975

.34 At December 31, 1975 cumulative IDC financial accounting/tax differences ($600,000) exceeds by $200,000 the sum of (a) excess statutory depletion ($400,000) and (b) cumulative IDC financial accounting/tax differences with respect to which taxes had been allocated (zero). Therefore, income taxes of $48,000 would be deferred with respect to the $100,000 increase in IDC financial accounting/tax differences during the year.

December 31, 1976

.35 At December 31, 1976 cumulative IDC financial accounting/tax differences ($760,000) exceeds by $10,000 the sum of (a) excess statutory depletion ($650,000) and (b) cumulative IDC financial accounting/tax differences with respect to which income taxes had been allocated ($100,000). Although IDC financial accounting/tax differences increased $160,000 during the year, the amount on which income taxes would be deferred is limited to $10,000. Therefore, income taxes of $4,800 would be deferred in the current year.

December 31, 1977

.36 At December 31, 1977 the sum of (a) excess statutory depletion ($860,000) and (b) cumulative IDC financial accounting/tax differences with respect to which income taxes had been allocated ($110,000) exceeds cumulative IDC financial accounting/

tax differences ($930,000). Therefore, no income taxes would be deferred in the current year. Previously deferred income taxes would not be reduced.

December 31, 1978

.37 At December 31, 1978 the sum of (a) excess statutory depletion ($1,020,000) and (b) cumulative IDC financial accounting/tax differences with respect to which income taxes had been allocated ($110,000) exceeds cumulative IDC financial accounting/tax differences ($1,010,000). Therefore, no income taxes would be deferred in the current year. Previously deferred income taxes would not be reduced.

December 31, 1979

.38 Reversals exceed originating IDC financial accounting/tax differences during the year by $20,000. Therefore, previously deferred income taxes would be reduced by $9,600 in the current year.

December 31, 1980

.39 Reversals exceed originating IDC financial accounting/tax differences during the year by $30,000. Therefore, previously deferred income taxes would be reduced by $14,400 in the current year.

Copyright © 1975 by Financial Accounting Standards Board

.40 The following summarizes the examples in paragraphs .33-.39:

	1	2	3	4	5	6	7
		IDC Financial Accounting/Tax Differences					
	Excess Statutory Depletion	Cumulative	Net Change	Memo Amounts*	Portion of Net Change on which Deferred Tax is Computed	Deferred Tax Expense Dr. (Cr.)	Cumulative Deferred Tax
1/01/75	$ 505,000	$ 500,000	$ N/A	$ 505,000	$ -0-	$ -0-	$ -0-
12/31/75	400,000	600,000	100,000	400,000	100,000	48,000	48,000
12/31/76	650,000	760,000	160,000	750,000	10,000	4,800	52,800
12/31/77	860,000	930,000	170,000	970,000	-0-	-0-	52,800
12/31/78	1,020,000	1,010,000	80,000	1,130,000	-0-	-0-	52,800
12/31/79	1,000,000	990,000	(20,000)	1,110,000	(20,000)	(9,600)	43,200
12/31/80	800,000	960,000	(30,000)	890,000	(30,000)	(14,400)	28,800

*Memo amounts represent the sum of (a) excess statutory depletion and (b) cumulative IDC financial accounting/tax differences with respect to which income taxes have been allocated (column 1 plus the cumulative amount in column 5 at the beginning of the period).

AC Section 4111

Interest on Receivables and Payables

[Source: APB Opinion No. 21.]

Effective for transactions entered into on or after October 1, 1971 unless otherwise indicated [1]

INTRODUCTION

.01 *Problem.* Business transactions often involve the exchange of cash or property, goods, or service for a note or similar instrument. The use of an interest rate that varies from prevailing interest rates warrants evaluation of whether the face amount and the stated interest rate of a note or obligation provide reliable evidence for properly recording the exchange and subsequent related interest. This section sets forth the Board's views regarding the appropriate accounting when the face amount of a note does not reasonably represent the present value [2] of the consideration given or received in the exchange. This circumstance may arise if the note is noninterest bearing or has a stated interest rate which is different from the rate of interest appropriate for the debt at the date of the transaction. Unless the note is recorded at its present value in this circumstance the sales price and profit to a seller in the year of the transaction and the purchase price and cost to the buyer are misstated, and interest income and interest expense in subsequent periods are also misstated. The primary objective of this section is to refine the manner of applying existing accounting principles in this circumstance. Thus, it is not intended to create a new accounting principle.

.02 *Applicability.* The principles discussed in this section are applicable to receivables and payables which represent contractual rights to receive money or contractual obligations to pay money on fixed or determinable dates, whether or not there is any stated provision for interest, except as stated in paragraphs .03 and .04. Such receivables and payables are collectively referred to in this section as

---

[1] See Paragraph .16.

[2] *Present value* is the sum of the future payments discounted to the present date at an appropriate rate of interest. Section 4111A contains a description of the valuation process.

"notes." Examples are secured and unsecured notes, debentures, bonds, mortgage notes, equipment obligations, and some accounts receivable and payable.

.03 Except that paragraph .15 covering statement presentation of discount and premium is applicable in all circumstances, this section is not intended to apply to:

(a) receivables and payables arising from transactions with customers or suppliers in the normal course of business which are due in customary trade terms not exceeding approximately one year;

(b) amounts which do not require repayment in the future, but rather will be applied to the purchase price of the property, goods, or service involved (e. g., deposits or progress payments on construction contracts, advance payments for acquisition of resources and raw materials, advances to encourage exploration in the extractive industries);

(c) amounts intended to provide security for one party to an agreement (e. g., security deposits, retainages on contracts);

(d) the customary cash lending activities and demand or savings deposit activities of financial institutions whose primary business is lending money;

(e) transactions where interest rates are affected by the tax attributes or legal restrictions prescribed by a governmental agency (e. g., industrial revenue bonds, tax exempt obligations, government guaranteed obligations, income tax settlements); and

(f) transactions between parent and subsidiary companies and between subsidiaries of a common parent.[3]

.04 This section is also not intended to apply to, and the Board is not presently taking a position[4] as to, the application of the present value measurement (valuation) technique to estimates of contractual or other obligations assumed in connection with sales of property, goods, or

[3] The Board has deferred consideration of the treatment of transactions between such companies pending consideration of the subject of reporting on components of a business enterprise and completion of the Accounting Research Study on intercorporate investments.

[4] In section 4092, the Board concluded that deferred income taxes should not be accounted for on a discounted (present value) basis. That conclusion is not modified by this section.

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

service, for example, a warranty for product performance. This section does not alter the accounting for convertible debt securities described in section 5516, *Accounting for Convertible Debt and Debt Issued with Stock Purchase Warrants.*

DISCUSSION

.05 *Note received or issued for cash.* The total amount of interest during the entire period of a cash loan is generally measured by the difference between the actual amount of cash received by the borrower and the total amount agreed to be repaid to the lender. Frequently, the stated or coupon interest rate differs from the prevailing rate applicable to similar notes, and the proceeds of the note differ from its face amount. As section 4111A demonstrates, such differences are related to differences between the present value upon issuance and the face amount of the note. The difference between the face amount and the proceeds upon issuance is shown as either discount or premium, which is amortized over the life of the note.[5]

.06 *Unstated rights or privileges.* A note issued solely for cash equal to its face amount is presumed to earn the stated rate of interest. However, in some cases the parties may also exchange unstated (or stated) rights or privileges, which are given accounting recognition by establishing a note discount or premium account. In such instances, the effective interest rate differs from the stated rate. For example, a corporation may lend a supplier cash which is to be repaid five years hence with no stated interest. Such a noninterest bearing loan may be partial consideration under a purchase contract for supplier products at lower than the prevailing market prices. In this circumstance, the difference between the present value of the receivable and the cash loaned to the supplier is appropriately regarded as an addition to the cost of products purchased during the con-

[5] For example, if a bond is issued at a discount or premium, such discount or premium is recognized in accounting for the original issue. The coupon or stated interest rate is not regarded as the effective yield or market rate. Moreover, if a long-term noninterest bearing note or bond is issued, its net proceeds are less than face amount and an effective interest rate is based on its market value upon issuance. As section 4111A illustrates, the coupon or stated rate of interest and the face amount of a note or bond may *not* be the appropriate bases for valuation. The presumption that market values provide the evidence for valuation must be overcome before using coupon or stated rates and face or maturity amounts as the bases for accounting.

tract term. The note discount is amortized as interest income over the five-year life of the note.

.07 *Note received or issued in a noncash transaction.* A note exchanged for property, goods, or service represents two elements, which may or may not be stipulated in the note: (1) the principal amount, equivalent to the bargained exchange price of the property, goods, or service as established between the supplier and the purchaser and (2) an interest factor to compensate the supplier over the life of the note for the use of funds he would have received in a cash transaction at the time of the exchange. Notes so exchanged are accordingly valued and accounted for at the present value of the consideration exchanged between the contracting parties at the date of the transaction in a manner similar to that followed for a cash transaction. The difference between the face amount and the present value upon issuance is shown as either discount or premium, which is amortized over the life of the note.

.08 *Determining present value.* If determinable, the established exchange price (which, presumably, is the same as the price for a cash sale) of property, goods, or service acquired or sold in consideration for a note may be used to establish the present value of the note. When notes are traded in an open market, the market rate of interest and market value of the notes provide the evidence of the present value. The above methods are preferable means of establishing the present value of the note.

.09 If an established exchange price is not determinable and if the note has no ready market, the problem of determining present value is more difficult. To estimate the present value of a note under such circumstances, an applicable interest rate is approximated which may differ from the stated or coupon rate. This process of approximation is frequently called imputation, and the resulting rate is often called an imputed interest rate. Nonrecognition of an apparently small difference between the stated rate of interest and the applicable current rate may have a material effect on the financial statements if the face amount of the note is large and its term is relatively long.

OPINION

.10 *Note exchanged for cash.* When a note[6] is re-

[6] Paragraphs .02, .03 and .04 describe the applicability of this section.

 © 1974, American Institute of Certified Public Accountants, Inc.

ceived or issued solely for cash and no other right or privilege is exchanged, it is presumed to have a present value at issuance measured by the cash proceeds exchanged. If cash and some other rights or privileges are exchanged for a note, the value of the rights or privileges should be given accounting recognition as described in paragraph .06.

.11 *Note exchanged for property, goods, or service.* When a note is exchanged for property, goods, or service in a bargained transaction entered into at arm's length, there should be a general presumption that the rate of interest stipulated by the parties to the transaction represents fair and adequate compensation to the supplier for the use of the related funds. That presumption, however, must not permit the form of the transaction to prevail over its economic substance and thus would not apply if (1) interest is not stated, or (2) the stated interest rate is unreasonable (paragraphs .12 and .13) or (3) the stated face amount of the note is materially different from the current cash sales price for the same or similar items or from the market value of the note at the date of the transaction. In these circumstances, the note, the sales price, and the cost of the property, goods, or service exchanged for the note should be recorded at the fair value of the property, goods, or service or at an amount that reasonably approximates the market value of the note, whichever is the more clearly determinable. That amount may or may not be the same as its face amount, and any resulting discount or premium should be accounted for as an element of interest over the life of the note (paragraph .14). In the absence of established exchange prices for the related property, goods, or service or evidence of the market value of the note (paragraph .08), the present value of a note that stipulates either no interest or a rate of interest that is clearly unreasonable should be determined by discounting all future payments on the notes using an imputed rate of interest as described in paragraphs .12 and .13. This determination should be made at the time the note is issued, assumed, or acquired; any subsequent changes in prevailing interest rates should be ignored.

.12 *Determining an appropriate interest rate.* The variety of transactions encountered precludes any specific interest rate from being applicable in all circumstances. However, some general guides may be stated. The choice

of a rate may be affected by the credit standing of the issuer, restrictive covenants, the collateral, payment and other terms pertaining to the debt, and, if appropriate, the tax consequences to the buyer and seller. The prevailing rates for similar instruments of issuers with similar credit ratings will normally help determine the appropriate interest rate for determining the present value of a specific note at its date of issuance. In any event, the rate used for valuation purposes will normally be at least equal to the rate at which the debtor can obtain financing of a similar nature from other sources at the date of the transaction. The objective is to approximate the rate which would have resulted if an independent borrower and an independent lender had negotiated a similar transaction under comparable terms and conditions with the option to pay the cash price upon purchase or to give a note for the amount of the purchase which bears the prevailing rate of interest to maturity.

.13 The selection of a rate may be affected by many considerations. For instance, where applicable, the choice of a rate may be influenced by (a) an approximation of the prevailing market rates for the source of credit that would provide a market for sale or assignment of the note; (b) the prime or higher rate for notes which are discounted with banks, giving due weight to the credit standing of the maker; (c) published market rates for similar quality bonds; (d) current rates for debentures with substantially identical terms and risks that are traded in open markets; and (e) the current rate charged by investors for first or second mortgage loans on similar property.[7]

.14 *Amortization of discount and premium.* With respect to a note which by the provisions of this section requires the imputation of interest, the difference between the present value and the face amount should be treated as discount or premium[8] and amortized as interest expense or income over the life of the note in such a way as to result in a constant rate of interest when applied to the amount

---

[7] A theory has been advanced which states that no imputation of interest is necessary if the stated interest rate on a note receivable exceeds the interest cost on the borrowed funds used to finance such notes. The Board considers this theory unacceptable for reasons discussed in this section.

[8] Differences between the recognition for financial accounting purposes and income tax purposes of discount or premium resulting from determination of the present value of a note should be treated as timing differences in accordance with section 4091, *Income Taxes.*

 © 1974, American Institute of Certified Public Accountants, Inc.

outstanding at the beginning of any given period. This is the "interest" method described in and supported by section 5361. However, other methods of amortization may be used if the results obtained are not materially different from those which would result from the "interest" method.

.15 *Statement presentation of discount and premium.* The discount or premium resulting from the determination of present value in cash or non-cash transactions is not an asset or liability separable from the note which gives rise to it. Therefore, the discount or premium should be reported in the balance sheet as a direct deduction from or addition to the face amount of the note. It should not be classified as a deferred charge or deferred credit. The description of the note should include the effective interest rate; the face amount should also be disclosed in the financial statements or in the notes to the statements.[9] Amortization of discount or premium should be reported as interest in the statement of income. Issue costs should be reported in the balance sheet as deferred charges.

EFFECTIVE DATE

.16 This section shall be effective for transactions entered into on or after October 1, 1971. The Board believes that the conclusions as to balance sheet presentation and disclosure in paragraph .15 should apply to transactions made prior as well as subsequent to the issuance of this section. However, this section is not intended to require the discounting of notes existing on September 30, 1971 which were not previously discounted. Notes that were previously recorded in fiscal years ending before October 1, 1971 should not be adjusted. However, notes that have previously been recorded in the fiscal year in which October 1, 1971 occurs may be adjusted to comply with the provisions of this section.

AC Section 4111A

Interest on Receivables and Payables—Appendix

.01 *Present value concepts.* Upon issuance of a note or bond, the issuer customarily records as a liability the face or principal amount of the obligation. Ordinarily, the recorded liability also represents the amount which is to be repaid upon maturity of the obligation. The value recorded in the liability account, however, may be different from the proceeds received or the present value of the obligation at issuance if the market rate of interest differs from the coupon rate of interest. For example, consider the issuance of a $1,000, 20-year bond which bears interest at 10% annually. If we assume that 10% is an appropriate market rate of interest for such a bond the proceeds at issuance will be $1,000. The bond payable would be recorded at $1,000 which represents the amount repayable at maturity and also the present value at issuance which is equal to the proceeds. However, under similar circumstances, if the prevailing market rate were more (less) than 10%, a 20-year 10% bond with a face amount of $1,000 would usually have a value at issuance and provide cash proceeds of less (more) than $1,000. The significant point is that, upon issuance, a bond is valued at (1) the present value of the future coupon interest payments *plus* (2) the present value of the future principal payments (face amount). These two sets of future cash payments are discounted at the prevailing market rate of interest (for an equivalent security) at the date of issuance of the debt. As the 8% and 12% columns show, premium or discount arises when the prevailing market rate of interest differs from the coupon rate:

	Assume prevailing market rate of		
	10%	*8%*	*12%*
1. Present value of annual interest payments of $100 (the coupon rate of 10% of $1,000) for 20 years	$ 851	$ 982	$747
2. Present value of payment of the face amount of $1,000 at the end of year 20	149	215	104
Present value and proceeds at date of issuance	$1,000	$1,197	$851

.02 In the case of a $1,000 noninterest bearing 20-year note, where the prevailing market rate for comparable credit risks is 10%, the following valuation should be made:

1. Present value of no annual interest payments	$ 0
2. Present value of payment of the face amount of $1,000 at the end of year 20	149
Present value and proceeds at date of issuance	$149

Comparison of the results of the illustrations in paragraph .01 with the illustration above shows the significant impact of interest.

.03 *Illustrations of balance sheet presentation of notes which are discounted.*

	December 31	
	1970	*1969*
Example 1—Discount presented in caption		
NOTE RECEIVABLE FROM SALE OF PROPERTY:		
$1,000,000 face amount, noninterest bearing, due December 31, 1975 (less unamortized discount based on imputed interest rate of 8% — 1970, $320,000; 1969, $370,000)	$ 680,000	$ 630,000
Example 2—Discount presented separately		
NOTE RECEIVABLE FROM SALE OF PROPERTY:		
Noninterest bearing note due December 31, 1975	$ 1,000,000	$ 1,000,000
Less unamortized discount based on imputed interest rate of 8%	320,000	370,000
Note receivable less unamortized discount	$ 680,000	$ 630,000
Example 3—Several notes involved		
LONG-TERM DEBT (Note 1):		
Principal amount	$24,000,000	$24,000,000
Less unamortized discount	2,070,000	2,192,000
Long-term debt less unamortized discount	$21,930,00	$21,808,000

Note 1—Long-Term Debt

Long-term debt at December 31, 1970 consisted of the following:

	Principal	*Unamortized Discount*
6% subordinated debentures, due 1984 (discount is based on imputed interest rate of 7%)	$20,000,000	$ 1,750,000
6½% bank loan, due 1973	3,000,000	—
Noninterest bearing note issued in connection with acquisition of property, due 1975 (discount is based on imputed interest rate of 8%)	1,000,000	320,000
Total	$24,000,000	$ 2,070,000

AC Section 4211

Accounting for Research and Development Costs

[Source: FASB Statement No. 2.]

INTRODUCTION

October 1974

.01 This Statement establishes standards of financial accounting and reporting for research and development costs with the objectives of reducing the number of alternative accounting and reporting practices presently followed and providing useful financial information about research and development costs. This Statement specifies:

a) Those activities that shall be identified as research and development for financial accounting and reporting purposes.

b) The elements of costs that shall be identified with research and development activities.

c) The accounting for research and development costs.

d) The financial statement disclosures related to research and development costs.

.02 Accounting for the costs of research and development activities conducted for others under a contractual arrangement is a part of accounting for contracts in general and is beyond the scope of this Statement. Indirect costs that are specifically reimbursable under the terms of a contract are also excluded from this Statement.

.03 This Statement does not apply to activities that are unique to enterprises in the extractive industries, such as prospecting, acquisition of mineral rights, exploration, drilling, mining, and related mineral development. It does apply, however, to research and development activities of enterprises in the extractive industries that are comparable in nature to research and development activities of other

enterprises, such as development or improvement of processes and techniques including those employed in exploration, drilling, and extraction.

.04 *APB Opinion No. 17* [section 5141], "Intangible Assets," is hereby amended to exclude from its scope those research and development costs encompassed by this Statement.

.05 Paragraph 13 of *APB Opinion No. 22* [section 2045.13], "Disclosure of Accounting Policies," is amended to delete "research and development costs (including basis for amortization)" as an example of disclosure "commonly required" with respect to accounting policies.

.06 Standards of financial accounting and reporting for research and development costs are set forth in paragraphs 7—16. The basis for the Board's conclusions, as well as alternatives considered by the Board and reasons for their rejection, are discussed in Appendix B to this Statement. Background information is presented in Appendix A.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Activities Constituting Research and Development

.07 Paragraphs 8—10 set forth broad guidelines as to the activities that shall be classified as research and development.

.08 For purposes of this Statement, research and development is defined as follows:

a) *Research* is planned search or critical investigation aimed at discovery of new knowledge with the hope that such knowledge will be useful in developing a new product or service (hereinafter "product") or a new process or technique (hereinafter "process") or in bringing about a significant improvement to an existing product or process.

b) *Development* is the translation of research findings or other knowledge into a plan or design for a new product or process or for a significant improvement to an existing product or process whether intended for sale or use. It includes the conceptual formulation, design, and testing of product alternatives, construction of prototypes, and operation of pilot plants. It does not include routine or periodic alterations to existing products, production lines,

 Copyright © 1974, Financial Accounting Standards Board

manufacturing processes, and other on-going operations even though those alterations may represent improvements and it does not include market research or market testing activities.

.09 The following are examples of activities that typically would be included in research and development in accordance with paragraph 8 (unless conducted for others under a contractual arrangement — see paragraph 2):

a) Laboratory research aimed at discovery of new knowledge.

b) Searching for applications of new research findings or other knowledge.

c) Conceptual formulation and design of possible product or process alternatives.

d) Testing in search for or evaluation of product or process alternatives.

e) Modification of the formulation or design of a product or process.

f) Design, construction, and testing of pre-production prototypes and models.

g) Design of tools, jigs, molds, and dies involving new technology.

h) Design, construction, and operation of a pilot plant that is not of a scale economically feasible to the enterprise for commercial production.

i) Engineering activity required to advance the design of a product to the point that it meets specific functional and economic requirements and is ready for manufacture.

.10 The following are examples of activities that typically would be excluded from research and development in accordance with paragraph 8:

a) Engineering follow-through in an early phase of commercial production.

b) Quality control during commercial production including routine testing of products.

c) Trouble-shooting in connection with break-downs during commercial production.

d) Routine, on-going efforts to refine, enrich, or otherwise improve upon the qualities of an existing product.

e) Adaptation of an existing capability to a particular requirement or customer's need as part of a continuing commercial activity.

f) Seasonal or other periodic design changes to existing products.

g) Routine design of tools, jigs, molds, and dies.

h) Activity, including design and construction engineering, related to the construction, relocation, rearrangement, or start-up of facilities or equipment other than (1) pilot plants (see paragraph 9(h)) and (2) facilities or equipment whose sole use is for a particular research and development project (see paragraph 11(a)).

i) Legal work in connection with patent applications or litigation, and the sale or licensing of patents.

Elements of Costs to Be Identified with Research and Development Activities

.11 Elements of costs shall be identified with research and development activities as follows:

a) *Materials, equipment, and facilities.* The costs of materials (whether from the enterprise's normal inventory or acquired specially for research and development activities) and equipment or facilities that are acquired or constructed for research and development activities and that have alternative future uses (in research and development projects or otherwise) shall be capitalized as tangible assets when acquired or constructed. The cost of such materials consumed in research and development activities and the depreciation of such equipment or facilities used in those activities are research and development costs. However, the costs of materials,

 Copyright © 1974, Financial Accounting Standards Board

equipment, or facilities that are acquired or constructed for a particular research and development project and that have no alternative future uses (in other research and development projects or otherwise) and therefore no separate economic values are research and development costs at the time the costs are incurred.

b) *Personnel.* Salaries, wages, and other related costs of personnel engaged in research and development activities shall be included in research and development costs.

c) *Intangibles purchased from others.* The costs of intangibles that are purchased from others for use in research and development activities and that have alternative future uses (in research and development projects or otherwise) shall be capitalized and amortized as intangible assets in accordance with *APB Opinion No. 17* [section 5141]. The amortization of those intangible assets used in research and development activities is a research and development cost. However, the costs of intangibles that are purchased from others for a particular research and development project and that have no alternative future uses (in other research and development projects or otherwise) and therefore no separate economic values are research and development costs at the time the costs are incurred.

d) *Contract services.* The costs of services performed by others in connection with the research and development activities of an enterprise, including research and development conducted by others in behalf of the enterprise, shall be included in research and development costs.

e) *Indirect costs.* Research and development costs shall include a reasonable allocation of indirect costs. However, general and administrative costs that are not clearly related to research and development activities shall not be included as research and development costs.

Accounting for Research and Development Costs

.12 All research and development costs encompassed by this Statement shall be charged to expense when incurred.

Disclosure

.13 Disclosure shall be made in the financial statements of the total research and development costs charged to expense in each period for which an income statement is presented.

.14 A government-regulated enterprise that defers research and development costs for financial accounting purposes in accordance with the Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit,'" shall disclose the following additional information about its research and development costs:

a) Accounting policy, including basis for amortization.

b) Total research and development costs incurred in each period for which an income statement is presented and the amount of those costs that has been capitalized or deferred in each period.

Effective Date and Transition

.15 This Statement shall be effective for fiscal years beginning on or after January 1, 1975, although earlier application is encouraged. The requirement of paragraph 12 that research and development costs be charged to expense when incurred shall be applied retroactively by prior period adjustment (described in paragraphs 18 and 26 of *APB Opinion No. 9* [sections 2010.17 and 2010.25], "Reporting the Results of Operations"). When financial statements for periods before the effective date or financial summaries or other data derived therefrom are presented, they shall be restated to reflect the prior period adjustment. The prior period adjustment shall recognize any related income tax effect. The nature of a restatement and its effect on income before extraordinary items, net income, and related per share amounts for each period presented shall be disclosed in the period of change.

.16 The disclosures specified in paragraphs 13—14 are encouraged but not required for fiscal periods prior to the effective date of this Statement. If disclosures for those earlier periods are made, amounts shall be based to the extent practicable on the guidelines in paragraphs 8—11 of this Statement for identifying research and development activities and costs.

Copyright © 1974, Financial Accounting Standards Board

The provisions of this Statement need not be applied to immaterial items.

Appendix A
BACKGROUND INFORMATION

.17 Expenditures for research and development constitute a significant element of the United States economy and are vital for its growth. Based on statistics for research and development as defined by the National Science Foundation (see paragraph 25), total expenditures were over $30 billion in 1973, approximately two-thirds of which was spent for research and development conducted by business enterprises and the balance for research and development conducted by the government, universities and colleges, and other organizations.

.18 In recognition of the significance of research and development and the alternative accounting and reporting practices presently followed for research and development costs, in April 1973 the FASB placed on its technical agenda a project on "Accounting for Research and Development and Similar Costs." The scope of the project encompassed accounting and reporting by companies in the development stage.

.19 A task force of 16 persons from industry, government, public accounting, the financial community, and academe was appointed in July 1973 to provide counsel to the Board in preparing a Discussion Memorandum analyzing issues related to the project.

.20 In February 1973 the AICPA published *Accounting Research Study No. 14*, "Accounting for Research and Development Expenditures." In view of the availability of that study and other published research studies and articles, which are cited in Appendix B and in the Discussion Memorandum, the FASB did not undertake a major research effort for the project. The FASB staff interviewed a limited number of selected financial analysts and commercial bankers and reviewed a substantial number of published financial statements.

.21 The Board issued the Discussion Memorandum on December 28, 1973, and held a public hearing on the subject on March 15, 1974. The Board received 74 position papers, letters of comment, and outlines of oral presentations in

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

connection with the public hearing and heard 14 oral presentations at the hearing.

.22 In its deliberations following the hearing, the Board concluded that the initial Statement of Financial Accounting Standards resulting from the project should address solely accounting for research and development costs. An Exposure Draft of a proposed Statement on "Accounting for Research and Development Costs" was issued on June 5, 1974. The Board received 168 letters of comment on the Exposure Draft.

Appendix B

BASIS FOR CONCLUSIONS

.23 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including the various alternatives considered and reasons for accepting some and rejecting others.

ACTIVITIES CONSTITUTING RESEARCH AND DEVELOPMENT

.24 The guidelines in paragraphs 8—10 for activities that should be identified as research and development are designed to accommodate a wide variety of research and development activities. Adherence to those guidelines should result in a reasonable degree of comparability. Differences among enterprises and among industries are so great that a detailed prescription of the activities and related costs includable in research and development, either for all companies or on an industry-by-industry basis, is not a realistic undertaking for the FASB.

.25 The Board began its consideration of a definition of research and development with the following definition by the National Science Foundation (NSF):[1]

> *Research and development* — Basic and applied research in the sciences and engineering and the design and development of prototypes and processes. This definition excludes quality control, routine product testing, market research, sales promotion, sales service, research in the social sciences or psychology, and other nontechnological activities or technical services.

.26 The NSF further classifies research and development activities by type, as follows:[2]

> *Basic research* — Original investigations for the advancement of scientific knowledge not having specific commercial objectives, although such investigations may be in fields of present or potential interest to the reporting company.

---

[1]National Science Foundation, *Research and Development in Industry 1971* (Washington, D.C.: U.S. Government Printing Office, May 1973), p. 19.

[2]*Ibid.*

Copyright © 1974, Financial Accounting Standards Board

> *Applied research* — Investigations directed to the discovery of new scientific knowledge having specific commercial objectives with respect to products or processes. This definition differs from that of basic research chiefly in terms of the objectives of the reporting company.
>
> *Development* — Technical activities of a nonroutine nature concerned with translating research findings or other scientific knowledge into products or processes. [Development] does not include routine technical services to customers or other activities excluded from . . . research and development.

.27 The NSF definition has the advantage of being relatively widely used and understood. However, it is oriented primarily to research in the physical and biological sciences and excludes research in the social sciences.

.28 Respondents to the Discussion Memorandum recommended modifications of the NSF definition as well as various other definitions which were generally similar to or broader than the NSF definition. The Board agreed that a broad definition including research and development activities in the social sciences such as those conducted by service-type business enterprises is appropriate for financial accounting and reporting purposes. Accordingly, the definition in paragraph 8 has been adopted.

.29 The Exposure Draft had included research and development activities conducted for others under a contractual arrangement within the definition of research and development and had proposed that all research and development costs not directly reimbursable by others be charged to expense when incurred. Some respondents to the Exposure Draft contended that costs incurred in research and development activities conducted for others under a contractual arrangement should continue to be accounted for in accordance with financial accounting standards for contracts in general rather than as research and development costs. The Board agrees with this view and the change is reflected in paragraph 2.

.30 The examples in paragraphs 9—10 incorporate certain changes, many of which were recommended by respondents to the Exposure Draft. The Board believes that those paragraphs as changed more clearly reflect its intent regarding the inclusion or exclusion of particular types of activities within the definition of research and development.

.31 Several respondents to the Exposure Draft raised questions about the inclusion or exclusion of the development of various types of computer software within the definition of research and development. Computer software is developed for many and diverse uses. Accordingly, in each case the nature of the activity for which the software is being developed should be considered in relation to the guidelines in paragraphs 8—10 to determine whether software costs should be included or excluded. For example, efforts to develop a new or higher level of computer software capability intended for sale (but not under a contractual arrangement) would be a research and development activity encompassed by this Statement.

ELEMENTS OF COSTS TO BE IDENTIFIED WITH RESEARCH AND DEVELOPMENT ACTIVITIES

.32 To achieve a reasonable degree of comparability among enterprises, the Board concluded that broad guidelines are appropriate to identify the elements of costs that should be included as research and development. Those guidelines are in paragraph 11.

.33 Consideration was given to the alternative that the costs of materials, equipment, or facilities that are acquired or constructed for a particular research and development project and that have no alternative future uses (in other research and development projects or otherwise) be apportioned over the life of the project rather than treated as research and development costs when incurred. The Board reasoned, however, that if materials, equipment, or facilities are of such a specialized nature that they have no alternative future uses, even in another research and development project, those materials, equipment, or facilities have no separate economic values to distinguish them from other types of costs such as salaries and wages incurred in a particular project. Accordingly, all costs of those materials, equipment, and facilities should be treated as research and development costs when incurred.

.34 Paragraph 11(c) reflects certain changes from the Exposure Draft to treat the costs of intangibles purchased from others in a manner similar to that in paragraph 11(a) for the costs of materials, equipment, or facilities. Paragraph 11(c) is not intended to alter the conclusions in paragraphs

87-88 of *APB Opinion No. 16* [section 1091.87-.88], "Business Combinations," regarding allocation of cost to assets acquired in a business combination accounted for by the purchase method.

.35 The conclusion that general and administrative costs not be allocated to research and development activities (unless clearly related) conforms to present accounting practice, which generally treats such costs as expenses when incurred.

.36 One question in the Discussion Memorandum was whether interest or other cost of capital should be allocated to research and development activities. At present, interest or other cost of capital generally is not allocated to the cost of assets or specific activities for financial accounting purposes. The Board believes that allocation of interest or other cost of capital to research and development activities is part of a broader question beyond the scope of this Statement.

ACCOUNTING FOR RESEARCH AND DEVELOPMENT COSTS

.37 The Board considered four alternative methods of accounting at the time research and development costs are incurred:

a) Charge all costs to expense when incurred.

b) Capitalize all costs when incurred.

c) Capitalize costs when incurred if specified conditions are fulfilled and charge all other costs to expense.

d) Accumulate all costs in a special category until the existence of future benefits can be determined.

.38 In concluding that all research and development costs be charged to expense when incurred (see paragraph 12), Board members considered the factors discussed in paragraphs 39—59. Individual Board members gave greater weight to some factors than to others.

Uncertainty of Future Benefits

.39 There is normally a high degree of uncertainty about the future benefits of individual research and development projects, although the element of uncertainty may diminish

as a project progresses. Estimates of the rate of success of research and development projects vary markedly — depending in part on how narrowly one defines a "project" and how one defines "success" — but all such estimates indicate a high failure rate. For example, one study of a number of industries found that an average of less than 2 percent of new product ideas and less than 15 percent of product development projects were commercially successful.[3]

.40 Even after a project has passed beyond the research and development stage, and a new or improved product or process is being marketed or used, the failure rate is high. Estimates of new product failures range from 30 percent to 90 percent, depending on the definition of failure used.[4] One study concludes that "for about every three products emerging from research and development departments as technical successes, there is an average of only one commercial success."[5] That study goes on to say that "of all the dollars of new product expense, almost three-fourths go to unsuccessful products; about two-thirds of these . . . dollars are in the 'development stage.' "[6]

Lack of Causal Relationship Between Expenditures and Benefits

.41 A direct relationship between research and development costs and specific future revenue generally has not been demonstrated, even with the benefit of hindsight. For example, three empirical research studies, which focus on companies in industries intensively involved in research and development activities, generally failed to find a significant correlation between research and development expenditures and increased future benefits as measured by subsequent sales,[7] earnings,[8] or share of industry sales.[9]

Accounting Recognition of Economic Resources

.42 In paragraph 57 of *APB Statement No. 4* [section 1023.18], "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises," economic resources are defined as the scarce means for carrying on economic activities. The economic resources of a particular enterprise are generally regarded as those *scarce* resources for which there is an *expectation of future benefits to the enterprise* either through use or sale.

.43 Not all of the economic resources of an enterprise are recognized as assets for financial accounting purposes. However, criteria for identifying those economic resources that should be recognized as the assets of an enterprise for accounting purposes have not been specified in the official accounting literature. One criterion that has been suggested in published research studies and articles and in position papers, letters of comment, and oral presentations the Board received in connection with the public hearing is that of *measurability*.

.44 The criterion of measurability would require that a resource not be recognized as an asset for accounting purposes unless at the time it is acquired or developed its future economic benefits can be identified and objectively measured.

.45 Paragraphs 39—40 indicate that at the time most research and development costs are incurred the future benefits are at best uncertain. In other words, there is no indication that an economic resource has been created. Moreover, even if at some point in the progress of an individual research and development project the expectation of future benefits becomes sufficiently high to indicate that an economic resource has been created, the question remains whether that resource should be recognized as an asset for financial accounting purposes. Although future benefits from a particular research and development project may be foreseen, they generally cannot be measured with a reasonable degree of certainty. According to the research data cited in paragraph 41, there is normally little, if any, direct relationship between the amount of current research and development expenditures and the amount of resultant future benefits to the enterprise. Research and development costs therefore fail to satisfy the suggested measurability test for accounting recognition as an asset.

.46 The criterion of exchangeability, which was discussed in the Exposure Draft, was not considered a significant factor by the Board in reaching its final conclusion on accounting for research and development costs. The Board believes that exchangeability needs further study and at this time the Board neither accepts nor rejects exchangeability as a criterion for accounting recognition of an economic resource.

Expense Recognition and Matching

.47 *APB Statement No. 4* [section 1021—1029] explicitly avoids using the term "matching" because it has a variety of meanings in the accounting literature. In its broadest sense, matching refers to the entire process of income determination —described in paragraph 147 of *APB Statement No. 4* [section 1026.11] as "identifying, measuring, and relating revenues and expenses of an enterprise for an accounting period." Matching may also be used in a more limited sense to refer only to the process of expense recognition or in an even more limited sense to refer to the recognition of expenses by associating costs with revenue on a cause and effect basis. In the following discussion, matching is used in its most limited sense to refer to the process of recognizing costs as expenses on a cause and effect basis.

.48 Three pervasive principles for recognizing costs as expenses are set forth in paragraphs 156—160 of *APB Statement No. 4* [section 1026.20—.24], as follows:

> *Associating Cause and Effect.* Some costs are recognized as expenses on the basis of a presumed direct association with specific revenue. . . . recognizing them as expenses accompanies recognition of the revenue.
>
> *Systematic and Rational Allocation.* . . . If an asset provides benefits for several periods its cost is allocated to the periods in a systematic and rational manner in the absence of a more direct basis for associating cause and effect.
>
> *Immediate Recognition.* Some costs are associated with the current accounting period as expenses because (1) costs incurred during the period provide no discernible future benefits, (2) costs recorded as assets in prior periods no longer provide discernible benefits, or (3) allocating costs either on the basis of association with revenue or among several accounting periods is considered to serve no useful purpose. . . . The principle of immediate recognition also requires that items carried as assets in prior periods that are discovered to have no discernible future benefit be charged to expense, for example, a patent that is determined to be worthless.

Copyright © 1974, Financial Accounting Standards Board

.49 As noted in paragraph 41, evidence of a direct causal relationship between current research and development expenditures and subsequent future benefits generally has not been found. Also, there is often a high degree of uncertainty about whether research and development expenditures will provide any future benefits. Thus, even an indirect cause and effect relationship can seldom be demonstrated. Because there is generally no direct or even indirect basis for relating costs to revenues, the Board believes that the principles of "associating cause and effect" and "systematic and rational allocation" cannot be applied to recognize research and development costs as expenses. That is, the notion of "matching" — when used to refer to the process of recognizing costs as expenses on any sort of cause and effect basis — cannot be applied to research and development costs. Indeed, the general lack of discernible future benefits at the time the costs are incurred indicates that the "immediate recognition" principle of expense recognition should apply.

Usefulness of Resulting Information

.50 *APB Statement No. 4* [sections 1021—1029] indicates that certain costs are immediately recognized as expenses because allocating them to several accounting periods "is considered to serve no useful purpose." There is general agreement that two of the basic elements in the decision models of many financial statement users are (a) expected return—the predicted amount and timing of the return on an investment—and (b) risk—the variability of that expected return. The data cited in paragraphs 39—41, the views of security analysts and other professional investors submitted to the Board in connection with the public hearing, and FASB interviews with selected analysts and bankers suggest that the relationship between current research and development costs and the amount of resultant future benefits to an enterprise is so uncertain that capitalization of any research and development costs is not useful in assessing the earnings potential of the enterprise. Therefore, it is unlikely that one's ability to predict the return on an investment and the variability of that return would be enhanced by capitalization.

Capitalization of All Costs When Incurred

.51 Enterprises undertake research and development activities with the hope of future benefits. If there were no such hope, the activities would not be conducted. Some

persons take the position that the accounting treatment for research and development costs should be determined by considering in the aggregate all of the research and development activities of an enterprise. In their view, if there is a high probability of future benefits from an enterprise's total research and development program, the entire cost of those activities should be capitalized without regard to the certainty of future benefits from individual projects.

.52 The Board believes, however, that it is not appropriate to consider accounting for research and development activities on an aggregate or total-enterprise basis for several reasons. For accounting purposes the expectation of future benefits generally is not evaluated in relation to broad categories of expenditures on an enterprise-wide basis but rather in relation to individual or related transactions or projects. Also, an enterprise's total research and development program may consist of a number of projects at varying stages of completion and with varying degrees of uncertainty as to their ultimate success. If research and development costs were capitalized on an enterprise-wide basis, a meaningful method of amortization could not be developed because the period of benefit could not be determined. Moreover, over 90 percent of the respondents to a survey reported in AICPA *Accounting Research Study No. 14* indicated that their company's philosophy is that research and development expenditures are intended to be recovered by current revenues rather than by revenue from new products.[10]

Selective Capitalization

.53 Selective capitalization — capitalizing research and development costs when incurred if specified conditions are fulfilled and charging to expense all other research and development costs — requires establishment of conditions that must be fulfilled before research and development costs are capitalized. The Board considered a number of factors on which prerequisite conditions might be based, including the following:

a) *Definition of product or process.* The new or improved product or process must be defined.

---

[10]Oscar S. Gellein and Maurice A. Newman, *Accounting Research Study No. 14*, "Accounting for Research and Development Expenditures," (New York: AICPA, 1973), p. 100.

 Copyright © 1974, Financial Accounting Standards Board

b) *Technological feasibility.* The new or improved product or process must be determined to be technologically feasible.

c) *Marketability/Usefulness.* The marketability of the product or process or, if it is to be used internally rather than sold, its usefulness to the enterprise must be substantially assured.

d) *Economic feasibility.* Probability of future economic benefits sufficient to recover all capitalized costs must be high. Encompassed by the notion of economic feasibility is measurability of future benefits. Also implicit is the ability to associate particular future benefits with particular costs.

e) *Management action.* Management must have definitely decided to produce and market or use the new product or process or to incorporate the significant improvement into an existing product or process.

f) *Distortion of net income comparisons.* Capitalization or immediate charging to expense of research and development costs must be determined on the basis of whether interperiod comparisons of net income would be materially distorted.

.54 None of those factors, however, lends itself to establishing a condition that could be objectively and comparably applied by all enterprises. Considerable judgment is required to identify the point in the progress of a research and development project at which a new or improved product or process is "defined" or is determined to be "technologically feasible," "marketable," or "useful." Nor can the "probability of future benefits" be readily assessed. A "management decision" to proceed with production does not necessarily assure future benefits. The Board does not believe that "distortion of net income comparisons," which a few respondents to the Discussion Memorandum suggested, is an operable criterion by which to decide whether research and development costs should be capitalized because the point at which net income comparisons might be "distorted" cannot be defined. Moreover, in assessing risk, financial statement users have indicated that they seek information about the variability of earnings.

.55 The Board has concluded that no set of conditions that might be established for capitalization of costs could achieve the comparability among enterprises that proponents of "selective capitalization" cite as a primary objective of that approach.

.56 If selective capitalization were applied only to costs incurred after fulfillment of the specified conditions, only a portion of the total costs of a particular research and development project would be capitalized and amortized. Thus, the capitalized amount would not indicate the total costs incurred to produce future benefits; nor would the amount of periodic amortization of capitalized costs represent a "matching" of costs and benefits.

.57 Selective capitalization might involve retroactive capitalization of previously incurred costs in addition to capitalization of costs incurred after fulfillment of the specified conditions. However, many research and development costs incurred before fulfillment of the conditions are not likely to be directly identifiable with the particular new or improved product or process for which costs would be capitalized. Moreover, retroactive capitalization of costs previously charged to expense is contrary to present accounting practice for other transactions whose initial accounting is not altered as a result of hindsight. The preparation of periodic financial statements requires many estimates and judgments for which restatements are not made in retrospect.

Accumulation of Costs in a Special Category

.58 The Board considered the proposal that all research and development costs be accumulated in a special category distinct from assets and expenses until a determination can be made about whether future benefits exist. That special category might be reported either below the asset section of the balance sheet (with segregation of a corresponding amount of stockholders' equity) or as a negative (contra) element of stockholders' equity. Ultimately, the accumulated costs would be transferred to assets (if future benefits become reasonably established) or written off (if it were reasonably established that no significant future benefits would ensue).

.59 A feature cited by proponents of this approach is that it draws attention to the uncertainty surrounding most research

Copyright © 1974, Financial Accounting Standards Board

and development costs and it enables postponement of the capitalize vs. expense decision. This alternative was rejected, however, for the following reasons. First, financial analysts and others have indicated that costs accumulated in that special category would not be useful in assessing the earning power of an enterprise because of the uncertainties involved, and the research data cited earlier tend to support that view. Second, use of a special category would alter the nature of the basic financial statements and would complicate the computation of ratios and other financial data.

DISCLOSURE

.60 Regardless of their position on the accounting treatment for research and development costs, respondents to the Discussion Memorandum generally pointed out that current disclosure practices for research and development costs vary and that requirements for informative disclosure need to be established. The disclosures specified in paragraphs 13—14 reflect the Board's general agreement with that view.

.61 The Exposure Draft had proposed that disclosure also be required of (a) the accounting policy for research and development costs, (b) the amount of directly reimbursable research and development costs incurred, (c) the costs of research and development conducted in behalf of the enterprise by others, and (d) the amounts and classifications in the income statement of research and development costs charged to expense during the period. The Board has accepted the recommendation of some respondents to the Exposure Draft that disclosure of accounting policy not be required[11] because this Statement permits only one method of accounting for research and development costs. Some letters of comment on the Exposure Draft indicated that data related to items (b), (c), and (d) above are frequently difficult to obtain and that those disclosures generally would not be meaningful. The Board agrees with this view; this Statement does not require those disclosures.

.62 The Board recognizes that disclosure of additional information about an enterprise's research and development activities might be useful to some financial statement users. However, many respondents to the Discussion Memorandum

---

[11]That disclosure is required by this Statement for certain government-regulated enterprises (see paragraph 14).

contended that certain kinds of information should not be required to be included in financial statements because the information is not sufficiently objective, is confidential in nature, or is beyond the scope of financial accounting information. For that reason, the Board concluded that disclosure of (a) the nature, status, and costs of individual research and development projects, (b) the nature and status of patents, (c) projections about new or improved products or processes, and (d) an enterprise's philosophy regarding research and development, all of which were included in the Discussion Memorandum as disclosure possibilities, should not be required. In addition, most respondents said that forecasts of research and development expenditures should not be considered in this project, and the Board agrees with that view. Disclosure of research and development costs by line of business was considered by the FASB in its project, "Financial Reporting for Segments of a Business Enterprise," but FASB Statement No. 14 [section 2081] does not require that disclosure. [As modified, effective for financial statements for fiscal years beginning after December 15, 1976, and for interim periods within those fiscal years, by FASB Statement No. 14.] (See section 2081.)

EFFECTIVE DATE AND TRANSITION

.63 The Board considered three alternative approaches to reporting a change in the method of accounting for research and development costs: (1) prior period adjustment, (2) the "cumulative effect" method described in *APB Opinion No. 20* [section 1051], "Accounting Changes," and (3) continued amortization of previously capitalized costs. The Board concluded that the prior period adjustment method will provide the most useful information about research and development costs for comparing financial data for periods after the effective date of this Statement with data presented for earlier periods.

.64 Upon consideration of all circumstances, the Board judged that the effective date specified in paragraph 15, which had been proposed in the Exposure Draft, is advisable.

AC Section 4211-1

Applicability of Section 4211 to Business Combinations Accounted for by the Purchase Method: An Interpretation of Section 4211

[Source: FASB Interpretation No. 4.]

February 1975

INTRODUCTION

.01 The FASB has been asked to explain the applicability of *FASB Statement No. 2* [section 4211], "Accounting for Research and Development Costs," to the cost of tangible and intangible assets to be used in research and development activities of an enterprise when those assets are acquired in a business combination accounted for by the purchase method.

.02 Broad guidelines about the activities to be classified as research and development and the elements of costs to be identified with those activities are set forth in paragraphs 8-11 of *Statement No. 2* [section 4211.08-.11]. Paragraph 12 of that Statement [section 4211.12] provides that research and development costs shall be charged to expense when incurred. However, some costs associated with research and development activities shall be capitalized if the item has alternative future uses in research and development or otherwise (see paragraphs 11(a) and 11(c) of *Statement No. 2*). [Sections 4211.11(a) and 4211.11(c).] The cost of materials consumed, the depreciation of equipment and facilities used, and the amortization of intangibles used in research and development activities are research and development costs.

.03 *Statement No. 2* amends *APB Opinion No. 17* [section 5141], "Intangible Assets," to exclude from the scope of that Opinion those research and development costs encompassed by the Statement but does not amend *APB Opinion No. 16* [section 1091], "Business Combinations." Paragraph 34 of the Statement [section 4211.34] indicates that paragraph 11(c) [section 4211.11(c)] is not intended to alter the conclusions in paragraphs 87-88 of *APB Opinion No. 16* [section 1091.87-.88] regarding allocation of cost to assets acquired in a business combination accounted for by the purchase method.

INTERPRETATION

.04 The intent of paragraph 34 of *Statement No. 2* [section 4211.34] is that the allocation of cost to the identifiable assets of an acquired enterprise shall be made in accordance with the provisions

of *APB Opinion No. 16* [section 1091]. Therefore, costs shall be assigned to all identifiable tangible and intangible assets, including any *resulting from* research and development activities of the acquired enterprise or *to be used in* research and development activities of the combined enterprise. Identifiable assets *resulting from* research and development activities of the acquired enterprise might include, for example, patents received or applied for, blueprints, formulas, and specifications or designs for new products or processes. Identifiable assets *to be used in* research and development activities of the combined enterprise might include, for example, materials and supplies, equipment and facilities, and perhaps even a specific research project in process. In either case, the costs to be assigned under *APB Opinion No. 16* [section 1091] are determined from the amount paid by the acquiring enterprise and *not* from the original cost to the acquired enterprise.

.05 The subsequent accounting by the combined enterprise for the costs allocated to assets[1] *to be used in* research and development activities shall be determined by reference to *Statement No. 2* [section 4211]. Paragraph 12 of *Statement No. 2* [section 4211.12] requires that costs identified with research and development activities shall be charged to expense when incurred unless the test of alternative future use in paragraph 11(a) or 11(c) [sections 4211.11(a) or 4211.11(c)] is met. That requirement also applies in a business combination accounted for by the purchase method. Accordingly, costs assigned to assets to be used in a particular research and development project and that have no alternative future use shall be charged to expense at the date of consummation of the combination. Therefore, the accounting for the cost of an item to be used in research and development activities is the same under paragraphs 11 and 12 of *Statement No. 2* [sections 4211.11 and 4211.12], whether the item is purchased singly, or as part of a group of assets, or as part of an entire enterprise in a business combination accounted for by the purchase method.

EFFECTIVE DATE AND TRANSITION

.06 Because there have been varying interpretations of *Statement No. 2* [section 4211] with respect to the accounting for the cost of tangible and intangible assets covered by this Interpretation, the Board has concluded that it shall be effective as follows:

---

[1] In this regard, paragraph 69 of *APB Opinion No. 16* [section 1091.69] states in part that: "The nature of an asset and not the manner of its acquisition determines an acquirer's subsequent accounting for the cost of that asset."

Copyright © 1975, Financial Accounting Standards Board

(a) Application of this Interpretation to business combinations accounted for by the purchase method that are initiated[2] after March 31, 1975 is required.

(b) Application of this Interpretation to business combinations accounted for by the purchase method that are initiated prior to April 1, 1975 and consummated after March 31, 1975 is encouraged but is not required. It may be applied selectively to those combinations.

(c) Application of this Interpretation to business combinations accounted for by the purchase method that were initiated and consummated prior to April 1, 1975 is encouraged but is not required. If an enterprise chooses to apply this Interpretation to those combinations, it shall be applied retroactively as described in paragraphs 15 and 16 of *Statement No. 2* [sections 4211.15 and 4211.16] to *all* business combinations accounted for by the purchase method that were consummated prior to April 1, 1975.

.07 This Interpretation shall not be applied prior to the initial application of *Statement No. 2* [section 4211].

→ *The next page is 9131.* ←

[2] See paragraph .46(a) of *APB Opinion No. 16* [section 1091.46(a)] for the definition of "initiated."

AC Section 4211-3

Applicability of Section 4211 to Computer Software: An Interpretation of Section 4211

[Source: FASB Interpretation No. 6.]

February 1975

INTRODUCTION

.01 The FASB has been asked to explain the applicability of *FASB Statement No. 2* [section 4211], "Accounting for Research and Development Costs," to costs incurred to obtain or develop computer software.

.02 Broad guidelines about the activities to be classified as research and development and the elements of costs to be identified with those activities are set forth in paragraphs 8-11 of *Statement No. 2* [section 4211.08-.11]. Paragraph 12 of that Statement [section 4211.12] provides that research and development costs shall be charged to expense when incurred. However, some costs associated with research and development activities shall be capitalized if the item has alternative future uses in research and development or otherwise (see paragraphs 11(a) and 11(c) of *Statement No. 2*). [Sections 4211.11(a) and 4211.11(c).] The costs of materials consumed, the depreciation of equipment and facilities used, and the amortization of intangibles used in research and development activities are research and development costs.

.03 Paragraph 31 of *Statement No. 2* [section 4211.31] states the following about the activities for which computer software is developed:

> Computer software is developed for many and diverse uses. Accordingly, in each case the nature of the activity for which the software is being developed should be considered in relation to the guidelines in paragraphs 8-10 to determine whether software costs should be included or excluded [in research and development]. For example, efforts to develop a new or higher level of computer software capability intended for sale (but not under a contractual arrangement) would be a research and development activity encompassed by this Statement.

INTERPRETATION

.04 Paragraph 8 of *Statement No. 2* [section 4211.08] defines research and development to include those activities aimed at developing or significantly improving a product or service (hereinafter "product") or a process or technique (hereinafter "process") whether the product or process is intended for sale or use. A process may be a system whose output is to be sold, leased, or otherwise marketed to others. A process also may be used internally as a part of a manufacturing activity or a service

activity where the service itself is marketed. A process may be intended to achieve cost reductions as opposed to revenue generation. Paragraph 8(b) of *Statement No. 2* [section 4211.08(b)], however, specifically excludes from research and development activities "market research or market testing activities." Those activities were excluded because they relate to the selling function of an enterprise. Thus, while in the broadest sense of the word, a process may be used in all of an enterprise's activities, the Board's intent in *Statement No. 2* [section 4211] was that the acquisition, development, or improvement of a process by an enterprise for use in its selling or administrative activities be excluded from the definition of research and development activities.[1] To the extent, therefore, that the acquisition, development, or improvement of a process by an enterprise for use in its selling or administrative activities includes costs for computer software, those costs are not research and development costs. Examples of the excluded costs of software are those incurred for development by an airline of a computerized reservation system or for development of a general management information system.

Purchase or Lease of Software

.05 Costs incurred to purchase or lease computer software developed by others are not research and development costs under *Statement No. 2* [section 4211] unless the software is for use in research and development activities. When software for use in research and development activities is purchased or leased, its cost shall be accounted for as specified by paragraphs 11(c) and 12 of *Statement No. 2* [sections 4211.11(c) and 4211.12]. That is, the cost shall be charged to expense as incurred unless the software has alternative future uses (in research and development or otherwise).

Internal Development of Software

.06 An enterprise may undertake development of computer software internally for its own use or as a product or process to be sold, leased, or otherwise marketed to others for their use. If development is undertaken for the enterprise's own use, the software may be intended, for example, to be used in the research and development activities of the enterprise or as a part of a newly developed or significantly improved product or process.

.07 *Development of software as a product or process to be sold, leased, or otherwise marketed.* Accounting for the cost of developing software for others under a contractual arrangement is

[1] General and administrative costs are discussed in paragraphs 11(e) and 35 of *Statement No. 2* [sections 4211.11(e) and 4211.35].

Copyright © 1975, Financial Accounting Standards Board

beyond the scope of *Statement No. 2* [section 4211], because paragraph 2 of the Statement [section 4211.02] indicates that this is part of accounting for contracts in general. On the other hand, if the development of software is undertaken to create a new or significantly improved product or process without any contractual arrangement, costs incurred for *conceptual formulation or the translation of knowledge into a design* would be research and development costs (see paragraph 8 of *Statement No. 2* [section 4211.08]). Other costs, including those incurred for programming and testing software, are research and development costs when incurred in the search for or the evaluation of product or process alternatives or in the design of a pre-production model. On the other hand, costs for programming and testing are *not* research and development costs when incurred, for example, in routine or other on-going efforts to improve an existing product or adapt a product to a particular requirement or customer's need. Because the term *product* also encompasses services that are sold, leased, or otherwise marketed to others, this paragraph applies, for example, to costs incurred in developing software to be used by a data processing service bureau or a computer time-sharing company.

.08 *Development of software to be used in research and development activities.* Developing or significantly improving a product or process that is intended to be sold, leased, or otherwise marketed to others is a research and development activity (see paragraph 8 of *Statement No. 2* [section 4211.08]). Similarly, developing or significantly improving a process whose output is a product that is intended to be sold, leased, or otherwise marketed to others is a research and development activity. Costs incurred by an enterprise in developing computer software internally for use in its research and development activities are research and development costs and, therefore, shall be charged to expense when incurred.[2] This includes costs incurred during all phases of software development because all of those costs are incurred in a research and development activity.

.09 *Development of software to be used as a part of a product or process.* An enterprise may undertake internal development of software as a part of a newly developed or significantly improved product or process that will be sold, leased, or otherwise marketed to others, or as a part of a process whose output is a product that will be sold, leased, or otherwise marketed to others. For example, a manufacturer of computerized typesetting machinery may undertake to develop and use software as a part of that machinery, or a medical laboratory may undertake to develop software

[2] The alternative future use test does not apply to the internal development of computer software; paragraph 11(c) of *Statement No. 2* [section 4211.11(c)] applies only to intangibles *purchased from others.*

for use in a newly developed analytical process. In those cases, costs incurred for *conceptual formulation or the translation of knowledge into a design* would be research and development costs (see paragraph 8 of *Statement No. 2* [section 4211.08]). Other costs, including those incurred for programming and testing software, are research and development costs when incurred in the search for or the evaluation of product or process alternatives or in the design of a pre-production model. On the other hand, costs for programming and testing are *not* research and development costs when incurred, for example, in routine or other on-going efforts to improve an existing product or process or adapt a product or process to a particular requirement or customer's need.

EFFECTIVE DATE AND TRANSITION

.10 Because there have been varying interpretations of *Statement No. 2* [section 4211] with respect to costs of computer software, this Interpretation shall be effective for fiscal years beginning on or after April 1, 1975. Earlier application is encouraged, except that this Interpretation shall not be applied prior to initial application of *Statement No. 2* [section 4211]. Retroactive application of this Interpretation, as described in paragraphs 15 and 16 of *Statement No. 2* [sections 4211.15 and 4211.16], to costs incurred in prior fiscal years is also encouraged but is not required.

The next page is 9181.

AC Section 4311

Accounting for Contingencies

[Source: FASB Statement No. 5, as amended.]

March 1975

INTRODUCTION

.01 For the purpose of this Statement, a contingency is defined as an existing condition, situation, or set of circumstances involving uncertainty as to possible gain (hereinafter a "gain contingency") or loss[1] (hereinafter a "loss contingency") to an enterprise that will ultimately be resolved when one or more future events occur or fail to occur. Resolution of the uncertainty may confirm the acquisition of an asset or the reduction of a liability or the loss or impairment of an asset or the incurrence of a liability.

.02 Not all uncertainties inherent in the accounting process give rise to contingencies as that term is used in this Statement. Estimates are required in financial statements for many on-going and recurring activities of an enterprise. The mere fact that an estimate is involved does not of itself constitute the type of uncertainty referred to in the definition in paragraph .01. For example, the fact that estimates are used to allocate the known cost of a depreciable asset over the period of use by an enterprise does not make depreciation a contingency; the eventual expiration of the utility of the asset is not uncertain. Thus, depreciation of assets is not a contingency as defined in paragraph .01, nor are such matters as recurring repairs, maintenance, and overhauls, which interrelate with depreciation. Also, amounts owed for services received, such as advertising and utilities, are not contingencies even though the accrued amounts may have been estimated; there is nothing uncertain about the fact that those obligations have been incurred.

.03 When a loss contingency exists, the likelihood that the future event or events will confirm the loss or impairment of an asset or the incurrence of a liability can range from probable to remote. This Statement uses the terms *probable*, *reasonably possible*, and *remote* to identify three areas within that range, as follows:

---

[1] The term *loss* is used for convenience to include many charges against income that are commonly referred to as *expenses* and others that are commonly referred to as *losses*.

a) *Probable.* The future event or events are likely to occur.

b) *Reasonably possible.* The chance of the future event or events occurring is more than remote but less than likely.

c) *Remote.* The chance of the future event or events occurring is slight.

.04 Examples of loss contingencies include:

a) Collectibility of receivables.

b) Obligations related to product warranties and product defects.

c) Risk of loss or damage of enterprise property by fire, explosion, or other hazards.

d) Threat of expropriation of assets.

e) Pending or threatened litigation.

f) Actual or possible claims and assessments.

g) Risk of loss from catastrophes assumed by property and casualty insurance companies including reinsurance companies.

h) Guarantees of indebtedness of others.

i) Obligations of commercial banks under "standby letters of credit."[2]

j) Agreements to repurchase receivables (or to repurchase the related property) that have been sold.

---

[2] As defined by the Federal Reserve Board, "standby letters of credit" include "every letter of credit (or similar arrangement however named or designated) which represents an obligation to the beneficiary on the part of the issuer (1) to repay money borrowed by or advanced to or for the account of the account party or (2) to make payment on account of any evidence of indebtedness undertaken by the account party or (3) to make payment on account of any default by the account party in the performance of an obligation." A note to that definition states that "as defined, 'standby letter of credit' would not include (1) commercial letters of credit and similar instruments where the issuing bank expects the beneficiary to draw upon the issuer and which do not 'guaranty' payment of a money obligation or (2) a guaranty or similar obligation issued by a foreign branch in accordance with and subject to the limitations of Regulation M [of the Federal Reserve Board]." Regulations of the Comptroller of the Currency and the Federal Deposit Insurance Corporation contain similar definitions.

Copyright © 1976, Financial Accounting Standards Board

.05 Some enterprises now accrue estimated losses from some types of contingencies by a charge to income prior to the occurrence of the event or events that are expected to resolve the uncertainties while, under similar circumstances, other enterprises account for those losses only when the confirming event or events have occurred.

.06 This Statement establishes standards of financial accounting and reporting for loss contingencies (see paragraphs .08—.16) and carries forward without reconsideration the conclusions of *Accounting Research Bulletin (ARB) No. 50*, "Contingencies," with respect to gain contingencies (see paragraph .17) and other disclosures (see paragraphs .18—.19). The basis for the Board's conclusions, as well as alternatives considered and reasons for their rejection, are discussed in Appendix C. Examples of application of this Statement are presented in Appendix A, and background information is presented in Appendix B.

.07 This Statement supersedes both *ARB No. 50* and Chapter 6 "Contingency Reserves," of *ARB No. 43*. The conditions for accrual of loss contingencies in paragraph .08 of this Statement do not amend any other present requirement in an Accounting Research Bulletin or Opinion of the Accounting Principles Board to accrue a particular type of loss or expense. Thus, for example, accounting for pension cost, deferred compensation contracts, and stock issued to employees are excluded from the scope of this Statement. Those matters are covered, respectively, in *APB Opinion No. 8* [section 4063], "Accounting for the Cost of Pension Plans," *APB Opinion No. 12*, "Omnibus Opinion—1967," paragraphs 6—8 [section 4064], and *APB Opinion No. 25* [section 4062], "Accounting for Stock Issued to Employees." Accounting for other employment-related costs, such as group insurance, vacation pay, workmen's compensation, and disability benefits, is also excluded from the scope of this Statement. Accounting practices for those types of costs and pension accounting practices tend to involve similar considerations.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Accrual of Loss Contingencies

.08 An estimated loss from a loss contingency (as defined in paragraph .01) shall be accrued by a charge to income[3] if *both* of the following conditions are met:

a) Information available prior to issuance of the financial statements indicates that it is probable that an asset had been impaired or a liability had been incurred at the date of the financial statements.[4] It is implicit in this condition that it must be probable that one or more future events will occur confirming the fact of the loss.

b) The amount of loss can be reasonably estimated.

Disclosure of Loss Contingencies

.09 Disclosure of the nature of an accrual[5] made pursuant to the provisions of paragraph .08, and in some circumstances the amount accrued, may be necessary for the financial statements not to be misleading.

.10 If no accrual is made for a loss contingency because one or both of the conditions in paragraph .08 are not met, or if an exposure to loss exists in excess of the amount accrued pursuant to the provisions of paragraph .08, disclosure of the contingency shall be made when there is at least a reasonable possibility that a loss or an additional loss may have been incurred.[6] The disclosure shall indicate the nature of the contingency and shall give an estimate of the possible loss or

---

[3] [Superseded, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

[4] *Date of the financial statements* means the end of the most recent accounting period for which financial statements are being presented.

[5] Terminology used shall be descriptive of the nature of the accrual (see paragraphs 57—64 of *Accounting Terminology Bulletin No. 1,* "Review and Resume").

[6] For example, disclosure shall be made of any loss contingency that meets the condition in paragraph .08(a) but that is not accrued because the amount of loss cannot be reasonably estimated (paragraph .08(b)). Disclosure is also required of some loss contingencies that do not meet the condition in paragraph .08(a)—namely, those contingencies for which there is a *reasonable possibility* that a loss may have been incurred even though information may not indicate that it is *probable* that an asset had been impaired or a liability had been incurred at the date of the financial statements.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

range of loss or state that such an estimate cannot be made. Disclosure is not required of a loss contingency involving an unasserted claim or assessment when there has been no manifestation by a potential claimant of an awareness of a possible claim or assessment unless it is considered probable that a claim will be asserted and there is a reasonable possibility that the outcome will be unfavorable.

.11 After the date of an enterprise's financial statements but before those financial statements are issued, information may become available indicating that an asset was impaired or a liability was incurred after the date of the financial statements or that there is at least a reasonable possibility that an asset was impaired or a liability was incurred after that date. The information may relate to a loss contingency that existed at the date of the financial statements, e.g., an asset that was not insured at the date of the financial statements. On the other hand, the information may relate to a loss contingency that did not exist at the date of the financial statements, e.g., threat of expropriation of assets after the date of the financial statements or the filing for bankruptcy by an enterprise whose debt was guaranteed after the date of the financial statements. In none of the cases cited in this paragraph was an asset impaired or a liability incurred at the date of the financial statements, and the condition for accrual in paragraph .08(a) is, therefore, not met. Disclosure of those kinds of losses or loss contingencies may be necessary, however, to keep the financial statements from being misleading. If disclosure is deemed necessary, the financial statements shall indicate the nature of the loss or loss contingency and give an estimate of the amount or range of loss or possible loss or state that such an estimate cannot be made. Occasionally, in the case of a loss arising after the date of the financial statements where the amount of asset impairment or liability incurrence can be reasonably estimated, disclosure may best be made by supplementing the historical financial statements with pro forma financial data giving effect to the loss as if it had occurred at the date of the financial statements. It may be desirable to present pro forma statements, usually a balance sheet only, in columnar form on the face of the historical financial statements.

.12 Certain loss contingencies are presently being disclosed in financial statements even though the possibility of loss may be remote. The common characteristic of those contingencies is a guarantee, normally with a right to proceed against an

outside party in the event that the guarantor is called upon to satisfy the guarantee. Examples include (a) guarantees of indebtedness of others, (b) obligations of commercial banks under "standby letters of credit," and (c) guarantees to repurchase receivables (or, in some cases, to repurchase the related property) that have been sold or otherwise assigned. The Board concludes that disclosure of those loss contingencies, and others that in substance have the same characteristic, shall be continued. The disclosure shall include the nature and amount of the guarantee. Consideration should be given to disclosing, if estimable, the value of any recovery that could be expected to result, such as from the guarantor's right to proceed against an outside party.

.13 This Statement applies to regulated enterprises in accordance with provisions of the Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit.'" If, in conformity with the Addendum, a regulated enterprise accrues for financial accounting and reporting purposes an estimated loss without regard to the conditions in paragraph .08, the following information shall be disclosed in its financial statements:

a) The accounting policy including the nature of the accrual and the basis for estimation.

b) The amount of any related "liability" or "asset valuation" account included in each balance sheet presented.

General or Unspecified Business Risks

.14 Some enterprises have in the past accrued so-called "reserves for general contingencies." General or unspecified business risks do not meet the conditions for accrual in paragraph .08, and no accrual for loss shall be made. No disclosure about them is required by this Statement.

Appropriation of Retained Earnings

.15 Some enterprises have classified a portion of retained earnings as "appropriated" for loss contingencies. In some cases, the appropriation has been shown outside the stockholders' equity section of the balance sheet. Appropriation of retained earnings is not prohibited by this Statement provided that it is shown within the stockholders' equity section of the balance sheet and is clearly identified as

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

an appropriation of retained earnings. Costs or losses shall not be charged to an appropriation of retained earnings, and no part of the appropriation shall be transferred to income.

Examples of Application of this Statement

.16 Examples of application of the conditions for accrual of loss contingencies in paragraph .08 and the disclosure requirements in paragraphs .09—.11 are presented in Appendix A.

Gain Contingencies

.17 The Board has not reconsidered *ARB No. 50* with respect to gain contingencies. Accordingly, the following provisions of paragraphs 3 and 5 of that Bulletin shall continue in effect:

a) Contingencies that might result in gains usually are not reflected in the accounts since to do so might be to recognize revenue prior to its realization.

b) Adequate disclosure shall be made of contingencies that might result in gains, but care shall be exercised to avoid misleading implications as to the likelihood of realization.

Other Disclosures

.18 Paragraph 6 of *ARB No. 50* required disclosure of a number of situations including "unused letters of credit, long-term leases, assets pledged as security for loans, pension plans, the existence of cumulative preferred stock dividends in arrears, and commitments such as those for plant acquisition or an obligation to reduce debts, maintain working capital, or restrict dividends." Subsequent Opinions issued by the Accounting Principles Board established more explicit disclosure requirements for a number of those items, i. e., leases (see *APB Opinion Nos. 5 and 31*)*, pension plans (see *APB Opinion No. 8* [section 4063]), and preferred stock dividend arrearages (see *APB Opinion No. 10,* paragraph 11(b) [section 5515.02b]).

.19 Situations of the type described in the preceding paragraph shall continue to be disclosed in financial statements, and this Statement does not alter the present disclosure requirements with respect to those items.

---

* Ed. Note: *APB Opinion Nos. 5 and 31* have been superseded by *FASB Statement No. 13, Accounting for Leases.* See section 4053.

Effective Date and Transition

.20 This Statement shall be effective for fiscal years beginning on or after July 1, 1975, although earlier application is encouraged. Thereafter, if financial statements for periods before the effective date, and financial summaries or other data derived therefrom, are presented, they shall be restated, if practicable, to conform to the provisions of paragraph .08 or .14 of this Statement.* In the year that this Statement is first applied, the financial statements shall disclose the nature of any restatement and its effect on income before extraordinary items, net income, and related per share amounts for each period restated. If restatement of financial statements or summaries for all prior periods presented is not practicable, information presented shall be restated for as many consecutive periods immediately preceding the effective date of this Statement as is practicable, and the cumulative effect of applying paragraph .08 or .14 on the retained earnings at the beginning of the earliest period restated (or at the beginning of the period in which this Statement is first applied if it is not practicable to restate any prior periods) shall be included in determining net income of that period (see paragraph 20 of *APB Opinion No. 20* [section 1051.20]).** The effect on income before extraordinary items, net income, and related per share amounts of applying this Statement in a period in which the cumulative effect is included in determining net income shall be disclosed for that period, and the reason for not restating all of the prior periods presented shall be explained. Reclassification of an appropriation of retained earnings to comply with paragraph .15 of this Statement shall be made in any financial statements for periods before the effective date of this Statement, or financial summaries or other data derived therefrom, that are presented after the effective date of this Statement. [As amended December 1975 by FASB Statement No. 11.] (See section 4312.)

The provisions of this Statement need not be applied to immaterial items.

* This does not alter the accounting for changes in estimates — see paragraph 31 of *APB Opinion No. 20* [section 1051.31].

** Pro forma disclosures required by paragraphs 19(d) and 21 of *APB Opinion No. 20* [sections 1051.19(d) and 1051.21] are not applicable.

Appendix A

EXAMPLES OF APPLICATION OF THIS STATEMENT

.21 This Appendix contains examples of application of the conditions for accrual of loss contingencies in paragraph .08 and of the disclosure requirements in paragraphs .09—.11. Some examples have been included in response to questions raised in letters of comment on the Exposure Draft. It should be recognized that no set of examples can encompass all possible contingencies or circumstances. Accordingly, accrual and disclosure of loss contingencies should be based on an evaluation of the facts in each particular case.

Collectibility of Receivables

.22 The assets of an enterprise may include receivables that arose from credit sales, loans, or other transactions. The conditions under which receivables exist usually involve some degree of uncertainty about their collectibility, in which case a contingency exists as defined in paragraph .01. Losses from uncollectible receivables shall be accrued when both conditions in paragraph .08 are met. Those conditions may be considered in relation to individual receivables or in relation to groups of similar types of receivables. If the conditions are met, accrual shall be made even though the particular receivables that are uncollectible may not be identifiable.

.23 If, based on available information, it is probable that the enterprise will be unable to collect all amounts due and, therefore, that at the date of its financial statements the net realizable value of the receivables through collection in the ordinary course of business is less than the total amount receivable, the condition in paragraph .08(a) is met because it is probable that an asset has been impaired. Whether the amount of loss can be reasonably estimated (the condition in paragraph .08(b)) will normally depend on, among other things, the experience of the enterprise, information about the ability of individual debtors to pay, and appraisal of the receivables in light of the current economic environment. In the case of an enterprise that has no experience of its own, reference to the experience of other enterprises in the same business may be appropriate. Inability to make a reasonable estimate of the amount of loss from uncollectible receivables (i. e., failure to satisfy the condition in paragraph .08(b))

precludes accrual and may, if there is significant uncertainty as to collection, suggest that the installment method, the cost recovery method, or some other method of revenue recognition be used (see paragraph 12 of *APB Opinion No. 10* [section 4020.01], "Omnibus Opinion—1966"); in addition, the disclosures called for by paragraph .10 of this Statement should be made.

Obligations Related to Product Warranties and Product Defects

.24 A warranty is an obligation incurred in connection with the sale of goods or services that may require further performance by the seller after the sale has taken place. Because of the uncertainty surrounding claims that may be made under warranties, warranty obligations fall within the definition of a contingency in paragraph .01. Losses from warranty obligations shall be accrued when the conditions in paragraph .08 are met. Those conditions may be considered in relation to individual sales made with warranties or in relation to groups of similar types of sales made with warranties. If the conditions are met, accrual shall be made even though the particular parties that will make claims under warranties may not be identifiable.

.25 If, based on available information, it is probable that customers will make claims under warranties relating to goods or services that have been sold, the condition in paragraph .08(a) is met at the date of an enterprise's financial statements because it is probable that a liability has been incurred. Satisfaction of the condition in paragraph .08(b) will normally depend on the experience of an enterprise or other information. In the case of an enterprise that has no experience of its own, reference to the experience of other enterprises in the same business may be appropriate. Inability to make a reasonable estimate of the amount of a warranty obligation at the time of sale because of significant uncertainty about possible claims (i.e., failure to satisfy the condition in paragraph .08(b)) precludes accrual and, if the range of possible loss is wide, may raise a question about whether a sale should be recorded prior to expiration of the warranty period or until sufficient experience has been gained to permit a reasonable estimate of the obligation; in addition, the disclosures called for by paragraph .10 of this Statement should be made.

Copyright © 1975, Financial Accounting Standards Board

.26 Obligations other than warranties may arise with respect to products or services that have been sold, for example, claims resulting from injury or damage caused by product defects. If it is probable that claims will arise with respect to products or services that have been sold, accrual for losses may be appropriate. The condition in paragraph .08(a) would be met, for instance, with respect to a drug product or toys that have been sold if a health or safety hazard related to those products is discovered and as a result it is considered probable that liabilities have been incurred. The condition in paragraph .08(b) would be met if experience or other information enables the enterprise to make a reasonable estimate of the loss with respect to the drug product or the toys.

Risk of Loss or Damage of Enterprise Property

.27 At the date of an enterprise's financial statements, it may not be insured against risk of future loss or damage to its property by fire, explosion, or other hazards. The absence of insurance against losses from risks of those types constitutes an existing condition involving uncertainty about the amount and timing of any losses that may occur, in which case a contingency exists as defined in paragraph .01. Uninsured risks may arise in a number of ways, including (a) noninsurance of certain risks or co-insurance or deductible clauses in an insurance contract or (b) insurance through a subsidiary or investee[7] to the extent not reinsured with an independent insurer. Some risks, for all practical purposes, may be noninsurable, and the self-assumption of those risks is mandatory.

.28 The absence of insurance does not mean that an asset has been impaired or a liability has been incurred at the date of an enterprise's financial statements. Fires, explosions, and other similar events that may cause loss or damage of an enterprise's property are random in their occurrence.[8] With respect to events of that type, the condition for accrual in

[7] The effects of transactions between a parent or other investor and a subsidiary or investee insurance company shall be eliminated from an enterprise's financial statements (see paragraph 6 of *ARB No. 51* [section 2051.07], "Consolidated Financial Statements," and paragraph 19(a) of *APB Opinion No. 18* [section 5131.19(a)], "The Equity Method of Accounting for Investments in Common Stock").

[8] The Board recognizes that, in practice, experience regarding loss or damage to depreciable assets is in some cases one of the factors considered in estimating the depreciable lives of a group of depreciable assets, along with such other factors as wear and tear, obsolescence, and maintenance and replacement policies. This Statement is not intended to alter present depreciation practices (see paragraph .02).

paragraph .08(a) is not satisfied prior to the occurrence of the event because until that time there is no diminution in the value of the property. There is no relationship of those events to the activities of the enterprise prior to their occurrence, and no asset is impaired prior to their occurrence. Further, unlike an insurance company, which has a contractual obligation under policies in force to reimburse insureds for losses, an enterprise can have no such obligation to itself and, hence, no liability.

Risk of Loss from Future Injury to Others, Damage to the Property of Others, and Business Interruption

.29 An enterprise may choose not to purchase insurance against risk of loss that may result from injury to others, damage to the property of others, or interruption of its business operations.[9] Exposure to risks of those types constitutes an existing condition involving uncertainty about the amount and timing of any losses that may occur, in which case a contingency exists as defined in paragraph .01.

.30 Mere exposure to risks of those types, however, does not mean that an asset has been impaired or a liability has been incurred. The condition for accrual in paragraph .08(a) is not met with respect to loss that may result from injury to others, damage to the property of others, or business interruption that may occur after the date of an enterprise's financial statements. Losses of those types do not relate to the current or a prior period but rather to the *future* period in which they occur. Thus, for example, an enterprise with a fleet of vehicles should not accrue for injury to others or damage to the property of others that may be caused by those vehicles in the future even if the amount of those losses may be reasonably estimable. On the other hand, the conditions in paragraph .08 would be met with respect to uninsured losses resulting from injury to others or damage to the property of others that took place prior to the date of the financial statements, even though the enterprise may not become aware of those matters until after that date, if the experience of the enterprise or other information enables it to make a reasonable estimate of the loss that was incurred prior to the date of its financial statements.

---

[9] As to injury or damage resulting from products that have been sold, see paragraph .26.

Copyright © 1975, Financial Accounting Standards Board

Write-Down of Operating Assets

.31 In some cases, the carrying amount of an operating asset not intended for disposal may exceed the amount expected to be recoverable through future use of that asset even though there has been no physical loss or damage of the asset or threat of such loss or damage. For example, changed economic conditions may have made recovery of the carrying amount of a productive facility doubtful. The question of whether, in those cases, it is appropriate to write down the carrying amount of the asset to an amount expected to be recoverable through future operations is not covered by this Statement.

Threat of Expropriation

.32 The threat of expropriation of assets is a contingency within the definition of paragraph .01 because of the uncertainty about its outcome and effect. If information indicates that expropriation is imminent and compensation will be less than the carrying amount of the assets, the condition for accrual in paragraph .08(a) is met. Imminence may be indicated, for example, by public or private declarations of intent by a government to expropriate assets of the enterprise or actual expropriation of assets of other enterprises. Paragraph .08(b) requires that accrual be made only if the amount of loss can be reasonably estimated. If the conditions for accrual are not met, the disclosures specified in paragraph .10 would be made when there is at least a reasonable possibility that an asset has been impaired.

Litigation, Claims, and Assessments

.33 The following factors, among others, must be considered in determining whether accrual and/or disclosure is required with respect to pending or threatened litigation and actual or possible claims and assessments:

a) The period in which the underlying cause (i.e., the cause for action) of the pending or threatened litigation or of the actual or possible claim or assessment occurred.

b) The degree of probability of an unfavorable outcome.

c) The ability to make a reasonable estimate of the amount of loss.

.34 As a condition for accrual of a loss contingency, paragraph .08(a) requires that information available prior to the issuance of financial statements indicate that it is probable that an asset had been impaired or a liability had been incurred at the date of the financial statements. Accordingly, accrual would clearly be inappropriate for litigation, claims, or assessments whose underlying cause is an event or condition occurring after the date of financial statements but before those financial statements are issued, for example, a suit for damages alleged to have been suffered as a result of an accident that occurred after the date of the financial statements. Disclosure may be required, however, by paragraph .11.

.35 On the other hand, accrual may be appropriate for litigation, claims, or assessments whose underlying cause is an event occurring on or before the date of an enterprise's financial statements even if the enterprise does not become aware of the existence or possibility of the lawsuit, claim, or assessment until after the date of the financial statements. If those financial statements have not been issued, accrual of a loss related to the litigation, claim, or assessment would be required if the probability of loss is such that the condition in paragraph .08(a) is met and the amount of loss can be reasonably estimated.

.36 If the underlying cause of the litigation, claim, or assessment is an event occurring before the date of an enterprise's financial statements, the probability of an outcome unfavorable to the enterprise must be assessed to determine whether the condition in paragraph .08(a) is met. Among the factors that should be considered are the nature of the litigation, claim, or assessment, the progress of the case (including progress after the date of the financial statements but before those statements are issued), the opinions or views of legal counsel and other advisers, the experience of the enterprise in similar cases, the experience of other enterprises, and any decision of the enterprise's management as to how the enterprise intends to respond to the lawsuit, claim, or assessment (for example, a decision to contest the case vigorously or a decision to seek an out-of-court settlement). The fact that legal counsel is unable to express an opinion that the outcome will be favorable to the enterprise should not necessarily be interpreted to mean that the condition for accrual of a loss in paragraph .08(a) is met.

 Copyright © 1975, Financial Accounting Standards Board

.37 The filing of a suit or formal assertion of a claim or assessment does not automatically indicate that accrual of a loss may be appropriate. The degree of probability of an unfavorable outcome must be assessed. The condition for accrual in paragraph .08(a) would be met if an unfavorable outcome is determined to be probable. If an unfavorable outcome is determined to be reasonably possible but not probable, or if the amount of loss cannot be reasonably estimated, accrual would be inappropriate, but disclosure would be required by paragraph .10 of this Statement.

.38 With respect to unasserted claims and assessments, an enterprise must determine the degree of probability that a suit may be filed or a claim or assessment may be asserted and the possibility of an unfavorable outcome. For example, a catastrophe, accident, or other similar physical occurrence predictably engenders claims for redress, and in such circumstances their assertion may be probable; similarly, an investigation of an enterprise by a governmental agency, if enforcement proceedings have been or are likely to be instituted, is often followed by private claims for redress, and the probability of their assertion and the possibility of loss should be considered in each case. By way of further example, an enterprise may believe there is a possibility that it has infringed on another enterprise's patent rights, but the enterprise owning the patent rights has not indicated an intention to take any action and has not even indicated an awareness of the possible infringement. In that case, a judgment must first be made as to whether the assertion of a claim is probable. If the judgment is that assertion is not probable, no accrual or disclosure would be required. On the other hand, if the judgment is that assertion is probable, then a second judgment must be made as to the degree of probability of an unfavorable outcome. If an unfavorable outcome is probable and the amount of loss can be reasonably estimated, accrual of a loss is required by paragraph .08. If an unfavorable outcome is probable but the amount of loss cannot be reasonably estimated, accrual would not be appropriate, but disclosure would be required by paragraph .10. If an unfavorable outcome is reasonably possible but not probable, disclosure would be required by paragraph .10.

.39 As a condition for accrual of a loss contingency, paragraph .08(b) requires that the amount of loss can be reasonably estimated. In some cases, it may be determined that a loss was incurred because an unfavorable outcome of

the litigation, claim, or assessment is probable (thus satisfying the condition in paragraph .08(a)), but the range of possible loss is wide. For example, an enterprise may be litigating an income tax matter. In preparation for the trial, it may determine that, based on recent decisions involving one aspect of the litigation, it is probable that it will have to pay additional taxes of $2 million. Another aspect of the litigation may, however, be open to considerable interpretation, and depending on the interpretation by the court the enterprise may have to pay taxes of $8 million over and above the $2 million. In that case, paragraph .08 requires accrual of the $2 million if that is considered a reasonable estimate of the loss. Paragraph .10 requires disclosure of the additional exposure to loss if there is a reasonable possibility that additional taxes will be paid. Depending on the circumstances, paragraph .09 may require disclosure of the $2 million that was accrued.

Catastrophe Losses of Property and Casualty Insurance Companies

.40 At the time that a property and casualty insurance company or reinsurance company issues an insurance policy covering risk of loss from catastrophes, a contingency arises. The contingency is the risk of loss *assumed* by the insurance company, that is, the risk of loss from catastrophes that may occur *during the term of the policy*. The insurance company has not assumed risk of loss for catastrophes that may occur *beyond* the term of the policy. Clearly, therefore, no asset has been impaired or liability incurred with respect to catastrophes that may occur beyond the terms of policies in force.

.41 The conditions in paragraph .08 should be considered with respect to the risk of loss assumed by an insurance company for catastrophes that may occur during the terms of policies in force to determine whether accrual of a loss is appropriate. To satisfy the condition in paragraph .08(a) that it be probable that a liability has been incurred to existing policyholders, the occurrence of catastrophes (i.e., the confirming future events) would have to be reasonably predictable within the terms of policies in force. Further, to satisfy the condition in paragraph .08(b), the amounts of losses therefrom would have to be reasonably estimable. Actuarial techniques are employed by insurance companies to predict the rate of occurrence of and amounts of losses from catastrophes over long periods of time for insurance rate-setting purposes.

Copyright © 1975, Financial Accounting Standards Board

Predictions over relatively short periods of time, such as an individual accounting period or the terms of a large number of existing insurance policies in force, are subject to substantial deviations. Consequently, assumption of risk of loss from catastrophes by property and casualty insurance companies and reinsurance companies fails to satisfy the conditions for accrual in paragraphs .08(a) and .08(b). Moreover, deferral of unearned premiums *within* the terms of policies in force represents the "unknown liability" for loss (including catastrophe losses) on unexpired policies, making an accrual inappropriate—see paragraphs .94—.96 in Appendix C. Recognition of premium income as earned revenue within the terms of policies in force is discussed in the AICPA Industry Audit Guide, "Audits of Fire and Casualty Insurance Companies."

.42 Although some property and casualty insurance companies have accrued an estimated amount for catastrophe losses, other insurance companies have accomplished the same objective by deferring a portion of the premium income. Deferral of any portion of premium income *beyond the terms of policies in force* is, in substance, similar to premature accrual of catastrophe losses and, therefore, also does not meet the conditions of paragraph .08.

.43 The conditions for accrual in paragraph .08 do not prohibit a property and casualty insurance company from accruing probable catastrophe losses that have been incurred on or before the date of its financial statements but that have not been reported by its policyholders as of that date. If the amount of loss can be reasonably estimated, paragraph .08 requires accrual of those incurred-but-not-reported losses.

Payments to Insurance Companies That May Not Involve Transfer of Risk

.44 To the extent that an insurance contract or reinsurance contract does not, despite its form, provide for indemnification of the insured or the ceding company by the insurer or reinsurer against loss or liability, the premium paid less the amount of the premium to be retained by the insurer or reinsurer shall be accounted for as a deposit by the insured or the ceding company. Those contracts may be structured in various ways, but if, regardless of form, their substance is that all or part of the premium paid by the insured or the ceding company is a deposit, it shall be accounted for as such.

.45 Operations in certain industries may be subject to such high risks that insurance is unavailable or is available only at what is considered to be a prohibitively high cost. Some enterprises in those industries have "pooled" their risks by forming a mutual insurance company in which they retain an equity interest and to which they pay insurance premiums. For example, some electric utility companies have formed such a mutual insurance company to insure risks related to nuclear power plants, and some oil companies have formed a company to insure against risks associated with petroleum exploration and production. Whether the premium paid represents a payment for the transfer of risk or whether it represents merely a deposit will depend on the circumstances surrounding each enterprise's interest in and insurance arrangement with the mutual insurance company. An analysis of the contract is required to determine whether risk has been transferred and to what extent.

Appendix B

BACKGROUND INFORMATION

.46 In April 1973, the FASB placed on its technical agenda a project then entitled "Accounting for Future Losses." The project addressed accrual and disclosure of loss contingencies. The Board believes that "Accounting for Contingencies" is a more descriptive title for this Statement than "Accounting for Future Losses."

.47 A task force of 16 persons from industry, public accounting, the financial community, and academe was appointed in the summer of 1973 to provide counsel to the Board in preparing a Discussion Memorandum analyzing issues related to the project.

.48 The Discussion Memorandum gave examples of various types of contingencies and considered several of those at length to assist in the development of standards of financial accounting and reporting. These included (a) uninsured risks ("self-insurance"), (b) risk of losses from catastrophes assumed by property and casualty insurance companies, and (c) risk of losses from expropriations by foreign governments.

.49 Research undertaken in connection with this project included (a) a search of relevant literature, (b) an examination of published financial statements in annual reports to shareholders and in filings with the SEC on Form 10-K, (c) a questionnaire survey conducted by the Financial

Copyright © 1975, Financial Accounting Standards Board

Executives Institute to which 64 companies responded, and (d) a study of catastrophe reserve accounting methods employed by property and casualty insurance companies. Summaries of research findings are included in appendices to the Discussion Memorandum.

.50 On January 3, 1973 (prior to the date the Board placed this subject on its agenda), the Securities and Exchange Commission issued its *Accounting Series Release No. 134*, which pointed out that a number of property and casualty insurance companies had adopted the accounting policy of making a provision from each period's income to cover a portion of major losses expected to occur in future periods. The SEC Release indicated that the Committee on Insurance Accounting and Auditing of the AICPA was working actively on the subject in cooperation with industry groups. The Release set forth certain disclosure requirements pending resolution of the question of accrual.

.51 The AICPA committee's report (dated July 17, 1973) was in the form of a memorandum setting forth the views of those committee members favoring and those opposing accrual of losses from future catastrophes. In the course of its study, the AICPA committee had gathered considerable data on the subject, in part from a survey of member companies of the American Insurance Association, and this information was made available to the Board.

.52 On August 2, 1973, the SEC announced in *Accounting Series Release No. 145* that property and casualty insurance companies should not change their method of accounting for catastrophe losses "until a single method has been adopted by the Financial Accounting Standards Board."

.53 The Board issued the Discussion Memorandum on March 13, 1974, and held a public hearing on the subject on May 13, 1974. The Board received 87 position papers, letters of comment, and outlines of oral presentations in response to the Discussion Memorandum. Eighteen presentations were made at the public hearing.

.54 An Exposure Draft of a proposed Statement on "Accounting for Contingencies" was issued on October 21, 1974. The Board received 212 letters of comment on the Exposure Draft.

Appendix C

BASIS FOR CONCLUSIONS

.55 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others.

SCOPE OF THIS STATEMENT

.56 Some respondents to the Exposure Draft proposed that the Statement not deal with accrual and disclosure of loss contingencies in general but, rather, only with the following three specific matters: "self-insurance," risks of losses from catastrophes assumed by property and casualty insurance companies including reinsurance companies, and threat of expropriation. As the basis for that position, they noted that the Discussion Memorandum considered those three matters at length. Other respondents suggested that catastrophe losses be dealt with in a separate Statement.

.57 The Board has concluded, however, that the broad issue of accrual and disclosure of loss contingencies should be dealt with in a single Statement, just as the Discussion Memorandum encompassed "the broad issue of accounting for future losses."[10] As the Discussion Memorandum stated, "future losses of all types presently known to affect enterprises and new types of future losses that may arise are conceptually included in the scope of this project." The three matters dealt with at length in the Discussion Memorandum were used "as examples to assist in the evaluation and development of criteria for accounting for future losses," and other examples were discussed. The Board has concluded that

---

[10] The Board believes that *contingencies* is a more descriptive term than *future losses,* and the Discussion Memorandum indicated that the project would necessarily involve reconsideration of both *ARB No. 50* and Chapter 6 of *ARB No. 43.*

Copyright © 1975, Financial Accounting Standards Board

loss contingencies such as those given as examples in paragraph .04 of this Statement have common characteristics and that questions about accounting for and reporting of those contingencies should be resolved comprehensively. It is for that reason, also, that the Board believes it inappropriate to deal with catastrophe losses in a separate Statement.

.58 A question has been raised whether uncollectibility of receivables and product warranties constitute contingencies within the scope of this Statement. The Board recognizes that uncertainties associated with uncollectibility of some receivables and some product warranties are likely to be, in part, inherent in making accounting estimates (described in paragraph .02) as well as, in part, the type of uncertainties that give rise to a contingency (described in paragraph .01). The Board believes that no useful purpose would be served by attempting to distinguish between those two types of uncertainties for purposes of establishing conditions for accrual of uncollectible receivables and product warranties. Consequently, those matters are deemed to be contingencies within the definition of paragraph .01 and should be accounted for pursuant to the provisions of this Statement.

ACCRUAL OF LOSS CONTINGENCIES

.59 Paragraph .08 requires that a loss contingency be accrued if the two specified conditions are met. The purpose of those conditions is to require accrual of losses when they are reasonably estimable and relate to the current or a prior period. The requirement that the loss be reasonably estimable is intended to prevent accrual in the financial statements of amounts so uncertain as to impair the integrity of those statements. The Board has concluded that disclosure is preferable to accrual when a reasonable estimate of loss cannot be made. Further, even losses that are reasonably estimable should not be accrued if it is not probable that an asset has been impaired or a liability has been incurred at the date of an enterprise's financial statements because those losses relate to a future period rather than the current or a prior period. Attribution of a loss to events or activities of

the current or prior periods is an element of asset impairment or liability incurrence.

.60 In establishing the conditions in paragraph .08, Board members considered the factors discussed in paragraphs .61—.101. Individual Board members gave greater weight to some factors than to others.

Accounting Accruals Do Not Provide Protection Against Losses

.61 Accrual of a loss related to a contingency does not create or set aside funds to lessen the possible financial impact of a loss, although some respondents to the Discussion Memorandum and the Exposure Draft argued to the contrary. The Board believes that confusion exists between accounting accruals (sometimes referred to as "accounting reserves") and the reserving or setting aside of specific assets to be used for a particular purpose or contingency. Accounting accruals are simply a method of allocating costs among accounting periods and have no effect on an enterprise's cash flow. An enterprise may choose to maintain or have access to sufficient liquid assets to replace or repair lost or damaged property or to pay claims in case a loss occurs. Alternatively, it may transfer the risk to others by purchasing insurance. Those are financial decisions, and if enterprise management decides to do neither, the presence or absence of an accrued credit balance on the balance sheet will have no effect on the consequences of that decision. The accounting standards set forth in this Statement do not affect the fundamental business economics of that decision.

.62 In that regard, some respondents to the Discussion Memorandum and the Exposure Draft contended that an accounting standard that does not permit periodic accrual of so-called "self-insurance reserves" and, in the case of insurance companies, so-called "catastrophe reserves" will force enterprises to purchase insurance or reinsurance because the "protection" afforded by the accrual would no longer exist. Those accruals, however, in no way protect the assets available to replace or repair uninsured property that

Copyright © 1975, Financial Accounting Standards Board

may be lost or damaged, or to satisfy claims that are not covered by insurance, or, in the case of insurance companies, to satisfy the claims of insured parties. Accrual, in and of itself, provides no financial protection that is not available in the absence of accrual.

.63 The sole result of accrual, for financial accounting and reporting purposes, is allocation of costs among accounting periods. Some respondents to the Discussion Memorandum and the Exposure Draft took the position that estimated losses from loss contingencies should be accrued even before available information indicates that it is probable that an asset has been impaired or a liability has been incurred to avoid reporting net income that fluctuates widely from period to period. In their view, financial statement users may be misled by those fluctuations. They believe that estimated losses should be accrued without regard to whether the loss relates to the current period if, based on experience, it is reasonable to expect losses sometime in the future.

.64 Financial statement users have indicated, however, that information about earnings variability is important to them. Two elements often cited as basic to the decision models of many financial statement users are (a) expected return — the predicted amount and timing of the return on an investment — and (b) risk — the variability of that expected return. If the nature of an enterprise's operations is such that irregularities in the incurrence of losses cause variations in periodic net income, that fact should not be obscured by accruing for anticipated losses that do not relate to the current period.

.65 The Board recognizes that some investors may have a preference for investments in enterprises having a stable pattern of earnings, because that indicates lesser uncertainty or risk than fluctuating earnings. That preference, in turn, is perceived by many as having a favorable effect on the market prices of those enterprises' securities. If accruals for such matters as future uninsured losses and catastrophes were prohibited, some respondents contended, enterprises would be forced to purchase insurance or reinsurance to achieve the more stable pattern of reported earnings that tends to

accompany the use of an "accounting reserve." Insurance or reinsurance reduces or eliminates risks and the inherent earnings fluctuations that accompany risks. Unlike insurance and reinsurance, however, the use of "accounting reserves" does not reduce or eliminate risk. The Board rejects the contention, therefore, that the use of "accounting reserves" is an alternative to insurance and reinsurance in protecting against risk. Earnings fluctuations are inherent in risk retention, and they should be reported as they occur. The Board cannot sanction the use of an accounting procedure to create the illusion of protection from risk when, in fact, protection does not exist.

.66 The Board has also considered the argument that periodic accrual of losses without regard to whether an asset has been impaired or liability incurred is justified on grounds of comparability of financial statements among enterprises. Some respondents contended, for example, that accrual is necessary to make the financial statements of enterprises that do not purchase insurance comparable to those of enterprises that do purchase insurance (and report the premiums as expenses) and to make the financial statements of property and casualty insurance companies comparable regardless of the extent to which reinsurance has been purchased. In the Board's view, however, to report activity when there has been none would obscure a fundamental difference in circumstance between enterprises that transfer risks to others and those that do not.

Financial Accounting and Reporting Reflects Primarily the Effects of Past Transactions and Existing Conditions

.67 Financial accounting and reporting reflects primarily the effects of past transactions and existing conditions, not future transactions or conditions. For example, paragraph 35 of *APB Statement No. 4* [section 1022.27], "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises," states:

> Financial accounting and financial statements are primarily historical in that information about events that have taken place provides the basic data of financial accounting and financial statements.

Copyright © 1975, Financial Accounting Standards Board

.68 The first condition in paragraph .08—that a loss contingency not be accrued until it is probable that an asset has been impaired or a liability has been incurred — is consistent with this concept of financial accounting and financial statements. That condition is not so past-oriented that accrual of a loss must await the occurrence of the confirming future event, for example, final adjudication or settlement of a lawsuit. The condition requires only that it be probable that the confirming future event will occur. The condition is intended to prohibit the recognition of a liability when it is not probable that one has been incurred and to prohibit the accrual of an asset impairment when it is not probable that an asset of an enterprise has been impaired.

The Concept of a Liability

.69 In many cases, the accrual of a loss contingency results in the recording of a liability, for example, accruals for a probable tax assessment, a warranty obligation, or a probable loss resulting from the guarantee of indebtedness of others. In the course of its deliberations, therefore, the Board found it relevant to consider the concept of a liability as expressed in accounting literature.

.70 The economic obligations of an enterprise are defined in paragraph 58 of *APB Statement No. 4* [section 1023.19] as "its present responsibilities to transfer economic resources or provide services to other entities in the future." Two aspects of that definition are especially relevant to accounting for contingencies: first, that liabilities are *present* responsibilities and, second, that they are obligations to *other entities.* Those notions are supported by other definitions of liabilities in published accounting literature, for example:

> Liabilities are claims of creditors against the enterprise, arising out of past activities, that are to be satisfied by the disbursement or utilization of corporate resources.[11]

---

[11] American Accounting Association, *Accounting and Reporting Standards for Corporate Financial Statements and Preceding Statements and Supplements* (Sarasota, Fla.: AAA, 1957), p. 16.

> A liability is the result of a transaction of the past, not of the future.[12]

.71 The condition in paragraph .08(a)—that a loss contingency shall be accrued if it is probable that a liability has been incurred — is intended to proscribe recognition of losses that relate to future periods but to require accrual of losses that relate to the current or a prior period (assuming the amount of loss can be reasonably estimated -- see paragraph .08(b)).

.72 Liability definitions also generally require that the amount of an economic obligation be known or susceptible of reasonable estimation before it is recorded as a liability. For example:

> [Liabilities] are measured by cash received, by the established price of noncash assets or services received, or by estimates of a definitive character when the amount owing cannot be measured more precisely.[13]

> The amount of the liability must be the subject of calculation or of close estimation.[14]

.73 The condition in paragraph .08(b)—that an estimated loss from a loss contingency not be accrued until the amount of loss can be reasonably estimated — is consistent with this feature of the liability concept.

Accounting for Impairment of Value of Assets

.74 The accrual of some loss contingencies may result in recording the impairment of the value of an asset rather than in recording a liability, for example, accruals for expropriation of assets or uncollectible receivables.

Accounting presently recognizes impairments of the value of assets such as the following:

a) Paragraph 9 of Chapter 3A, "Current Assets and Current Liabilities," of *ARB No. 43* [section 2031.09] provides that "in the case of marketable securities where market value is less than cost by a substantial amount and it is evident that the decline in market value is not due to a mere temporary condition, the amount to be included as a current asset should not exceed the market value."

b) Statement 5 of Chapter 4, "Inventory Pricing," of *ARB No. 43* [section 5121.07—.08] states that "a departure from the cost basis of pricing the inventory is required when the utility of the goods is no longer as great as its cost. . . . A loss of utility is to be reflected as a charge against the revenues of the period in which it occurs."

c) Paragraph 19(h) of *APB Opinion No. 18* [section 5131.19 (h)], "The Equity Method of Accounting for Investments in Common Stock," states that "a loss in value of an investment which is other than a temporary decline should be recognized the same as a loss in value of other long-term assets."

d) Paragraph 15 of *APB Opinion No. 30* [section 2012.15], "Reporting the Results of Operations," states that "if a loss is expected from the proposed sale or abandonment of a segment, the estimated loss should be provided for at the measurement date. . . ." Paragraph 14 [section 2012.14] states that the measurement date is the date on which management "commits itself to a formal plan to dispose of a segment of the business, whether by sale or abandonment."

e) Paragraph 183 of *APB Statement No. 4* [section 1027.09] states that "when enterprise assets are damaged by others, asset amounts are written down to recoverable costs and a loss is recorded."

.75 A recurring principle underlying all of these references to asset impairments in the accounting literature is that a loss should not be accrued until it is probable that an asset *has*

been impaired and the amount of the loss can be reasonably estimated. As indicated by those references, impairment is recognized, for instance, when a non-temporary decline in the market price of marketable securities below cost *has taken place*, when the utility of inventory *is no longer* as great as its cost, when a commitment, in terms of a formal plan, *has been made* to abandon a segment of a business or to sell a segment at less than its carrying amount, when enterprise assets *are damaged*, and so forth. The condition in paragraph .08(a) is intended to proscribe accrual of losses that relate to future periods, and the condition in paragraph .08(b) further requires that the amount of loss be reasonably estimable before it is accrued.

The Matching Concept

.76 A number of respondents to the Discussion Memorandum and the Exposure Draft noted that losses from certain types of contingencies are likely to occur irregularly over an extended period of time encompassing a number of accounting periods. In their view, the matching process in accounting requires that estimated losses from those types of contingencies be accrued in each accounting period even if not directly related to events or activities of the period.

.77 *APB Statement No. 4* [sections 1021—1029] explicitly avoids using the term "matching" because it has a variety of meanings in the accounting literature. In its broadest sense, matching refers to the entire process of income determination —described in paragraph 147 of *APB Statement No. 4* [section 1026.11] as "identifying, measuring, and relating revenue and expenses of an enterprise for an accounting period." Matching may also be used in a more limited sense to refer only to the process of expense recognition or in an even more limited sense to refer to the recognition of expenses by associating costs with revenue on a cause and effect basis.

.78 Three pervasive principles for recognizing costs as expenses are set forth in paragraphs 156-160 of *APB Statement No. 4* [section 1026.20—.24] as follows:

Copyright © 1975, Financial Accounting Standards Board

> *Associating Cause and Effect.* . . . Some costs are recognized as expenses on the basis of a presumed direct association with specific revenue . . . recognizing them as expenses accompanies recognition of the revenue.
>
> *Systematic and Rational Allocation.* . . . If an asset provides benefits for several periods its cost is allocated to the periods in a systematic and rational manner in the absence of a more direct basis for associating cause and effect.
>
> *Immediate Recognition.* Some costs are associated with the current accounting period as expenses because (1) costs incurred during the period provide no discernible future benefits, (2) costs recorded as assets in prior periods no longer provide discernible benefits or (3) allocating costs either on the basis of association with revenue or among several accounting periods is considered to serve no useful purpose.

.79 Some who believe that matching requires accrual of losses that are likely to occur irregularly over an extended period of time encompassing a number of accounting periods cite the systematic and rational allocation principle of expense recognition as justification for their position. That principle, however, involves the systematic and rational allocation of the cost of an asset (an asset that *has been* acquired) throughout the estimated periods that the asset provides benefits or the systematic and rational accrual of the amount of some obligations (obligations that *have been* incurred) throughout the estimated periods that the obligations are incurred. The customary depreciation of plant and equipment is an example of the former; when reasonably estimable, the accrual of vacation pay is an example of the latter. The systematic and rational allocation principle has no application to assets that are expected to be acquired in the future or to obligations that are expected to be incurred in the future.

.80 Matching, in the sense of recognizing expenses by associating costs with specific revenue on a cause and effect basis, is a consideration in relation to accrual for such matters as uncollectible receivables and warranty obligations. For example, most enterprises that make credit sales or warrant

their products or services regularly incur losses from uncollectible receivables and warranty obligations. Frequently, those losses can be associated with revenue on a cause and effect basis. If the amount of those losses can be reasonably estimated, paragraph .08 of this Statement requires accrual if it is probable that an asset has been impaired (estimated uncollectible receivables) or that a liability has been incurred (estimated warranty claims).

Spreading the Burden of Irregularly Occurring Costs to Successive Generations of Customers and Shareholders

.81 Some respondents to the Discussion Memorandum and the Exposure Draft contended that all costs of doing business should be accrued in each accounting period so that successive generations of customers and shareholders would bear their share of all costs including those that occur irregularly. It would seem, however, that those irregularly occurring costs are usually borne by customers through pricing policy and that pricing is not necessarily dependent upon financial accounting and reporting practices. With regard to accrual on grounds that it enables successive generations of shareholders to bear their share of irregularly occurring costs, see paragraphs .63—.65.

Conservatism

.82 On the grounds of conservatism, some respondents supported accrual of estimated losses from loss contingencies before available information indicates that it is probable that an asset has been impaired or a liability has been incurred. Conservatism is indicated as one of the "characteristics and limitations" of financial accounting in paragraph 35 of *APB Statement No. 4* [section 1022.27] as follows:

> *Conservatism.* The uncertainties that surround the preparation of financial statements are reflected in a general tendency toward early recognition of unfavorable events and minimization of the amount of net assets and net income.

Copyright © 1975, Financial Accounting Standards Board

.83 Conservatism is further discussed in paragraph 171 of *APB Statement No. 4* [section 1026.35]:

> *Conservatism.* Frequently, assets and liabilities are measured in a context of significant uncertainties. Historically, managers, investors, and accountants have generally preferred that possible errors in measurement be in the direction of understatement rather than overstatement of net income and net assets. This has led to the convention of conservatism. . . .

.84 The conditions for accrual in paragraph .08 are not inconsistent with the accounting concept of conservatism. Those conditions are not intended to be so rigid that they require virtual certainty before a loss is accrued. They require only that it be *probable* that an asset has been impaired or a liability has been incurred and that the amount of loss be *reasonably* estimable. In the absence of that probability or estimability, however, the Board has concluded that disclosure is preferable to accruing in the financial statements amounts so uncertain as to impair the integrity of the financial statements.

Risk of Future Loss or Damage of Enterprise Property, Injury to Others, Damage to the Property of Others, and Business Interruption

.85 Some persons contend that the decision not to purchase insurance against losses that can be reasonably expected some time in the future (such as risk of loss or damage of enterprise property, injury to others, damage to the property of others, and business interruption) justifies periodic accrual for those losses without regard to whether it is probable that an asset has been impaired or a liability incurred at the date of the financial statements. As a basis for their position, they frequently cite the following factors: matching of revenue and expense, spreading the burden of irregularly occurring costs to successive generations of customers, and conservatism. They also believe that accrual of estimated losses from those types of risks improves the comparability of the financial statements of enterprises that do not insure with those of enterprises that purchase insurance. Some

contend that a prohibition against periodic accrual for uninsured losses will force enterprises to purchase insurance coverage that would not otherwise be purchased.

.86 In the Board's judgment, however, the mere existence of risk, at the date of an enterprise's financial statements, does not mean that a loss should be accrued. Anticipation of asset impairments or liabilities or losses from business interruption that do not relate to the current or a prior period is not justified by the matching concept.

.87 The Board's views regarding the contention that periodic accrual for uninsured losses is a way of providing protection against loss and improving comparability among enterprises that do and do not purchase insurance, and the contention that prohibition of accrual will force enterprises to purchase insurance, are discussed in paragraphs .61—.66. The Board's position regarding periodic accrual for uninsured risks and other loss contingencies on the grounds of spreading the burden of irregularly occurring costs to successive generations of customers or on the grounds of conservatism is discussed in paragraphs .81—.84.

.88 Some respondents to the Exposure Draft said that prohibition against periodic accrual for uninsured losses would be detrimental to government contractors because requirements of Federal government agencies in auditing costs subject to procurement regulations currently allow reimbursement for periodic accruals for uninsured losses only if they are included in the contractor's financial statements. Contract reimbursement and financial accounting and reporting may well have different objectives. Accordingly, the provisions of this Statement may not be appropriate for contract reimbursement purposes.

Catastrophe Losses of Property and Casualty Insurance Companies

.89 At the time that a property and casualty insurance company or reinsurance company issues an insurance policy covering risk of loss from catastrophes, a contingency arises.

Copyright © 1975, Financial Accounting Standards Board

The contingency is the risk of loss *assumed* by the insurance company, that is, the risk of loss from catastrophes that may occur *during the term of the policy.*

.90 Some respondents to the Discussion Memorandum and the Exposure Draft proposed that insurance companies accrue estimated losses from catastrophes including both those that may occur during the terms of insurance policies in force and those that may occur beyond the terms of policies in force. Other respondents proposed that some portion of the premium revenue of a property and casualty insurance company be deferred beyond the terms of insurance policies in force to provide what, in substance, is an estimated liability for future castasrophe losses. Some respondents proposed that accrual of estimated losses or deferral of premiums be permitted but not required. On the other hand, some respondents to the Discussion Memorandum and the Exposure Draft were opposed to any accrual for future catastrophe losses by means of an estimated liability or deferral of premium revenue. Because those estimated liabilities and revenue deferrals have come to be referred to as "catastrophe reserves," that term will be used in paragraphs .91—.101 for convenience.

.91 In response to the Exposure Draft, it was recommended that the FASB appoint a special committee to study further the matter of catastrophe reserve accounting and to make recommendations thereon. The Board has concluded, however, that its own research and that of others (mentioned in Appendix B to this Statement and summarized in the Discussion Memorandum), the written responses received to the Discussion Memorandum, the presentations made at the public hearing, and the letters of comment on the Exposure Draft provide the Board with sufficient information with which to reach a conclusion.

.92 Proponents of catastrophe reserve accounting generally cite the following reasons for their position:

a) *Catastrophes certain to occur.* Over the long term, catastrophes are certain to occur; therefore, they are not contingencies.

b) *Predictability of catastrophe losses.* On the basis of experience and by application of appropriate statistical techniques, catastrophe losses can be predicted over the long term with reasonable accuracy.

c) *Matching.* Some portion of property and casualty insurance premiums is intended to cover losses that usually occur infrequently and at intervals longer than both the terms of the policies in force and the financial accounting and reporting period. Catastrophe losses should, therefore, be accrued when the revenue is recognized (or premiums should be deferred beyond the terms of policies in force to periods in which the catastrophes occur) to match catastrophe losses with the related revenue.

d) *Stabilization of reported income.* Catastrophe reserve accounting stabilizes reported income and avoids erratic variations caused by irregularly occurring catastrophes.

e) *Comparability.* Reinsurance premiums paid by a prime insurer are said to be similar to accrual of catastrophe losses prior to their occurrence because the reinsurance premiums paid reduce income before a catastrophe loss occurs. Accrual of catastrophe losses as an expense prior to occurrence of a catastrophe makes the financial statements of property and casualty insurance companies comparable regardless of the extent to which reinsurance has been purchased.

f) *Non-accrual would force purchase of reinsurance.* Non-accrual of catastrophe losses will force property and casualty insurance companies to purchase reinsurance.

g) *Generations of policyholders.* Periodic accrual of estimated catastrophe losses charges each generation of policyholders with its share of the loss through the premium structure.

.93 The Board does not find those arguments persuasive. The fact that over the long term catastrophes are certain to occur does not justify accrual before the catastrophes occur. As

Copyright © 1975, Financial Accounting Standards Board

stated in paragraph .59, the purpose of the conditions for accrual in paragraph .08 is to require accrual of losses if they are reasonably estimable *and relate to the current or a prior period.* An enterprise may know with certainty, for example, next year's administrative salaries, but that does not justify accrual in the current accounting period because those salaries do not relate to that period. As indicated in paragraphs .67—.68, financial accounting and reporting reflects primarily the effects of past transactions and existing conditions, not future transactions or conditions; accrual for losses from catastrophes that are expected to occur *beyond the terms of insurance policies in force* would amount to accrual of a liability before one has been incurred. Existing policyholders are insured only during the period covered by their insurance contracts; an insurance company is not presently obligated to policyholders for catastrophes that may occur after expiration of their policies. Accrual for those catastrophe losses would record a liability that is inconsistent with the concept of a liability discussed in paragraphs .69—.73.

.94 The Board recognizes that the costs of catastrophes to insurance companies are large and are incurred irregularly and that insurance companies recoup those costs in the long run through periodic adjustments in the premiums charged to policyholders. It is the view of the Board, however, that the long-run nature of pricing of premiums should not be a determinant of the time when a liability is recorded.

.95 The AICPA Industry Audit Guide, "Audits of Fire and Casualty Insurance Companies," describes accounting for premiums as follows (pp. 24-25):

> As soon as a policy is issued promising to indemnify for loss, the insurance company incurs a potential liability. The company may be called upon to pay the full amount of the policy, a portion of the policy, or nothing. It would be impossible to try to measure the liability under a single policy. However, since insurance is based on the law of averages, one may estimate from experience the loss on a large number of policies.

> As state supervision of insurance developed, the insurance departments set about providing a legal basis for determining the potential liability under outstanding policies in order to establish an ample reserve for the protection of policyholders and provide a uniform method of calculation. It was recognized that, since the premium is expected to pay losses and expenses, and provide a margin of profit over the term of the policy, the portion measured by the unexpired term should be adequate to pay policy liabilities (principally losses and loss expenses) and return premiums during the unexpired term on a uniform basis for all companies. Therefore the unearned premium was adopted as the basis for computing the unknown liability on unexpired policies.

.96 Because unearned premiums represents the "unknown liability," the Board is of the view that it is inappropriate to accrue an additional amount as an estimate for that same unknown liability. Further, in the Board's view, deferral of premiums beyond the terms of policies in force is inconsistent with the concept of revenue recognition set forth in the Audit Guide and is without any conceptual basis. Moreover, the Board believes that its conclusion regarding the time at which accruals shall be made for catastrophic losses is consistent with the Audit Guide. It should be noted that this Statement does not prohibit (and, in fact, requires) accrual of a *net* loss (that is, a loss in excess of deferred premiums) that probably will be incurred on insurance policies that are in force, provided that the loss can be reasonably estimated, just as accrual of net losses on long-term construction-type contracts is required (see *ARB No. 45* [section 4031], "Long-Term Construction-Type Contracts").

.97 With respect to catastrophes that may occur within the terms of policies in force, to satisfy the conditions for accrual in paragraph .08, the occurrence of catastrophes would have to be probable during the terms of those policies, and the amounts of losses therefrom would have to be reasonably estimable. The letters of comment and position papers received in response to the Discussion Memorandum and the Exposure Draft and presentations at the public hearing lead

Copyright © 1975, Financial Accounting Standards Board

the Board to conclude that neither the timing of catastrophes nor the amounts of losses therefrom are reasonably predictable within the terms of policies in force.

.98 The Board is of the view that accrual of losses from catastrophes is not justified by the accounting concept of matching. Systematic and rational allocation does not apply to costs that have not been incurred. The Board recognizes that large and irregularly occurring costs must of necessity be considered in systematically and rationally determining premiums to be charged to customers but does not believe that pricing considerations should dictate the accrual of losses for financial accounting purposes. The Board also does not believe that matching in the sense of recognizing expenses by associating losses with specific revenue on a cause and effect basis is, in and of itself, a basis for accrual of catastrophe losses prior to the event causing the loss. The Board believes that, for the reasons stated in paragraphs .94—.96, there can be no presumed direct association with specific revenue prior to the event causing the catastrophe loss.

.99 The Board's views regarding justification of periodic accrual of catastrophe reserves on grounds of (a) stabilizing reported income, (b) improving comparability among financial statements of insurance companies, and (c) preventing the "forced" purchase of reinsurance are discussed in paragraphs .61—.66.

.100 The argument that accrual of catastrophe reserves enables each generation of policyholders to bear its share of the losses through the premiums that it is charged is also questionable because amounts established for premiums are not necessarily dependent on financial accounting and reporting practices.

.101 The Board considered the proposal that catastrophe reserve accounting be permitted but not made mandatory. Whether it is probable that an asset has been impaired or a liability incurred is determined by the circumstances, not by choice. Accordingly, the conditions for accrual in paragraph

.08 apply to all loss contingencies, including risk of loss from catastrophes assumed by property and casualty insurance companies and reinsurance companies. In the Board's view, the use of different methods to report catastrophe losses in similar circumstances cannot be justified.

APPLICABILITY TO LIFE INSURANCE COMPANIES

.102 Some respondents to the Exposure Draft inquired as to whether the conditions for accrual in paragraph .08 are intended to change accounting practices of life insurance companies. This Statement does not amend the AICPA Industry Audit Guide, "Audits of Stock Life Insurance Companies."

DISCLOSURE OF NONINSURANCE

.103 A number of respondents to the Exposure Draft inquired as to whether it is the Board's intent to require disclosure of noninsurance or underinsurance. Some recommended that the Board require disclosures with respect to uninsured risks that enterprises ordinarily insure against. Others said that they were unable to define risks that would ordinarily be insured against because the insurance practices of enterprises are so varied. Because of the problems involved in developing operational criteria for disclosure of noninsured or underinsured risks, this Statement does not require disclosure of uninsured risks. However, the Board does not discourage those disclosures in appropriate circumstances.

EFFECTIVE DATE AND TRANSITION

.104 The Board considered three alternative approaches to a change in the method of accounting for contingencies: (1) prior period adjustment, (2) the "cumulative effect" method described in *APB Opinion No. 20* [section 1051], "Accounting Changes," and (3) retention of amounts accrued for contingencies that do not meet the conditions for accrual in paragraph .08 until

Copyright © 1975, Financial Accounting Standards Board

those amounts are exhausted by actual losses charged thereto. The Exposure Draft had proposed the change be effected by the prior period adjustment method. A large number of respondents to the Exposure Draft, however, opposed the prior period adjustment method for a number of reasons, including significant difficulties involved in determining the degree of probability and estimability that had existed in prior periods as would have been required if the conditions in paragraph .08 were applied retroactively. On further consideration of all the circumstances, the Board has concluded that use of the "cumulative effect" method described in *APB Opinion No. 20* [section 1051] represents a satisfactory solution and has concluded that the effective date in paragraph .20 is advisable.

AC Section 4311-1

Reasonable Estimation of the Amount of a Loss: An Interpretation of Section 4311

[Source: FASB Interpretation No. 14.]

September 1976

INTRODUCTION

.01 The two conditions for accrual of an estimated loss from a loss contingency set forth in paragraph 8 of *FASB Statement No. 5* [section 4311.08], "Accounting for Contingencies," are that "(a) information available prior to issuance of the financial statements indicates that it is probable that an asset had been impaired or a liability had been incurred at the date of the financial statements. . . ." and "(b) the amount of loss can be reasonably estimated." In some situations in which condition (a) in paragraph 8 [section 4311.08] is met, a range of loss can be reasonably estimated but no single amount within the range appears at the time to be a better estimate than any other amount within the range. The Board has been asked to clarify whether, in those situations, condition (b) in paragraph 8 [section 4311.08] also is met and, if so, to explain what amount of loss should be accrued.

INTERPRETATION

.02 As indicated in paragraph 59 of *FASB Statement No. 5* [section 4311.59], the purpose of the two conditions in paragraph 8 [section 4311.08] of the Statement is "to require accrual of losses when they are reasonably estimable and relate to the current or a prior period." Condition (b) in paragraph 8 [section 4311.08], that "the amount of loss can be reasonably estimated," does not delay accrual of a loss until only a single amount can be reasonably estimated. To the contrary, when condition (a) in paragraph 8 [section 4311.08] is met, i. e., "it is probable that an asset had been impaired or a liability had been incurred," and information available indicates that the estimated amount of loss is within a range of amounts, it follows that some amount of loss has occurred and can be reasonably estimated.

.03 When condition (a) in paragraph 8 [section 4311.08] is met with respect to a particular loss contingency and the reasonable estimate of the loss is a range, condition (b) in paragraph 8 [section 4311.08] is met and an amount shall be accrued for the loss. When some amount within the range appears at the time to be a

better estimate than any other amount within the range, that amount shall be accrued. When no amount within the range is a better estimate than any other amount, however, the minimum amount in the range shall be accrued.[1] In addition, paragraph 9 [section 4311.09] of the Statement may require disclosure of the nature and, in some circumstances, the amount accrued, and paragraph 10 [section 4311.10] requires disclosure of the nature of the contingency and the additional exposure to loss if there is at least a reasonable possibility of loss in excess of the amount accrued.

.04 As an example, assume that an enterprise is involved in litigation at the close of its fiscal year ending December 31, 1976 and information available indicates that an unfavorable outcome is probable. Subsequently, after a trial on the issues, a verdict unfavorable to the enterprise is handed down, but the amount of damages remains unresolved at the time the financial statements are issued. Although the enterprise is unable to estimate the exact amount of loss, its reasonable estimate at the time is that the judgment will be for not less than $3 million or more than $9 million. No amount in that range appears at the time to be a better estimate than any other amount. *FASB Statement No. 5* [section 4311] requires accrual of the $3 million at December 31, 1976, disclosure of the nature of the contingency and the exposure to an additional amount of loss of up to $6 million, and possibly disclosure of the amount of the accrual.

.05 The same answer would result under the example in paragraph .04 above if it is probable that a verdict will be unfavorable even though the trial has not been completed before the financial statements are issued. In that situation, condition (a) in paragraph 8 [section 4311.08] would be met because information available to the enterprise indicates that an unfavorable verdict is probable. An assessment that the range of loss is between $3 million and $9 million would meet condition (b) in paragraph 8 [section 4311.08]. If no single amount in that range is a better estimate than any other amount, *FASB Statement No. 5* [section 4311] requires accrual of $3 million at December 31, 1976, disclosure of the nature of the contingency and the exposure to an additional amount of loss of up to $6 million, and possibly disclosure of the amount of the accrual. Note, however, that if the enterprise had assessed the verdict differently (e.g., that an unfavorable verdict was *not* probable but was only reasonably possible), condition (a) in paragraph 8 [section 4311.08] would not have been met and no amount of loss would be accrued but

[1] Even though the minimum amount in the range is not necessarily the amount of loss that will be ultimately determined, it is not likely that the ultimate loss will be less than the minimum amount.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

the nature of the contingency and any amount of loss that is reasonably possible would be disclosed.

.06 Assume that in the examples given in paragraphs .04 and .05 above condition (a) in paragraph 8 [section 4311.08] has been met and a reasonable estimate of loss is a range between $3 million and $9 million but a loss of $4 million is a better estimate than any other amount in that range. In that situation, *FASB Statement No. 5* [section 4311] requires accrual of $4 million, disclosure of the nature of the contingency and the exposure to an additional amount of loss of up to $5 million, and possibly disclosure of the amount of the accrual.

.07 As a further example, assume that at December 31, 1976 an enterprise has an investment of $1,000,000 in the securities of another enterprise that has declared bankruptcy, and there is no quoted market price for the securities. Condition (a) in paragraph 8 [section 4311.08] has been met because information available indicates that the value of the investment has been impaired, and a reasonable estimate of loss is a range between $300,000 and $600,000. No amount of loss in that range appears at the time to be a better estimate of loss than any other amount. *FASB Statement No. 5* [section 4311] requires accrual of the $300,000 loss at December 31, 1976, disclosure of the nature of the contingency and the exposure to an additional amount of loss of up to $300,000, and possibly disclosure of the amount of the accrual.

EFFECTIVE DATE AND TRANSITION

.08 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods beginning after October 15, 1976. Earlier application is encouraged in financial statements for annual and interim periods beginning before October 15, 1976 that have not been previously issued. An accrual for a loss contingency or an adjustment of an established accrual for a loss contingency resulting from application of this Interpretation shall be accounted for as a change in estimate in accordance with the requirements of paragraph 31 of *APB Opinion No. 20* [section 1051.31], "Accounting Changes." This Interpretation shall not be applied retroactively for previously issued annual and interim financial statements.

AC Section 4312

Accounting for Contingencies— Transition Method

an amendment of Section 4311

[Source: FASB Statement No. 11.]

December 1975

INTRODUCTION AND BACKGROUND INFORMATION

.01 *FASB Statement No. 5* [section 4311], "Accounting for Contingencies," was issued by the Board in March 1975. With respect to that Statement's effective date and transition, paragraph 20 of that Statement [section 4311.20] read as follows:

> This Statement shall be effective for fiscal years beginning on or after July 1, 1975, although earlier application is encouraged. A change in accounting principle resulting from compliance with paragraph .08 or .14 of this Statement shall be reported in accordance with *APB Opinion No. 20* [section 1051], "Accounting Changes." Accordingly, except in the special circumstances referred to in paragraphs 29-30 of *APB Opinion No. 20* [section 1051.29-.30], the cumulative effect of the change on retained earnings at the beginning of the year in which the change is made shall be included in net income of the year of the change, and the disclosures specified in *APB Opinion No. 20* [section 1051] shall be made. Reclassification of an appropriation of retained earnings to comply with paragraph .15 of this Statement shall be made in any financial statements for periods before the effective date of this Statement, or financial summaries or other data derived therefrom, that are presented after the effective date of this Statement.

.02 In Appendix C, "Basis for Conclusions," of that Statement, paragraph 104 [section 4311.104] reads as follows:

> The Board considered three alternative approaches to a change in the method of accounting for contingencies: (1) prior period adjustment, (2) the "cumulative effect" method described in *APB Opinion No. 20* [section 1051], "Accounting Changes," and (3) retention of amounts accrued for contingencies that do not meet the conditions for accrual in paragraph .08 until those amounts are exhausted by actual losses charged thereto. The Exposure Draft had proposed the change be effected by the prior period adjustment method. A large number of respondents to the Exposure Draft, however, opposed the prior period adjustment method for a number of reasons, including significant difficulties involved in determining the degree of probability and estimability that had existed in prior periods as would have been required if the conditions in paragraph .08 were applied retroactively. On further consideration of all the circumstances, the Board has concluded that use of the "cumulative effect" method

described in *APB Opinion No. 20* [section 1051] represents a satisfactory solution and has concluded that the effective date in paragraph .20 is advisable.

.03 The Exposure Draft of *FASB Statement No. 5* [section 4311] proposed a transition requiring retroactive restatement by prior period adjustment. In Appendix B, "Basis for Conclusions," of the Exposure Draft, the Board stated a preference for the prior period adjustment method because, in its judgment at the time, it would provide the most useful information for comparing financial data for periods after the adoption of the Statement with prior periods.

.04 The Board recently issued *FASB Statement No. 8* [section 1083], "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements." With respect to that Statement's effective date and transition, paragraphs 35 and 36 of that Statement [section 1083.035 and 1083.036] read as follows:

> This Statement shall be effective for fiscal years beginning on or after January 1, 1976,[14] although earlier application is encouraged. Thereafter, if financial statements for periods before the effective date, and financial summaries or other data derived therefrom, are presented, they shall be restated, if practicable, to conform to the provisions of paragraphs .007-.031 of this Statement. In the year that this Statement is first applied, the financial statements shall disclose the nature of any restatement and its effect on income before extraordinary items, net income, and related per share amounts for each period restated.[*]
>
> If restatement of financial statements or summaries for all prior periods presented is not practicable, information presented shall be restated for as many consecutive periods immediately preceding the effective date of this Statement as is practicable, and the cumulative effect of applying paragraphs .007-.031 on the retained earnings at the beginning of the earliest period restated (or at the beginning of the period in which the Statement is first applied if it is not practicable to restate any prior periods) shall be included in determining net income of that period (see paragraph 20 of *APB Opinion No. 20* [section 1051.20], "Accounting Changes").[15] The effect on income before extraordinary items, net income, and related per share amounts of applying this Statement in a period in which the cumulative effect is included in determining net income shall be disclosed for that period, and the reason for not restating all of the prior periods presented shall be explained.

.05 Although the Exposure Draft of *FASB Statement No. 8* [section 1083] indicated that transition under that Statement

---

[14] For enterprises having fiscal years of 52 or 53 weeks instead of the calendar year, this Statement shall be effective for fiscal years beginning in late December 1975.

[*] Amended, effective January 1, 1978, by FASB Statement No. 20. (See section 1084.)

[15] Pro forma disclosures required by paragraphs 19(d) and 21 of *APB Opinion No. 20* [sections 1051.19(d) and 1051.21] are not applicable.

Copyright © 1978, American Institute of Certified Public Accountants, Inc.

would be required in accordance with paragraphs 19-21, 25, and 39 of *APB Opinion No. 20* [sections 1051.19-.21, 1051.25, and 1051.39] (viz., to include in the determination of net income in the year of change the effect of the accounting change), in the final Statement, the Board concluded that prior period restatement is the preferable method to provide useful information about foreign currency transactions and foreign operations for comparing financial data for a number of periods. In Appendix D, "Basis for Conclusions," of that Statement, paragraphs 240 and 241 [sections 1083.240 and 1083.241] read as follows:

> The Board concluded that because of the various methods of translation or of recognition of exchange gains and losses now followed in practice and because of the complex nature of the translation process, a prospective method of transition is not feasible. The Board considered whether the transition should be by prior period restatement or by cumulative effect adjustment (the method specified in the Exposure Draft). The Board concluded that prior period restatement is the preferable method to provide useful information about foreign currency transactions and foreign operations for purposes of comparing financial data for periods after the effective date of this Statement with data presented for earlier periods.
>
> The Board recognizes, however, that the procedures called for by this Statement may sometimes differ significantly from procedures followed in previous periods. In addition, restatement requires the availability of records or information that an enterprise may no longer have or that its past procedures did not require. Therefore, if the effect of the restatement on all individual periods presented cannot be computed or reasonably estimated, the cumulative effect adjustment method shall be used in accordance with paragraph .036.

Reconsideration of the Transition Method of Section 4311

.06 In considering and resolving the issue of transition in *FASB Statement No. 8* [section 1083], the Board was mindful that there were similarities in characteristics of certain accounts affected by *FASB Statement No. 8* [section 1083] and *FASB Statement No. 5* [section 4311]. As indicated in paragraph 104 of *FASB Statement No. 5* [section 4311.104], one of the factors that led the Board to conclude that use of the cumulative effect method would be preferable to restatement of financial statements for prior periods was its concern about the cases in which there might be significant difficulties in determining the degree of probability and estimability that existed in the prior periods. After reconsideration of the differences in the transition methods required by *FASB Statement Nos. 5* and *8* [sections 4311 and 1083] and the factors that led the Board to reach different conclusions on transition in those two Statements, the Board has concluded that the cumulative effect method should not be

required as it now is by *FASB Statement No. 5* [section 4311] in those cases in which the difficulties of determining probability and estimability retroactively are not present. On reconsideration of all the circumstances, the Board has concluded that, in order to provide the most useful information, it is preferable for an enterprise adopting *FASB Statement No. 5* [section 4311] to restate its financial statements for as many immediately preceding periods as is practicable in accordance with the revised transition method set forth in paragraph .10 of this Statement.

.07 Some enterprises elected to apply *FASB Statement No. 5* [section 4311] prior to its effective date (as encouraged in paragraph 20 of the Statement [section 4311.20]) and issued annual or interim financial statements or financial summaries or other data derived therefrom using the cumulative effect method of transition. The Board considered whether those enterprises should now be required to conform to the method of transition to *FASB Statement No. 5* [section 4311] specified by this Statement. Although the Board strongly encourages those enterprises to restate their financial statements in a manner similar to that required of enterprises that did not elect early application, it has concluded that it should not require them to do so.

.08 An Exposure Draft of a proposed Statement on "Accounting for Contingencies—Transition Method" was issued on October 31, 1975. Forty-five letters were received in response to that Exposure Draft.

.09 The Board concluded that on the basis of existing data it could make an informed decision on the matter addressed in this Statement without a public hearing and that the effective date in paragraph .11 is advisable.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Amendment to Section 4311

.10 Paragraph 20 of *FASB Statement No. 5* [section 4311.20] is amended to read as follows:

> *FASB Statement No. 5* [section 4311] shall be effective for fiscal years beginning on or after July 1, 1975, although earlier application is encouraged. Thereafter, if financial statements for periods before the effective date, and financial summaries or other data derived therefrom, are presented, they shall be restated, if practicable, to conform to the provisions of paragraph 8 or 14 of *FASB Statement No. 5* [section 4311.08 or 4311.14].* In the year that the Statement is

* This does not alter the accounting for changes in estimates—see paragraph 31 of *APB Opinion No. 20* [section 1051.31].

Copyright © 1976, Financial Accounting Standards Board

first applied, the financial statements shall disclose the nature of any restatement and its effect on income before extraordinary items, net income, and related per share amounts for each period restated. If restatement of financial statements or summaries for all prior periods presented is not practicable, information presented shall be restated for as many consecutive periods immediately preceding the effective date of *FASB Statement No. 5* [section 4311] as is practicable, and the cumulative effect of applying paragraph 8 or 14 [sections 4311.08 or 4311.14] on the retained earnings at the beginning of the earliest period restated (or at the beginning of the period in which the Statement is first applied if it is not practicable to restate any prior periods) shall be included in determining net income of that period (see paragraph 20 of *APB Opinion No. 20* [section 1051.20]).** The effect on income before extraordinary items, net income, and related per share amounts of applying *FASB Statement No. 5* [section 4311] in a period in which the cumulative effect is included in determining net income shall be disclosed for that period, and the reason for not restating all of the prior periods presented shall be explained. Reclassification of an appropriation of retained earnings to comply with paragraph 15 of *FASB Statement No. 5* [section 4311.15] shall be made in any financial statements for periods before the effective date of the Statement, or financial summaries or other data derived therefrom, that are presented after the effective date of the Statement.

Effective Date and Transition

.11 This amendment to *FASB Statement No. 5* [section 4311] shall be effective retroactively to the effective date of *FASB Statement No. 5* [section 4311] except that enterprises that have issued financial statements for annual or interim periods, or financial summaries or other data derived therefrom, prior to January 1, 1976 based on the original transition requirement in paragraph 20 of *FASB Statement No. 5* [section 4311.20] are strongly encouraged but not required to comply with this Statement when those financial statements or financial summaries or other data derived therefrom are subsequently presented for the first time on or after January 1, 1976.

The provisions of this Statement need not be applied to immaterial items.

** Pro forma disclosures required by paragraphs 19(d) and 21 of *APB Opinion No. 20* [sections 1051.19(d) and 1051.21] are not applicable.

AC Section 5111

Receivables from Officers, Employees or Affiliated Companies

[Source: ARB No. 43, Chap. 1A, Par. 5.]

Issue date, unless otherwise indicated: 1934[1]

.01 Notes or accounts receivable due from officers, employees, or affiliated companies must be shown separately and not included under a general heading such as notes receivable or accounts receivable.

The next page is 9341.

[1] The above rule was adopted by the membership of the Institute in 1934. It had been recommended in 1932 to the New York Stock Exchange by the Institute's committee on cooperation with stock exchanges.

AC Section 5121

Inventory Pricing

[Source: ARB No. 43, Chap. 4, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 Whenever the operation of a business includes the ownership of a stock of goods, it is necessary for adequate financial accounting purposes that inventories be properly compiled periodically and recorded in the accounts.[1] Such inventories are required both for the statement of financial position and for the periodic measurement of income.

.02 This section sets forth the general principles applicable to the pricing of inventories of mercantile and manufacturing enterprises. Its conclusions are not directed to or necessarily applicable to noncommercial businesses or to regulated utilities.

STATEMENT 1

The term *inventory* is used herein to designate the aggregate of those items of tangible personal property which (1) are held for sale in the ordinary course of business, (2) are in process of production for such sale, or (3) are to be currently consumed in the production of goods or services to be available for sale.

Discussion

.03 The term *inventory* embraces goods awaiting sale (the merchandise of a trading concern and the finished goods of a manufacturer), goods in the course of production (work in process), and goods to be consumed directly or indirectly in production (raw materials and supplies). This definition of inventories excludes long-term assets subject to depreciation accounting, or goods which, when put into use, will be so classified. The fact that a depreciable asset is retired from regular use and held for sale does not indicate that the item should be classified as part of the inventory. Raw materials and supplies purchased for

[1] Prudent reliance upon perpetual inventory records is not precluded.

production may be used or consumed for the construction of long-term assets or other purposes not related to production, but the fact that inventory items representing a small portion of the total may not be absorbed ultimately in the production process does not require separate classification. By trade practice, operating materials and supplies of certain types of companies such as oil producers are usually treated as inventory.

STATEMENT 2

A major objective of accounting for inventories is the proper determination of income through the process of matching appropriate costs against revenues.

Discussion

.04 An inventory has financial significance because revenues may be obtained from its sale, or from the sale of the goods or services in whose production it is used. Normally such revenues arise in a continuous repetitive process or cycle of operations by which goods are acquired and sold, and further goods are acquired for additional sales. In accounting for the goods in the inventory at any point of time, the major objective is the matching of appropriate costs against revenues in order that there may be a proper determination of the realized income. Thus, the inventory at any given date is the balance of costs applicable to goods on hand remaining after the matching of absorbed costs with concurrent revenues. This balance is appropriately carried to future periods provided it does not exceed an amount properly chargeable against the revenues expected to be obtained from ultimate disposition of the goods carried forward. In practice, this balance is determined by the process of pricing the articles comprised in the inventory.

STATEMENT 3

The primary basis of accounting for inventories is cost, which has been defined generally as the price paid or consideration given to acquire an asset. As applied to inventories, cost means in principle the sum of the applicable expenditures

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

and charges directly or indirectly incurred in bringing an article to its existing condition and location.

Discussion

.05 In keeping with the principle that accounting is primarily based on cost, there is a presumption that inventories should be stated at cost. The definition of cost as applied to inventories is understood to mean acquisition and production cost,[2] and its determination involves many problems. Although principles for the determination of inventory costs may be easily stated, their application, particularly to such inventory items as work in process and finished goods, is difficult because of the variety of problems encountered in the allocation of costs and charges. For example, under some circumstances, items such as idle facility expense, excessive spoilage, double freight, and rehandling costs may be so abnormal as to require treatment as current period charges rather than as a portion of the inventory cost. Also, general and administrative expenses should be included as period charges, except for the portion of such expenses that may be clearly related to production and thus constitute a part of inventory costs (product charges). Selling expenses constitute no part of inventory costs. It should also be recognized that the exclusion of all overheads from inventory costs does not constitute an accepted accounting procedure. The exercise of judgment in an individual situation involves a consideration of the adequacy of the procedures of the cost accounting system in use, the soundness of the principles thereof, and their consistent application.

STATEMENT 4

Cost for inventory purposes may be determined under any one of several assumptions as to the flow of cost factors (such as first-in first-out, average, and last-in first-out); the major objective in selecting a method should be to choose the one which, under the circumstances, most clearly reflects periodic income.

---

[2] In the case of goods which have been written down below cost at the close of a fiscal period, such reduced amount is to be considered the cost for subsequent accounting purposes.

Discussion

.06 The cost to be matched against revenue from a sale may not be the identified cost of the specific item which is sold, especially in cases in which similar goods are purchased at different times and at different prices. While in some lines of business specific lots are clearly identified from the time of purchase through the time of sale and are costed on this basis, ordinarily the identity of goods is lost between the time of acquisition and the time of sale. In any event, if the materials purchased in various lots are identical and interchangeable, the use of identified cost of the various lots may not produce the most useful financial statements. This fact has resulted in the development of general acceptance of several assumptions with respect to the flow of cost factors (such as *first-in first-out, average,* and *last-in first-out*) to provide practical bases for the measurement of periodic income.[3] In some situations a reversed mark-up procedure of inventory pricing, such as the retail inventory method, may be both practical and appropriate. The business operations in some cases may be such as to make it desirable to apply one of the acceptable methods of determining cost to one portion of the inventory or components thereof and another of the acceptable methods to other portions of the inventory.

.07 Although selection of the method should be made on the basis of the individual circumstances, it is obvious that financial statements will be more useful if uniform methods of inventory pricing are adopted by all companies within a given industry.

STATEMENT 5

A departure from the cost basis of pricing the inventory is required when the utility of the goods is no longer as great as its cost. Where there is evidence that the utility of goods, in their disposal in the ordinary course of business, will be less than

[3] Standard costs are acceptable if adjusted at reasonable intervals to reflect current conditions so that at the balance-sheet date standard costs reasonably approximate costs computed under one of the recognized bases. In such cases descriptive language should be used which will express this relationship, as, for instance, "approximate costs determined on the first-in first-out basis," or, if it is desired to mention standard costs, "at standard costs, approximating average costs."

© 1974, American Institute of Certified Public Accountants, Inc.

cost, whether due to physical deterioration, obsolescence, changes in price levels, or other causes, the difference should be recognized as a loss of the current period. This is generally accomplished by stating such goods at a lower level commonly designated as *market*.

Discussion

.08 Although the cost basis ordinarily achieves the objective of a proper matching of costs and revenues, under certain circumstances cost may not be the amount properly chargeable against the revenues of future periods. A departure from cost is required in these circumstances because cost is satisfactory only if the utility of the goods has not diminished since their acquisition; a loss of utility is to be reflected as a charge against the revenues of the period in which it occurs. Thus, in accounting for inventories, a loss should be recognized whenever the utility of goods is impaired by damage, deterioration, obsolescence, changes in price levels, or other causes. The measurement of such losses is accomplished by applying the rule of pricing inventories at *cost or market, whichever is lower*. This provides a practical means of measuring utility and thereby determining the amount of the loss to be recognized and accounted for in the current period.

STATEMENT 6

As used in the phrase *lower of cost or market*[4] the term *market* means current replacement cost (by purchase or by reproduction, as the case may be) except that:

(1) Market should not exceed the net realizable value (i.e., estimated selling price in the ordinary course of business less reasonably predictable costs of completion and disposal); and

(2) Market should not be less than net realizable value reduced by an allowance for an approximately normal profit margin.

---

[4] The terms *cost or market, whichever is lower* and *lower of cost or market* are used synonymously in general practice and in this section. The committee does not express any preference for either of the two alternatives.

Discussion

.09 The rule of *cost or market, whichever is lower* is intended to provide a means of measuring the residual usefulness of an inventory expenditure. The term *market* is therefore to be interpreted as indicating utility on the inventory date and may be thought of in terms of the equivalent expenditure which would have to be made in the ordinary course at that date to procure corresponding utility. As a general guide, utility is indicated primarily by the current cost of replacement of the goods as they would be obtained by purchase or reproduction. In applying the rule, however, judgment must always be exercised and no loss should be recognized unless the evidence indicates clearly that a loss has been sustained. There are therefore exceptions to such a standard. Replacement or reproduction prices would not be appropriate as a measure of utility when the estimated sales value, reduced by the costs of completion and disposal, is lower, in which case the realizable value so determined more appropriately measures utility. Furthermore, where the evidence indicates that cost will be recovered with an approximately normal profit upon sale in the ordinary course of business, no loss should be recognized even though replacement or reproduction costs are lower. This might be true, for example, in the case of production under firm sales contracts at fixed prices, or when a reasonable volume of future orders is assured at stable selling prices.

.10 Because of the many variations of circumstances encountered in inventory pricing, Statement 6 is intended as a guide rather than a literal rule. It should be applied realistically in the light of the objectives expressed in this section and with due regard to the form, content, and composition of the inventory. The committee considers, for example, that the retail inventory method, if adequate markdowns are currently taken, accomplishes the objectives described herein. It also recognizes that, if a business is expected to lose money for a sustained period, the inventory should not be written down to offset a loss inherent in the subsequent operations.

© 1974, American Institute of Certified Public Accountants, Inc.

STATEMENT 7

Depending on the character and composition of the inventory, the rule of *cost or market, whichever is lower* may properly be applied either directly to each item or to the total of the inventory (or, in some cases, to the total of the components of each major category). The method should be that which most clearly reflects periodic income.

Discussion

.11 The purpose of reducing inventory to *market* is to reflect fairly the income of the period. The most common practice is to apply the *lower of cost or market* rule separately to each item of the inventory. However, if there is only one end-product category the cost utility of the total stock—the inventory in its entirety—may have the greatest significance for accounting purposes. Accordingly, the reduction of individual items to *market* may not always lead to the most useful result if the utility of the total inventory to the business is not below its cost. This might be the case if selling prices are not affected by temporary or small fluctuations in current costs of purchase or manufacture. Similarly, where more than one major product or operational category exists, the application of the *cost or market, whichever is lower* rule to the total of the items included in such major categories may result in the most useful determination of income.

.12 When no loss of income is expected to take place as a result of a reduction of cost prices of certain goods because others forming components of the same general categories of finished products have a market equally in excess of cost, such components need not be adjusted to market to the extent that they are in balanced quantities. Thus, in such cases, the rule of *cost or market, whichever is lower* may be applied directly to the totals of the entire inventory, rather than to the individual inventory items, if they enter into the same category of finished product and if they are in balanced quantities, provided the procedure is applied consistently from year to year.

.13 To the extent, however, that the stocks of particular materials or components are excessive in relation to others, the more widely recognized procedure of applying

the *lower of cost or market* to the individual items constituting the excess should be followed. This would also apply in cases in which the items enter into the production of unrelated products or products having a material variation in the rate of turnover. Unless an effective method of classifying categories is practicable, the rule should be applied to each item in the inventory.

.14 When substantial and unusual losses result from the application of this rule it will frequently be desirable to disclose the amount of the loss in the income statement as a charge separately identified from the consumed inventory costs described as *cost of goods sold*.

STATEMENT 8

The basis of stating inventories must be consistently applied and should be disclosed in the financial statements; whenever a significant change is made therein, there should be disclosure of the nature of the change and, if material, the effect on income in accordance with section 1051, *Accounting Changes*. [As amended, effective for fiscal periods beginning after July 31, 1971 by APB Opinion No. 20.]

Discussion

.15 While the basis of stating inventories does not affect the over-all gain or loss on the ultimate disposition of inventory items, any inconsistency in the selection or employment of a basis may improperly affect the periodic amounts of income or loss. Because of the common use and importance of periodic statements, a procedure adopted for the treatment of inventory items should be consistently applied in order that the results reported may be fairly allocated as between years. A change of such basis may have an important effect upon the interpretation of the financial statements both before and after that change, and hence, in the event of a change, a full disclosure of its nature and of its effect, if material, upon income should be made. (See also section 2031.09.)

STATEMENT 9

Only in exceptional cases may inventories properly be stated above cost. For example, pre-

© 1974, American Institute of Certified Public Accountants, Inc.

cious metals having a fixed monetary value with no substantial cost of marketing may be stated at such monetary value; any other exceptions must be justifiable by inability to determine appropriate approximate costs, immediate marketability at quoted market price, and the characteristic of unit interchangeability. Where goods are stated above cost this fact should be fully disclosed.

Discussion

.16 It is generally recognized that income accrues only at the time of sale, and that gains may not be anticipated by reflecting assets at their current sales prices. For certain articles, however, exceptions are permissible. Inventories of gold and silver, when there is an effective government-controlled market at a fixed monetary value, are ordinarily reflected at selling prices. A similar treatment is not uncommon for inventories representing agricultural, mineral, and other products, units of which are interchangeable and have an immediate marketability at quoted prices and for which appropriate costs may be difficult to obtain. Where such inventories are stated at sales prices, they should of course be reduced by expenditures to be incurred in disposal, and the use of such basis should be fully disclosed in the financial statements.

STATEMENT 10

Accrued net losses on firm purchase commitments for goods for inventory, measured in the same way as are inventory losses, should, if material, be recognized in the accounts and the amounts thereof separately disclosed in the income statement.

Discussion

.17 The recognition in a current period of losses arising from the decline in the utility of cost expenditures is equally applicable to similar losses which are expected to arise from firm, uncancelable, and unhedged commitments for the future purchase of inventory items. The net loss on such commitments should be measured in the same way as are inventory losses and, if material, should be recognized

in the accounts and separately disclosed in the income statement. The utility of such commitments is not impaired, and hence there is no loss, when the amounts to be realized from the disposition of the future inventory items are adequately protected by firm sales contracts or when there are other circumstances which reasonably assure continuing sales without price decline.

AC Section 5131

The Equity Method of Accounting for Investments in Common Stock

[Source: APB Opinion No. 18, as amended.]

Effective for fiscal periods beginning after December 31, 1971, unless otherwise indicated [1]

INTRODUCTION

.01 The Accounting Principles Board expresses in this section its views on the equity method of accounting for investments in common stock. This section clarifies the applicability of the equity method of accounting (paragraph .06b) to investments in common stock of subsidiaries and extends the applicability of the equity method of accounting to investments in common stock of corporate joint ventures and certain other investments in common stock. The section also applies to investments reported in parent-company financial statements when such statements are prepared for issuance to stockholders as the financial statements of the primary reporting entity.[2]

.02 This section does not apply to investments in common stock held by (a) investment companies registered under the Investment Company Act of 1940 or investment companies which would be included under the Act (including small business investment companies) except that the number of stockholders is limited and the securities are not offered publicly, or (b) nonbusiness entities, such as estates, trusts and individuals. The section also does not apply to investments in common stock other than those described in the section.

.03 Several terms are used in this section as indicated:

a. ''Investor'' refers to a business entity that holds an investment in voting stock of another company.

---

[1] See paragraph .21.

[2] An accounting research study on the broader subject of accounting for intercorporate investments is now in process and will encompass the matters on parent-company financial statements and on consolidated financial statements covered in section 2051 and in section 1081.

b. "Investee" refers to a corporation that issued voting stock held by an investor.

c. "Subsidiary" refers to a corporation which is controlled, directly or indirectly, by another corporation. The usual condition for control is ownership of a majority (over 50%) of the outstanding voting stock. The power to control may also exist with a lesser percentage of ownership, for example, by contract, lease, agreement with other stockholders or by court decree.

d. "Corporate joint venture" refers to a corporation owned and operated by a small group of businesses (the "joint venturers") as a separate and specific business or project for the mutual benefit of the members of the group. A government may also be a member of the group. The purpose of a corporate joint venture frequently is to share risks and rewards in developing a new market, product or technology; to combine complementary technological knowledge; or to pool resources in developing production or other facilities. A corporate joint venture also usually provides an arrangement under which each joint venturer may participate, directly or indirectly, in the overall management of the joint venture. Joint venturers thus have an interest or relationship other than as passive investors. An entity which is a subsidiary of one of the "joint venturers" is not a corporate joint venture. The ownership of a corporate joint venture seldom changes, and its stock is usually not traded publicly. A minority public ownership, however, does not preclude a corporation from being a corporate joint venture.

e. "Dividends" refers to dividends paid or payable in cash, other assets, or another class of stock and does not include stock dividends or stock splits.

f. "Earnings or losses of an investee" and "financial position of an investee" refer to net income (or net loss) and financial position of an investee determined in accordance with accounting principles generally accepted in the United States.

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

DISCUSSION

.04 Section 2051.02 states that: "There is a presumption that consolidated statements are more meaningful than separate statements and that they are usually necessary for a fair presentation when one of the companies in the group directly or indirectly has a controlling financial interest in the other companies." Consolidated financial statements combine the assets, liabilities, revenues and expenses of subsidiaries with the corresponding items of the parent company. Intercompany items are eliminated to avoid double counting and prematurely recognizing income. Consolidated financial statements report the financial position and results of operations of the parent company and its subsidiaries as an economic entity. In practice, consolidation has been limited to subsidiary companies, although under certain circumstances valid reasons may exist for omitting a subsidiary from consolidation.[3]

.05 Investments are sometimes held in stock of companies other than subsidiaries, namely corporate joint ventures and other noncontrolled corporations. These investments are usually accounted for by one of two methods—the cost method or the equity method. While practice varies to some extent, the cost method is generally followed for most investments in noncontrolled corporations, in some corporate joint ventures, and to a lesser extent in unconsolidated subsidiaries, particularly foreign. The equity method is generally followed for investments in unconsolidated domestic subsidiaries, some corporate joint ventures and some noncontrolled corporations. An adaptation of the cost method, the lower of cost or market, has also been followed for investments in certain marketable securities if a decline in market value is evidently not a mere temporary condition.*

.06 A summary of the two principal methods of accounting for the investments in common stock discussed in this section follows:

a. *The cost method.* An investor records an investment in the stock of an investee at cost, and recognizes as income dividends received that are distributed from net accumulated earnings of the investee since the date of acquisition by the investor. The net accumu-

[3] See section 2051.03-.04 and section 1081.08.

* Modified by section 5132, *Accounting for Certain Marketable Securities.*

lated earnings of an investee subsequent to the date of investment are recognized by the investor only to the extent distributed by the investee as dividends. Dividends received in excess of earnings subsequent to the date of investment are considered a return of investment and are recorded as reductions of cost of the investment. A series of operating losses of an investee or other factors may indicate that a decrease in value of the investment has occurred which is other than temporary and should accordingly be recognized.*

b. *The equity method.* An investor initially records an investment in the stock of an investee at cost, and adjusts the carrying amount of the investment to recognize the investor's share of the earnings or losses of the investee after the date of acquisition. The amount of the adjustment is included in the determination of net income by the investor, and such amount reflects adjustments similar to those made in preparing consolidated statements including adjustments to eliminate intercompany gains and losses, and to amortize, if appropriate, any difference between investor cost and underlying equity in net assets of the investee at the date of investment. The investment of an investor is also adjusted to reflect the investor's share of changes in the investee's capital. Dividends received from an investee reduce the carrying amount of the investment. A series of operating losses of an investee or other factors may indicate that a decrease in value of the investment has occurred which is other than temporary and which should be recognized even though the decrease in value is in excess of what would otherwise be recognized by application of the equity method.

.07 Under the cost method of accounting for investments in common stock, dividends are the basis for recognition by an investor of earnings from an investment. Financial statements of an investor prepared under the cost method may not reflect substantial changes in the affairs of an investee. Dividends included in income of an investor for a period may be unrelated to the earnings (or losses) of

* Modified by section 5132, *Accounting for Certain Marketable Securities.*

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

an investee for that period. For example, an investee may pay no dividends for several periods and then pay dividends substantially in excess of the earnings of a period. Losses of an investee of one period may be offset against earnings of another period because the investor reports neither in results of operations at the time they are reported by the investee. Some dividends received from an investee do not cover the carrying costs of an investment whereas the investor's share of the investee's earnings more than covers those costs. Those characteristics of the cost method may prevent an investor from reflecting adequately the earnings related to an investment in common stock—either cumulatively or in the appropriate periods.

.08 Corporations have increasingly established or participated in corporate joint venture arrangements or taken substantial positions (but less than majority ownership) in other corporations. The significant increase in the number of intercorporate investments of less than majority ownership of voting stock has broadened interest in reflecting earnings from investments on a more timely basis than by receipt of dividends. Some hold that such investments should be accounted for at market value and that this basis of accounting is most appropriate, whether market value is lower than or higher than cost. Others hold that the equity method is the most appropriate basis of accounting for some or all investments of that type.

.09 Under the market value method, an investor recognizes both dividends received and changes in market prices of the stock of the investee company as earnings or losses from an investment. Dividends received are accounted for as part of income from the investment. In addition, an investor adjusts the carrying amount of its investment based on the market value of the investee's stock. Change in market value since the preceding reporting date is included in results of operations of the investor. Reporting of investments in common stock at market value (or at approximate fair value if market value is not available) is considered to meet most closely the objective of reporting the economic consequences of holding the investment. However, the market value method is now used only in special circumstances. While the Board believes the market value method provides the best presentation of investments

in some situations, it concludes that further study is necessary before the market value method is extended beyond current practice.

.10 Under the equity method, an investor recognizes its share of the earnings or losses of an investee in the periods for which they are reported by the investee in its financial statements rather than in the period in which an investee declares a dividend. An investor adjusts the carrying amount of an investment for its share of the earnings or losses of the investee subsequent to the date of investment and reports the recognized earnings or losses in income. Dividends received from an investee reduce the carrying amount of the investment. Thus, the equity method is an appropriate means of recognizing increases or decreases measured by generally accepted accounting principles in the economic resources underlying the investments. Furthermore, the equity method of accounting more closely meets the objectives of accrual accounting than does the cost method since the investor recognizes its share of the earnings and losses of the investee in the periods in which they are reflected in the accounts of the investee.

.11 Under the equity method, an investment in common stock is generally shown in the balance sheet of an investor as a single amount. Likewise, an investor's share of earnings or losses from its investment is ordinarily shown in its income statement as a single amount.

.12 The equity method tends to be most appropriate if an investment enables the investor to influence the operating or financial decisions of the investee. The investor then has a degree of responsibility for the return on its investment, and it is appropriate to include in the results of operations of the investor its share of the earnings or losses of the investee. Influence tends to be more effective as the investor's percent of ownership in the voting stock of the investee increases. Investments of relatively small percentages of voting stock of an investee tend to be passive in nature and enable the investor to have little or no influence on the operations of the investee.

.13 Some hold the view that neither the market value method nor the equity method is appropriate accounting for investments in common stock where the investor holds less

© 1974, American Institute of Certified Public Accountants, Inc.

than majority ownership of the voting stock. They would account for such investments at cost. Under that view the investor is not entitled to recognize earnings on its investment until a right to claim the earnings arises, and that claim arises only to the extent dividends are declared. The investor is considered to have no earnings on its investment unless it is in a position to control the distribution of earnings. Likewise, an investment or an investor's operations are not affected by losses of an investee unless those losses indicate a loss in value of the investment that should be recognized.

OPINION

.14 The Board reaffirms the conclusion that investors should account for investments in common stock of unconsolidated domestic subsidiaries by the equity method in consolidated financial statements, and the Board now extends this conclusion to investments in common stock of all unconsolidated subsidiaries (foreign as well as domestic) in consolidated financial statements. The equity method is not, however, a valid substitute for consolidation and should not be used to justify exclusion of a subsidiary when consolidation is otherwise appropriate. The Board also concludes that parent companies should account for investments in the common stock of subsidiaries by the equity method in parent-company financial statements prepared for issuance to stockholders as the financial statements of the primary reporting entity.[4]

[.15] [Superseded, effective January 1, 1977, by FASB Statement No. 13] (see section 4053).

.16 The Board concludes that the equity method best enables investors in corporate joint ventures to reflect the underlying nature of their investment in those ventures.

[4] Section 2051.03-.04 and section 1081.08 described, among other things, the conditions under which a subsidiary should or might not be consolidated. The limitations on consolidation described in section 2051.03 and section 1081.08, should also be applied as limitations to the use of the equity method. The Board has deferred further consideration of the treatment of foreign subsidiaries in consolidated statements and the treatment of all subsidiaries in parent-company statements that are not prepared for issuance to stockholders as the financial statements of the primary reporting entity until the accounting research study on intercorporate investments is published. In the meantime, the provisions of section 1081 continue in effect. The conclusions in paragraph .14 of this section apply to investments in foreign subsidiaries unless those companies are operating under conditions of exchange restrictions, controls or other uncertainties of a type that would affect decisions as to consolidation or application of the equity method; if those conditions exist, the cost method should be followed.

Therefore, investors should account for investments in common stock of corporate joint ventures by the equity method, both in consolidated financial statements and in parent-company financial statements prepared for issuance to stockholders as the financial statements of the primary reporting entity.[6]

.17 The Board concludes that the equity method of accounting for an investment in common stock should also be followed by an investor whose investment in voting stock gives it the ability to exercise significant influence over operating and financial policies of an investee even though the investor holds 50% or less of the voting stock. Ability to exercise that influence may be indicated in several ways, such as representation on the board of directors, participation in policy making processes, material intercompany transactions, interchange of managerial personnel, or technological dependency. Another important consideration is the extent of ownership by an investor in relation to the concentration of other shareholdings, but substantial or majority ownership of the voting stock of an investee by another investor does not necessarily preclude the ability to exercise significant influence by the investor. The Board recognizes that determining the ability of an investor to exercise such influence is not always clear and applying judgment is necessary to assess the status of each investment. In order to achieve a reasonable degree of uniformity in application, the Board concludes that an investment (direct or indirect) of 20% or more of the voting stock of

---

[5] Footnote 5 to paragraph .15 superseded by FASB Statement No. 13.

[6] The equity method should not be applied to the investments described in this paragraph insofar as the limitations on the use of the equity method outlined in footnote 4 would be applicable to investments other than those in subsidiaries.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

an investee should lead to a presumption that in the absence of evidence to the contrary an investor has the ability to exercise significant influence over an investee. Conversely, an investment of less than 20% of the voting stock of an investee should lead to a presumption that an investor does not have the ability to exercise significant influence unless such ability can be demonstrated. When the equity method is appropriate, it should be applied in consolidated financial statements and in parent-company financial statements prepared for issuance to stockholders as the financial statements of the primary reporting entity.[7]

.18 An investor's *voting stock interest* in an investee should be based on those currently outstanding securities whose holders have present voting privileges. Potential voting privileges which may become available to holders of securities of an investee should be disregarded. An investor's *share of the earnings or losses* of an investee should be based on the shares of *common* stock held by an investor without recognition of securities of the investee which are designated as "common stock equivalents" under section 2011.[8]

.19 *Applying the equity method.* The difference between consolidation and the equity method lies in the details reported in the financial statements. Thus, an investor's net income for the period and its stockholders' equity at the end of the period are the same whether an investment in a subsidiary is accounted for under the equity method or the subsidiary is consolidated (except as indicated in paragraph .19 i). The procedures set forth below should be followed by an investor in applying the equity method of accounting to investments in common stock of unconsoli-

---

[7] The equity method should not be applied to the investments described in this paragraph insofar as the limitations on the use of the equity method outlined in footnote 4 would be applicable to investments other than those in subsidiaries.

[8] Section 2011.39 states: "The designation of securities as common stock equivalents in this section is solely for the purpose of determining primary earnings per share. No changes from present practices are recommended in the accounting for such securities, in their presentation within the financial statements or in the manner of determining net assets per common share. Information is available in the financial statements and elsewhere for readers to make judgments as to the present and potential status of the various securities outstanding." Sections 2011A.20-.24 discuss the treatment of common stock equivalents of subsidiaries in computing earnings per share of a parent company. The provisions of those paragraphs also apply to investments in common stock of corporate joint ventures and investee companies accounted for under the equity method.

dated subsidiaries, corporate joint ventures, and other investees which qualify for the equity method:

a. Intercompany profits and losses should be eliminated until realized by the investor or investee as if a subsidiary, corporate joint venture or investee company were consolidated.

b. A difference between the cost of an investment and the amount of underlying equity in net assets of an investee should be accounted for as if the investee were a consolidated subsidiary.[9]

c. The investment(s) in common stock should be shown in the balance sheet of an investor as a single amount, and the investor's share of earnings or losses of an investee(s) should ordinarily be shown in the income statement as a single amount except for the extraordinary items as specified in (d) below.

d. The investor's share of extraordinary items and its share of prior-period adjustments reported in the financial statements of the investee in accordance with sections 2010 and 2012 should be classified in a similar manner unless they are immaterial in the income statement of the investor. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

e. A transaction of an investee of a capital nature that affects the investor's share of stockholders' equity of the investee should be accounted for as if the investee were a consolidated subsidiary.

f. Sales of stock of an investee by an investor should be accounted for as gains or losses equal to the difference at the time of sale between selling price and carrying amount of the stock sold.

g. If financial statements of an investee are not sufficiently timely for an investor to apply the equity method currently, the investor ordinarily should record its share of the earnings or losses of an investee from the most recent available financial statements. A lag in reporting should be consistent from period to period.

[9] For investments made prior to November 1, 1970, the effective date of section 5141, investors are not required to amortize any goodwill in the absence of evidence that the goodwill has a limited term of existence; prospective amortization of such goodwill is encouraged.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

h. A loss in value of an investment which is other than a temporary decline should be recognized the same as a loss in value of other long-term assets. Evidence of a loss in value might include, but would not necessarily be limited to, absence of an ability to recover the carrying amount of the investment or inability of the investee to sustain an earnings capacity which would justify the carrying amount of the investment. A current fair value of an investment that is less than its carrying amount may indicate a loss in value of the investment. However, a decline in the quoted market price below the carrying amount or the existence of operating losses is not necessarily indicative of a loss in value that is other than temporary. All are factors to be evaluated.

i. An investor's share of losses of an investee may equal or exceed the carrying amount of an investment accounted for by the equity method plus advances made by the investor. The investor ordinarily should discontinue applying the equity method when the investment (and net advances) is reduced to zero and should not provide for additional losses unless the investor has guaranteed obligations of the investee or is otherwise committed to provide further financial support for the investee.[10] If the investee subsequently reports net income, the investor should resume applying the equity method only after its share of that net income equals the share of net losses not recognized during the period the equity method was suspended.

[j.] [Superseded, effective for fiscal periods beginning after December 31, 1971 by APB Opinion No. 23.][11]

k. When an investee has outstanding cumulative preferred stock, an investor should compute its share of earnings (losses) after deducting the investee's preferred dividends, whether or not such dividends are declared.

---

[10] An investor should, however, provide for additional losses when the imminent return to profitable operations by an investee appears to be assured. For example, a material, nonrecurring loss of an isolated nature may reduce an investment below zero even though the underlying profitable operating pattern of an investee is unimpaired.

[11] See section 4095.

l. An investment in voting stock of an investee company may fall below the level of ownership described in paragraph .17 from sale of a portion of an investment by the investor, sale of additional stock by an investee, or other transactions and the investor may thereby lose the ability to influence policy, as described in that paragraph. An investor should discontinue accruing its share of the earnings or losses of the investee for an investment that no longer qualifies for the equity method. The earnings or losses that relate to the stock retained by the investor and that were previously accrued should remain as a part of the carrying amount of the investment. The investment account should not be adjusted retroactively under the conditions described in this subparagraph. However, dividends received by the investor in subsequent periods which exceed his share of earnings for such periods should be applied in reduction of the carrying amount of the investment (see paragraph .06a).

m. An investment in common stock of an investee that was previously accounted for on other than the equity method may become qualified for use of the equity method by an increase in the level of ownership described in paragraph .17 (i. e., acquisition of additional voting stock by the investor, acquisition or retirement of voting stock by the investee, or other transactions). When an investment qualifies

 © 1974, American Institute of Certified Public Accountants, Inc.

for use of the equity method, the investor should adopt the equity method of accounting. The investment, results of operations (current and prior periods presented), and retained earnings of the investor should be adjusted retroactively in a manner consistent with the accounting for a step-by-step acquisition of a subsidiary.

n. The carrying amount of an investment in common stock of an investee that qualifies for the equity method of accounting as described in subparagraph (m) may differ from the underlying equity in net assets of the investee. The difference should affect the determination of the amount of the investor's share of earnings or losses of an investee as if the investee were a consolidated subsidiary. However, if the investor is unable to relate the difference to specific accounts of the investee, the difference should be considered to be goodwill and amortized over a period not to exceed forty years, in accordance with section 5141.[12]

.20 *Disclosures.* The significance of an investment to the investor's financial position and results of operations should be considered in evaluating the extent of disclosures of the financial position and results of operations of an investee. If the investor has more than one investment in common stock, disclosures wholly or partly on a combined basis may be appropriate. The following disclosures are generally applicable to the equity method of accounting for investments in common stock:

a. Financial statements of an investor should disclose parenthetically, in notes to financial statements, or in separate statements or schedules (1) the name of each investee and percentage of ownership of common stock, (2) the accounting policies of the investor with respect to investments in common stock,[13] and

[12] For investments made prior to November 1, 1970, the effective date of section 5141, investors are not required to amortize any goodwill in the absence of evidence that the goodwill has a limited term of existence; prospective amortization of such goodwill is encouraged.

[13] Disclosure should include the names of any significant investee corporations in which the investor holds 20% or more of the voting stock, but the common stock is not accounted for on the equity method, together with the reasons why the equity method is not considered appropriate, and the names of any significant investee corporations in which the investor holds less than 20% of the voting stock and the common stock is accounted for on the equity method, together with the reasons why the equity method is considered appropriate.

(3) the difference, if any, between the amount at which an investment is carried and the amount of underlying equity in net assets and the accounting treatment of the difference.

b. For those investments in common stock for which a quoted market price is available, the aggregate value of each identified investment based on the quoted market price usually should be disclosed. This disclosure is not required for investments in common stock of subsidiaries.

c. When investments in unconsolidated subsidiaries are, in the aggregate, material in relation to financial position or results of operations, summarized information as to assets, liabilities, and results of operations should be presented in the notes or separate statements should be presented for such subsidiaries, either individually or in groups, as appropriate.

d. When investments in common stock of corporate joint ventures or other investments of 50% or less accounted for under the equity method are, in the aggregate, material in relation to the financial position or results of operations of an investor, it may be necessary for summarized information as to assets, liabilities, and results of operations of the investees to be presented in the notes or in separate statements, either individually or in groups, as appropriate.

e. Conversion of outstanding convertible securities, exercise of outstanding options and warrants and other contingent issuances of an investee may have a significant effect on an investor's share of reported earnings or losses. Accordingly, material effects of possible conversions, exercises or contingent issuances should be disclosed in notes to the financial statements of an investor.[14]

EFFECTIVE DATE

.21 This section shall be effective for all fiscal periods beginning after December 31, 1971, and should be applied retroactively to all investments in common stock held

[14] See footnote 8.

© 1974, American Institute of Certified Public Accountants, Inc.

during any portion of the period for which results of operations are presented regardless of the date the investments were acquired. However, the Board encourages earlier application of the provisions of this section. Adjustments resulting from a change in accounting method to comply with this section should be treated as adjustments of prior periods, and financial statements presented for the periods affected should be restated appropriately.

AC Section 5132

Accounting for Certain Marketable Securities

[Source: FASB Statement No. 12.]

December 1975

INTRODUCTION AND BACKGROUND INFORMATION

.01 There has long been diversity in accounting for marketable securities. Paragraph 9, Chapter 3A, "Current Assets and Current Liabilities," of *Accounting Research Bulletin (ARB) No. 43* [section 2031.09] (originally adopted as *ARB No. 30* in 1947) narrowed practice somewhat by stating:

> . . . practice varies with respect to the carrying basis for current assets such as marketable securities and inventories. In the case of marketable securities where market value is less than cost by a substantial amount and it is evident that the decline in market value is not due to a mere temporary condition, the amount to be included as a current asset should not exceed the market value.

Chapter 3A of *ARB No. 43* [section 2031] did not, however, deal with the question of whether a write-up of a previous write-down might be permissible to reflect a recovery in the market. *Accounting Principles Board (APB) Opinion No. 18* [section 5131], "The Equity Method of Accounting for Investments in Common Stock," dealt with accounting for investments by the equity method when the investor has "significant influence" over the investee, thus establishing accounting principles for those investments. In addition, a number of Industry Audit Guides, issued by the AICPA for certain industries, describe specialized accounting practices applied in those industries. At present, some enterprises are carrying marketable securities at cost, some at market (or variations of market), some at the lower of cost or market, and some are applying more than one of those methods to different classes of securities. During

1973 and 1974, there were substantial declines in market values of many securities. As a result, in many enterprises where securities are carried at cost, the carrying amount is in excess of current market value. In other enterprises where carrying amounts were written down to reflect the market decline, the partial recovery in the market in 1975 has given rise to a situation in which securities are being carried at amounts which are below both original cost and current market value.

.02 Concern over the lack of definitive guidance in the authoritative literature with respect to certain accounting problems accentuated by these conditions led to requests for the FASB to consider those problems on an urgent basis. The issues raised were submitted to the members of the Board's Screening Committee on Emerging Problems, and their recommendations were weighed by the Board in arriving at its decision to proceed with a project of limited scope, based on the three questions stated in paragraph .03.

.03 The Board has concluded that the following questions concerning financial accounting and reporting for marketable securities require resolution as soon as possible:

a) Under what circumstances should marketable equity securities that are carried on a cost basis be written down below cost?

b) Should marketable equity securities that have been written down be written back up based on market recoveries or other criteria?

c) If a parent company and one or more subsidiaries or investees follow different methods of accounting for marketable securities, should any adjustments be made to conform the subsidiaries' or investees' methods of accounting to that of the parent company in consolidated or parent company financial statements?[1]

.04 An Exposure Draft of a proposed Statement on "Accounting for Certain Marketable Securities" was issued November 6, 1975, and a public hearing based on the Exposure Draft was held on December 8, 1975. The Board received 272 position papers and letters of comment in response to the Exposure Draft. Twenty presentations were made at the public hearing.

---

[1] The term *parent company financial statements* as used in this Statement is limited to those parent company financial statements prepared for issuance as the financial statements of the primary reporting entity.

Copyright © 1976, Financial Accounting Standards Board

.05 This Statement does not apply to not-for-profit organizations[2] or mutual life insurance companies; it does, however, apply to mutual savings banks (see paragraphs .39 and .40) as well as to other for-profit mutual enterprises. This Statement also does not apply to employee benefit plans because that subject is a separate item on the FASB's current agenda.

.06 Investments accounted for by the equity method, as described in *APB Opinion No. 18* [section 5131], are beyond the scope of this Statement except for the provisions of paragraph .18.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Enterprises in Industries Not Having Specialized Accounting Practices with Respect to Marketable Securities

.07 For purposes of applying paragraphs .08-.13 of this Statement, certain terms are defined as follows:

a) *Equity security* encompasses any instrument representing ownership shares (e.g., common, preferred, and other capital stock), or the right to acquire (e.g., warrants, rights, and call options) or dispose of (e.g., put options) ownership shares in an enterprise at fixed or determinable prices. The term does not encompass preferred stock that by its terms either must be redeemed by the issuing enterprise or is redeemable at the option of the investor, nor does it include treasury stock or convertible bonds.

b) *Marketable,* as applied to an equity security, means an equity security as to which sales prices or bid and ask prices are currently available on a national securities exchange (i.e., those registered with the Securities and Exchange Commission) or in the over-the-counter market. In the over-the-counter market, an equity security shall be considered marketable when a quotation is publicly reported by the National Association of Securities Dealers Automatic Quotations System or by the National Quotations Bureau Inc. (provided, in the latter case, that quotations are available from at least three dealers). Equity securities traded in foreign markets

[2] For this purpose, not-for-profit organizations are those described in the third sentence of paragraph 5 of the Introduction to *ARB No. 43* [section 510.05].

shall be considered marketable when such markets are of a breadth and scope comparable to those referred to above. Restricted stock[3] does not meet this definition.

c) *Market price* refers to the price (see paragraph .07(b)) of a single share or unit of a marketable equity security.

d) *Market value* refers to the aggregate of the market price times the number of shares or units of each marketable equity security in the portfolio. When an entity has taken positions involving short sales, sales of calls, and purchases of puts for marketable equity securities and the same securities are included in the portfolio, those contracts shall be taken into consideration in the determination of market value of the marketable equity securities.

e) *Cost* refers to the original cost of a marketable equity security unless a new cost basis has been assigned based on recognition of an impairment of value that was deemed other than temporary or as the result of a transfer between current and noncurrent classifications as described in paragraph .10. In such cases, the new cost basis shall be the cost for the purposes of this Statement.

f) The *valuation allowance* for a marketable equity securities portfolio represents the net unrealized loss (the amount by which aggregate cost exceeds market value) in that portfolio.

g) The *carrying amount* of a marketable equity securities portfolio is the amount at which that portfolio of marketable equity securities is reflected in the financial statements of an enterprise.

h) A *realized gain or loss* represents the difference between the net proceeds from the sale of a marketable equity security and its cost.

i) *Net unrealized gain or loss* on a marketable equity securities

---

[3] Restricted stock for purposes of this Statement shall mean securities for which sale is restricted by a governmental or contractual requirement except where such requirement terminates within one year or where the holder has the power by contract or otherwise to cause the requirement to be met within one year. Any portion of the stock which can reasonably be expected to qualify for sale within one year, such as may be the case under Rule 144 or similar rules of the Securities and Exchange Commission, is not considered restricted.

Copyright © 1976, Financial Accounting Standards Board

portfolio represents the difference between the market value of its securities and their aggregate cost at any given date.

.08 The carrying amount of a marketable equity securities portfolio shall be the lower of its aggregate cost or market value, determined at the balance sheet date. The amount by which aggregate cost of the portfolio exceeds market value shall be accounted for as the valuation allowance.

.09 Marketable equity securities owned by an entity[4] shall, in the case of a classified balance sheet, be grouped into separate portfolios according to the current or noncurrent classification of the securities for the purpose of comparing aggregate cost and market value to determine carrying amount. In the case of an unclassified balance sheet, marketable equity securities shall for the purposes of this Statement be considered as noncurrent assets. The current portfolios of entities that are consolidated in financial statements and that do not follow specialized industry accounting practices with respect to marketable securities shall be treated as a single consolidated portfolio for the comparison of aggregate cost and market value; similarly, the noncurrent portfolios of entities that are consolidated in financial statements and that do not follow specialized industry accounting practices with respect to marketable securities shall be treated as a single consolidated portfolio for the comparison of aggregate cost and market value. The portfolios of marketable equity securities owned by an entity (subsidiary or investee) that is accounted for by the equity method shall not be combined with the portfolios of marketable equity securities owned by any other entity included in the financial statements.[5] However, such an entity is, itself, subject to the requirements of this Statement.

.10 If there is a change in the classification of a marketable equity security between current and noncurrent, the security shall

[4] For this purpose, marketable equity securities owned by an investee accounted for by the equity method shall not be considered owned by the entity (investor).

[5] This constitutes an exception to paragraph 19 of *APB Opinion No. 18* [section 5131.19] in those cases in which a subsidiary accounted for under the equity method has a net unrealized gain or loss on a portfolio of marketable equity securities that would serve to offset, in whole or in part, the net unrealized gain or loss on a comparable portfolio of marketable equity securities of the parent or consolidated entity. If the subsidiary were consolidated and its portfolios were combined with comparable portfolios of other entities in the consolidation in accordance with this paragraph, a different effect on consolidated net income would be produced, as compared with the equity method.

be transferred between the corresponding portfolios at the lower of its cost or market value at date of transfer. If market value is less than cost, the market value shall become the new cost basis, and the difference shall be accounted for as if it were a realized loss and included in the determination of net income.

.11 Realized gains and losses shall be included in the determination of net income of the period in which they occur. Changes in the valuation allowance for a marketable equity securities portfolio included in current assets shall be included in the determination of net income of the period in which they occur. Accumulated changes in the valuation allowance for a marketable equity securities portfolio included in noncurrent assets or in an unclassified balance sheet shall be included in the equity section of the balance sheet and shown separately.

.12 The following information with respect to marketable equity securities owned shall be disclosed either in the body of the financial statements or in the accompanying notes:

a) As of the date of each balance sheet presented, aggregate cost and market value (each segregated between current and noncurrent portfolios when a classified balance sheet is presented) with identification as to which is the carrying amount.

b) As of the date of the latest balance sheet presented, the following, segregated between current and noncurrent portfolios when a classified balance sheet is presented:

   i) Gross unrealized gains representing the excess of market value over cost for all marketable equity securities in the portfolio having such an excess.

   ii) Gross unrealized losses representing the excess of cost over market value for all marketable equity securities in the portfolio having such an excess.

c) For each period for which an income statement is presented:

   i) Net realized gain or loss included in the determination of net income.

   ii) The basis on which cost was determined in computing realized gain or loss (i.e., average cost or other method used).

Copyright © 1976, Financial Accounting Standards Board

iii) The change in the valuation allowance(s) that has been included in the equity section of the balance sheet during the period and, when a classified balance sheet is presented, the amount of such change included in the determination of net income.

.13 An enterprise's financial statements shall not be adjusted for realized gains or losses or for changes in market prices with respect to marketable equity securities when such gains or losses or changes occur after the date of the financial statements but prior to their issuance, except for situations covered by paragraph .21. However, significant net realized and net unrealized gains and losses arising after the date of the financial statements, but prior to their issuance, applicable to marketable equity securities owned at the date of the most recent balance sheet shall be disclosed.

Enterprises in Industries Having Specialized Accounting Practices with Respect to Marketable Securities

.14 Certain industries apply specialized industry accounting practices with respect to marketable securities. Such industries include investment companies, brokers and dealers in securities, stock life insurance companies, and fire and casualty insurance companies. Except for the requirements in paragraphs .15, .21, and .22, this Statement does not alter any industry's specialized accounting practices. Paragraphs .15, .17, and .19 deal with marketable equity securities as that term is defined in paragraph .07. Paragraphs .16, .18, and .20-.22 deal with marketable securities as that term is used in the particular industries concerned, including, but not limited to, marketable equity securities.

.15 Entities that carry marketable equity securities at cost shall hereafter carry them at the lower of their aggregate cost or market value.[6] In making this determination, the provisions of paragraphs .07-.09 shall be applied with the exception of the third sentence of paragraph .09. The portfolios of entities that are consolidated in financial statements and that follow the same specialized industry accounting practices with respect to marketable equity securities

[6] This does not preclude entities in industries in which either the cost basis or the market basis is an accepted specialized practice from electing the market basis where such election is permissible in that industry. In such an election, the provisions of paragraphs 15-17 of *APB Opinion No. 20* [section 1051.15-.17], "Accounting Changes," shall not apply.

shall be treated as a single portfolio for the comparison of aggregate cost and market value. This Statement does not alter any entity's specialized industry practice for reporting gains and losses, whether realized or unrealized, for marketable equity securities.

.16 Entities that do not include unrealized gains and losses[7] on marketable securities in the determination of net income but that do include them in the equity section of the balance sheet shall disclose the following information, either in the body of the financial statements or in the accompanying notes:

a) Gross unrealized gains and gross unrealized losses as of the date of the latest balance sheet presented.

b) Change in net unrealized gain or loss (the amount by which equity has been increased or decreased as a result of unrealized gains and losses) for each period for which an income statement is presented.

.17 An enterprise's financial statements shall not be adjusted for realized gains or losses or for changes in market prices with respect to marketable equity securities when such gains or losses or changes occur after the date of the financial statements, but prior to their issuance, except for situations covered by paragraph .21. However, significant net realized and net unrealized gains and losses arising after the date of the financial statements, but prior to their issuance, applicable to marketable equity securities in the portfolio at the date of the most recent balance sheet shall be disclosed.

Enterprises That Include Entities Whose Accepted Accounting Practices Differ with Respect to Marketable Securities

.18 If an investee accounted for by the equity method or a subsidiary follows accepted accounting practices that are different from those of the parent or investor with respect to marketable securities, those practices shall be retained in the consolidated or parent company financial statements in which those entities are included. As an exception to this requirement, if it is the practice of the parent or investor to include realized gains and

---

[7] For the purposes of paragraph .16, unrealized gains and losses shall have the same meaning as is presently accepted in the particular industry's specialized accounting practice.

Copyright © 1976, Financial Accounting Standards Board

losses in the determination of net income, or would so include them if present, the accounting treatment of a subsidiary or an investee that does not follow such practice shall be conformed to that of the parent or investor in that particular respect in consolidated or parent company financial statements.

.19 If the parent company in a consolidation follows specialized industry accounting practices with respect to marketable securities but two or more consolidated subsidiaries do not (and hence are subject to the provisions of paragraphs .08-.13 of this Statement), the current and noncurrent portfolios of marketable equity securities of such subsidiaries shall be consolidated as separate current and noncurrent portfolios in the manner provided in paragraph .09, exclusive of the portfolios of the parent company, for the purpose of determining carrying amounts in accordance with paragraph .09. The information required by paragraph .12 shall be disclosed in the consolidated financial statements with respect to such subsidiaries.

.20 If the consolidated financial statements reflect more than one accepted practice of accounting for marketable securities, the disclosures required by this Statement and those encompassed by specialized industry practice, as applicable, shall be disclosed either in the body of the financial statements or in the accompanying notes for the marketable securities accounted for under each such practice.

Decline in Market Value Is Assessed to Be Other Than Temporary

.21 For those marketable securities for which the effect of a change in carrying amount is included in stockholders' equity rather than in net income (including marketable securities in unclassified balance sheets), a determination must be made as to whether a decline in market value below cost as of the balance sheet date of an individual security is other than temporary.[8] If the decline is judged to be other than temporary, the cost basis of the individual security shall be written down to a new cost basis and the amount of the write-down shall be accounted for as a realized loss. The new cost basis shall not be changed for subsequent recoveries in market value.

---

[8] For a recent discussion of this subject, see the Auditing Interpretation published by the staff of the Auditing Standards Division, AICPA, "Evidential Matter for the Carrying Amount of Marketable Securities," in *The Journal of Accountancy,* April 1975. (See AU section 9332.01-.14.)

Income Taxes

.22 Unrealized gains and losses on marketable securities, whether recognized in net income or included in the equity section of the balance sheet, shall be considered as timing differences, and the provisions of *APB Opinion No. 11* [section 4091], "Accounting for Income Taxes," shall be applied in determining whether such net unrealized gain or loss shall be reduced by the applicable income tax effect. A tax effect shall be recognized on an unrealized capital loss only when there exists assurance beyond a reasonable doubt that the benefit will be realized by an offset of the loss against capital gains.

Effective Date and Transition

.23 The provisions of this Statement, other than those of paragraph .18, shall be effective for financial statements for annual and interim periods ending on or after December 31, 1975.[9] If initial application of this Statement necessitates establishment of a valuation allowance for a marketable equity securities portfolio included in current assets, the amount thereof shall be included in the determination of net income for the period in which this Statement is initially applied. If initial application of this Statement necessitates establishment of a valuation allowance for a marketable equity securities portfolio included in noncurrent assets or in an unclassified balance sheet, the amount thereof shall be reflected separately in stockholders' equity as of the end of the period in which this Statement is initially applied. For initial application of this Statement, the provisions of paragraph .10 shall not apply to transfers between current and noncurrent classifications made as of or before December 31, 1975.[10] Financial statements for annual and interim periods ending before December 31, 1975[11] shall not be restated except as stated below. The provisions of paragraph .18 of this Statement shall be effective for financial statements for annual and interim periods ending on or after December 31, 1975.[12] Those provisions shall be applied retroactively by prior period adjustment (described in paragraphs 18 and 26 of *APB Opinion No. 9* [sections 2010.17 and 2010.25], "Reporting the Results of Operations"). When prior period

[9] For enterprises having fiscal years of 52 or 53 weeks instead of the calendar year, this Statement shall be effective for financial statements for periods ending in late December 1975.

[10] See footnote 9.

[11] See footnote 9.

[12] See footnote 9.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

financial statements or financial summaries or other data derived therefrom are presented, they shall be restated to conform to those provisions.

> **The provisions of this Statement need not be applied to immaterial items.**

Appendix A

BASIS FOR CONCLUSIONS

.24 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including alternatives considered and the reasons for accepting some and rejecting others.

Scope

.25 The three questions which the Board addressed as constituting financial reporting problems requiring early resolution are those listed in paragraph .03. Questions (a) and (b) relate to the determination of carrying amount for marketable equity securities, whereas question (c) relates to the issue of conformity in consolidated or parent company financial statements of different methods of accounting with respect to all marketable securities, whether or not they are equity securities.

.26 Because of the urgency of resolving these questions within a limited time frame, the Board concluded that the scope of the project should be limited essentially to the questions as presented. Although a number of respondents objected to the short exposure period and the proximity of the proposed effective date, the Board determined that the problems should be resolved for application in 1975. As stated in paragraph .02, the requests that the Board deal with the problems had indicated that such a timely answer was needed. On the basis of available information, including that obtained at the public hearing and in position papers and letters of comment, the Board concluded that it could make an informed decision on the questions as presented and that the effective date and method of transition specified herein are advisable.

.27 The Board is mindful of the fact that enterprises in certain industries apply specialized accounting practices presently accepted in those industries. The Board concluded that consideration of questions (a) and (b) with respect to those particular industries should be limited to the enterprises within those industries that carry marketable equity securities on the basis of cost. The alternative bases for carrying marketable equity securities

The next page is 9403.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

(e.g., market value, appraised value, fair value) which are permitted in certain specialized industry accounting practices with respect to marketable securities have not been considered by the Board and are not altered by this Statement. The Board further concluded that it would not, as a part of this project, examine or change specialized industry practice for reporting gains and losses, whether realized or unrealized, for marketable securities. To do so would expand the scope of the project in that consideration of the fundamental issues that led to the adoption of those specialized practices would be required. This, the Board decided, could not be done in the limited time available for the completion of this project.

.28 For the reasons discussed in paragraph .27, the "Standards of Financial Accounting and Reporting" of this Statement contain separate provisions for two categories of enterprises: those in industries not having specialized accounting practices with respect to marketable securities, and those in industries having such specialized accounting practices.

Enterprises in Industries Not Having Specialized Accounting Practices with Respect to Marketable Securities

.29 In considering questions (a) and (b) of paragraph .03 the Board noted that the questions pertain to marketable equity securities carried on a cost basis. The Board's conclusion that the lower of cost or market should apply in the determination of carrying amount for such securities was based on the following factors:

a) The Board excluded from its consideration market value alone as the determinant of carrying value. Consideration of that alternative would raise pervasive issues concerning the valuation of other types of assets, including the concept of historic cost versus current or realizable value. The Board concluded that it could not examine these conceptual issues in a project of such limited scope.

b) The Board noted that continuance of original cost as the carrying amount of a portfolio of marketable equity securities when its market value is lower has the effect of deferring

recognition of the decline in the realizable value of such securities based on the expectation of a future recovery in market value which may or may not occur. Because of the uncertainty of such future recovery, the Board concluded that original cost is not a proper determinant of carrying amount for marketable equity securities when market value is below cost. A number of respondents advanced the argument that, in the case of securities held as long-term investments, a decline in market value viewed as temporary should not be reflected in net income. While not necessarily accepting this argument, the Board took into account the fact that this argument has considerable support in current practice, and that the Auditing Interpretation referred to in footnote 8 is consistent with it. The Board concluded that the conceptual question of whether such differences should or should not be included in income could not be dealt with in this project, and hence no such requirement should be made at this time. However, the Board concluded that a decline in market value below cost should in all cases be reflected in the balance sheet and when such securities are classified as current assets, the decline in market value below cost should enter into the determination of net income. In the case of current assets, it is the Board's view that the realization of the loss in value of the securities should be regarded as imminent and therefore should be recognized in the determination of net income.

c) In adopting the lower of cost or market as the determinant for carrying amount, the Board required that when write-downs have been made because the market value of the portfolio has dropped below cost, if market value subsequently rises, the write-down be reversed to the extent that the resulting carrying amount does not exceed cost. The Board does not regard the reversal of the write-down as representing recognition of an unrealized gain. Rather, the Board views the write-down as establishing a valuation allowance representing the estimated reduction in the realizable value of the portfolio, and it views a subsequent market increase as having reduced or eliminated the requirement for such an allowance. In the Board's view, the reversal of the write-down represents a change in an accounting estimate of an unrealized loss (see paragraph 2 of *FASB Statement No.* 5 [section 4311.02], "Accounting for Contingencies" and paragraph 10 of *APB Opinion No.* 20 [section 1051.10]).

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.30 The Exposure Draft required that all changes in the carrying amounts of the marketable equity securities portfolio be reflected in income currently and made no distinction in that regard between the current or noncurrent classifications of such securities. Some respondents favored the separation of the single portfolio called for by the Exposure Draft into current and noncurrent portfolios with the change in carrying amount for the noncurrent portfolio to be reflected in equity rather than in income. They argued that fluctuations in the market value of long-term investments should not be reflected in income and to do so would cause distortions which would not be understood by investors. While not necessarily agreeing with these arguments, for the reasons discussed in paragraph .29(b), the Board decided not to require in this Statement that declines in the market value below cost of noncurrent marketable equity securities be reflected in net income. In reaching this decision, the Board recognized that the present concepts of income require authoritative clarification with respect to the recognition of unrealized gains and losses on long-term assets. Such clarification, the Board noted, is beyond the scope of this Statement. For these reasons, the Board concluded that marketable equity securities classified as noncurrent assets should constitute a separate portfolio from those securities classified as current assets for the determination of carrying amount, and that changes in the carrying amount of the noncurrent portfolio should be reflected in the equity section of the balance sheet rather than included in income, provided that the decline in market value is assessed as temporary.

.31 An issue inherent in the determination of carrying amount for marketable equity securities was whether the lower of cost or market method adopted by the Board should be applied on the basis of individual security holdings or on a portfolio basis. In deciding to require application on a portfolio basis (with the exceptions noted in paragraph .09), the Board considered the following factors: Many enterprises regard their portfolios of marketable equity securities (excluding long-term investments accounted for under the equity method) as collective assets. A requirement that the application of lower of cost or market be made on an individual security basis would, in the Board's view, be unduly conservative and at variance with the manner in which enterprises generally view their investment in marketable equity securities. The Board recognized that the application of the criterion on a portfolio basis may be regarded as having the effect of offsetting the unrealized losses on one security with unrealized gains on

another. However, the Board agrees with those respondents who regard the current and noncurrent portfolios of marketable equity securities each as collective assets, hence the determination of the carrying amount on a collective (portfolio) basis is in the Board's view appropriate despite the offsets referred to. The disclosures required by paragraph .12(b) are intended to inform as to the extent to which such offsets exist in the portfolio.

.32 Paragraph .30 discussed the reasons for the Board's decision to change from a single portfolio basis as provided by the Exposure Draft to separate portfolios for current and noncurrent assets. The Exposure Draft noted that such a separation of portfolios would provide opportunities for transfers between portfolios simply by changing classifications and that such transfers could result in significant changes in net income. The Board had this feature in mind in requiring that transfers between the current and noncurrent portfolios be accounted for in the manner prescribed by paragraph .10. This has the effect of accounting for an unrealized loss at the date of transfer in the same manner as if it had been realized, thus reducing the incentive to cause significant changes in income by transferring securities between portfolios. The Board recognized, however, that the above requirement would not be effective in the case of a transfer from noncurrent to current classifications of a security having an excess of market value over cost which would serve to offset a reverse situation in the current portfolio, thus affecting the determination of net income. However, as mentioned in paragraph .31, the disclosures required by paragraph .12(b) should assist users of financial statements in assessing the effects of such transfers.

.33 The definition of "equity security" in the Exposure Draft included convertible bonds. Many respondents believed that such inclusion was in conflict with *APB Opinion No. 14* [section 5516], "Accounting for Convertible Debt and Debt Issued with Stock Purchase Warrants." It was pointed out further that the market sometimes values a convertible bond primarily on its equity characteristics and at other times primarily on its debt characteristics. The Board concluded that it was impractical to apply criteria under which a convertible bond might in some time intervals come under the definition and at other times be excluded. Accordingly, the Board decided that convertible bonds, and, for consistency, convertible preferred stock with redemption requirements, would be excluded from the definition of equity securities.

Copyright © 1976, Financial Accounting Standards Board

.34 A number of respondents asked for clarification of what was encompassed by the term "restricted stock" with respect to the statement in the Exposure Draft that restricted stock did not meet the definition of "marketable." Footnote 3 of this Statement is intended to provide the requested clarification. The Board's decision to consider restricted stock as meeting the definition of marketable where the restriction terminates or can be terminated by the holder within one year is based on the view that current market value is relevant in applying the lower of cost or market determination to such securities, whereas in the case of longer term restrictions, the application of current market value is of lesser relevance.

.35 Paragraph .09 provides, as did the Exposure Draft, that "The portfolios of marketable equity securities owned by an entity (subsidiary or investee) that is accounted for by the equity method shall not be combined with the portfolios of marketable equity securities owned by any other entity included in the financial statements.[5]" Some respondents were of the opinion that the portfolio(s) of unconsolidated subsidiaries accounted for by the equity method should be so combined, especially in the case of 100 percent owned subsidiaries, and that failure to do so would be contrary to paragraph 19 of *APB Opinion No. 18* [section 5131.19]. Some of the respondents expressing this view acknowledged that there were both conceptual and mechanical problems involved in implementing this recommendation, but none offered specific suggestions for resolving them. The Board noted in the Exposure Draft and in footnote 5 of this Statement that the procedure called for constitutes an exception to paragraph 19 of *APB Opinion No. 18* [section 5131.19]. The Board rejected the recommendation that the portfolios of equity method subsidiaries be combined with others, because to do so could produce illogical results either with respect to the carrying amount of marketable securities as reflected in the consolidated balance sheet, or the carrying amount of the equity method subsidiary as reflected in the same balance sheet.

Enterprises in Industries Having Specialized Accounting Practices with Respect to Marketable Securities

.36 Paragraph .14 states that, with the exception of paragraphs .15, .21, and .22, this Statement does not alter any industry's specialized accounting practices with respect to marketable securities.

.37 Paragraph .15 requires that entities that carry marketable equity securities at cost shall hereafter carry them at the lower of their aggregate cost or market value with the following exception: entities in industries whose specialized accounting practices permit market value as an acceptable alternate carrying basis may elect that basis. The cost basis is no longer acceptable for determining carrying amount for marketable equity securities and is replaced by the lower of aggregate cost or market value.

.38 The Board's decision to replace the cost basis with the lower of cost or market basis in industries having specialized accounting practices took into account the following factors:

a) Having concluded that the cost basis should be replaced in all enterprises in industries with nonspecialized accounting practices, the Board could find no justification for maintaining cost as a basis for marketable equity securities in the other industries.

b) As stated in paragraph .27, this Statement does not alter specialized industry practice for reporting gains and losses on marketable securities because to do so would involve a reconsideration of fundamental issues in those industries. However, a change in the carrying basis for marketable equity securities does not, in the Board's view, necessitate such a reconsideration.

c) Elimination of cost as a carrying basis for marketable equity securities in the industries having specialized accounting practices serves to reduce some of the disparity in practice among those industries as well as with industries not having specialized accounting practices.

Applicability

.39 Numerous responses from the mutual savings bank industry urged that mutual savings banks be excluded from the scope of this Statement. The principal arguments advanced were: mutual savings banks are regulated and, in some states, are required to

 Copyright © 1976, Financial Accounting Standards Board

carry marketable securities at cost; the exclusion of not-for-profit organizations should apply to mutual savings banks; the element of mutuality (absence of shareholders) applies equally to these organizations as it does to mutual life insurance companies. The Board did not find these arguments persuasive. When mutual savings banks, which are in an industry not having specialized accounting practices, present financial statements purporting to be in conformity with generally accepted accounting principles, the fact that they are regulated or that they do not have shareholders does not, in the Board's view, justify different accounting for marketable equity securities from that required to be followed by other entities not having specialized accounting practices. Accordingly, the provisions of this Statement apply to mutual savings banks, as well as to other for-profit mutual enterprises, except mutual life insurance companies.

.40 Mutual life insurance companies were excluded from the scope of this Statement because, unlike stock life insurance companies (see paragraph .14), there is disagreement as to whether generally accepted accounting principles exist for mutual life insurance companies.[13] This coupled with the complexity of some of the issues involved in life insurance accounting caused the Board to conclude that it could not resolve these questions within this project. On the other hand, mutual savings banks, which are not excluded from the scope of this Statement, do present financial statements prepared in conformity with generally accepted accounting principles and there are no complex related accounting issues involved as is the case with mutual life insurance companies.

.41 The Exposure Draft proposed that the Statement be applied retroactively by prior period restatement. That method of transition was proposed on the premise that it would afford maximum comparability among financial statements. The Board has obtained information, subsequent to the issuance of the Exposure Draft, that a number of companies have in past years made substantial reclassifications of marketable equity securities as between current and noncurrent assets. With the Board's decision to provide for separate portfolios of current and noncurrent marketable equity securities with different accounting for changes in carrying value of the two portfolios, the number of and seemingly divergent

[13] See the Preface to *AICPA Industry Audit Guide,* "Audits of Stock Life Insurance Companies."

bases for reclassifications that have occurred in recent years would, in the case of retroactive restatement, result in less rather than more comparability. The new requirement that transfers between current and noncurrent portfolios be accounted for in a manner to treat reductions in market value below cost as realized losses at the date of transfer would, if applied retroactively, accentuate this effect. For these reasons, the Board concluded that the interests of users of financial statements would best be served by making the Statement effective December 31, 1975 [14] (except for paragraph .18 for which retroactive application is still required).

[14] See footnote 9.

Appendix B

ILLUSTRATION OF DISCLOSURES REQUIRED BY PARAGRAPH .12 OF THIS STATEMENT

.42 The following example illustrates the disclosure requirements of paragraph .12 for an enterprise having a classified balance sheet. For purposes of this illustration it is presumed that the only marketable securities that the enterprise owns are marketable equity securities as defined in paragraph .07. The illustration does not encompass all possible circumstances that may arise in connection with the disclosure requirements, nor does it indicate the Board's preference for a particular format.

Computational Information

The details on the following pages pertain to marketable equity securities owned at December 31:

	1975			1974		
	Cost	Market	Unrealized Gain (Loss)	Cost	Market	Unrealized Gain (Loss)
In Current Assets:						
Security A	$100,000	$100,000	$ —	$200,000	$250,000	$ 50,000
B	200,000	150,000	(50,000)	300,000	250,000	(50,000)
C	200,000	175,000	(25,000)	200,000	150,000	(50,000)
D	150,000	100,000	(50,000)	150,000	200,000	50,000
E	50,000	100,000	50,000	50,000	75,000	25,000
F	200,000	225,000	25,000	—	—	—
Total of Portfolio	$900,000	$850,000	$(50,000)	$900,000	$925,000	$ 25,000
Valuation Allowance—Current			$(50,000)			Not Applicable
In Noncurrent Assets:						
Security G	$300,000	$200,000	$(100,000)	$300,000	$100,000	$(200,000)
H	100,000	190,000	90,000	100,000	250,000	150,000
I	250,000	150,000	(100,000)	250,000	150,000	(100,000)
Total of Portfolio	$650,000	$540,000	$(110,000)	$650,000	$500,000	$(150,000)
Valuation Allowance—Noncurrent			$(110,000)			Not Applicable

Copyright © 1976, Financial Accounting Standards Board

During 1975 the following sales of securities took place. (There were no sales of securities in 1974.):

	Net Proceeds of Sale	Cost	Realized Gain (Loss)
Security A	$125,000	$100,000	$ 25,000
Security B	65,000	100,000	(35,000)
	$190,000	$200,000	$(10,000)

The valuation allowances required at December 31, 1975 are as follows:

	Charged Against Income	Charged Against Equity
In Current Assets:		
Cost $900,000 less market $850,000	$50,000*	
In Noncurrent Assets:		
Cost $650,000 less market $540,000		$110,000*

* No tax effect was recognized because there is no assurance beyond a reasonable doubt that the benefit will be realized by an offset of the loss against capital gains.

Disclosure Requirements

BALANCE SHEET

	December 31,	
	1975	1974
Current Assets		
Marketable equity securities, carried at market in 1975 and at cost in 1974 (Note 1)	$850,000	$900,000
Noncurrent Assets		
Marketable equity securities, carried at market in 1975 and at cost in 1974 (Note 1)	540,000	650,000
Stockholders' Equity		
Net unrealized loss on noncurrent marketable equity securities (Note 1)	(110,000)	—

NOTES TO FINANCIAL STATEMENTS

Note 1—Marketable Equity Securities

At December 31, 1975, the current and noncurrent portfolios of marketable equity securities are each carried at their lower of cost or market at the balance sheet date. Marketable equity securities included in current and noncurrent assets had a cost of $900,000 and $650,000, respectively, at December 31, 1975.

To reduce the carrying amount of the current marketable equity securities portfolio to market, which was lower than cost at December 31, 1975, a valuation allowance in the amount of $50,000 was established with a corresponding charge to net income at that date. To reduce the carrying amount of the noncurrent marketable equity securities portfolio to market, which was lower than cost at December 31, 1975, a valuation allowance in the amount of $110,000 was established by a charge to stockholders' equity representing the net unrealized loss.

Copyright © 1976, Financial Accounting Standards Board

At December 31, 1974, the current and noncurrent portfolios of marketable equity securities were not required to be carried at their lower of cost or market at the balance sheet date and were carried at cost. Marketable equity securities included in current and noncurrent assets had a market value of $925,000 and $500,000, respectively, at December 31, 1974.

At December 31, 1975, gross unrealized gains and gross unrealized losses pertaining to the marketable equity securities in the portfolios were as follows:

	Gains	Losses
Current	$75,000	$125,000
Noncurrent	$90,000	$200,000

A net realized loss of $10,000 on the sale of marketable equity securities was included in the determination of net income for 1975. The cost of the securities sold was based on the average cost of all the shares of each such security held at the time of sale. There were no sales of marketable equity securities during 1974.

AC Section 5132-1

Application of Section 5132 to Personal Financial Statements: An Interpretation of Section 5132

[Source: FASB Interpretation No. 10.]

September 1976

INTRODUCTION

.01 Paragraph 5 of *FASB Statement No. 12* [section 5132.05], "Accounting for Certain Marketable Securities," enumerates the entities excluded from the scope of the Statement but does not mention individuals. The AICPA Industry Audit Guide, "Audits of Personal Financial Statements," states that ". . . financial statements for individuals should be prepared on a cost basis, in conformity with generally accepted accounting principles" and that ". . . financial information on an estimated value basis is useful . . . as additional financial information" (pages 2 and 3). Further, the Industry Audit Guide recommends a two-column presentation of personal financial statements: "The first column should present financial data on the cost basis, paralleled by a second column presenting estimated values" (page 3). The FASB has been asked to clarify whether in personal financial statements prepared in conformity with generally accepted accounting principles the presentation of marketable equity securities on an estimated value basis in the second column supplants the requirement of paragraph 8 of *FASB Statement No. 12* [section 5132.08] to carry marketable equity securities at the lower of aggregate cost or aggregate market value in the first column.

INTERPRETATION

.02 Personal financial statements prepared in conformity with generally accepted accounting principles are included in the scope of *FASB Statement No. 12* [section 5132]. The presentation of marketable equity securities on an estimated value basis as additional financial information in the second column does not supplant the requirement of paragraph 8 of *FASB Statement No. 12* [section 5132.08] to carry marketable equity securities at the lower of aggregate cost or aggregate market value in the first column.

EFFECTIVE DATE AND TRANSITION

.03 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods ending after

October 15, 1976. Earlier application is encouraged in financial statements for annual and interim periods ending before October 16, 1976 that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued annual or interim financial statements.

AC Section 5132-2

Changes in Market Value after the Balance Sheet Date: An Interpretation of Section 5132

[Source: FASB Interpretation No. 11.]

September 1976

INTRODUCTION

.01 Paragraphs 13 and 17 [1] of *FASB Statement No. 12* [sections 5132.13 and 5132.17], "Accounting for Certain Marketable Securities," specify in part that "an enterprise's financial statements shall not be adjusted for realized gains or losses or for changes in market prices with respect to marketable equity securities when such gains or losses or changes occur after the date of the financial statements but prior to their issuance, except for situations covered by paragraph 21 [section 5132.21]." The Board has been requested to clarify the meaning of the qualification, *except for situations covered by paragraph 21* [section 5132.21].

.02 Paragraph 21 of *FASB Statement No. 12* [section 5132.21] states:

> For those marketable securities for which the effect of a change in carrying amount is included in stockholders' equity rather than in net income (including marketable securities in unclassified balance sheets), a determination must be made as to whether a decline in market value below cost as of the balance sheet date of an individual security is other than temporary. . . . If the decline is judged to be other than temporary, the cost basis of the individual security shall be written down to a new cost basis and the amount of the write-down shall be accounted for as a realized loss. The new cost basis shall not be changed for subsequent recoveries in market value.

The Board also has been asked to elaborate on the amount of the write-down that shall be accounted for as a realized loss when the "decline in market value below cost *as of the balance sheet date* of an individual security is other than temporary." (Emphasis added.)

INTERPRETATION

.03 In the case of those marketable securities for which the effect of a change in carrying amount is included in stockholders' equity rather than in net income, the phrase "except for situations covered by paragraph 21 [section 5132.21]" in paragraphs 13 [section 5132.13] and 17 [section 5132.17] refers to the provi-

[1] Paragraph 13 applies to enterprises in industries not having specialized accounting practices with respect to marketable securities, and paragraph 17 applies to enterprises in industries having specialized accounting practices with respect to marketable securities.

sions in paragraph 21 [section 5132.21] requiring a decline in market value below cost as of the balance sheet date of an individual security that is determined to be other than temporary to be accounted for as a realized loss. In judging whether a decline in market value below cost at the balance sheet date is other than temporary, a gain or loss realized on subsequent disposition or changes in market price occurring after the date of the financial statements but prior to their issuance shall be taken into consideration along with other factors.

.04 The amount of decline in market value below cost of an individual marketable equity security that is accounted for as a realized loss as of the balance sheet date because the decline is other than temporary shall not exceed the difference between market value at the balance sheet date and cost of the marketable equity security. Further declines in market value after the balance sheet date might indicate that the decline in market value below cost at the balance sheet date was other than temporary. However, those declines result from information, events, or changes in expectations occurring after the balance sheet date. Accordingly, if a decline in market value below cost as of the balance sheet date of an individual security is judged to be other than temporary, further declines in market value occurring after the date of the balance sheet shall not be included in the amount that is accounted for as a realized loss as of the balance sheet date. Recoveries in market value after the balance sheet date also result from information, events, or changes in expectations occurring after the balance sheet date, but they tend to indicate that a portion or all of the decline at the balance sheet date was in fact temporary. Accordingly, such recoveries shall be considered when estimating the amount of decline as of the balance sheet date that is judged to be other than temporary.

EFFECTIVE DATE AND TRANSITION

.05 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods ending after October 15, 1976. Earlier application is encouraged in financial statements for annual and interim periods ending before October 16, 1976 that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued annual or interim financial statements.

AC Section 5132-3

Accounting for Previously Established Allowance Accounts: An Interpretation of Section 5132

[Source: FASB Interpretation No. 12.]

September 1976

INTRODUCTION

.01 Paragraph 8 of *FASB Statement No. 12* [section 5132.08], "Accounting for Certain Marketable Securities," specifies that the "carrying amount of a marketable equity securities portfolio shall be the lower of its aggregate cost or market value, determined at the balance sheet date." Paragraph 7(e) of *FASB Statement No. 12* [section 5132.07(e)] defines "cost" of a marketable equity security as "original cost . . . unless a new cost basis has been assigned based on recognition of an impairment of value that was deemed other than temporary. . . . In such cases, the new cost basis shall be the cost. . . ."

.02 Prior to the issuance of *FASB Statement No. 12* [section 5132], some enterprises that carried marketable equity securities at cost had reduced the carrying amount of individual marketable equity securities to market value through an allowance account with a corresponding amount included in the determination of net income. In some of those cases, a new cost basis was not established for individual securities and the allowance account was expected to increase or decrease depending on fluctuations in the market price of the marketable equity security because the decline in market value below cost was assessed to be temporary. The Board has been asked to clarify whether, in those cases, the original cost of the individual securities or the original cost reduced by an existing allowance account should be used in applying paragraphs 7(e) and 8 of *FASB Statement No. 12* [sections 5132.07(e) and 5132.08].

INTERPRETATION

.03 The original cost of individual marketable equity securities shall be used in applying paragraphs 7(e) and 8 of *FASB Statement No. 12* [sections 5132.07(e) and 5132.08] by an enterprise that carried marketable equity securities at cost and that (a) had reduced the carrying amount of individual marketable equity securities through an allowance account with a corresponding amount included in the determination of net income prior to the

effective date of the Statement and (b) expected the allowance account to increase or decrease in the future based on fluctuations in the market price of the security because the decline in market value below cost was assessed to be temporary. Any balance remaining in such an existing allowance account shall be eliminated and credited to income in the period in which this Interpretation is initially applied. The valuation allowance would then be determined in accordance with paragraph 8 of *FASB Statement No. 12* [section 5132.08].

.04 If, prior to the effective date of *FASB Statement No. 12* [section 5132], a new cost basis had been assigned to a marketable equity security based on recognition of an impairment of value that was deemed other than temporary, the new cost basis shall be used in applying the provisions of *FASB Statement No. 12* [section 5132].

EFFECTIVE DATE AND TRANSITION

.05 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods ending after October 15, 1976. Earlier application is encouraged in financial statements for annual and interim periods ending before October 16, 1976 that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued annual or interim financial statements.

AC Section 5132-4

Consolidation of a Parent and Its Subsidiaries Having Different Balance Sheet Dates: An Interpretation of Section 5132

[Source: FASB Interpretation No. 13.]

September 1976

INTRODUCTION

.01 Paragraphs 8, 9, and 15 of *FASB Statement No. 12* [sections 5132.08, 5132.09, and 5132.15], "Accounting for Certain Marketable Securities," set forth the requirements of the portfolio basis for comparing cost and market value. The portfolio basis requires that marketable equity securities owned by enterprises that are consolidated and that do not follow specialized accounting practices with respect to marketable equity securities, or that are consolidated and follow the same specialized accounting practices with respect to marketable equity securities, shall be aggregated into separate portfolios according to the current or noncurrent classifications of the securities. The aggregate cost and aggregate market value of the portfolios are compared to determine carrying amount.

.02 Paragraph 13 of *FASB Statement No. 12* [section 5132.13], which applies to enterprises in industries not having specialized accounting practices with respect to marketable securities, states:

> An enterprise's financial statements shall not be adjusted for realized gains or losses or for changes in market prices with respect to marketable equity securities when such gains or losses or changes occur after *the date of the financial statements* but prior to their issuance, except for situations covered by paragraph 21. However, significant net realized and net unrealized gains and losses arising after *the date of the financial statements,* but prior to their issuance, applicable to marketable equity securities owned at the date of the most recent balance sheet shall be disclosed. (Emphasis added.)

Paragraph 17 of *FASB Statement No. 12* [section 5132.17], which applies to enterprises in industries having specialized accounting practices with respect to marketable securities, is in substance identical to paragraph 13 of the Statement.

.03 The financial statements of a subsidiary sometimes are consolidated with the financial statements of its parent even though the financial statements of the subsidiary are as of a date different from the financial statements of the parent. The use of different dates is permitted by paragraph 4 of *ARB No.*

51 [section 2051.05], "Consolidated Financial Statements," which states:

> A difference in fiscal periods of a parent and a subsidiary does not of itself justify the exclusion of the subsidiary from consolidation. It ordinarily is feasible for the subsidiary to prepare, for consolidation purposes, statements for a period which corresponds with or closely approaches the fiscal period of the parent. However, where the difference is not more than about three months, it usually is acceptable to use, for consolidation purposes, the subsidiary's statements for its fiscal period; when this is done, recognition should be given by disclosure or otherwise to the effect of intervening events which materially affect the financial position or results of operations.

.04 The Board has been requested to clarify application of the portfolio basis specified in *FASB Statement No. 12* [section 5132] when the financial statements of a subsidiary are as of a date different from that of its parent and are consolidated with the financial statements of its parent. Further, the Board has been asked to explain the meaning of "the date of the financial statements" in paragraphs 13 and 17 of *FASB Statement No. 12* [sections 5132.13 and 5132.17] when the financial statements of a subsidiary or investee are as of a date different from that of its parent or investor and are consolidated with or accounted for by the equity method in the financial statements of its parent or investor.

INTERPRETATION

.05 To compute the amount of any valuation allowance(s) required by *FASB Statement No. 12* [section 5132] in the consolidated financial statements, aggregate cost and aggregate market value of the portfolio(s) shall be determined for each subsidiary that is consolidated as of the date of each subsidiary's balance sheet, and those aggregates shall be combined with aggregate cost and aggregate market value of the parent's portfolio(s) determined as of the parent's balance sheet date. For example, assume that consolidated financial statements dated December 31, 1976 and issued on March 1, 1977 include the financial statements of the parent as of December 31, 1976 and of the subsidiary as of October 31, 1976. The cost of the marketable equity securities owned by the subsidiary at October 31, 1976 is added to the cost of the marketable equity securities owned by the parent at December 31, 1976. The market values at October 31, 1976 of the securities owned by the subsidiary and the market values at December 31, 1976 of the securities owned by the parent are aggregated in the same manner. The aggregate cost and aggregate market value of the portfolios are compared to determine the carrying amount in the consolidated financial statements.

.06 For purposes of applying paragraphs 13 and 17 of *FASB Statement No. 12* [sections 5132.13 and 5132.17], "the date of the

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

financial statements" shall be for each subsidiary or investee the date of the financial statements that are consolidated with or accounted for by the equity method in the financial statements of its parent or investor. The last sentence in each of those paragraphs requires disclosure of significant net realized gains or losses and of significant net unrealized gains or losses arising after the date of the financial statements. Using the assumptions in the example in paragraph .05 above, aggregate amounts are computed as follows for possible disclosure: the net *realized* gains or losses arising after October 31, 1976 and prior to March 1, 1977 applicable to the marketable equity securities in the portfolio of the subsidiary at October 31, 1976 are aggregated with the net *realized* gains or losses arising after December 31, 1976 and prior to March 1, 1977 applicable to the marketable equity securities in the portfolio of the parent at December 31, 1976. Likewise, net *unrealized* gains or losses arising in the portfolio of the subsidiary after October 31, 1976 and prior to March 1, 1977 applicable to the marketable equity securities in the portfolio of the subsidiary at October 31, 1976 are aggregated with the net *unrealized* gains or losses arising after December 31, 1976 and prior to March 1, 1977 applicable to the marketable equity securities in the portfolio of the parent at December 31, 1976. If significant, each of the aggregate amounts shall be disclosed.

.07 If the financial statements of a subsidiary are consolidated with the financial statements of its parent and the financial statements of the subsidiary are as of a date different from the financial statements of the parent, paragraph 4 of *ARB No. 51* [section 2051.05] requires that "recognition should be given by disclosure or otherwise to the effect of intervening events which materially affect the financial position or results of operations." In the case of the subsidiary in the example in paragraph .05 above, that requirement pertains to the period from October 31, 1976 to December 31, 1976. Accordingly, in addition to the disclosure required by paragraph .06 above, the net realized gains or losses and the net unrealized gains or losses arising after October 31, 1976 and prior to December 31, 1976 applicable to the marketable equity securities of the subsidiary shall be disclosed if they "materially affect the financial position or results of operations." Further, as required by paragraphs 13 and 17 of *FASB Statement No. 12* [sections 5132.13 and 5132.17],[1] the subsidiary's financial statements shall not be adjusted for realized gains or losses or for changes in market prices with respect to its marketable equity securities occurring after October 31, 1976

---

[1] See also *FASB Interpretation No. 11* [section 5132-2], "Changes in Market Value after the Balance Sheet Date: an interpretation of FASB Statement No. 12 [section 5132]."

and prior to December 31, 1976, unless the decline in market value below cost of an individual marketable equity security is determined to be other than temporary and, accordingly, shall be accounted for as a realized loss.

EFFECTIVE DATE AND TRANSITION

.08 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods ending after October 15, 1976. Earlier application is encouraged in financial statements for annual and interim periods ending before October 16, 1976 that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued annual or interim financial statements.

AC Section 5132-5

Clarification of Definitions and Accounting for Marketable Equity Securities That Become Nonmarketable: An Interpretation of Section 5132

[Source: FASB Interpretation No. 16.]

February 1977

INTRODUCTION

.01 The FASB has been asked to clarify the definitions of the terms "marketable" and "restricted stock" as used in *FASB Statement No. 12* [section 5132], "Accounting for Certain Marketable Securities," and to clarify whether paragraph 10 of *FASB Statement No. 12* [section 5132.10] requires a new cost basis to be assigned when a marketable equity security becomes nonmarketable if its market value is less than its cost at that time.

.02 For purposes of applying paragraphs 8-13, 15, 17, and 19 of *FASB Statement No. 12* [section 5132.08—.13, section 5132.15, section 5132.17, and section 5132.19], the term "marketable" is defined in paragraph 7(b) of the Statement [section 5132.07(b)] as follows:

> *Marketable,* as applied to an equity security, means an equity security as to which sales prices or bid and ask prices are currently available on a national securities exchange (i. e., those registered with the Securities and Exchange Commission) or in the over-the-counter market. In the over-the-counter market, an equity security shall be considered marketable when a quotation is publicly reported by the National Association of Securities Dealers Automatic Quotations System or by the National Quotations Bureau Inc. (provided, in the latter case, that quotations are available from at least three dealers). Equity securities traded in foreign markets shall be considered marketable when such markets are of a breadth and scope comparable to those referred to above. Restricted stock[3] does not meet this definition.

Footnote 3 to that paragraph defines restricted stock as follows:

> Restricted stock for purposes of this Statement shall mean securities for which sale is restricted by a governmental or contractual requirement except where such requirement terminates within one year or where the holder has the power by contract or otherwise to cause the requirement to be met within one year. Any portion of the stock which can reasonably be expected to qualify for sale within one year, such as may be the case under Rule 144 or similar rules of the Securities and Exchange Commission, is not considered restricted [under *FASB Statement No. 12*] [section 5132].

.03 Paragraph 10 of *FASB Statement No. 12* [section 5132.10] states:

> If there is a change in the classification of a marketable equity security between current and noncurrent, the security shall be transferred between the corresponding portfolios at the lower of its cost or market value at date of transfer. If market value is less than cost, the market value shall become the new cost basis, and the difference shall be accounted for as if it were a realized loss and included in the determination of net income.

INTERPRETATION

Definitions

.04 For purposes of applying paragraphs 8-13, 15, 17, and 19 of *FASB Statement No. 12* [section 5132.08—.13, section 5132.15, section 5132.17, and section 5132.19], an equity security is not considered marketable if market price quotations specified by the Statement (see paragraph .02 above) are not available or if it is "restricted stock" as defined in the Statement (see paragraph .02 above) even though market price quotations are available for securities of the same class that are not restricted.

.05 The determination of whether an equity security is marketable is made as of the balance sheet date,[1] but a temporary lack of trades or price quotations for an equity security at the balance sheet date does not make it nonmarketable for purposes of applying *FASB Statement No. 12* [section 5132] if the required market prices are available on days closely preceding and following the balance sheet date in that situation, the market price of a security traded on a national securities exchange shall be determined from the sales or bid and ask prices on the first day following the balance sheet date that the information is available. If the lack of a publicly reported quotation by the National Association of Securities Dealers Automatic Quotations System or the lack of three quotations by the National Quotations Bureau Inc. is a mere temporary condition as described above for a security traded in the over-the-counter market, its market price shall be determined from:

a. The quotation publicly reported by the National Association of Securities Dealers Automatic Quotations System on the first day following the balance sheet date that a quotation is publicly reported, or

b. The quotation(s) reported by the National Quotations Bureau Inc. as of the balance sheet date if at least one quotation is

[1] If the balance sheet date falls on a date that securities are not normally traded (e. g., Saturday or Sunday), the availability of market price quotations shall be determined as of the most recent business day preceding the balance sheet date.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

available as of that date or on the first day following the balance sheet date that quotations are reported if no quotations are available on the balance sheet date.

.06 If it can be reasonably expected that a security "for which sale is restricted by a governmental or contractual requirement" can qualify for sale within one year of the balance sheet date and market price quotations for unrestricted securities of the same class are available as of the balance sheet date, the security is considered marketable at the balance sheet date for purposes of applying *FASB Statement No. 12* [section 5132] (see paragraph .02 above). In this situation, market price quotations for unrestricted shares of the same class at the balance sheet date provide a surrogate market price for the restricted shares and shall be considered as the market price for the security. If the restricted security cannot qualify for sale within one year or market price quotations are not available for unrestricted shares of the same class, the security is considered nonmarketable for purposes of applying the Statement.

.07 As an example of the application of paragraph .06 above, assume that an enterprise pledges a marketable equity security as collateral for a loan due in three years. Normally, debt agreements permit substitution for the collateral or sale of the collateral if the proceeds are used to repay the loan. However, if the debt agreement prohibits sale of or substitution for the collateral for the term of the loan, the pledged security becomes "restricted stock" and nonmarketable for purposes of applying *FASB Statement No. 12* [section 5132] at the time it is pledged and shall be excluded from the enterprise's portfolio of marketable equity securities from that date until one year before expiration of the long-term debt agreement.

.08 As a further example, assume that an enterprise owns common stock that cannot be sold to the public, except pursuant to Rule 144 of the Securities and Exchange Commission (see explanation below), until a registration statement has been filed with the SEC and has become effective. Also assume that the stock is marketable at one balance sheet date pursuant to an effective registration statement. At the next balance sheet date, the registration statement is no longer effective and the enterprise does not have the power to cause another one to be filed within one year. Then, only the portion of the stock that "can reasonably be expected to qualify for sale within one year . . . under Rule 144 . . . is not considered restricted" under *FASB*

Statement No. 12 [section 5132]. Rule 144 specifies that if certain conditions are met a security may be sold to the public without an effective registration statement on file with the SEC, subject to a limitation on the number of shares that may be sold during a given time period. The number of shares eligible for sale is based on the total number of shares of the security outstanding or the average weekly trading volume of the security for a stated past period. Changes in the number of shares outstanding or in trading volume change the number of shares that qualify for sale under Rule 144. The number of shares considered marketable for purposes of applying the Statement are those that "can reasonably be expected to qualify for sale within one year"; the determination of such number is a matter of judgment based on past trading volumes, the presently outstanding shares and plans for changes therein, and other relevant factors. The number of shares considered nonmarketable are those that cannot qualify for sale within one year under the preceding sentence.

Accounting

.09 Paragraph 10 of *FASB Statement No. 12* [section 5132.10] applies to all transfers between current and noncurrent classifications of equity securities that are marketable, as that term is defined in the Statement (see paragraph .02 above). If the change in the classification of an equity security is coincident with a change in its status from marketable to nonmarketable or from nonmarketable to marketable, paragraph 10 of the Statement [section 5132.10] shall apply to the transfer between current and noncurrent classifications. Paragraph 10 of the Statement [section 5132.10] requires that if the market value of the security is less than its cost when it is transferred between current and noncurrent classifications, "the market value shall become the new cost basis, and the difference shall be accounted for as if it were a realized loss and included in the determination of net income." In that situation, market value shall be the security's last available market price if the transfer between classifications is coincident with a change in status from marketable to nonmarketable and the first available market price if the transfer between classifications is coincident with a change in status from nonmarketable to marketable.

.10 The accounting for a nonmarketable security is outside of the scope of *FASB Statement No. 12* [section 5132]. When a marketable equity security becomes nonmarketable, the cost of that security shall be excluded from the portfolio of marketable equity securities of which it was a part for purposes of applying the Statement. When a nonmarketable equity security becomes marketable, that security shall be included in the portfolio of

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

marketable equity securities at cost. The term *cost* is defined in paragraph 7(e) of the Statement [section 5132.07(e)] as "the original cost . . . unless a new cost basis has been assigned based on recognition of an impairment of value that was deemed other than temporary or as the result of a transfer between current and noncurrent classifications as described in paragraph 10 [of the Statement] [section 5132.10]. In such cases, the new cost basis shall be the cost for the purposes of this Statement."

EFFECTIVE DATE AND TRANSITION

.11 The provisions of this Interpretation shall be effective for financial statements for annual and interim periods ending after March 15, 1977. Earlier application is encouraged in financial statements for annual and interim periods ending before March 16, 1977 that have not been previously issued. This Interpretation shall not be applied retroactively for previously issued annual or interim financial statements.

AC Section 5141

Accounting for Intangible Assets

[Source: APB Opinion No. 17, as amended.]

Effective to account for intangible assets acquired after October 31, 1970, unless otherwise indicated [1]

SUMMARY

Problem

.01 An enterprise may acquire intangible assets from others or may develop them itself. Many kinds of intangible assets may be identified and given reasonably descriptive names, for example, patents, franchises, trademarks, and the like. Other types of intangible assets lack specific identifiability. Both identifiable and unidentifiable assets may be developed internally. Identifiable intangible assets may be acquired singly, as a part of a group of assets, or as part of an entire enterprise, but unidentifiable assets cannot be acquired singly. The excess of the cost of an acquired company over the sum of identifiable net assets, usually called goodwill, is the most common unidentifiable intangible asset.

.02 Accounting for an intangible asset involves the same kinds of problems as accounting for other long-lived assets, namely, determining an initial carrying amount, accounting for that amount after acquisition under normal business conditions (amortization), and accounting for that amount if the value declines substantially and permanently. Solving the problems is complicated by the characteristics of an intangible asset: its lack of physical qualities makes evidence of its existence elusive, its value is often difficult to estimate, and its useful life may be indeterminable.

---

[1] See paragraphs .33-.35.

.03 The Director of Accounting Research of the American Institute of Certified Public Accountants has published Accounting Research Study No. 10, *Accounting for Goodwill,* by George R. Catlett and Norman O. Olson.[2] The study emphasizes accounting for goodwill acquired in a business combination but also discusses accounting for goodwill developed internally. The study cites the supporting authoritative pronouncements and their influences on accounting practices and evaluates the effects of practices on financial reporting.

Scope and Effect of Section

.04 The Board has considered the conclusions and recommendations of Accounting Research Study No. 10, the discussions of the appropriateness of accepted methods of accounting for intangible assets, and proposals for alternative accounting procedures. The Board expresses in this section its conclusions on accounting for intangible assets. Those research and development costs encompassed by FASB Statement of Financial Accounting Standards No. 2 are excluded from the scope of this section. [As amended, effective for fiscal years beginning on or after January 1, 1975, by FASB Statement No. 2.] (See section 4211.)

.05 This section covers the accounting for both identifiable and unidentifiable intangible assets that a company acquires, including those acquired in business combinations. "Company" in this section refers to both incorporated and unincorporated enterprises. The conclusions of the section apply to intangible assets recorded, if any, on the acquisition of some or all of the stock held by minority stockholders of a subsidiary company. This section also covers accounting for costs of developing goodwill and other unidentifiable intangible assets with indeterminate lives.

.06 The provisions of this section apply to costs of developing identifiable intangible assets that a company defers and records as assets. Some companies defer costs incurred to develop identifiable intangible assets while others record the costs as expenses as incurred. Certain

[2] Accounting research studies are not pronouncements of the Board or of the Institute but are published for the purpose of stimulating discussion on important accounting matters.

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

costs, for example, preoperating costs, present problems which need to be studied separately. The question of deferral of those costs is beyond the scope of this section. [As amended, effective for fiscal years beginning on or after January 1, 1975, by FASB Statement No. 2.] (See section 4211.)

.07 This section applies to regulated companies in accordance with the provisions of section 6011, *Accounting Principles for Regulated Industries.*

.08 The conclusions of this section modify previous views of the Board and its predecessor, the Committee on Accounting Procedure.

Conclusions

.09 The Board concludes that a company should record as assets the costs of intangible assets acquired from others, including goodwill acquired in a business combination. A company should record as expenses the costs to develop intangible assets which are not specifically identifiable. The Board also concludes that the cost of each type of intangible asset should be amortized by systematic charges to income over the period estimated to be benefited. The period of amortization should not, however, exceed forty years.

BACKGROUND

Bases of Classification

.10 Various intangible assets differ in their characteristics, their useful lives, their relations to operations, and their later dispositions. Intangible assets may be classified on several different bases:

Identifiability—separately identifiable or lacking specific identification.

Manner of acquisition—acquired singly, in groups, or in business combinations or developed internally.

Expected period of benefit—limited by law or contract, related to human or economic factors, or indefinite or indeterminate duration.

Separability from an entire enterprise—rights transferable without title, salable, or inseparable from the enterprise or a substantial part of it.

Present Accounting

Accounting for Costs at Acquisition

.11 Present principles of accounting for intangible assets are generally similar to those for tangible, long-lived assets such as property, plant, and equipment. Intangible assets acquired from other entities are recorded at cost when acquired. Costs incurred to develop specifically identifiable intangible assets are often recorded as assets if the periods of expected future benefit are reasonably determinable. Costs of developing other intangible assets are usually recorded as expenses when incurred.

Accounting for Deferred Costs After Acquisition

.12 Intangible assets have been divided into two classes for purposes of accounting for their costs: (a) those with a

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

determinable term of existence because it is limited by law, regulation, or agreement, or by the nature of the asset, and (b) those having no limited term of existence and no indication of limited life at the time of acquisition. The cost of a type (a) intangible asset is amortized by systematic charges to income over the term of existence or other period expected to be benefited. The cost of a type (b) intangible asset may be treated in either of two ways: (1) the cost may be retained until a limit on the term of existence or a loss of value is evident, at which time the cost is amortized systematically over the estimated remaining term of existence or, if worthless, written off as an extraordinary item in the income statement, or (2) the cost may be amortized at the discretion of management by charges to income even though no present evidence points to a limited term of existence or a loss of value.

.13 The cost of an intangible asset, including goodwill acquired in a business combination, may not be written off as a lump sum to capital surplus or to retained earnings nor be reduced to a nominal amount at or immediately after acquisition (section 2010, and Chapter 5, ARB No. 43).

Criticism of Present Practice

.14 Present accounting for goodwill and other unidentifiable intangible assets is often criticized because alternative methods of accounting for costs are acceptable. Some companies amortize the cost of acquired intangible assets over a short arbitrary period to reduce the amount of the asset as rapidly as practicable, while others retain the cost as an asset until evidence shows a loss of value and then record a material reduction in a single period. Selecting an arbitrary period of amortization is criticized because it may understate net income during the amortization period and overstate later net income. Retaining the cost as an asset is criticized because it may overstate net income before the loss of value is recognized and understate net income in the period of write-off.

Appraisal of Alternative Procedures

Cost of Intangible Assets

.15 The cost of intangible assets acquired either singly or in groups, including intangible assets acquired in a busi-

ness combination, from other businesses or individuals is determined by general principles of the historical-cost basis of accounting. The costs of developing goodwill and other intangible assets with indeterminate lives are ordinarily not distinguishable from the current costs of operations and are thus not assignable to specific assets.

Treatment of Costs

.16 Costs of intangible assets which have fixed or reasonably determinable terms of existence are now amortized by systematic charges to income over their terms of existence. Differences of opinion center on the amortization of acquired intangible assets with lives which cannot be estimated reliably either at the date of acquisition or perhaps long after, for example, goodwill and trade names.

.17 The literature on business combinations and goodwill, including Accounting Research Study No. 10, *Accounting for Goodwill,* contains at least four possible accounting treatments of goodwill and similar intangible assets:

a. Retain the cost as an asset indefinitely unless a reduction in its value becomes evident.

b. Retain the cost as an asset but permit amortization as an operating expense over an arbitrary period.

c. Retain the cost as an asset but require amortization as an operating expense over its estimated limited life or over an arbitrary but specified maximum and minimum period.

d. Deduct the cost from stockholders' equity at the date acquired.

.18 *Arguments for nonamortization.* The two of the four accounting proposals which do not involve amortization of goodwill as an operating expense are based in part on the contention that goodwill value is not consumed or used to produce earnings in the same manner as various property rights, and therefore net income should not be reduced by amortization of goodwill. Further, net income should not be reduced by both amortization of goodwill and current expenditures that are incurred to enhance or maintain the value of the acquired intangible assets. All

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

methods of amortizing goodwill are criticized as arbitrary because the life of goodwill is indefinite and an estimated period of existence is not measurable.

.19 The basis for proposing that the cost of goodwill be retained as an asset until a loss in value becomes evident is that the cost incurred for acquired goodwill should be accounted for as an asset at the date acquired and in later periods. The cost should not be reduced as long as the value of the asset is at least equal to that cost.

.20 The basis for proposing that the cost of goodwill be deducted from stockholders' equity at the date acquired is that the nature of goodwill differs from other assets and warrants special accounting treatment. Since goodwill attaches only to a business as a whole and its value fluctuates widely for innumerable reasons, estimates of either the terms of existence or current value are unreliable for purposes of income determination.

Accounting on the Historical-Cost Basis

.21 All assets which are represented by deferred costs are essentially alike in historical-cost based accounting. They result from expenditures or owners' contributions and are expected to increase revenue or reduce costs to be incurred in future periods. If future benefit or the period to be benefited is questionable, the expenditure is usually treated as a current expense and not as a deferred cost. Associating deferred costs with the revenue or period to which they are expected to relate is a basic problem in historical-cost based accounting both in measuring periodic income and in accounting for assets. The basic accounting treatment does not depend on whether the asset is a building, a piece of equipment, an element of inventory, a prepaid insurance premium, or whether it is tangible or intangible. The cost of goodwill and similar intangible assets is therefore essentially the same as the cost of land, buildings, or equipment under historical-cost based accounting. Deducting the cost of an asset from stockholders' equity (either retained earnings or capital in excess of par or stated value) at the date incurred does not match costs with revenue.

.22 Accounting for the cost of a long-lived asset after acquisition normally depends on its estimated life. The cost of assets with perpetual existence, such as land, is carried forward as an asset without amortization, and the cost of assets with finite lives is amortized by systematic charges to income. Goodwill and similar intangible assets do not clearly fit either classification; their lives are neither infinite nor specifically limited, but are indeterminate. Thus, although the principles underlying present practice conform to the principles of accounting for similar types of assets, their applications have led to alternative treatments. Amortizing the cost of goodwill and similar intangible assets on arbitrary bases in the absence of evidence of limited lives or decreased values may recognize expenses and decreases of assets prematurely, but delaying amortization of the cost until a loss is evident may recognize the decreases after the fact.

A Practical Solution

.23 A solution to this dilemma is to set minimum and maximum amortization periods. This accounting follows from the observation that few, if any, intangible assets last forever, although some may seem to last almost indefinitely. Allocating the cost of goodwill or other intangible assets with an indeterminate life over time is necessary because the value almost inevitably becomes zero at some future date. Since the date at which the value becomes zero is indeterminate, the end of the useful life must necessarily be set arbitrarily at some point or within some range of time for accounting purposes.

OPINION

Acquisition of Intangible Assets

.24 The Board concludes that a company should record as assets the costs of intangible assets acquired from other enterprises or individuals. Costs of developing, maintaining, or restoring intangible assets which are not specifically identifiable, have indeterminate lives, or are inherent in a continuing business and related to an enterprise as a whole—such as goodwill—should be deducted from income when incurred.

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

.25 *Cost of intangible assets.* Intangible assets acquired singly should be recorded at cost at date of acquisition. Cost is measured by the amount of cash disbursed, the fair value of other assets distributed, the present value of amounts to be paid for liabilities incurred, or the fair value of consideration received for stock issued as described in section 1091.67.

.26 Intangible assets acquired as part of a group of assets or as part of an acquired company should also be recorded at cost at date of acquisition. Cost is measured differently for specifically identifiable intangible assets and those lacking specific identification. The cost of identifiable intangible assets is an assigned part of the total cost of the group of assets or enterprise acquired, normally based on the fair values of the individual assets. The cost of unidentifiable intangible assets is measured by the difference between the cost of the group of assets or enterprise acquired and the sum of the assigned costs of individual tangible and identifiable intangible assets acquired less liabilities assumed. Cost should be assigned to all specifically identifiable intangible assets; cost of identifiable assets should not be included in goodwill. Principles and procedures of determining cost of assets acquired, including intangible assets, are discussed in detail in section 1091.66-.89.

Amortization of Intangible Assets

.27 The Board believes that the value of intangible assets at any one date eventually disappears and that the recorded costs of intangible assets should be amortized by systematic charges to income over the periods estimated to be benefited. Factors which should be considered in estimating the useful lives of intangible assets include:

a. Legal, regulatory, or contractual provisions may limit the maximum useful life.

b. Provisions for renewal or extension may alter a specified limit on useful life.

c. Effects of obsolescence, demand, competition, and other economic factors may reduce a useful life.

d. A useful life may parallel the service life expectancies of individuals or groups of employees.

e. Expected actions of competitors and others may restrict present competitive advantages.

f. An apparently unlimited useful life may in fact be indefinite and benefits cannot be reasonably projected.

g. An intangible asset may be a composite of many individual factors with varying effective lives.

The period of amortization of intangible assets should be determined from the pertinent factors.

.28 The cost of each type of intangible asset should be amortized on the basis of the estimated life of that specific asset and should not be written off in the period of acquisition. Analysis of all factors should result in a reasonable estimate of the useful life of most intangible assets. A reasonable estimate of the useful life may often be based on upper and lower limits even though a fixed existence is not determinable.

.29 The period of amortization should not, however, exceed forty years. Analysis at the time of acquisition may indicate that the indeterminate lives of some intangible assets are likely to exceed forty years and the cost of those assets should be amortized over the maximum period of forty years, not an arbitrary shorter period.

.30 *Method of amortization.* The Board concludes that the straight-line method of amortization—equal annual amounts—should be applied unless a company demonstrates that another systematic method is more appropriate. The financial statements should disclose the method and period of amortization. Amortization of acquired goodwill and of other acquired intangible assets not deductible in computing income taxes payable does not create a timing difference, and allocation of income taxes is inappropriate.

.31 *Subsequent review of amortization.* A company should evaluate the periods of amortization continually to determine whether later events and circumstances warrant revised estimates of useful lives. If estimates are changed, the unamortized cost should be allocated to the increased or reduced number of remaining periods in the revised useful life but not to exceed forty years after acquisition. Estimation of value and future benefits of an intangible asset

Copyright © 1976, American Institute of Certified Public Accountants, Inc.

may indicate that the unamortized cost should be reduced significantly by a deduction in determining net income (section 2012.19-.24). However, a single loss year or even a few loss years together do not necessarily justify an extraordinary charge to income for all or a large part of the unamortized cost of intangible assets. The reason for an extraordinary deduction should be disclosed. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

Disposal of Goodwill

.32 Ordinarily goodwill and similar intangible assets cannot be disposed of apart from the enterprise as a whole. However, a large segment or separable group of assets of an acquired company or the entire acquired company may be sold or otherwise liquidated, and all or a portion of the unamortized cost of the goodwill recognized in the acquisition should be included in the cost of the assets sold.

EFFECTIVE DATE

.33 The provisions of this section shall be effective to account for intangible assets acquired after October 31, 1970. Intangible assets recognized in business combinations initiated before November 1, 1970 and consummated on or after that date under the terms prevailing on October 31, 1970 [3] may be accounted for in accordance with this section or Chapter 5 of ARB No. 43 and section 2010.

.34 The provisions of this section should not be applied retroactively to intangible assets acquired before November 1, 1970, whether in business combinations or otherwise.

.35 The Board encourages the application on a prospective basis to all intangible assets held on October 31, 1970 of the provisions in paragraphs .27 to .31 of this section which require amortization of all intangible assets. Unless the provisions of this section are applied prospectively, the accounting for intangible assets held on October 31, 1970 should be in accordance with Chapter 5 of ARB No. 43 as modified by section 2010.

AC Section 5361

Amortization of Debt Discount and Expense or Premium[1]

[Source: APB Opinion No. 12, Pars. 16 and 17.]

Effective for fiscal periods beginning after December 31, 1967, unless otherwise indicated

.01 Questions have been raised as to the appropriateness of the "interest" method of periodic amortization of discount and expense or premium on debt (i.e., the difference between the net proceeds, after expense, received upon issuance of debt and the amount repayable at its maturity) over its term. The objective of the interest method is to arrive at a periodic interest cost (including amortization) which will represent a level effective rate on the sum of the face amount of the debt and (plus or minus) the unamortized premium or discount and expense at the beginning of each period. The difference between the periodic interest cost so calculated and the nominal interest on the outstanding amount of the debt is the amount of periodic amortization.

.02 In the Board's opinion, the interest method of amortization is theoretically sound and an acceptable method.

AC Section 5362

Early Extinguishment of Debt

[Source: APB Opinion No. 26, as amended.]

Effective for all extinguishments of debt occurring on or after January 1, 1973, unless otherwise indicated [1]

INTRODUCTION

.01 Debt is frequently extinguished in various ways before its scheduled maturity. Generally, the amount paid upon reacquisition of debt securities will differ from the net carrying amount of the debt at that time. This section expresses the views of the Accounting Principles Board regarding the appropriate accounting for that difference.

.02 *Applicability.* This section applies to the early extinguishment of all kinds of debt. (For early extinguishments of debt through troubled debt restructurings, FASB Statement No. 15 [section 5363], *Accounting by Debtors and Creditors for Troubled Debt Restructurings,* applies.) It supersedes section 5151. However, this section does not apply to debt that is converted pursuant to the existing conversion privileges of the holder. Moreover, it does not alter the accounting for convertible debt securities described in section 5516. This section applies to regulated companies in accordance with the provisions of section 6011, *Accounting Principles for Regulated Industries,* 1962. [As amended, effective for troubled debt restructurings consummated after Dec. 31, 1977, by FASB Statement No. 15.] (See section 5363.)

.03 *Definitions.* Several terms are used in this section as follows:

a. *Early extinguishment* is the reacquisition of any form of debt security or instrument before its scheduled maturity except through conversion by the holder, regardless of whether the debt is viewed as terminated or is held as so-called "treasury bonds." All open-market or mandatory reacquisitions of debt securities to meet sinking fund requirements are early extinguishments.

---

[1] See paragraph .22.

b. *Net carrying amount* of debt is the amount due at maturity, adjusted for unamortized premium, discount, and cost of issuance.

c. *Reacquisition price* of debt is the amount paid on early extinguishment, including a call premium and miscellaneous costs of reacquisition. If early extinguishment is achieved by a direct exchange of new securities, the reacquisition price is the total present value of the new securities.

d. *Difference* as used in this section is the excess of the reacquisition price over the net carrying amount or the excess of the net carrying amount over the reacquisition price.

DISCUSSION

.04 *Current practice.* Early extinguishment of debt is usually achieved in one of three ways: use of existing liquid assets, use of proceeds from issuance of equity securities, and use of proceeds from issuing other debt securities. The replacement of debt with other debt is frequently called refunding.

.05 Differences on nonrefunding extinguishments are generally treated currently in income as losses or gains. Three basic methods are generally accepted to account for the differences on refunding transactions:

a. Amortization over the remaining original life of the extinguished issue

b. Amortization over the life of the new issue

c. Recognition currently in income as a loss or gain.

Each method has been supported in court decisions, in rulings of regulatory agencies, and in accounting literature.

.06 *Amortization over life of old issue.* Some accountants believe that the difference on refunding should be amortized over the remaining original life of the extinguished issue. In effect, the difference is regarded as an adjustment of the cash cost of borrowing that arises from obtaining another arrangement for the unexpired term of the old agreement. Therefore, the cost of money over the remaining period of the original issue is affected by the difference that results upon extinguishment of the original contract. Early extinguishment occurs for various reasons, but usually because it is financially advantageous to the

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

issuer, for example, if the periodic cash interest outlay can be reduced for future periods. Accordingly, under this view the difference should be spread over the unexpired term of the original issue to obtain the proper periodic cost of borrowed money. If the maturity date of the new issue precedes the maturity date of the original issue, a portion of the difference is amortized over the life of the new debt and the balance of the difference is recognized currently in income as a loss or gain.

.07 *Amortization over life of new issue.* Some accountants believe that the difference on refunding should be amortized over the life of the new issue if refunding occurs because of lower current interest rates or anticipated higher interest rates in the future. Under this view, the principal motivation for refunding is to establish a more favorable interest rate over the term of the new issue. Therefore, the expected benefits to be obtained over the life of the new issue justify amortization of the difference over the life of the new issue.

.08 *Recognition currently in income.* Some accountants believe a difference on refunding is similar to the difference on other early extinguishments and should be recognized currently in income in the period of the extinguishment. This view holds that the value of the old debt has changed over time and that paying the call price or current market value is the most favorable way to extinguish the debt. The change in the market value of the debt is caused by a change in the market rate of interest, but the change has not been reflected in the accounts. Therefore, the entire difference is recorded when the specific contract is terminated because it relates to the past periods when the contract was in effect. If the accountant had foreseen future events perfectly at the time of issuance, he would have based the accounting on the assumption that the maturity value of the debt would equal the reacquisition price. Thus, no difference upon early extinguishment would occur because previous periods would have borne the proper interest expense. Furthermore, a call premium necessary to eliminate an old contract and an unamortized discount or premium relate to the old contract and cannot be a source of benefits from a new debt issue. For example, a larger (or smaller) coupon rate could have been set on the old issue to avoid an

unamortized discount (or premium) at issuance. When such debt originally issued at par is refunded, few accountants maintain that some portion of past interest should be capitalized and written off over the remaining life of the old debt or over the life of the new debt.

.09 Another argument in favor of current recognition of the difference as gain or loss is also related to market forces but is expressed differently. If debt is callable, the call privilege is frequently exercised when the market value of the bonds as determined by the current yield rate exceeds the call price. A loss or gain is recognized on extinguishing the debt because an exchange transaction occurs in which the call or current market value of the debt differs from its net carrying amount. For example, the market value of the debt ordinarily rises as the market rate of interest falls. If market values were recorded as the market rate of interest fluctuates, the changes in the market value of the debt would have been recorded periodically as losses or gains. The bond liability would not exceed the call price.

.10 On the other hand, some accountants holding views opposing current recognition of the difference in income believe that recognizing the difference as gains or losses may induce a company to report income by borrowing money at high rates of interest in order to pay off discounted low-rate debt. Conversely, a large potential charge to income may discourage refunding even though it is economically desirable; the replacement of high cost debt with low cost debt may result in having to recognize a large loss. Thus, a company may show higher current income in the year of extinguishment while increasing its economic cost of debt and lower current income while decreasing its economic cost of debt. For these reasons, these accountants favor deferral.

.11 *Extinguishment of convertible debt.* Accountants have expressed differing views regarding accounting for the extinguishment of convertible debt. In section 5516, which is directed in part to accounting for convertible debt at time of issue, the Board concluded that no portion of the proceeds from the issuance of the types of convertible debt securities defined in section 5516 should be accounted for as attributable to the conversion feature. In reaching that conclusion, the Board placed greater weight on the inseparability of the

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

debt and conversion option and less weight on practical difficulties. The Board emphasized that a convertible debt security is a complex hybrid instrument bearing an option the alternative choices of which cannot exist independently of one another. The holder ordinarily does not sell one right and retain the other. Furthermore, the two choices are mutually exclusive; the holder cannot exercise the option to convert unless he foregoes the right to redemption, and vice versa. Therefore, section 5516 implies that (except for conversion) a difference on extinguishing convertible debt needs to be recognized in the same way as a difference on extinguishment of debt without conversion features.

.12 The various views expressed on how to account for the extinguishment of convertible debt to some extent reflect the same attitudes as to the nature of the debt at time of issue as were considered in section 5516. Thus, some accountants believe that a portion of the proceeds at issuance is attributable to the conversion feature. If the convertible debt is later extinguished, the initial value of the conversion feature should then be recorded as an increase in stockholders' equity. The balance of the difference would, under that view of the transaction, be a gain or loss in income of the period of extinguishment.

.13 Some accountants maintain that the intent of issuing convertible debt is to raise equity capital. A convertible debt is therefore in substance an equity security, and all the difference on extinguishing convertible debt should be an increase or decrease of paid-in capital.

.14 Another view is that the market price that gives rise to the difference reflects both the level of interest rates on debt and the prices of the related common stock or both. Those expressing this view believe that if the effects of these factors can be identified at the time of extinguishment, the difference attributable to the interest rate should be accounted for as gain or loss in income, and that the difference attributable to the market price of the issuer's common stock should be accounted for as an increase or decrease in paid-in capital.

.15 Some accountants believe that the accounting for a difference on extinguishment of convertible debt depends on the nature of the security at the time of extinguishment.

Events after time of issue may provide evidence that a convertible debt is either still debt in substance or equity in substance. Under this view the purchase price on extinguishment provides the best evidence as to whether the security is essentially debt or equity. Convertible debt that is selling below the call or redemption price at time of extinguishment is essentially debt; the difference should be a gain in current income. Moreover, if convertible debt has a coupon rate that exceeds the current market rate of interest and clearly causes the issue to trade at a premium as a debt instrument, the difference on extinguishment should be a loss in current income. On the other hand, if convertible debt is selling above the call or redemption price because of the conversion privilege, it is essentially a common stock. In effect, market forces have transformed a debt instrument into an equity security, and the extinguishment provides an explicit transaction to justify recognizing that the convertible debt is in substance a common stock equivalent. Those who hold this view believe that accounting should report the substance of the transaction rather than its form; convertible debt need not be converted into common stock to demonstrate that the extinguishment transaction is equivalent to a purchase of common stock for retirement.

.16 *Economic nature of extinguishment.* In many respects the essential economics of the decision leading to the early extinguishment of outstanding debt are the same, regardless of whether such debt is extinguished via the use of the existing liquid assets, new equity securities, or new debt. That is, the decision favoring early extinguishment usually implies that the net present value of future cash inflows and outflows is maximized by extinguishing the debt now rather than by letting it run to maturity. The savings may be in lower cash interest costs on a new debt issue, in increased earnings per share of common stock if the assets are not earning the interest rate on the outstanding debt, or in some other form. The essential event is early extinguishment. Under this view, the difference is associated with extinguishing the existing debt and is accounted for the same regardless of how extinguishment is accomplished.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.17 To illustrate that view, assume that three firms each have long-term debt outstanding with ten years remaining to maturity. The first firm may have excess cash and no investment opportunities that earn a rate of return higher than the cash savings that would ensue from immediately extinguishing the debt. The second firm may wish to replace the debt with a similar issue bearing a lower coupon rate. The third firm may have excessive debt and may want to replace the debt with a new issue of common stock. The underlying reason for the early extinguishment in all three cases is to obtain a perceived economic advantage. The relevant comparison in the replacement of debt with other debt is with the costs of other debt. The comparison in other cases is with other means of financing. The means by which the debt is extinguished have no bearing on how to account for the loss or gain.

OPINION

.18 The following conclusions of the Board are based primarily on the reasoning in paragraphs .08, .09, .11, .16, and .17.

.19 *Reduction of alternatives.* The Board concludes that all extinguishments of debt before scheduled maturities are fundamentally alike. The accounting for such transactions should be the same regardless of the means used to achieve the extinguishment.

.20 *Disposition of amounts.* A difference between the reacquisition price and the net carrying amount of the extinguished debt should be recognized currently in income of the period of extinguishment as losses or gains and identified as a separate item.[2] The criteria in section 2013 and in section 2012 as amended by section 2013 should be used to determine whether the losses or gains are ordinary or extraordinary items. Gains and losses should not be amortized to future periods. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.) [As amended, effective for extinguishments occurring after

---

[2] If upon extinguishment of debt, the parties also exchange unstated (or stated) rights or privileges, the portion of the consideration exchanged allocable to such unstated (or stated) rights or privileges should be given appropriate accounting recognition. Moreover, extinguishment transactions between related entities may be in essence capital transactions.

March 31, 1975 by FASB Statement No. 4.] (See section 2013.)

.21 *Convertible debt.* The extinguishment of convertible debt before maturity does not change the character of the security as between debt and equity at that time. Therefore, a difference between the cash acquisition price of the debt and its net carrying amount should be recognized currently in income in the period of extinguishment as losses or gains.

EFFECTIVE DATE

.22 This section shall be effective for all extinguishments of debt occurring on or after January 1, 1973. Extinguishment transactions are considered to be terminated events similar to that set forth in section 1051.16 and as such, extinguishments that were previously recorded in fiscal years ending before January 1, 1973 should not be adjusted. However, the accounting for refunding transactions that have been previously reported in the fiscal year in which December 31, 1972 occurs may be retroactively restated to comply with the provisions of this section.

AC Section 5363

Accounting by Debtors and Creditors for Troubled Debt Restructurings

[Source: FASB Statement No. 15.]

June 1977

INTRODUCTION

.001 This Statement establishes standards of financial accounting and reporting by the debtor and by the creditor for a troubled debt restructuring. The Statement does not cover accounting for allowances for estimated uncollectible amounts and does not prescribe or proscribe particular methods for estimating amounts of uncollectible receivables.

.002 A restructuring of a debt constitutes a *troubled debt restructuring* for purposes of this Statement if the creditor for economic or legal reasons related to the debtor's financial difficulties grants a concession to the debtor that it would not otherwise consider. That concession either stems from an agreement between the creditor and the debtor or is imposed by law or a court. For example, a creditor may restructure the terms of a debt to alleviate the burden of the debtor's near-term cash requirements, and many troubled debt restructurings involve modifying terms to reduce or defer cash payments required of the debtor in the near future to help the debtor attempt to improve its financial condition and eventually be able to pay the creditor. Or, for example, the creditor may accept cash, other assets, or an equity interest in the debtor in satisfaction of the debt though the value received is less than the amount of the debt because the creditor concludes that step will maximize recovery of its investment.[1]

[1] Although troubled debt that is fully satisfied by foreclosure, repossession, or other transfer of assets or by grant of equity securities by the debtor is, in a technical sense, not restructured, that kind of event is included in the term *troubled debt restructuring* in this Statement.

.003 Whatever the form of concession granted by the creditor to the debtor in a troubled debt restructuring, the creditor's objective is to make the best of a difficult situation. That is, the creditor expects to obtain more cash or other value from the debtor, or to increase the probability of receipt, by granting the concession than by not granting it.

.004 In this Statement, a *receivable* or *payable* (collectively referred to as *debt*) represents a contractual right to receive money or a contractual obligation to pay money on demand or on fixed or determinable dates that is already included as an asset or liability in the creditor's or debtor's balance sheet at the time of the restructuring. Receivables or payables that may be involved in troubled debt restructurings commonly result from lending or borrowing of cash, investing in debt securities that were previously issued, or selling or purchasing goods or services on credit. Examples are accounts receivable or payable, notes, debentures and bonds (whether those receivables or payables are secured or unsecured and whether they are convertible or nonconvertible), and related accrued interest, if any. Typically, each receivable or payable is negotiated separately, but sometimes two or more receivables or payables are negotiated together. For example, a debtor may negotiate with a group of creditors but sign separate debt instruments with each creditor. For purposes of this Statement, restructuring of each receivable or payable, including those negotiated and restructured jointly, shall be accounted for individually. The substance rather than the form of the receivable or payable shall govern. For example, to a debtor, a bond constitutes one payable even though there are many bondholders.

.005 A troubled debt restructuring may include, but is not necessarily limited to, one or a combination of the following:

a. Transfer from the debtor to the creditor of receivables from third parties, real estate, or other assets to satisfy fully or partially a debt (including a transfer resulting from foreclosure or repossession).

b. Issuance or other granting of an equity interest to the creditor by the debtor to satisfy fully or partially a debt unless the equity interest is granted pursuant to existing terms for converting the debt into an equity interest.

c. Modification of terms of a debt, such as one or a combination of:
   1. Reduction (absolute or contingent) of the stated interest rate for the remaining original life of the debt.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

2. Extension of the maturity date or dates at a stated interest rate lower than the current market rate for new debt with similar risk.
3. Reduction (absolute or contingent) of the face amount or maturity amount of the debt as stated in the instrument or other agreement.
4. Reduction (absolute or contingent) of accrued interest.

.006 Troubled debt restructurings may occur before, at, or after the stated maturity of debt, and time may elapse between the agreement, court order, etc. and the transfer of assets or equity interest, the effective date of new terms, or the occurrence of another event that constitutes consummation of the restructuring. The date of consummation is the *time of the restructuring* in this Statement.

.007 A debt restructuring is not necessarily a troubled debt restructuring for purposes of this Statement even if the debtor is experiencing some financial difficulties. For example, a troubled debt restructuring is not involved if (a) the fair value[2] of cash, other assets, or an equity interest accepted by a creditor from a debtor in full satisfaction of its receivable at least equals the creditor's recorded investment in the receivable;[3] (b) the fair value of cash, other assets, or an equity interest transferred by a debtor to a creditor in full settlement of its payable at least equals the debtor's carrying amount of the payable; (c) the creditor reduces the effective interest rate on the debt primarily to reflect a decrease in market interest rates in general or a decrease in the risk so as to maintain a relationship with a debtor that can readily obtain funds from other sources at the current market interest rate; or (d) the debtor issues in exchange for its debt new marketable debt having an effective interest rate based on its market price that is at or near the current market interest rates of debt with similar maturity dates and stated interest rates issued by nontroubled debtors. In general, a debtor that can obtain funds from sources other than the existing creditor at market interest rates at or near those for nontroubled debt is not involved in a troubled debt restructuring. A debtor in a troubled debt restructuring can obtain funds from sources other than the existing creditor in the troubled debt restructuring, if at all, only at effective interest rates (based on market prices) so high that it cannot afford to pay them. Thus, in an attempt to protect as much of its investment as possible, the

---

[2] Defined in paragraph .013.

[3] Defined in footnote 17.

creditor in a troubled debt restructuring grants a concession to the debtor that it would not otherwise consider.

.008 For purposes of this Statement, troubled debt restructurings do not include changes in lease agreements (the accounting is prescribed by *FASB Statement No. 13* [section 4053], "Accounting for Leases") or employment-related agreements (for example, pension plans and deferred compensation contracts). Nor do troubled debt restructurings include debtors' failures to pay trade accounts according to their terms or creditors' delays in taking legal action to collect overdue amounts of interest and principal, unless they involve an agreement between debtor and creditor to restructure.

.009 The Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'," states that "differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect in regulated businesses of the rate-making process" and discusses the application of generally accepted accounting principles to regulated industries. FASB Statements and Interpretations should therefore be applied to regulated companies that are subject to the rate-making process in accordance with the provisions of the Addendum.

.010 This Statement supersedes *FASB Interpretation No. 2,* "Imputing Interest on Debt Arrangements Made under the Federal Bankruptcy Act," and shall be applied to the types of situations that were covered by that Interpretation. Thus, it shall be applied to troubled debt restructurings consummated under reorganization, arrangement, or other provisions of the Federal Bankruptcy Act or other Federal statutes related thereto.[4] It also amends *APB Opinion No. 26* [section 5362], "Early Extinguishment of Debt," to the extent needed to exclude from that Opinion's scope early extinguishments of debt through troubled debt restructurings.

.011 Appendix A provides background information. Appendix B sets forth the basis for the Board's conclusions, including alternatives considered and reasons for accepting some and rejecting others.

---

[4] This Statement does not apply, however, if under provisions of those Federal statutes or in a quasi-reorganization or corporate readjustment (*ARB No. 43,* Chapter 7, Section A [section 5581], "Quasi-Reorganization or Corporate Readjustment . . .") with which a troubled debt restructuring coincides, the debtor restates its liabilities generally.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Accounting by Debtors

.012 A debtor shall account for a troubled debt restructuring according to the type of the restructuring as prescribed in the following paragraphs.

Transfer of Assets in Full Settlement

.013 A debtor that transfers its receivables from third parties, real estate, or other assets to a creditor to settle fully a payable shall recognize a gain on restructuring of payables (see paragraph .021). The gain shall be measured by the excess of (i) the carrying amount of the payable settled (the face amount increased or decreased by applicable accrued interest and applicable unamortized premium, discount, finance charges, or issue costs) over (ii) the fair value of the assets transferred to the creditor.[5] The fair value of the assets transferred is the amount that the debtor could reasonably expect to receive for them in a current sale between a willing buyer and a willing seller, that is, other than in a forced or liquidation sale. Fair value of assets shall be measured by their market value if an active market for them exists. If no active market exists for the assets transferred but exists for similar assets, the selling prices in that market may be helpful in estimating the fair value of the assets transferred. If no market price is available, a forecast of expected cash flows may aid in estimating the fair value of assets transferred, provided the expected cash flows are discounted at a rate commensurate with the risk involved.[6]

---

[5] Paragraphs .013, .015 and .019 indicate that the fair value of assets transferred or the fair value of an equity interest granted shall be used in accounting for a settlement of a payable in a troubled debt restructuring. That guidance is not intended to preclude using the fair value of the payable settled if more clearly evident than the fair value of the assets transferred or of the equity interest granted in a full settlement of a payable (paragraphs .013 and .015). (See paragraph 67 of *APB Opinion No. 16* [section 1091.67], "Business Combinations.") However, in a partial settlement of a payable (paragraph .019), the fair value of the assets transferred or of the equity interest granted shall be used in all cases to avoid the need to allocate the fair value of the payable between the part settled and the part still outstanding.

[6] Some factors that may be relevant in estimating the fair value of various kinds of assets are described in paragraphs 88 and 89 of *APB Opinion No. 16* [section 1091.88-.89], paragraphs 12-14 of *APB Opinion No. 21* [section 4111.11-.13], "Interest on Receivables and Payables," and paragraph 25 of *APB Opinion No. 29* [section 1041.25], "Accounting for Nonmonetary Transactions."

.014 A difference between the fair value and the carrying amount of assets transferred to a creditor to settle a payable is a gain or loss on transfer of assets.[7] The debtor shall include that gain or loss in measuring net income for the period of transfer, reported as provided in *APB Opinion No. 30* [section 2012], "Reporting the Results of Operations."

Grant of Equity Interest in Full Settlement

.015 A debtor that issues or otherwise grants an equity interest to a creditor to settle fully a payable shall account for the equity interest at its fair value.[8] The difference between the fair value of the equity interest granted and the carrying amount of the payable settled shall be recognized as a gain on restructuring of payables (see paragraph .021).

Modification of Terms

.016 A debtor in a troubled debt restructuring involving only modification of terms of a payable—that is, not involving a transfer of assets or grant of an equity interest—shall account for the effects of the restructuring prospectively from the time of restructuring, and shall not change the carrying amount of the payable at the time of the restructuring unless the carrying amount exceeds the total future cash payments specified by the new terms.[9] That is, the effects of changes in the amounts or timing (or both) of future cash payments designated as either interest or face amount shall be reflected in future periods.[10] Interest expense shall be computed in a way that a constant effective interest rate is ap-

---

[7] The carrying amount of a receivable encompasses not only unamortized premium, discount, acquisition costs, and the like but also an allowance for uncollectible amounts and other "valuation" accounts, if any. A loss on transferring receivables to creditors may therefore have been wholly or partially recognized in measuring net income before the transfer and be wholly or partly a reduction of a valuation account rather than a gain or loss in measuring net income for the period of the transfer.

[8] See footnote 5.

[9] In this Statement, *total future cash payments* includes related accrued interest, if any, at the time of the restructuring that continues to be payable under the new terms.

[10] All or a portion of the carrying amount of the payable at the time of the restructuring may need to be reclassified in the balance sheet because of changes in the terms, for example, a change in the amount of the payable due within one year after the date of the debtor's balance sheet. A troubled debt restructuring of a short-term obligation after the date of a debtor's balance sheet but before that balance sheet is issued may affect the classification of that obligation in accordance with *FASB Statement No. 6* [section 2033], "Classification of Short-Term Obligations Expected to Be Refinanced."

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

plied to the carrying amount of the payable at the beginning of each period between restructuring and maturity (in substance the "interest" method prescribed by paragraph 15 of *APB Opinion No. 21* [section 4111.14]). The new effective interest rate shall be the discount rate that equates the present value of the future cash payments specified by the new terms (excluding amounts contingently payable) with the carrying amount of the payable.

.017 If, however, the total future cash payments specified by the new terms of a payable, including both payments designated as interest and those designated as face amount, are less than the carrying amount of the payable, the debtor shall reduce the carrying amount to an amount equal to the total future cash payments specified by the new terms and shall recognize a gain on restructuring of payables equal to the amount of the reduction (see paragraph .021).[11] Thereafter, all cash payments under the terms of the payable shall be accounted for as reductions of the carrying amount of the payable, and no interest expense shall be recognized on the payable for any period between the restructuring and maturity of the payable.[12]

.018 A debtor shall not recognize a gain on a restructured payable involving indeterminate future cash payments as long as the maximum total future cash payments may exceed the carrying amount of the payable. Amounts designated either as interest or as face amount by the new terms may be payable contingent on a specified event or circumstance (for example, the debtor may be required to pay specified amounts if its financial condition improves to a specified degree within a specified period). To determine whether the debtor shall recognize a gain according to the provisions of paragraphs .016 and .017, those contingent amounts shall be included in the "total future cash payments specified by the new terms" to the extent necessary to prevent recognizing a gain at the time of restructuring that may be offset by future interest expense. Thus, the debtor shall apply paragraph 17 of *FASB Statement No. 5* [section 4311.17], "Accounting for Contingencies," in which probability of occurrence of a gain con-

[11] If the carrying amount of the payable comprises several accounts (for example, face amount, accrued interest, and unamortized premium, discount, finance charges, and issue costs) that are to be continued after the restructuring, some possibly being combined, the reduction in carrying amount may need to be allocated among the remaining accounts in proportion to the previous balances. However, the debtor may choose to carry the amount designated as face amount by the new terms in a separate account and adjust another account accordingly.

[12] The only exception is to recognize interest expense according to paragraph .022.

tingency is not a factor, and shall assume that contingent future payments will have to be paid. The same principle applies to amounts of future cash payments that must sometimes be estimated to apply the provisions of paragraphs .016 and .017. For example, if the number of future interest payments is flexible because the face amount and accrued interest is payable on demand or becomes payable on demand, estimates of total future cash payments shall be based on the maximum number of periods possible under the restructured terms.

Combination of Types

.019 A troubled debt restructuring may involve partial settlement of a payable by the debtor's transferring assets or granting an equity interest (or both) to the creditor and modification of terms of the remaining payable.[13] A debtor shall account for a troubled debt restructuring involving a partial settlement and a modification of terms as prescribed in paragraphs .016-.018 except that, first, assets transferred or an equity interest granted in that partial settlement shall be measured as prescribed in paragraphs .013 and .015, respectively, and the carrying amount of the payable shall be reduced by the total fair value of those assets or equity interest.[14] A difference between the fair value and the carrying amount of assets transferred to the creditor shall be recognized as a gain or loss on transfer of assets. No gain on restructuring of payables shall be recognized unless the remaining carrying amount of the payable exceeds the total future cash payments (including amounts contingently payable) specified by the terms of the debt remaining unsettled after the restructuring. Future interest expense, if any, shall be determined according to the provisions of paragraphs .016-.018.

Related Matters

.020 A troubled debt restructuring that is in substance a repossession or foreclosure by the creditor or other transfer of assets to the creditor shall be accounted for according to the provisions of paragraphs .013, .014, and .019.

---

[13] Even if the stated terms of the remaining payable, for example, the stated interest rate and the maturity date or dates, are not changed in connection with the transfer of assets or grant of an equity interest, the restructuring shall be accounted for as prescribed by paragraph .019.

[14] If cash is paid in a partial settlement of a payable in a troubled debt restructuring, the carrying amount of the payable shall be reduced by the amount of cash paid.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.021 Gains on restructuring of payables determined by applying the provisions of paragraphs .013-.020 of this Statement shall be aggregated, included in measuring net income for the period of restructuring, and, if material, classified as an extraordinary item, net of related income tax effect, in accordance with paragraph 8 of *FASB Statement No. 4* [section 2013.08], "Reporting Gains and Losses from Extinguishment of Debt."

.022 If a troubled debt restructuring involves amounts contingently payable, those contingent amounts shall be recognized as a payable and as interest expense in future periods in accordance with paragraph 8 of *FASB Statement No. 5* [section 4311.08]. Thus, in general, interest expense for contingent payments shall be recognized in each period in which (a) it is probable that a liability has been incurred and (b) the amount of that liability can be reasonably estimated. Before recognizing a payable and interest expense for amounts contingently payable, however, accrual or payment of those amounts shall be deducted from the carrying amount of the restructured payable to the extent that contingent payments included in "total future cash payments specified by the new terms" prevented recognition of a gain at the time of restructuring (paragraph .018).

.023 If amounts of future cash payments must be estimated to apply the provisions of paragraphs .016-.018 because future interest payments are expected to fluctuate—for example, the restructured terms may specify the stated interest rate to be the prime interest rate increased by a specified amount or proportion—estimates of maximum total future payments shall be based on the interest rate in effect at the time of the restructuring. Fluctuations in the effective interest rate after the restructuring from changes in the prime rate or other causes shall be accounted for as changes in estimates in the periods the changes occur. However, the accounting for those fluctuations shall not result in recognizing a gain on restructuring that may be offset by future cash payments (paragraphs .018 and .022). Rather, the carrying amount of the restructured payable shall remain unchanged, and future cash payments shall reduce the carrying amount until the time that any gain recognized cannot be offset by future cash payments.

.024 Legal fees and other direct costs that a debtor incurs in granting an equity interest to a creditor in a troubled debt restructuring shall reduce the amount otherwise recorded for that equity interest according to paragraphs .015 and .019. All other direct costs that a debtor incurs to effect a troubled debt restructuring shall be deducted in measuring gain on restructuring of payables or shall

be included in expense for the period if no gain on restructuring is recognized.

Disclosure by Debtors

.025 A debtor shall disclose, either in the body of the financial statements or in the accompanying notes, the following information about troubled debt restructurings that have occurred during a period for which financial statements are presented:

a. For each restructuring:[15] a description of the principal changes in terms, the major features of settlement, or both.

b. Aggregate gain on restructuring of payables and the related income tax effect (paragraph .021).

c. Aggregate net gain or loss on transfers of assets recognized during the period (paragraphs .014 and .019).

d. Per share amount of the aggregate gain on restructuring of payables, net of related income tax effect.

.026 A debtor shall disclose in financial statements for periods after a troubled debt restructuring the extent to which amounts contingently payable are included in the carrying amount of restructured payables pursuant to the provisions of paragraph .018. If required by paragraphs 9–13 of *FASB Statement No. 5* [section 4311.09-.13], a debtor shall also disclose in those financial statements total amounts that are contingently payable on restructured payables and the conditions under which those amounts would become payable or would be forgiven.

Accounting by Creditors

.027 A creditor shall account for a troubled debt restructuring according to the type of the restructuring as prescribed in the following paragraphs. Paragraphs .028-.042 do not apply to a receivable that the creditor is accounting for at market value in accordance with specialized industry practice (for example, a marketable debt security accounted for at market value by a mutual fund). Estimated cash expected to be received less estimated costs expected to be incurred is not market value in accordance with specialized industry practice as that term is used in this paragraph.

[15] Separate restructurings within a fiscal period for the same category of payables (for example, accounts payable or subordinated debentures) may be grouped for disclosure purposes.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Receipt of Assets in Full Satisfaction

.028 A creditor that receives from a debtor in full satisfaction of a receivable either (i) receivables from third parties, real estate, or other assets or (ii) shares of stock or other evidence of an equity interest in the debtor, or both, shall account for those assets (including an equity interest) at their fair value at the time of the restructuring (see paragraph .013 for how to measure fair value).[16] The excess of (i) the recorded investment in the receivable[17] satisfied over (ii) the fair value of assets received is a loss to be recognized according to paragraph .035.

.029 After a troubled debt restructuring, a creditor shall account for assets received in satisfaction of a receivable the same as if the assets had been acquired for cash.

Modification of Terms

.030 A creditor in a troubled debt restructuring involving only modification of terms of a receivable—that is, not involving receipt of assets (including an equity interest in the debtor)—shall account for the effects of the restructuring prospectively and shall not change the recorded investment in the receivable at the time of the restructuring unless that amount exceeds the total future cash receipts specified by the new terms.[18] That is, the

---

[16] Paragraphs .028 and .033 indicate that the fair value of assets received shall be used in accounting for satisfaction of a receivable in a troubled debt restructuring. That guidance is not intended to preclude using the fair value of the receivable satisfied if more clearly evident than the fair value of the assets received in full satisfaction of a receivable (paragraph .028). (See paragraph 67 of *APB Opinion No. 16* [section 1091.67].) However, in a partial satisfaction of a receivable (paragraph .033), the fair value of the assets received shall be used in all cases to avoid the need to allocate the fair value of the receivable between the part satisfied and the part still outstanding.

[17] *Recorded investment in the receivable* is used in paragraphs .028-.041 instead of *carrying amount of the receivable* because the latter is net of an allowance for estimated uncollectible amounts or other "valuation" account, if any, while the former is not. The recorded investment in the receivable is the face amount increased or decreased by applicable accrued interest and unamortized premium, discount, finance charges, or acquisition costs and may also reflect a previous direct write-down of the investment.

[18] In this Statement, total future cash receipts includes related accrued interest, if any, at the time of the restructuring that continues to be receivable under the new terms. Uncertainty of collection of noncontingent amounts specified by the new terms (see paragraph .032 for inclusion of contingent amounts) is not a factor in applying paragraphs .030-.032 but should, of course, be considered in accounting for allowances for uncollectible amounts.

effects of changes in the amounts or timing (or both) of future cash receipts designated either as interest or as face amount shall be reflected in future periods.[19] Interest income shall be computed in a way that a constant effective interest rate is applied to the recorded investment in the receivable at the beginning of each period between restructuring and maturity (in substance the "interest" method prescribed by paragraph 15 of *APB Opinion No. 21* [section 4111.14]).[20] The new effective interest rate shall be the discount rate that equates the present value of the future cash receipts specified by the new terms (excluding amounts contingently receivable) with the recorded investment in the receivable.

.031 If, however, the total future cash receipts specified by the new terms of the receivable, including both receipts designated as interest and those designated as face amount, are less than the recorded investment in the receivable before restructuring, the creditor shall reduce the recorded investment in the receivable to an amount equal to the total future cash receipts specified by the new terms. The amount of the reduction is a loss to be recognized according to paragraph .035. Thereafter, all cash receipts by the creditor under the terms of the restructured receivable, whether designated as interest or as face amount, shall be accounted for as recovery of the recorded investment in the receivable, and no interest income shall be recognized on the receivable for any period between the restructuring and maturity of the receivable.[21]

.032 A creditor shall recognize a loss on a restructured receivable involving indeterminate future cash receipts unless the minimum future cash receipts specified by the new terms at least equals the recorded investment in the receivable. Amounts designated either as interest or as face amount that are receivable from the debtor may be contingent on a specified event or circumstance (for example, specified amounts may be receivable from the debtor if the debtor's financial condition improves to a specified degree within a specified period). To determine whether the creditor shall

---

[19] All or a portion of the recorded investment in the receivable at the time of restructuring may need to be reclassified in the balance sheet because of changes in the terms.

[20] Some creditors—for example, finance companies (*AICPA Industry Audit Guide,* "Audits of Finance Companies," Chapter 2)—use methods that recognize less revenue in early periods of a receivable than does the "interest" method. The accounting for restructured receivables described in this Statement is not intended to change creditors' methods of recognizing revenue to require a different method for restructured receivables from that for other receivables.

[21] The only exception is to recognize interest income according to paragraph .036.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

recognize a loss according to the provisions of paragraphs .030 and .031, those contingent amounts shall be included in the "total future cash receipts specified by the new terms" only if at the time of restructuring those amounts meet the conditions that would be applied under the provisions of paragraph 8 of *FASB Statement No. 5* [section 4311.08] in accruing a loss. That is, a creditor shall recognize a loss unless contingent future cash receipts needed to make total future cash receipts specified by the new terms at least equal to the recorded investment in the receivable both are probable and can be reasonably estimated. The same principle applies to amounts of future cash receipts that must sometimes be estimated to apply the provisions of paragraphs .030 and .031. For example, if the number of interest receipts is flexible because the face amount and accrued interest is collectible on demand or becomes collectible on demand after a specified period, estimates of total future cash receipts should be based on the minimum number of periods possible under the restructured terms.

Combination of Types

.033 A troubled debt restructuring may involve receipt of assets (including an equity interest in the debtor) in partial satisfaction of a receivable and a modification of terms of the remaining receivable.[22] A creditor shall account for a troubled debt restructuring involving a partial satisfaction and modification of terms as prescribed in paragraphs .030-.032 except that, first, the assets received shall be accounted for at their fair values as prescribed in paragraph .028 and the recorded investment in the receivable shall be reduced by the fair value of the assets received.[23] No loss on the restructuring shall be recognized unless the remaining recorded investment in the receivable exceeds the total future cash receipts specified by the terms of the receivable remaining unsatisfied after the restructuring. Future interest income, if any, shall be determined according to the provisions of paragraphs .030-.032.

Related Matters

.034 A troubled debt restructuring that is in substance a repossession or foreclosure by the creditor, or in which the creditor

[22] Even if the stated terms of the remaining receivable, for example, the stated interest rate and the maturity date or dates, are not changed in connection with the receipt of assets (including an equity interest in the debtor), the restructuring shall be accounted for as prescribed by paragraph .033.

[23] If cash is received in a partial satisfaction of a receivable, the recorded investment in the receivable shall be reduced by the amount of cash received.

otherwise obtains one or more of the debtor's assets in place of all or part of the receivable, shall be accounted for according to the provisions of paragraphs .028 and .033 and, if appropriate, .039.

.035 Losses determined by applying the provisions of paragraphs .028-.034 of this Statement shall, to the extent that they are not offset against allowances for uncollectible amounts or other valuation accounts, be included in measuring net income for the period of restructuring and reported according to *APB Opinion No. 30* [section 2012]. Although this Statement does not address questions concerning estimating uncollectible amounts or accounting for the related valuation allowance (paragraph .001), it recognizes that creditors use allowances for uncollectible amounts. Thus, a loss from reducing the recorded investment in a receivable may have been recognized before the restructuring by deducting an estimate of uncollectible amounts in measuring net income and increasing an appropriate valuation allowance. If so, a reduction in the recorded investment in the receivable in a troubled debt restructuring is a deduction from the valuation allowance rather than a loss in measuring net income for the period of restructuring. A valuation allowance can also be used to recognize a loss determined by applying paragraphs .028-.034 that has not been previously recognized in measuring net income. For example, a creditor with an allowance for uncollectible amounts pertaining to a group of receivables that includes the restructured receivable may deduct from the allowance the reduction of recorded investment in the restructured receivable and recognize the loss in measuring net income for the period of restructuring by estimating the appropriate allowance for remaining receivables, including the restructured receivable.

.036 If a troubled debt restructuring involves amounts contingently receivable, those contingent amounts shall not be recognized as interest income in future periods before they become receivable—that is, they shall not be recognized as interest income before both the contingency has been removed and the interest has been earned.[24] Before recognizing those amounts as interest income, however, they shall be deducted from the recorded investment in the restructured receivable to the extent that contingent receipts included in "total future cash receipts specified by the new terms" avoided recognition of a loss at the time of restructuring (paragraph .032).

[24] *FASB Statement No. 5,* paragraph 17 [section 4311.17], (which continued without reconsideration certain provisions of *ARB No. 50,* "Contingencies"), states, in part: "Contingencies that might result in gains usually are not reflected in the accounts since to do so might be to recognize revenue prior to its realization."

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.037 If amounts of future cash receipts must be estimated to apply the provisions of paragraphs .030-.032 because future interest receipts are expected to fluctuate—for example, the restructured terms may specify the stated interest rate to be the prime interest rate increased by a specified amount or proportion—estimates of the minimum total future receipts shall be based on the interest rate in effect at the time of restructuring. Fluctuations in the effective interest rate after the restructuring from changes in the prime rate or other causes shall be accounted for as changes in estimates in the periods the changes occur except that a creditor shall recognize a loss and reduce the recorded investment in a restructured receivable if the interest rate decreases to an extent that the minimum total future cash receipts determined using that interest rate fall below the recorded investment in the receivable at that time.

.038 Legal fees and other direct costs incurred by a creditor to effect a troubled debt restructuring shall be included in expense when incurred.

.039 A receivable from the sale of assets previously obtained in a troubled debt restructuring shall be accounted for according to *APB Opinion No. 21* [section 4111] regardless of whether the assets were obtained in satisfaction (full or partial) of a receivable to which that Opinion was not intended to apply. A difference, if any, between the amount of the new receivable and the carrying amount of the assets sold is a gain or loss on sale of assets.

Disclosure by Creditors

.040 A creditor shall disclose, either in the body of the financial statements or in the accompanying notes, the following information about troubled debt restructurings as of the date of each balance sheet presented:

a. For outstanding receivables whose terms have been modified in troubled debt restructurings, by major category:[25] (i) the aggregate recorded investment; (ii) the gross interest income that would have been recorded in the period then ended if

[25] The appropriate major categories depend on various factors, including the industry or industries in which the creditor is involved. For example, for a commercial banking enterprise, at a minimum, the appropriate categories are investments in debt securities and loans. Information need not be disclosed, however, for non-interest-bearing trade receivables; loans to individuals for household, family, and other personal expenditures; and real estate loans secured by one-to-four family residential properties.

those receivables had been current in accordance with their original terms and had been outstanding throughout the period or since origination, if held for part of the period; and (iii) the amount of interest income on those receivables that was included in net income for the period. A receivable whose terms have been modified need not be included in that disclosure if, subsequent to restructuring, its effective interest rate (paragraph .030) has been equal to or greater than the rate that the creditor was willing to accept for a new receivable with comparable risk.

b. The amount of commitments, if any, to lend additional funds to debtors owing receivables whose terms have been modified in troubled debt restructurings.

.041 A financial institution, or other creditor, may appropriately disclose the information prescribed by paragraph .040, by major category, for the aggregate of outstanding reduced-earning and nonearning receivables rather than separately for outstanding receivables whose terms have been modified in troubled debt restructurings.

Substitution or Addition of Debtors

.042 A troubled debt restructuring may involve substituting debt of another business enterprise, individual, or government unit[26] for that of the troubled debtor or adding another debtor (for example, as a joint debtor). That kind of restructuring should be accounted for according to its substance. For example, a restructuring in which, after the restructuring, the substitute or additional debtor controls, is controlled by, or is under common control[27] with the original debtor is an example of one that shall be accounted for by the creditor according to the provisions of paragraphs .030-.032. Those paragraphs shall also apply to a restructuring in which the substitute or additional debtor and original debtor are related after the restructuring by an agency, trust, or other

---

[26] Government units include, but are not limited to, states, counties, townships, municipalities, school districts, authorities, and commissions. See page 4 of *AICPA Industry Audit Guide,* "Audits of State and Local Governmental Units."

[27] "Control" in this paragraph has the meaning described in paragraph 3(c) of *APB Opinion No. 18* [section 5131.03(c)], "The Equity Method of Accounting for Investments in Common Stock": "The usual condition for control is ownership of a majority (over 50%) of the outstanding voting stock. The power to control may also exist with a lesser percentage of ownership, for example, by contract, lease, agreement with other stockholders or by court decree."

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

relationship that in substance earmarks certain of the original debtor's funds or funds flows for the creditor although payments to the creditor may be made by the substitute or additional debtor. In contrast, a restructuring in which the substitute or additional debtor and the original debtor do not have any of the relationships described above after the restructuring shall be accounted for by the creditor according to the provisions of paragraphs .028 and .033.

Effective Date and Transition

.043 The preceding paragraphs of this Statement, other than paragraphs .039-.041, shall be effective for troubled debt restructurings consummated after December 31, 1977.[28] Earlier application is encouraged for those consummated on or before December 31, 1977 but during fiscal years for which annual financial statements have not previously been issued. The paragraphs shall not be applied to those consummated during fiscal years for which annual financial statements have previously been issued.

.044 Paragraph .039 shall be effective for receivables resulting from sales of assets after December 31, 1977 regardless of whether the provisions of this Statement were applied to the related troubled debt restructuring. Earlier application is encouraged for receivables from sales of assets on or before December 31, 1977 but during fiscal years for which annual financial statements have not previously been issued. It shall not be applied to those from sales of assets during fiscal years for which annual financial statements have previously been issued.

.045 The information prescribed by paragraphs .040 and .041 shall be disclosed in financial statements for fiscal years ending after December 15, 1977. Earlier application is encouraged in financial statements for fiscal years ending before December 16, 1977. For the purpose of applying paragraph .040, "receivables whose terms have been modified in troubled debt restructurings" shall encompass not only (a) receivables whose terms have been modified in troubled debt restructurings to which the other provisions of this Statement have been applied in accordance with paragraph .043 but also (b) those whose terms have been modified in earlier restructurings that constitute troubled debt restructurings (para-

---

[28] For an enterprise having a fiscal year of 52 or 53 weeks ending in the last seven days in December or the first seven days in January, references to December 31, 1977 in paragraphs .043 and .044 shall mean the date in December 1977 or January 1978 on which the fiscal year ends.

graphs .002-.008) but have been excluded from its other provisions because of the timing of the restructurings.

The provisions of this Statement need not be applied to immaterial items.

Appendix A

BACKGROUND INFORMATION

.046 There has been a substantial increase in recent years in the number of debtors that are unable to meet their obligations on outstanding debt because of financial difficulties. Sometimes the debtor and the creditor have restructured the debt to enable the debtor to avoid bankruptcy proceedings or other consequences of default, and the number of troubled debt restructurings receiving publicity has also increased. Although many of the most publicized troubled debt restructurings have involved debtors that are real estate companies or real estate investment trusts, debtors in other industries have also been involved in troubled debt restructurings.

.047 *APB Opinion No. 26* [section 5362], "Early Extinguishment of Debt," established the accounting by a debtor for debt extinguished before its scheduled maturity. A number of commentators have observed, however, that not all troubled debt restructurings are "extinguishments" as that term is used in *APB Opinion No. 26* [section 5362]. Also, since many troubled debt restructurings have occurred on or after the scheduled maturity of the debt, questions have arisen about accounting for debt restructurings that are not early extinguishments. It has been suggested that troubled debt restructurings should be considered separately from restructurings, including early extinguishments, that do not involve the economic or legal pressure to restructure on the creditor that characterizes troubled debt restructurings.

.048 Concern over the lack of guidance in the authoritative literature on accounting for troubled debt restructurings, accentuated by their increasing number, led to requests that the Financial Accounting Standards Board consider the matter. The Board submitted the question to the Screening Committee on Emerging Problems and weighed its recommendations in deciding to proceed with a project limited in scope to accounting and reporting by a debtor whose debt is restructured in a troubled loan situation. The Board issued an Exposure Draft of a Proposed Statement, "Restructuring of Debt in a Troubled Loan Situation," dated November 7, 1975, and held a public hearing on December 12, 1975. The Board received 63 written responses to the Exposure Draft and heard five oral presentations at the public hearing. A number of respondents objected to the accounting prescribed by the Exposure Draft, but they held divergent views about the appropriate accounting. Major issues of concern centered on (a) whether

certain kinds of troubled debt restructurings require reductions of carrying amounts of debt, (b) if they do, whether the effect of the reduction should be included in measuring current net income, be deferred, or be considered a contribution to capital, and (c) whether interest that is contingently payable on restructured debt should be recognized before it becomes payable.

.049 During the same period, uncertainties arose about the abilities of some state and local government units to pay their obligations when due. Some of those obligations have also been restructured, for example, by continuing the existing obligation for a designated period at a reduced interest rate or by substituting obligations with later maturities of the same or a related issuer. Questions about accounting and reporting by creditors for those restructured securities led various individuals and organizations to urge the Board to consider that matter.

.050 The Board considered (a) the lack of authoritative guidance and divergent views about accounting and reporting by debtors for troubled debt restructurings and by creditors for restructured securities of state and local government units and (b) the similarities of the issues for debtors and creditors and concluded that the accounting and reporting issues affecting both debtors and creditors should be considered in a single project. The Board therefore announced on January 7, 1976, that it had added to its agenda a project to determine accounting and reporting by both debtors and creditors. At the same time the Board announced that since the new project concerned accounting by both debtors and creditors, the Board would not issue a Statement covering the limited topic of the November 7, 1975 Exposure Draft.

.051 The Securities and Exchange Commission issued, also on January 7, 1976, *Accounting Series Release No. 188,* "Interpretive Statement by the Commission on Disclosure by Registrants of Holdings of Securities of New York City and Accounting for Securities Subject to Exchange Offer and Moratorium." The Commission did not require a particular accounting method because of the divergent views on accounting for the securities held and "the fact that the Financial Accounting Standards Board has agreed to undertake a study of the accounting problems . . . with the intention of developing standards which can be applied to year-end statements in 1976."

.052 The Board appointed a task force in January 1976 to provide counsel in preparing a Discussion Memorandum. Its sixteen members included individuals from academe, the financial com-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

munity, industry, law, and public accounting. The Board issued a Discussion Memorandum, "Accounting by Debtors and Creditors When Debt Is Restructured," dated May 11, 1976, comprehending accounting and reporting by debtors and creditors for "any change in the amount or timing of cash payments otherwise required under the terms of the debt at the date of restructuring." It received 894 written responses to the Discussion Memorandum and heard 37 oral presentations at a public hearing on July 27-30, 1976.

.053 In addition, the FASB staff reviewed the accounting and reporting practices of a number of debtors and creditors involved in troubled debt restructurings and interviewed a limited number of individuals who were directly associated with some of those restructurings.

.054 The Board issued an Exposure Draft of a proposed Statement on "Accounting by Debtors and Creditors for Troubled Debt Restructurings," dated December 30, 1976. It received 96 letters of comment on the Exposure Draft.

Appendix B

BASIS FOR CONCLUSIONS

.055 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including various alternatives considered and reasons for accepting some and rejecting others.

SCOPE OF THIS STATEMENT

.056 Paragraph .001 states that this Statement establishes standards of financial accounting and reporting by the debtor and by the creditor for a troubled debt restructuring. In contrast, the Discussion Memorandum comprehended all restructurings that changed "the amount or timing of cash payments otherwise required under the terms of the debt at the date of the restructuring." The broader scope of the Discussion Memorandum, which encompassed nontroubled as well as troubled debt restructurings, was due to several factors. The Board considered it necessary to obtain additional information about accounting practices and problems for both troubled and nontroubled debt restructurings. Some respondents to the November 7, 1975 Exposure Draft of a Proposed Statement, "Restructuring of Debt in a Troubled Loan Situation," expressed concern that to apply its guidelines for identifying troubled loan situations would require considerable judgment. Some Task Force members and other commentators advised the Board to comprehend all restructurings accomplished by exchanges of debt for debt or of equity securities for debt that may not be covered by *APB Opinion No. 26* [section 5362].[29]

.057 Most respondents to the Discussion Memorandum that commented on the matter, however, recommended that a Statement at this time should be limited to accounting for troubled debt restructurings. Numerous respondents indicated that restructurings of debt in nontroubled situations present no significant or unusual accounting problems that merit consideration or require new accounting and reporting standards. Many respondents contended that the kinds of major changes that might result from new standards on accounting for all restructurings should be deferred pending progress on the FASB's existing projects on accounting for interest costs and the conceptual framework for financial accounting and reporting. Some respondents argued that a useful distinction between troubled and nontroubled restructurings of debt can be made

[29] See paragraph .047 of this Statement.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

and that the need to use judgment in some circumstances should not be a deterrent to making that distinction in a Statement. A number of respondents to the Exposure Draft [30] made similar comments.

.058 The Board found persuasive the views described in the preceding paragraph and decided to limit the scope of this Statement to troubled debt restructurings. The Board also decided that conclusions in this Statement should not attempt to anticipate results of considering the issues in its Discussion Memorandum, "Conceptual Framework for Financial Accounting and Reporting: Elements of Financial Statements and Their Measurement," dated December 2, 1976. Rather, the Board believes that, to the extent possible, the accounting for troubled debt restructurings prescribed in this Statement should be consistent and compatible with the existing accounting framework.

.059 Paragraph .001 also states that the Statement does not establish standards of financial accounting and reporting for allowances for uncollectible amounts and does not prescribe or proscribe particular methods for estimating amounts of uncollectible receivables. Several respondents to the Exposure Draft urged the Board to adopt the method of accounting for uncollectible amounts based on the net realizable value of collateral property set forth in *Statement of Position 75-2,* "Accounting Practices of Real Estate Investment Trusts," issued June 27, 1975 by the Accounting Standards Division of the American Institute of Certified Public Accountants. Others noted potential conflicts between the Exposure Draft and the AICPA publication and requested clarification. Still others urged the Board to reject the method for estimating amounts of uncollectible receivables in *Statement of Position 75–2.*

.060 Since this Statement neither prescribes nor proscribes particular methods for estimating uncollectible amounts of receivables, it takes no position on whether the net realizable value of collateral is a proper basis for estimating allowances for uncollectible amounts of receivables. However, the accounting prescribed in this Statement for assets received in troubled debt restructurings differs from that in *Statement of Position 75–2,* for reasons given in paragraphs .065-.105, and the accounting prescribed in this Statement governs.

---

[30] References to "Exposure Draft" in this Appendix are to "Accounting by Debtors and Creditors for Troubled Debt Restructurings," dated December 30, 1976, unless the reference specifically identifies the earlier Exposure Draft, "Restructuring of Debt in a Troubled Loan Situation," dated November 7, 1975.

.061 Paragraphs .002-.008 identify debt restructurings that fall within the scope of this Statement. This paragraph and the next are intended to clarify further the meaning of *troubled debt restructuring* for purposes of this Statement. The description of a troubled debt restructuring is based generally on that in the November 7, 1975 Exposure Draft, which many respondents to that Exposure Draft and the Discussion Memorandum found satisfactory. It focuses on the economic and legal considerations related to the debtor's financial difficulties that in effect compel the creditor to restructure a receivable in ways more favorable to the debtor than the creditor would otherwise consider. The creditor participates in a troubled debt restructuring because it no longer expects its investment in the receivable to earn the rate of return expected at the time of investment and may view loss of all or part of the investment to be likely unless the receivable is restructured. Thus, a troubled debt restructuring involves a receivable whose risk to the creditor has greatly increased since its acquisition, and if the creditor were not faced with the need to restructure to protect itself, it would require a much higher effective interest rate to invest in the same receivable currently. If the receivable has a market price, the effective interest rate based on that market price will have increased because of that increased risk to the creditor—that is, it will have increased more than market interest rates generally (or fallen less than market rates or increased while interest rates generally have fallen).

.062 Although the broad description of a troubled debt restructuring in paragraphs .002-.008 includes settlements of debt by transfers of assets and grants of equity interests in debtors, *troubled debt restructuring* refers in particular to modifications of terms intended to continue an existing debt by making the terms more favorable to the debtor to protect the creditor's investment. For purposes of this Statement, troubled debt restructurings do not include changes in terms resulting in an effective interest rate based on market price of the debt that is comparable to effective interest rates applicable to debt issued by nontroubled debtors, for example, a situation in which a debtor is able to exchange for its outstanding debt new marketable debt with an effective interest rate at or near the market interest rates for debt issued by nontroubled debtors generally. The fact that the debtor can obtain that interest rate only by including a "sweetener," such as a conversion privilege, does not make that transaction a troubled debt restructuring because (a) the debtor is sufficiently strong financially that the kind of economic compulsion on the creditor described earlier is not present, (b) the "sweetener" represents so drastic a change in the terms of the debt

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

that the transaction is in substance the exchange of new debt for outstanding debt rather than merely a modification of terms to continue an existing debt, or (c) some combination of both factors.

.063 Some respondents to the Discussion Memorandum advocated that the scope of this Statement specifically exclude restructurings of receivables related to consumer finance activities or to all or certain residential properties. Their reasons focused primarily on the individual insignificance of those receivables in a creditor's financial position and on the cost involved to account for reductions in recorded investments in large numbers of receivables that may be restructured. The Board concluded that accounting for restructurings of those receivables in troubled situations should in general be the same as for other troubled debt restructurings. However, grouping like items or using statistical measures may be appropriate for receivables that are not individually material.

.064 Some respondents to the Exposure Draft suggested that the *time of a troubled debt restructuring* be clarified because several dates or events may be involved. The time may be significant in matters relating to recognizing gains or losses from restructuring or to the effective date of the Statement. Paragraph .006 specifies the time of a restructuring to be the date of consummation, that is, the time that assets are transferred, new terms become effective, and the like. A debtor should not recognize a gain on restructuring before consummation of the restructuring; a creditor should record receipt of an asset or equity interest at that date or should formally write down a restructured receivable, but may already have recognized a loss on restructuring through estimated uncollectible amounts.

DIVERGENT VIEWS OF TROUBLED DEBT RESTRUCTURINGS

.065 Respondents to the Discussion Memorandum expressed divergent views about the substance of various types of troubled debt restructurings and appropriate accounting for them within the existing accounting framework. Those views fall generally into three categories:

a. All troubled debt restructurings constitute events that are part of continuing efforts by creditors to recover amounts invested and obtain a return on investment despite debtors' financial difficulties; therefore, troubled debt restructurings may require certain disclosures, but usually do not require changes in carrying amounts of payables or recorded investments in receivables or recognition of gains or losses.

b. All debt restructurings, troubled and nontroubled, constitute transactions whose financial effect on assets or liabilities (receivables or payables) should be recognized, including recognition of gains or losses.

c. Accounting for a troubled debt restructuring depends on the characteristics of the restructuring. Some troubled debt restructurings constitute transactions requiring recognition of changes in receivables or payables and related gains or losses; other troubled debt restructurings do not.

Recognition of Changes Not Appropriate

.066 Respondents who contended that troubled debt restructurings constitute events for which recognition of changes in assets or liabilities is usually not appropriate within the existing accounting framework generally focused on accounting by creditors. They reasoned that a troubled debt restructuring commonly involves a concession granted unilaterally by the creditor to increase its prospects of recovering the amount invested. The debtor is usually a passive beneficiary of the effects of the restructuring. Troubled debt restructurings typically result from the debtor's financial difficulties that existed before restructuring, and in the existing accounting framework the creditor should have considered the debtor's financial difficulties in estimating an allowance for uncollectible amounts regardless of whether those difficulties were likely to culminate in a restructuring. According to those respondents, the restructuring event in itself has no accounting significance except to sometimes provide more definitive evidence of the effect of the debtor's financial difficulties on the creditor's ability to recover the recorded investment in the receivable.

.067 According to that view, the creditor should record no change in a receivable restructured in a troubled debt restructuring and no gain or loss whether the restructuring involves (i) transfer of receivables, real estate, or other noncash assets from the debtor to the creditor to satisfy the receivable, (ii) grant to the creditor of an equity interest in the debtor to satisfy the receivable, (iii) modification of the terms of the receivable, or (iv) some combination of transfer of assets or grant of equity interests (or both) and modification of terms. The normal, expected course of events in a creditor's activities is to invest cash, earn interest on the cash invested, and eventually recover the cash. Although a creditor initiates or agrees to a restructuring to protect the amount invested, not to acquire noncash assets, the creditor may accept noncash assets (including an equity interest) as a necessary intermediate step. The creditor previously held a claim on the debtor's assets, either through a

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

receivable secured by specific collateral or through an unsecured general claim against the debtor's assets. Accepting noncash assets in a restructuring represents the exercise of that claim; the assets stand in the place of the receivable. According to that view, the creditor's recorded investment in the receivable should become the recorded investment in the surrogate assets obtained. Then, since whether the creditor recovers that investment depends on the cash received for the assets that replaced the receivable, recoverability of that recorded investment as a result of obtaining the surrogate assets should be assessed. An expected failure, if any, to recover all of the recorded investment should be recognized as a loss by the creditor to the extent not previously recognized. However, transfer of the assets to the creditor should not precipitate recognition of a loss that was not inherent in the receivable before the restructuring; at most, the transfer provides evidence of the existence and amount of a loss.

Recognition of Changes Appropriate for All Debt Restructurings

.068 Some respondents advocated for virtually all debt restructurings, troubled and nontroubled, the accounting normally required in the existing accounting framework for initial recognition of assets and liabilities. They reasoned that each restructuring is an exchange resulting in a new asset for the creditor or liability for the debtor in place of the old one. According to that view, the presence or absence of financial difficulties does not affect the appropriate accounting for a restructuring; at most, a debtor's financial difficulties may affect the terms of the exchange. Those respondents contended that all assets and liabilities exchanged in debt restructurings should be measured at their fair values at the time of the restructuring by both debtors and creditors. They considered continued use of recorded amounts derived from previous exchange transactions to be inappropriate for restructured receivables and payables because it ignores a current exchange transaction and may ignore gains or losses that have occurred and should be recognized.

Accounting Depends on Circumstances

.069 Some respondents contended that the controlling criterion in determining appropriate accounting for a debt restructuring within the existing accounting framework is whether the restructuring involves transfer of resources, obligations, or both between debtor and creditor. According to that view, a troubled debt restructuring

involving transfer of resources, obligations, or both should be accounted for the same as other transfers of resources and obligations in the existing accounting framework and may involve recognizing a gain or loss. A troubled debt restructuring involving no transfer of resources or obligations requires no accounting for changes in assets or liabilities, except to recognize losses in accordance with *FASB Statement No. 5* [section 4311].

.070 Some respondents distinguished debt restructurings involving transfers of resources, obligations, or both from those involving no transfers on the basis of whether the debtor transferred assets or granted an equity interest to the creditor to satisfy the debt or the restructuring involved modification of terms only. Other respondents classified modifications of terms involving reduction of face amount of the debt with transfers of assets or grants of equity interests (discussed further in paragraphs .106-.155).

Board Conclusions about Recognizing Changes in Assets or Liabilities

.071 *APB Statement No. 4* [sections 1021-1029], "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises," describes relevant parts of the existing accounting framework. That Statement defines "economic resources" as "the scarce means (limited in supply relative to desired uses) available for carrying on economic activities" and identifies "claims to receive money" as an economic resource. It defines "economic obligations" as "present responsibilities to transfer economic resources or provide services to other entities in the future" and identifies "obligations to pay money" as an economic obligation. It also states that "events that change resources, obligations, and residual interest are the basis for the basic elements of results of operations . . . and other changes in financial position with which financial accounting is concerned." (See *APB Statement No. 4,* paragraphs 57, 58, and 61 [sections 1023.18-.19 and 1023.22].)

.072 According to *APB Statement No. 4* [sections 1021-1029], almost all of the events that in the existing accounting framework normally change assets and liabilities and also affect net income for the period of change are either "exchanges" or "nonreciprocal transfers," the two classes that comprise "transfers of resources or obligations to or from other entities." The other classes of events—"external events other than transfers of resources or obligations to or from other entities" (price changes, interest rate changes, technological changes, vandalism, etc.) and "internal events" (production and casualties)—result in

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

revenues or gains only through "exceptions" and result in expenses or losses only because some produce losses by definition or by applying the "modifying convention" of conservatism. (See *APB Statement No. 4,* paragraphs 62 and 180-187 [sections 1023.23 and 1027.06-.13].)

.073 An exchange is a reciprocal transfer between the enterprise and another entity in which "the enterprise either sacrifices resources or incurs obligations in order to obtain other resources or satisfy other obligations." "Exchanges between the enterprise and other entities (enterprises or individuals) are generally recorded in financial accounting when the transfer of resources or obligations takes place or services are provided." Nonreciprocal transfers are "transfers in one direction of resources or obligations, either from the enterprise to other entities or from other entities to the enterprise." In nonreciprocal transfers between the enterprise and entities other than owners, "one of the two entities is often passive, a mere beneficiary or victim of the other's actions." Nonreciprocal transfers between the enterprise and entities other than owners "are recorded when assets are acquired (except that some noncash assets received as gifts are not recorded), when assets are disposed of or their loss is discovered, or when liabilities come into existence or are discovered." (See *APB Statement No. 4,* paragraphs 62, 181, and 182 [sections 1023.23 and 1027.07-.08].)

.074 The Board rejected the view that virtually all troubled debt restructurings have the same substance in the existing accounting framework. It therefore rejected both the view that accounting for all troubled debt restructurings should involve recognition of changes in assets or liabilities and perhaps gains and losses and the view that no troubled debt restructurings should require recognition of changes in assets or liabilities or gains or losses.

.075 The Board concluded that a troubled debt restructuring that involves transfer of resources or obligations requires accounting for the resources or obligations transferred whether that restructuring involves an exchange transaction or a nonreciprocal transfer. Both kinds of transfers are accounted for in the existing accounting framework on essentially the same basis (exchange price received or paid or fair value received or given). In this Statement, therefore, the Board found it unnecessary to decide whether the transfer of resources and obligations in various types of troubled debt restructurings is reciprocal (an exchange) or nonreciprocal as those terms are used in paragraph 62 of *APB Statement No. 4* [section 1023.23].

.076 The Board also concluded that a troubled debt restructuring that does not involve a transfer of resources or obligations is a

continuation of an existing debt. It is neither an event that results in a new asset or liability for accounting purposes nor an event that requires a new measurement of an existing asset or liability.

.077 The Board noted that guidance regarding the types of troubled debt restructurings that involve transfers of resources, obligations, or both is sparse in existing accounting pronouncements, and various views exist. The Board concluded that to the extent a troubled debt restructuring involves (i) transfer of receivables, real estate, or other assets from debtor to creditor to satisfy debt or (ii) grant to the creditor of an equity interest in the debtor to satisfy debt (or a combination of both), a transfer of resources or obligations has occurred that in the existing accounting framework should be accounted for at fair value. The debtor has given up assets or granted an equity interest to settle a payable, and the creditor has received the assets or equity interest in satisfaction of a receivable. In contrast, to the extent a troubled debt restructuring involves only modification of terms of continuing debt, no transfer of resources or obligations has occurred. The substance of troubled debt restructurings involving modifications of continuing debt is discussed in paragraphs .106-.155.

.078 Several respondents to the Exposure Draft disagreed with the Board's distinction between troubled debt restructurings involving transfers of assets or grants of equity interests in debtors and those involving only modifications of terms. Some respondents wished to have fewer kinds of troubled debt restructurings accounted for as transactions between debtors and creditors and thus disagreed with the Exposure Draft's conclusions on accounting for transfers of assets; their views are noted in the next section. Others wished to account for more kinds of troubled debt restructurings as transactions between debtors and creditors and thus disagreed with the Exposure Draft's conclusions on accounting for modifications of terms; their views are noted in paragraphs .150-.153.

ACCOUNTING FOR RESTRUCTURINGS INVOLVING TRANSFERS

Accounting by Debtors and Creditors for Transfer of Assets

Concept of Fair Value

.079 Some respondents to the Exposure Draft continued to argue that all troubled debt restructurings should be accounted for as modifications of terms of debt and that none should be accounted for as transfers of assets (paragraphs .066 and .067). Others ac-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

cepted the need to account for some troubled debt restructurings as asset transfers but held that obtaining assets through foreclosure or repossession under terms included in lending agreements should be distinguished from obtaining assets in exchange for cash or in other "asset swaps." They contended that (a) only the form of the asset is changed by foreclosure or repossession, (b) the substance of a secured loan is that the lender may choose either to postpone receipt of cash or take the asset to optimize cash receipts and recovery of its investment, and (c) foreclosure or repossession is not the completion of a lending transaction but merely a step in the transaction that begins with lending cash and ends with collecting cash.

.080 The Board rejected those arguments for the reasons given in paragraphs .071-.077, emphasizing that an event in which (a) an asset is transferred between debtor and creditor, (b) the creditor relinquishes all or part of its claim against the debtor, and (c) the debtor is absolved of all or part of its obligation to the creditor is the kind of event that is the basis of accounting under the existing transaction-based accounting framework. To fail to recognize an event that fits the usual description of a transaction and to recognize only the lending and collection of cash as transactions would significantly change the existing accounting framework.

.081 Use of the fair value of an asset transferred to measure the debtor's gain on restructuring and gain or loss on the asset's disposal or the creditor's cost of acquisition is not adopting some kind of "current value accounting." On the contrary, that use of fair value is common practice within the existing accounting framework. Paragraph .013 of this Statement explains briefly the meaning of *fair value* and refers to *APB Opinions No. 16* [section 1091], *No. 21* [section 4111], and *No. 29* [section 1041], which use *fair value* in the same way and provide guidance about determining fair values within the existing accounting framework. The term *fair value* is used in essentially the same way as *market value* was used in the Discussion Memorandum to denote a possible attribute to be measured at the time a debt is restructured. *Fair value* is defined in paragraph 181 of *APB Statement No. 4* [section 1027.07] as "the approximation of exchange price in transfers in which money or money claims are not involved." Although a "money claim" is necessarily involved in transferring assets to settle a payable in a troubled debt restructuring, the troubled circumstances in which the transfer occurs make it obvious that the amount of the "money claim" does not establish an exchange price. Determining fair value of the assets transferred in a troubled debt restructuring is usually necessary to approximate an exchange price for the

same reasons that determining fair value is necessary to account for transfers of assets in nonmonetary transactions (*APB Opinion No. 29* [section 1041]).

.082 That point is emphasized in this Appendix because some respondents to the Exposure Draft apparently misunderstood the concept of fair value (paragraph 11 of the Exposure Draft and paragraph .013 of this Statement) and the discounting of expected cash flows specified in those paragraphs. Paragraph .013 permits discounting of expected cash flows from an asset transferred or received in a troubled debt restructuring to be used to estimate fair value only if no market prices are available either for the asset or for similar assets. The sole purpose of discounting cash flows in that paragraph is to estimate a current market price as if the asset were being sold by the debtor to the creditor for cash. That estimated market price provides the equivalent of a sale price on which the debtor can base measurement of a gain on restructuring and a gain or loss on disposal of the asset and the equivalent of a purchase price on which the creditor can measure the acquisition cost of the asset. To approximate a market price, the estimate of fair value should use cash flows and discounting in the same way the marketplace does to set prices—in essence, the marketplace discounts expected future cash flows from a particular asset "at a rate commensurate with the risk involved" in holding the asset. An individual assessment of expected cash flows and risk may differ from what the marketplace's assessment would be, but the procedure is the same.

.083 In contrast to the purpose of paragraph .013, *AICPA Statement of Position No. 75-2* [31] is concerned with different measures —net realizable value to a creditor of a receivable secured by real property and net realizable value of repossessed or foreclosed property. Its method of accounting for assets obtained by foreclosure or repossession thus differs from the method specified in this Statement. It proposes discounting expected cash flows at a rate based on the creditor's "cost of money" to measure the "holding cost" of the asset until its realizable value is collected in cash. The concept of fair value in paragraph .013 does not involve questions of whether interest is a "holding cost" or "period cost" because it is concerned with estimating market price, not net realizable value, however defined. Accounting for transfers of assets in troubled debt restructurings and for the assets after transfer is, of course, governed by this Statement.

.084 Several respondents to the Exposure Draft suggested that the Statement should explicitly state that troubled debt restructurings

[31] See paragraphs .059 and .060 of this Statement.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

that are in substance transfers of assets should be accounted for according to that substance. The Board agreed that a restructuring may be in substance a foreclosure, repossession, or other transfer of assets even though formal foreclosure or repossession proceedings are not involved. Thus, the Statement requires accounting for a transfer of assets if, for example, the creditor obtains control or ownership (or substantially all of the benefits and risks incident to ownership) of one or more assets of the debtor and the debtor is wholly or partially relieved of the obligations under the debt, or if both the debt and one or more assets of the debtor are transferred to another debtor that is controlled by the creditor.

Debtor's Recognition of Gain or Loss

.085 Responses to the November 7, 1975 Exposure Draft, the May 11, 1976 Discussion Memorandum, and the Exposure Draft included two general procedures for a debtor to account for a gain or loss from a troubled debt restructuring involving a transfer of assets to settle a payable:

a. The debtor recognizes a difference, if any, between the carrying amount of assets transferred and the carrying amount of the payable settled as a gain on restructuring of a payable.

b. The debtor (1) recognizes a difference, if any, between the fair value and carrying amount of assets transferred as a gain or loss on transfer of assets and (2) recognizes a difference, if any, between the fair value of assets transferred and the carrying amount of the payable settled, as a gain on restructuring of a payable.

.086 Some respondents contended that debtors should not recognize the difference between the carrying amount and fair value of assets transferred to settle a payable as a gain or loss on assets. Instead, the net difference, if any, between the carrying amount of assets transferred and the carrying amount of a payable settled should be recognized as a gain or loss on restructuring of a payable. They argued that to measure the fair value of assets transferred would be costly and subjective in certain circumstances and that distinctions in the debtor's income statement between a gain or loss on disposition of assets and a gain on settlement of payables in the same troubled debt restructuring would probably not be helpful and might be arbitrary.

.087 Other respondents who addressed the question emphasized the desirability of being able to assess separately the debtor's

performance with respect to the transferred assets. They suggested that measuring the fair values of the transferred assets is essential to that assessment and conveys significant information that is obscured if fair values are not measured. For example, the fair values of some assets transferred (such as real estate) may often exceed their carrying amounts, while the fair values of other assets transferred (such as receivables) may sometimes be less than their face amounts. In the existing accounting framework, the first kind of difference is not recognized before disposal of the asset, but the second kind of difference is likely to have been recognized before restructuring by some debtors but not recognized by others for various reasons. Failure to include a gain or loss for the difference between the fair values and carrying amounts of assets transferred in troubled debt restructurings is likely to obscure differences and similarities between restructurings, according to that view, and respondents who advocated separate recognition of a debtor's gains or losses on assets transferred and gains on restructuring argued that separate recognition is required to provide consistent information about a single debtor for different periods and comparable information about different debtors for the same periods. The need for separate recognition is accentuated if gains and losses on transfer of assets are classed differently from gains on restructuring in the debtor's income statement (that is, if the latter are classified as extraordinary items).

.088 The Board concluded that the fair value of the assets transferred in a troubled debt restructuring constitutes the best measure of the debtor's sacrifice to settle the payable and therefore that the fair value of assets transferred should be used to measure the gain on restructuring of the payable. In the existing accounting framework, gains, and losses on certain kinds of noncurrent assets, are usually recognized on assets only when the assets are sold or otherwise disposed of. For many assets, that gain or loss on sale or disposal is the only indication of whether the enterprise did well or poorly by having the asset. That indication is lost if the gain or loss on disposition is buried in a gain on restructuring of troubled debt, and the effect of the restructuring itself is also obscured. Further, unless fair value of the asset transferred is used to account for the transaction, the proportion of a payable settled by the transfer can usually be determined only by arbitrary and complicated allocations if the transfer settles only part of the payable and the terms are modified on the remainder (paragraph .019).

.089 Since a gain or loss recognized by a debtor on the assets transferred to settle a payable in a troubled debt restructuring

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

is closely related to a gain recognized by a debtor on restructuring of a payable, the Board concluded that the aggregate amount of each should be disclosed for restructurings that have occurred during a period for which financial statements are presented (paragraph .025).

Creditor's Subsequent Accounting

.090 The Board considered two proposals for a creditor's accounting for assets received in full satisfaction of a receivable in a troubled debt restructuring: (a) the creditor accounts for the assets received at their fair value and recognizes as a loss a difference, if any, between the total fair value of assets received and the recorded investment in the receivable satisfied or (b) the creditor accounts for the assets received at the recorded investment in the receivable satisfied and recognizes no loss. Those alternatives are described in paragraphs .065-.070, and the Board's reasons for adopting the first proposal are given in paragraphs .071-.078.

.091 Several respondents to the Exposure Draft requested guidance on a creditor's accounting after a troubled debt restructuring for assets received in the restructuring. Some asked the Board to require or permit creditors to accrue interest on all assets acquired through repossession or foreclosure. In response, paragraph .029 states that "after a troubled debt restructuring, a creditor shall account for assets received in satisfaction of a receivable the same as if the assets had been acquired for cash." The fair value at the time of transfer of an asset transferred to a creditor in a troubled debt restructuring is a measure of its cost to the creditor and generally remains its carrying amount (except for depreciation or amortization) until sale or other dispositon if the asset is inventory, land, building, equipment, or other nonmonetary asset. That is, under the present accounting framework, interest is accrued only on some receivables and other monetary assets. Except for the effects of a few specialized rules that permit interest cost to be added to the cost of some assets under construction, etc., interest is not accrued on nonmonetary assets. That framework governs accounting for assets acquired in a troubled debt restructuring. The method of accounting for assets received through foreclosure, repossession, or other asset transfer to satisfy a receivable proposed by *Statement of Position 75–2* is not compatible with the accounting specified in this Statement.

Debtor's Accounting for Grant of Equity Interest

.092 The Board considered three proposals for a debtor's accounting for an equity interest granted to a creditor to settle a payable in a troubled debt restructuring:

a. The debtor directly increases its owners' equity by the fair value of the equity interest granted[32] and recognizes the difference between that fair value and the carrying amount of the payable settled as a gain included in measuring net income.

b. Same as (a) except that the resulting gain is included directly in the owners' equity of the debtor.

c. The debtor directly increases its owners' equity by the carrying amount of the payable settled, recognizing no gain.

.093 Respondents favoring use of fair value to record a grant of an equity interest contended that the increase in the owners' equity of the debtor as a result of a troubled debt restructuring should be measured by the consideration received for the equity interest granted, not by the carrying amount of the payable settled because that carrying amount has no current economic significance. They also contended that a separate measure of a gain on restructuring of payables provides useful information.

.094 Among those who advocated use of fair value to record an equity interest granted to settle debt in a troubled debt restructuring and recognition of a resulting gain on restructuring, some advocated including that gain in measuring net income and others advocated including it directly in the debtor's equity accounts. Those favoring inclusion in net income argued that all gains from troubled debt restructurings are components of net income whether they arise from transfer of assets or grant of equity interests. Those favoring direct inclusion in owners' equity argued that, to the extent an equity interest is involved, the restructuring is a capital transaction and gains resulting from capital transactions should be recognized as direct increases in paid-in or contributed owners' equity rather than as components of net income.

.095 Those who advocated that the debtor's increase in equity for an equity interest granted should be the carrying amount of

[32] "Fair value" in this context normally means the fair value of the liability satisfied or the fair value of the equity interest granted, whichever is the more clearly evident (*APB Opinion No. 16,* paragraph 67 [section 1091.67], and *APB Statement No. 4,* paragraph 182 [section 1027.08]).

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

the debt settled also argued that granting an equity interest is essentially a capital transaction to which the notion of a gain does not apply. That solution was proposed in the November 7, 1975 Exposure Draft. Advocates of that view noted that paragraph 187 of *APB Statement No. 4* [section 1027.13] states that, among other sources, increases in owners' equity arise from investments in an enterprise by its owners. According to that view, a creditor that accepts an equity interest in the debtor in satisfaction of a receivable becomes an owner; the debtor's measure of the owners' investment is the carrying amount of the payable settled.

.096 After considering the comments received in response to the November 7, 1975 Exposure Draft, the May 11, 1976 Discussion Memorandum, and the Exposure Draft, the Board concluded that a debtor should record an equity interest in the debtor granted to a creditor to settle a payable in a troubled debt restructuring at its fair value, and the difference between that fair value and the carrying amount of the payable settled should be recognized as a gain in measuring net income. The Board recognizes that, for some debtors involved in troubled debt restructurings, estimating either the fair value of the equity interest granted or the fair value of the payable settled may be difficult. That estimate is necessary, however, to measure separately the consideration received for the equity interest and the gain on restructuring. To include the gain on restructuring in contributed equity would violate a clear principle for accounting for issues of stock—capital stock issued is recorded at the fair value of the consideration received (*APB Statement No. 4,* paragraph 182 [section 1027.08]). The consideration received for the stock issued in that kind of troubled debt restructuring is cancellation of the payable (or part of it), but the fair value of the consideration received is not measured by the carrying amount of the payable. Whether the consideration received is measured by the fair value of the stock issued or the fair value of the payable cancelled, the consideration is less than the carrying amount of the payable. To record the stock issued at the carrying amount of the payable thus results in recording the stock at an amount in excess of the consideration received; to include the gain in restructuring in contributed equity instead of net income gives the same result.

.097 To recognize a gain on restructuring acknowledges that the creditor accepted something less than the carrying amount of the payable to settle it. Since that is the essential result whether the restructuring is in the form of a transfer of assets from debtor to creditor or the form of a grant to the creditor of an equity inter-

est in the debtor, the Board believes that essentially the same accounting applies in the existing accounting framework to both kinds of restructurings. Although the creditor becomes an owner of the debtor to the extent that the creditor accepts an equity interest in the debtor, that is a consequence of the kind of consideration used to settle a payable in a restructuring. The restructuring itself is an agreement between a debtor and a creditor, and the gain to the debtor results because the creditor accepted less consideration than the carrying amount of the debt.

Classification of Debtor's Gain on Restructuring

.098 Alternatives considered by the Board for classifying gain on a troubled debt restructuring in the debtor's financial statements were that the gain is: (a) always included in measuring net income in accordance with *APB Opinion No. 30* [section 2012], (b) always included in measuring net income as an extraordinary item, and (c) always included as a direct addition to paid-in capital. Most respondents addressing the question recommended classifying a gain on restructuring debt as an extraordinary item, primarily because they perceived it to be similar to gains or losses on extinguishment of debt that, according to *FASB Statement No. 4* [section 2013], shall be aggregated and, if material, classified as an extraordinary item, net of related income tax effect. Some respondents recommended classifying the gain as a direct increase in paid-in capital, contending that since the gain results from a unilateral action by the creditor, the debtor has in effect received a contribution to equity from the creditor.

.099 The Board concluded that a gain on restructuring (net of related income tax effect), if material, should always be classified as an extraordinary item in measuring the debtor's net income. The Board recognized that to apply the criteria in *APB Opinion No. 30* [section 2012] to a particular debtor's gain on restructuring would not necessarily result in its classification as an extraordinary item. The Board concluded, however, that a gain on restructuring of a payable in a troubled debt restructuring is indistinguishable from a gain or loss on other extinguishments of debt, and the same classification in financial statements is appropriate. Since *FASB Statement No. 4* [section 2013] classifies a gain or loss on extinguishment of debt as an extraordinary item, the classification is appropriate for a gain on restructuring of a payable.

.100 Some respondents suggested that "legal fees and other direct costs that a debtor incurs in granting an equity interest

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

to a creditor in a troubled debt restructuring" (paragraph .024) always be included as extraordinary items whether or not the debtor recognizes a gain on restructuring. Issuing equity interests is not an extraordinary event for a business enterprise, however, and related costs are not extraordinary items under any existing authoritative literature. Deducting those costs from the proceeds of issue has been customary practice, and this Statement does not change that custom. But only costs of issuing the equity interest may be accounted for that way. All other direct costs of a troubled debt restructuring are expenses of the period of restructuring but shall be deducted from a gain, if any, on restructuring.

Creditor's Accounting for Loss on Restructuring

.101 Some respondents to the Discussion Memorandum, especially financial institutions, indicated that they hold and manage broad groups of earning assets (primarily loans and investments) as portfolios rather than as individual assets. According to them, their primary consideration in making a new loan or investment is to recover the amount invested, and the rate of return on the amount invested is a secondary consideration. Although one objective is to obtain an appropriate rate of return for the particular credit risk, changes in market conditions and general economic conditions as well as changes affecting the individual asset or debtor may cause the actual return from a loan or investment to vary from that originally anticipated. Therefore, the objective is to maintain a portfolio with an average yield that provides an adequate margin over the cost of funds and that has risk, maturity, marketability, and liquidity characteristics that are appropriate for the particular institution. To achieve that objective, the contractual rate of return required on individual loans and investments must include a factor to offset the probability that some of them will become nonearning assets, some will ultimately recover amounts invested only with difficulty, and some will involve loss of at least a portion of the amounts invested.

.102 The financial difficulties of a debtor that lead to a troubled debt restructuring usually require the creditor to consider those difficulties carefully in determining whether to recognize a loss on the existing receivable. Typically, before restructuring occurs, the creditor has determined the need for a related allowance for uncollectible amounts in light of those difficulties. An allowance for uncollectible amounts may have been based on individual receivables, on groups of similar receivables without necessarily attempting to identify particular receivables that may prove un-

collectible, or both. The creditor typically has numerous lending transactions and expects loan losses to recur as a consequence of customary and continuing business activities. Almost all respondents who commented on the classification of a creditor's loss on restructuring recommended that the loss be accounted for in a manner consistent with the enterprise's method of accounting for other losses related to its receivables. Usually that involves recognizing specific losses as they are identified and periodically adjusting the allowance for uncollectible amounts based on an assessment of its adequacy for losses not yet specifically identified. Respondents recommended that the net effect of recognizing specific losses and adjusting the valuation allowance be included in measuring net income in accordance with the provisions of *APB Opinion No. 30* [section 2012].

.103 The Board considered the varied frequency and significance for creditors of troubled debt restructurings in the light of the discussion in *APB Opinion No. 30* [section 2012], and agreed that (a) a creditor should account for a loss from a troubled debt restructuring in the same manner as a creditor's other losses on receivables (that is, as deductions in measuring net income or as reductions of an allowance for uncollectible amounts), and (b) *APB Opinion No. 30* [section 2012] should apply to losses on restructuring that are included in measuring net income.

Creditor's Sale of Assets Received in Restructuring

.104 A creditor whose customary business activities include lending may sell an asset that was previously acquired in a troubled debt restructuring. The consideration received in that sale may be represented, in whole or in part, by a receivable. The Board considered whether a receivable received in that way is exempt from the provisions of *APB Opinion No. 21* because paragraph 3(d) of that Opinion [section 4111.03(d)] states that, except for one paragraph, the Opinion does not apply to several kinds of receivables or payables or activities, including "the customary cash lending activities and demand or savings deposit activities of financial institutions whose primary business is lending money." Some respondents to the Exposure Draft held that acquiring and disposing of those assets is part of "the customary cash lending activities" of certain financial institutions.

.105 The "lending activities" referred to in paragraph 3(d) of *APB Opinion No. 21* [section 4111.03(d)] are modified by the words "customary" and "cash," and the Board concluded that the sale of an asset, such as real estate, by a financial institution is distinguishable from its customary cash lending activities. The view that the customary cash lending activities of a finan-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

cial institution include repossession or foreclosure and resale of assets is part of the argument that repossessions and foreclosures are not transactions to be accounted for but merely changes in the form of the asset (paragraphs .066, .067, and .079-.084). The Board rejected that contention and also rejected this part of it. *APB Opinion No. 21* [section 4111] focuses primarily on the possible misstatement of the exchange price (sale price or purchase price) in an exchange of a noncash asset for a receivable or payable, with consequent misstatement in the period of the transaction of gain or loss on sale or acquisition cost and misstatement in later periods of interest income or interest expense. The resale of repossessed or foreclosed assets is that kind of transaction and involves the same questions. Accordingly, the Board concluded that a receivable resulting from sale of an asset received in a troubled debt restructuring is covered by that Opinion, including paragraph 12, which prescribes the measurement of a note (receivable) exchanged "for property, goods, or service in a bargained transaction entered into at arm's length."

ACCOUNTING FOR RESTRUCTURINGS INVOLVING MODIFICATION OF TERMS

Background Information

.106 A creditor holds a receivable with the expectation that the future cash receipts, both those designated as interest and those designated as face amount, specified by the terms of the agreement will provide a return of the creditor's investment in that receivable and a return on the investment (interest income).[33] That essential nature of a creditor's investment in a receivable is the same whether the creditor invested cash (for example, a cash loan to a debtor or a cash purchase of debt securities) or exchanged assets or services (for example, a sale of the creditor's services, product, or other assets) for the receivable.

.107 Similarly, a debtor expects the future cash payments specified by the terms of a payable to include a cost (interest expense) for the privilege of deferring repayment of funds borrowed or deferring payment for goods or services acquired. The essential nature of a debtor's payable is the same whether the debtor received cash in exchange for the payable (for example, a cash loan

[33] The terms of some short-term receivables and payables (for example, trade accounts receivable or payable) may not be expected to result in interest income or interest expense to the creditor or debtor except as it may be implicit in the transaction (for example, implicit in the price of a product sold or purchased on account).

or the issue of debt securities for cash) or received other assets or services (for example, a purchase of services, materials, or other assets from the creditor).

.108 The difference between the amount a creditor invests in a receivable and the amount it receives from the debtor's payments of interest and face amount is the return on the investment (interest income) for the entire period the receivable is held. Similarly, the difference between the amount a debtor receives and the amount it pays for interest and face amount is the cost of deferring payment (interest expense) for the entire period the payable is outstanding. The question that must be answered to account for a debt (a receivable or payable) and related interest is how that total interest income or expense is to be allocated to the accounting periods comprising the entire period that the receivable is held or the payable is outstanding.

.109 That allocation of interest income or expense to periods is normally accomplished in present accounting practice by the interest method, which measures the interest income or expense of each period by applying the effective interest rate implicit in the debt to the amount of the debt at the beginning of the period, assuming that all cash receipts or payments will occur as specified in the agreement. The effective interest rate implicit in the debt may be the same as or different from the interest rate stated in the agreement (the stated interest rate). The effective and stated rates are the same if the amount invested or borrowed equals the face amount; the rates differ if the amount invested or borrowed is greater or less than the face amount.

.110 Thus, the recorded investment in a receivable or the carrying amount of a payable, both at the time of the originating transaction and at the beginning of each period comprising the entire period a receivable is held or a payable is outstanding, is the sum of the present values of (a) the amounts of periodic future cash receipts or payments that are designated as interest and (b) the face amount of cash due at maturity, both discounted at the effective interest rate implicit in the debt. If the effective interest rate differs from the stated interest rate, the recorded investment in the receivable or carrying amount of the payable in financial statements is the face amount plus unamortized premium or less unamortized discount, and that amount is used to measure the interest income or expense, as described in the preceding paragraph.

.111 Numerous references to and descriptions of the concepts and procedures referred to in paragraphs .108-.110 are found in the pronouncements of the Accounting Principles Board and

the Financial Accounting Standards Board, for example, on accounting for leases (*FASB Statement No. 13* [section 4053]); accounting for the cost of pension plans (*APB Opinion No. 8* [section 4063]); accounting for interest on receivables and payables (*APB Opinions No. 12* [section 5361] *and No. 21* [section 4111]); accounting for early extinguishment of debt (*APB Opinion No. 26* [section 5362]); recording receivables and payables of a company acquired in a business combination (*APB Opinion No. 16,* paragraphs 87-89 [section 1091.87-.89]); and translating receivables and payables denominated in a foreign currency (*FASB Statement No. 8,* paragraph 39 [section 1083.039]).

.112 Pronouncements of the Accounting Principles Board also include several specific statements of broad principle. They include: "The general principles to apply the historical-cost basis of accounting to an acquisition of an asset depend on the nature of the transaction: . . . b. An asset acquired by incurring liabilities is recorded at cost—that is, at the present value of the amounts to be paid" (*APB Opinion No. 16,* paragraph 67 [section 1091.67]); "Conceptually, a liability is measured at the amount of cash to be paid discounted to the time the liability is incurred" (*APB Statement No. 4,* paragraph 181 [M-1C] [section 1027.07]); and ". . . upon issuance, a bond is valued at (1) the present value of the future coupon interest payments *plus* (2) the present value of the future principal payments (face amount). . . . discounted at the prevailing market rate of interest . . . at the date of issuance of the debt" and ". . . the difference between the present value and the face amount should be treated as discount or premium and amortized as interest expense or income over the life of the note in such a way as to result in a constant rate of interest when applied to the amount outstanding at the beginning of any given period. This is the 'interest' method described in and supported by paragraphs 16 and 17 of *APB Opinion No. 12* [section 5361.01-.02]" (*APB Opinion No. 21,* paragraphs 18 [Appendix] and 15 [sections 4111A.01 and 4111.14]).

Kinds of Modifications and Accounting Issues

.113 Agreements between a creditor and a debtor that modify the terms of an existing debt may affect (i) only the *timing* of future cash receipts or payments specified by the agreement—the timing of periodic interest, the maturity date, or both, (ii) only the *amounts* of cash to be received or paid—the amounts of interest, face amount, or both, or (iii) *both* timing and amounts of cash to be received or paid.

.114 Two major issues arise in accounting for an existing debt whose terms are modified in a troubled debt restructuring. One issue involves whether to: (a) continue the same recorded invest-

ment for the receivable or carrying amount for the payable and recognize the effects of the new terms prospectively as reduced interest income or expense or (b) recognize a loss or gain by changing the recorded amount. The interest method (paragraph .109) is used in both (a) and (b) to allocate interest income or expense to periods between restructuring and maturity, but in general, the implicit annual interest rate will be higher, and the resulting interest income or expense will be larger in each of the remaining periods, if a loss (creditor) or gain (debtor) is recognized at the time of a troubled debt restructuring, as in (b), than if the effects of the new terms are recognized prospectively, as in (a).

.115 The other issue involves two related questions: Should the same accounting (either (a) or (b) in paragraph .114) apply both to modifications of *timing* and to modifications of *amounts* to be received or paid under the agreement? And should the same accounting apply both to modifications of *interest* and to modifications of *face amount*? The following paragraphs explain and illustrate those issues and summarize the arguments advanced for various proposed solutions.

.116 Modifications of terms that affect only the *timing* of amounts to be received or paid do not change the total amount to be received or paid. However, changes in timing of the amounts to be received or paid on a debt change its present value determined by discounting at the prerestructuring effective interest rate or a current market interest rate or change the effective interest rate needed to discount the amounts to the prerestructuring present value (recorded investment in receivable or carrying amount of payable) or market value. Modifications that affect only the *amount* of interest or face amount (or both unless they are exactly offsetting) to be received or paid change total amounts as well as present values, effective interest rates, or both. Modifications of *both timing and amount* to be received or paid combine those effects. A hypothetical case illustrates those kinds of modifications and their effects.

.117 A creditor holds a receivable calling for receipt of $100 at the end of each year for five more years and receipt of the $1,000 face amount at the end of those five years. The stated interest rate is 10 percent, compounded annually. The recorded investment in the receivable is $1,000, and the effective annual interest rate implicit in the investment is also 10 percent. If all amounts are received as agreed, the creditor will receive total interest income of $500—the difference between the total amount to be received ($1,500) and the recorded investment in the receivable ($1,000)—

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

and the effective interest rate on the $1,000 investment will be 10 percent. However, the terms of the receivable are to be modified in a troubled debt restructuring. The four modifications that follow are examples of the three kinds of modifications described in paragraphs .113 and .116 (change in amount of interest and change in face amount are both illustrated; change in timing of face amount raises no issues different from change in timing of interest and is not illustrated):

1. *Timing of interest only*—Terms modified to defer collection of interest until the receivable matures (a single collection of $500 at the end of five years is substituted for five annual collections of $100).

2. *Amount of interest only*—Terms modified to leave unchanged the timing of interest and the timing and amount of the face amount but reduce the annual interest from $100 to $60.

3. *Amount of face amount only*—Terms modified to leave unchanged the amounts and timing of interest but reduce the face amount to $800 due at the end of five years.

4. *Both timing of interest and amount of face amount*—Terms modified to defer collection of interest until the receivable matures and reduce the face amount to $800 (modifications 1 and 3 combined).

.118 The following chart lists several factual observations that can be made about the effects on the creditor's receivable of each of those restructurings. In general, the same observations apply to the debtor's payable.

	Before Modification
Observation:	
a. Amount by which total cash receipts specified by the terms exceed recorded investment in the receivable:	
Interest	$ 500
Face amount	1,000
Total cash receipts	$1,500
Recorded investment	1,000
Excess of specified cash receipts over recorded investment	$ 500
b. Effective interest rate on the recorded investment ($1,000)	10.0%
c. Present value of the total cash receipts discounted at the prerestructuring effective interest rate (10%)	$1,000
d. Present value of the total cash receipts discounted at the current market interest rate (assumed to be 12%)	$ 928
e. Face amount specified by the terms	$1,000

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Modification 1 (Timing Only)	Modification 2 (Amount of Interest Only)	Modification 3 (Amount of Face Amount Only)	Modification 4 (Timing and Amount)
$ 500	$ 300	$ 500	$ 500
1,000	1,000	800	800
$1,500	$1,300	$1,300	$1,300
1,000	1,000	1,000	1,000
$ 500	$ 300	$ 300	$ 300
8.5%	6.0%	6.5%	5.4%
$ 931	$ 848	$ 876	$ 807
$ 851	$ 784	$ 814	$ 738
$1,000	$1,000	$ 800	$ 800

Alternatives Considered

.119 Proposals for accounting for troubled debt restructurings tend to focus on the various observations (paragraph .118) about the effects of modifying the terms of a debt.

a. Some respondents focused on the effect of a troubled debt restructuring on the effective interest rate (observation (b)). They would not reduce the recorded investment in a receivable or carrying amount of a payable and recognize a loss (creditor) or gain (debtor) as long as the new terms did not result in a negative effective interest rate on the recorded investment or carrying amount—that is, as long as the total future cash receipts or

payments specified by the new terms (including both amounts designated as interest and the amount designated as face amount) at least equaled the recorded investment or carrying amount (observation (a)). Thus, they would recognize no loss or gain for any of the four modifications in the illustration in paragraphs .117 and .118.

b. Some respondents focused on the effect of a troubled debt restructuring on the face amount of the debt (observation (e)). They would not reduce the recorded investment in a receivable or carrying amount of a payable as long as the restructuring modified only the timing or amount of designated interest or the timing of the designated face amount, but would recognize a loss (creditor) or gain (debtor) if restructuring reduced the face amount of the debt. Thus, they would recognize a loss or gain for modifications 3 and 4 in the illustration.

c. Some respondents focused on the effect of a troubled debt restructuring on the present value of the debt discounted at the effective interest rate before restructuring (observation (c)). They would reduce the recorded investment in a receivable or carrying amount of a payable to the present value of the total future cash receipts or payments under the new terms discounted at the prerestructuring effective interest rate and recognize a loss (creditor) or gain (debtor) equal to the reduction. Thus, they would recognize a loss or gain for each of the modifications in the illustration.

d. Some respondents focused on the fair or market value of the debt after a troubled debt restructuring. They would account for each restructuring as an exchange of debt, recording a new receivable or payable at its fair or market value and recognizing a loss (creditor) or gain (debtor) for the difference between that fair or market value and the recorded investment or carrying amount of the receivable or payable replaced. Thus, they would recognize a loss or gain for each of the modifications in the illustration.

The following paragraphs summarize those four views and their variations.

Change in Effective Rate View

.120 Some respondents emphasized that, in the absence of a transfer of resources or obligations, the existing accounting framework does not require losses to be recognized or permit gains to be

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

recognized because of events that affect only future profitability of an investment but do not affect the recoverability of the investment itself. They contended that applying that principle to troubled debt restructurings means that no loss or gain should be recognized on a debt because of modification of terms of debt unless part of the recorded investment in a receivable is not recoverable or part of the carrying amount of a payable will not be paid under the new terms. In their view, a creditor should recognize a loss to the extent that the total future cash receipts specified by the new terms is less than the recorded investment in the receivable, and a debtor should recognize a gain to the extent that the total future cash payments specified by the new terms is less than the carrying amount of the payable.

.121 According to that view, if the recorded investment in a receivable is recoverable or the carrying amount of a payable is to be paid under the new terms,[34] interest income or expense is allocated to the periods between restructuring and maturity of the debt by using the reduced effective interest rate that is implicit in the difference between the recorded investment or carrying amount before (and after) restructuring and the future cash receipts or payments specified by the new terms. If a loss or gain is recognized at the time of restructuring, the recorded investment or carrying amount equals the total future cash receipts or payments, and no interest income or expense is allocated to the remaining periods between restructuring and maturity.

.122 Some of those respondents contended that the amount invested by a creditor in a receivable has some of the characteristics of, and is analogous to, an investment in plant, property, intangibles, and similar assets sometimes called "capital assets." According to that analogy, modifying the terms of receivables in troubled debt restructurings is similar to modifying selling prices of products produced by those capital assets; the modifications affect the profitability of those assets but are not recorded in the existing accounting framework unless they result in an inability to recover the investment in the assets. That capital asset analogy leads its proponents to accounting for troubled debt restructurings that is essentially the same as that described in paragraphs .120 and .121.

.123 Certain respondents who supported the views described in paragraphs .120-.122 argued that the resulting accounting not only is required by the existing accounting framework but also accur-

[34] The likelihood of collection of the amounts specified by the new terms of a receivable should, of course, be assessed in determining allowances for estimated uncollectible amounts.

ately describes a troubled debt restructuring involving only modification of terms. They held that, unless the effective interest rate on a debt becomes negative in a troubled debt restructuring, the essential effect of modifying terms is to reduce the effective interest rate on the debt—that is, to decrease the effective rate of return to the creditor and to decrease the effective cost to the debtor of deferring payment. For example, some responding financial analysts argued that to disclose the creditor's new effective interest rate on restructured receivables would be more useful for their purposes than for the creditor to report a loss on restructuring and then show those receivables to be earning the prerestructuring interest rate, the current market interest rate, or some other rate higher than the effective rate on the recorded investment in a receivable before restructuring.

.124 According to respondents who emphasized the effect of a troubled debt restructuring on the effective interest rate, there is no economic basis for distinguishing modifications of future cash receipts or payments designated as interest from modifications of future cash receipts or payments designated as face amount. They argued that a creditor in a troubled debt restructuring attempts first to assure recovery of its investment (which is represented in its financial statements by the recorded investment in the receivable) and then to obtain the highest interest income commensurate with the situation. Whether the amounts to be received under the new terms are designated as receipts of interest or receipt of face amount is a minor consideration; the significant question is whether the new terms allow the creditor to recover its investment.

.125 According to that view, since numerous combinations of receipts or payments designated as interest and face amount can be structured to produce a particular present value or effective interest rate, to base accounting on that distinction is likely to result in questionable, if not indefensible, financial reporting. The creditor in a troubled debt restructuring may have considerable flexibility in designating a proportion of the future receipts or payments under the new terms as interest and designating another proportion as face amount. If those designations were to dictate the accounting, a creditor desiring to recognize a loss on restructuring and to recognize higher interest income for later periods could restructure terms in one way, while a creditor desiring to avoid recognizing a loss on restructuring and to recognize lower interest income for later periods could restructure the terms in another way, even though the underlying cash receipts specified by the new terms were the same, both in timing and amount, for both creditors. A creditor desiring to recognize a gain on restructuring could conceivably in-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

crease the amount designated as face amount to an amount higher than the present recorded investment and reduce the amounts designated as receipt of interest; a debtor might agree to that arrangement if it were financially troubled at the time of restructuring but expected to be able to pay the higher face amount later.

Change in Face Amount View

.126 Some respondents distinguished modifications of face amounts from modifications affecting only amounts or timing of receipts or payments designated as interest or timing of the maturity date. They would neither reduce recorded investment in a receivable or carrying amount of a payable nor recognize loss or gain in a troubled debt restructuring if a modification of terms of a debt changed only the *amounts or timing* of receipts or payments designated as interest or changed the *timing* of receipts or payments designated as face amount. They held, however, that if a troubled debt restructuring *reduces the face amount* of a debt, the creditor should recognize a loss, and the debtor should recognize a gain.[35]

.127 To record a modification of terms involving reduction of face amount of a debt, proponents of that view would reduce the recorded investment in the receivable or carrying amount of the payable by the same proportion as the reduction of the face amount and recognize a loss (creditor) or gain (debtor) for that amount. If the restructuring changed the effective interest rate on the remaining recorded investment or carrying amount, they would allocate interest income or expense to the remaining periods between restructuring and maturity using that new effective interest rate. That rate would be implicit in the difference between the new recorded investment in the receivable or carrying amount of the payable and the future cash receipts or payments specified by the new terms. That rate would be higher for a debt whose face amount had been reduced, and would therefore result in more interest income or expense for those periods, than the rate described in paragraph .121.

.128 Respondents who distinguished between modifications of terms that change the face amount of a debt and other kinds of modifications generally agreed with the view expressed in paragraphs .120 and .122 that the existing accounting framework does not recognize losses or gains from events that change the profitability of existing assets but requires a loss to be recognized if the event causes part or all of an investment in an asset to become un-

[35] Some proponents of this view opposed recognizing gains from troubled debt restructurings not involving transfers of assets or grants of equity interests.

recoverable. Those respondents gave several reasons for concluding that reduction of face amount of a debt in a troubled debt restructuring requires proportionate reduction of the recorded investment in the receivable or carrying amount of the payable and recognition of a resulting loss or gain.

.129 Some respondents who favored accounting based on a distinction between modifications of face amount and other modifications argued that to the extent that the face amount of a debt is reduced, the debtor-creditor relationship has been terminated, and the accounting should recognize that termination. In other words, the face amount adjusted by a premium or discount, if any, measured in the market at the time a receivable or payable was created is recognized in the existing accounting framework as an asset for the creditor or liability for the debtor; reducing that face amount therefore reduces an asset or liability proportionately, and the reduction must be recognized. In their view, to the extent the face amount is reduced, a transfer of resources or obligations occurs.

.130 Some respondents described the analogy between a creditor's investment in a receivable and an investment in "capital assets" that is noted in paragraph .122 and contended that reductions of face amounts of receivables in troubled debt restructurings are analogous to events that reduce the amount, rather than the future profitability, of capital assets. Both they and the respondents whose view is described in the preceding paragraph held that the act of reducing the face amount showed that the creditor and debtor agreed that the receivable and payable had been decreased.

.131 Some respondents contended in effect that accounting for receivables and payables in the existing accounting framework is based on the face amount of a receivable or payable, or perhaps on the face amount plus a premium or minus a discount at the date of acquisition or issue, and a change in the face amount is a change in an asset (receivable) or liability (payable). They implicitly assumed or concluded that the present value concepts described in the pronouncements noted in paragraphs .111 and .112 did not apply to receivables or payables involved in troubled debt restructurings. Thus, they contended that the distinction between the face amount due at maturity and the amounts designated as interest to be received or paid periodically until maturity is vital in determining proper accounting for a troubled debt restructuring. According to that view, the face amount due at maturity (sometimes referred to as the "principal") is the basis of the recorded investment in a receivable or carrying amount of a payable; that investment or carrying amount does not include the present

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

value of future receipts or payments designated as interest. That is, a creditor or debtor records the face amount (perhaps increased by premium or decreased by discount) when a receivable is obtained or a payable is incurred, and no value is ascribed in the accounts to rights to receive or obligations to pay amounts designated as interest; rather, cash receipts or payments designated as interest are recognized in the accounts only as they become receivable or payable in future periods. Some respondents holding that view added that to record a loss (creditor) or gain (debtor) because future cash receipts or payments designated as interest are modified in a troubled debt restructuring would represent abandonment of the existing historical cost framework and constitute piecemeal implementation of current value accounting.

.132 Several respondents who supported the views described in paragraphs .126-.131 held that the accounting required by those views is presently used, at least by some financial institutions. Some banker respondents indicated that troubled debt restructurings involving reductions in face amount or "principal" are exceedingly rare, but that most bankers would probably recognize a loss of "principal" in recording one in which their institution was the creditor.

.133 Differences between the view that focuses on the effect of a troubled debt restructuring on face amount (paragraphs .126-.132) and the view that focuses on its effect on the effective interest rate (paragraphs .120-.125) pertain wholly to troubled debt restructurings that reduce the amount designated as face amount. Both views lead to the same accounting for troubled debt restructurings involving other kinds of modification of terms.

Present Value at Prerestructuring Rate View

.134 Some respondents contended that accounting for troubled debt restructurings should recognize the revised pattern of cash receipts or payments under the new terms of the restructured debt. That is, they would continue to use the effective interest rate established when the receivable was acquired or payable was incurred and would reduce the recorded investment or carrying amount to the present value of the future cash receipts or payments specified by the new terms.

.135 Those respondents in effect supported the accounting proposed in the FASB Exposure Draft, "Restructuring of Debt in a Troubled Loan Situation" (November 7, 1975): a debtor should account for a troubled debt restructuring that involves modification of terms of debt by adjusting the carrying amount of the payable

to the present value of the cash payments (both those designated as interest and those designated as face amount) required of the debtor after restructuring, discounted at the prerestructuring effective interest rate, and recognizing a gain on restructuring of the payable equal to the difference, if any, between that present value and the carrying amount of the payable before restructuring (paragraph 6 of that Exposure Draft). Since a troubled debt restructuring almost invariably involves stretching out or deferring the debtor's payments, and may involve reducing amounts due as well, the present value of a restructured payable is almost invariably less than its carrying amount (both are determined by discounting at the same interest rate); a debtor would thus normally recognize a gain on the restructuring. The November 7, 1975 Exposure Draft dealt only with accounting by debtors, but if the counterpart accounting were adopted by creditors, the creditor would normally recognize a loss equal to the difference between its recorded investment in the receivable before restructuring and the present value at the prerestructuring effective interest rate. Interest expense or income in future periods would continue to be based on the prerestructuring interest rate.

.136 Some respondents who held the view described in paragraphs .134 and .135 agreed with the view in paragraphs .124 and .125 that no economic basis exists for distinguishing between modifications of face amounts and other kinds of modifications. The major difference between the two views is that the accounting for one view (paragraphs .134 and .135) retains the same effective interest rate as before restructuring and changes the present value of the future cash receipts or payments specified by the new terms, while the other view (paragraphs .124 and .125) retains the same present value as before restructuring (the recorded investment in a receivable or carrying amount of a payable)[36] and changes the effective interest rate for the periods remaining between restructuring and maturity.

Fair Value View

.137 Some respondents contended that modifying terms in a troubled debt restructuring results in an exchange of new debt for the previous debt. The new debt should be recorded at its fair value—usually the present value of the future cash receipts or payments specified by the new terms (whether designated as interest or face amount) discounted at the current market rate of interest for receivables or payables with similar terms and risk

[36] Unless the restructuring causes the effective interest rate to fall below zero.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

characteristics. Those respondents contended that every debt restructuring is an exchange transaction (paragraph .068), and they would recognize a loss (creditor) and gain (debtor) to the extent of the difference between the recorded investment in the receivable or carrying amount of the payable before restructuring and the fair value of the receivable or payable after restructuring. Interest income and expense in future periods would be based on the market rate of interest at the time of restructuring.

.138 Respondents who supported the view just described agreed that designations of amounts as face amount or interest should not determine whether a loss or gain should be recognized (paragraphs .124 and .125) because only the amounts and timing of cash receipts or payments, and not their names, affect the present value of a receivable or payable. They disagreed with other respondents by contending that the current market interest rate—which gives the fair value of a receivable or payable—should be used because an exchange transaction had occurred.[37]

.139 Some of the responding financial analysts indicated a preference for accounting that does not use a current interest rate to determine whether a creditor should recognize a loss in a troubled debt restructuring involving modification of terms. According to them, to use a current interest rate to discount future cash receipts only for receivables that have been restructured would not result in meaningful information about the earning potential of a creditor's entire loan or investment portfolio and might be confusing because receivables that were not restructured would continue to reflect the various historical interest rates at the time of each investment.

Conclusions on Modification of Terms

.140 After considering the information received in connection with (i) the Exposure Draft, "Restructuring of Debt in a Troubled Loan Situation" (November 7, 1975), and the public hearing based on it (paragraph .048), (ii) the Discussion Memorandum, "Accounting By Debtors and Creditors When Debt Is Restructured" (May 11, 1976), and the public hearing based on it (paragraph .052), and (iii) the Exposure Draft, the Board concluded that the substance of all modifications of a debt in a troubled debt restructuring is essentially the same whether they are modifications of

[37] Some respondents contended that the fair value of the receivable or payable after restructuring should be measured by discounting the future cash flows specified by the new terms at the cost of capital to the creditor or debtor, as appropriate.

timing, modifications of amounts designated as interest, or modifications of amounts designated as face amounts. All of those kinds of modifications affect future cash receipts or payments and therefore affect (a) the creditor's total return on the receivable, its effective interest rate, or both and (b) the debtor's total cost on the payable, its effective interest rate, or both. The Board believes that accounting for restructured debt should be based on the substance of the modifications—the effect on cash flows—not on the labels chosen to describe those cash flows.

.141 The Board thus rejected views that modifications involving changes in face amounts should be distinguished from and accounted for differently from modifications involving amounts of future cash receipts or payments designated as interest and modifications involving timing of future cash receipts or payments. The major reason for that rejection is given in the preceding paragraph: the substance of a troubled debt restructuring lies in its effect on the *timing and amounts* of cash receipts or payments due in the future. Whether an amount due at a particular time is described as face amount or interest is of no consequence to either the present value of the receivable or payable or its effective interest rate.

.142 The Board considered the views described in paragraphs .129-.132 and rejected them to the extent they conflict with the Board's conclusions. In the Board's view, a debtor-creditor relationship is described by the entire agreement between the debtor and creditor and not merely by the face amount of the debt. Changes in that relationship therefore encompass changes in timing and changes in amounts designated as interest as well as changes in an amount designated as face amount. The same reasoning applies to the analogy between debt and investment in "capital assets." A reduction in a troubled debt restructuring of an amount designated as face amount is not, in the Board's view, analogous to the loss or destruction of a portion of a capital asset. Indeed, the economic impact of reducing an amount designated as face amount is essentially the same as that of reducing by the same amount an amount designated as interest that is due at the same time. Thus, although an analogy between investment in a receivable and investment in a capital asset may have merit, an analogy between an amount designated as the face amount of a receivable and the physical entirety of a capital asset does not.

.143 The Board also rejected the view that accounting is based on the face amount or "principal" in the existing accounting framework. That view is not consistent with the weight of the pro-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

nouncements noted in paragraphs .111 and .112 to the effect that the recorded investment in a receivable or carrying amount of a payable is the present value of the future cash receipts or payments specified by the terms of the debt discounted at the effective interest rate that is implicit in the debt at its inception. That accounting explicitly excludes from the recorded investment in a receivable or carrying amount of a payable the interest income or expense to be recognized in future periods. The interest method recognizes that interest income or expense as a constant percent (the effective interest rate) of the recorded investment or carrying amount at the beginning of each future period as the interest income or expense becomes receivable or payable. The method is not a "current value method" as that term is generally used in the accounting literature, unless the effective interest rate used to determine present value and interest income or expense each period is the current market interest rate for the period.

.144 The Board noted the argument that current practice in some financial institutions is to record losses based on reductions in troubled debt restructurings of amounts designated as face amount. The Board also noted that several respondents indicated that modifications of terms of that kind almost never occur. Presumably, a creditor would generally prefer to alleviate the debtor's cash difficulties by deferring payment of the amount designated as face amount rather than by reducing it because deferring payment preserves a creditor's maximum claim in the event of the debtor's bankruptcy. The Board decided that accounting for reductions in troubled debt restructurings of amounts designated as face amounts, although occurring only rarely, should be made consistent with accounting for other modifications of future cash receipts or payments in troubled debt restructurings and with the accounting pronouncements referred to in paragraphs .111 and .112.

.145 The Board also considered the views described in paragraphs .134-.139 and rejected them to the extent they conflict with the Board's conclusions. The Board concluded that since a troubled debt restructuring involving modification of terms of debt does not involve transfers of resources or obligations (paragraph .077), restructured debt should continue to be accounted for in the existing accounting framework, on the basis of the recorded investment in the receivable or carrying amount of the payable before the restructuring. The effective interest rate on that debt should be determined by the relation of the recorded investment in the receivable or carrying amount of the payable and the future cash receipts or payments specified by the new terms of the debt.

.146 To introduce the current market interest rate to provide a new measure of the recorded investment in a restructured receivable or carrying amount of a restructured payable is inappropriate in the existing accounting framework in the absence of a transfer of resources or obligations, that is, if only the terms of a debt are modified in a troubled debt restructuring. Moreover, since the new terms are not negotiated on the basis of the current market rates of interest, there is little or no reason to believe that a current market rate of interest applied to the restructured debt reflects the effective return to the creditor or the effective cost to the debtor. On the contrary, the circumstances of a troubled debt restructuring give every reason to believe that, except by coincidence, it does not. Similarly, there is little or no reason to believe that a restructured debt continues to earn or cost the same effective interest rate as before the restructuring. The restructuring reflected the creditor's recognition that its investment in the receivable no longer could earn that rate and that a lower effective rate was inevitable. In other words, the effect of the restructuring was to decrease the effective interest rate on a continuing debt, and the accounting should show that result.

.147 The Board found persuasive the arguments that a creditor in a troubled debt restructuring is interested in protecting its unrecovered investment (represented in the accounts by the recorded investment in the receivable) and, if possible, obtaining a return. To the creditor, therefore, the effect of a restructuring that provides for recovery of the investment is to reduce the rate of return (the effective interest rate) between the restructuring and maturity. Similarly, the effect of that kind of restructuring to the debtor is to reduce the cost of credit (the effective interest rate) between the restructuring and maturity.

.148 Thus, the Board concluded that no loss (creditor) or gain (debtor) should be recognized in a troubled debt restructuring if the total future cash receipts or payments (whether designated as interest or face amount) specified by the new terms at least equals the recorded investment or carrying amount of the debt before the restructuring. The creditor should reduce the recorded investment in the receivable and recognize a loss and the debtor should reduce the carrying amount of the payable and recognize a gain to the extent that the recorded investment or carrying amount exceeds the total cash receipts or payments specified by the new terms. Some respondents to the Exposure Draft apparently misunderstood the reason for using *total* future cash receipts or payments to compare with the recorded investment in a receivable or the carrying amount of a payable to determine whether to recognize

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

a loss or gain on restructuring. Some wondered if the failure to discount the future cash flows implied changes in pronouncements that require discounting or de-emphasis or abandonment by the Board of discounting methods. On the contrary, the Statement is based solidly on the need to consider the effect of interest. Indeed, the Board's conclusion is that a troubled debt restructuring affects primarily the effective interest rate and results in no loss or gain as long as the effective rate does not fall below zero. It requires recognition of a loss to prevent the effective rate from falling below zero. The effective interest rate inherent in the unrecovered receivable or unpaid payable and the cash flows specified by the modified terms is then used to recognize interest income or interest expense between restructuring and maturity.

.149 The Board also concluded that the fair values of assets transferred or equity interest granted in partial settlement of debt in a troubled debt restructuring should be accounted for the same as a partial cash payment. The recorded investment in the receivable or carrying amount of the payable should be reduced by the amount of cash or fair value transferred, and the remaining receivable or payable should be accounted for the same as a modification of terms. That accounting avoids basing losses or gains on restructuring on arbitrary allocations otherwise required to determine the amount of a receivable satisfied or payable settled by transfer of assets or grant of an equity interest.

.150 Several respondents to the Exposure Draft disagreed with its proposed conclusions on accounting for modifications of terms in troubled debt restructurings. One group, which favored accounting for all troubled debt restructurings at fair value as exchanges of debt, criticized the Exposure Draft for failing to recognize losses and gains from decreases in present values of receivables and payables, for being inconsistent with *APB Opinions No. 21* [section 4111] and *No. 26* [section 5362], and for elevating form over substance. Another group, which agreed with the Exposure Draft except for restructurings in which face amounts of receivables are reduced, criticized it for failing to recognize losses and gains from decreases in face amounts, for changing existing practice, and for elevating form over substance. Both views are discussed individually in earlier paragraphs (.126-.139) and are there shown to be virtually opposite views to each other, but they have some similarities when compared to the accounting in the Exposure Draft and this Statement.

.151 For example, both criticisms of the Exposure Draft noted in the preceding paragraph result from rejection of fundamental

conclusions in the Exposure Draft. Thus, respondents who favor accounting for all troubled debt restructurings as exchanges of debt disagreed with the conclusions that "a troubled debt restructuring that does not involve a transfer of resources or obligations is a continuation of an existing debt" and "to the extent that a troubled debt restructuring involves only a modification of terms of continuing debt, no transfer of resources or obligations has occurred (paragraphs .076 and .077). Respondents with that view presumably saw troubled debt restructurings as of the same essence as exchanges covered by *APB Opinions No. 21* [section 4111] and *No. 26* [section 5362] and found the Exposure Draft inconsistent with those Opinions. If, however, the conclusions quoted earlier in this paragraph are accepted, modifications of terms of continuing debt are different in substance from exchanges of resources or obligations, and the Exposure Draft is consistent with the Opinions.

.152 Similarly, some respondents who favor recognizing losses and gains from reducing face amounts in troubled debt restructurings disagreed with the conclusion that "the substance of all modifications of a debt in a troubled debt restructuring is essentially the same whether they are modifications of timing, modifications of amounts designated as interest, or modifications of amounts designated as face amounts" (paragraph .140). That is, they think that financial institutions' customary distinctions between principal and interest have more substance than the effects of modifications on future cash flows, although they admit that changes in practice would be minimal because few troubled debt restructurings involve changes in face amounts (paragraph .144).

.153 The fact that elevating form over substance is a criticism common to the arguments of respondents who fundamentally disagreed with the Exposure Draft emphasizes that various views on proper accounting depend on varying perceptions of the substance of modification of terms in a troubled debt restructuring. The preceding paragraphs note three different views of that substance: the view on which the Exposure Draft and this Statement are based and two other views that differ significantly not only from the view adopted but from each other. The Board carefully analyzed all three views before issuing the Exposure Draft and decided on one of them for the reasons stated in paragraphs .106-.152.

.154 Some respondents who agreed generally with the accounting for modifications of terms specified in the Exposure Draft and some who preferred to recognize debtors' gains and creditors' losses from decreases in face amounts expressed concern that a debtor's prepayment may result in recognizing a creditor's loss in the

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

wrong period (they are silent about a debtor's gain). That is, if a debtor may prepay a reduced face amount without penalty, total future cash receipts may actually be less than the recorded investment in the receivable even though the total future amounts specified by the restructured terms are at least equal to the recorded investment, and no loss is recognized by the creditor at the time of restructuring under paragraph .016. The loss would be recorded in the period of prepayment rather than the period of restructuring. They propose that a creditor be required to recognize a loss on restructuring in the period of restructuing to the extent that a reduction of face amount is not protected by a prepayment penalty.

.155 This Statement does not include that kind of test based on prepayment penalties. The proposed test rests on the assumption that a loss resulting from prepayment necessarily is a loss on restructuring, and that presumption is questionable. At the time of restructuring, the most probable estimate of future cash receipts is usually that the debtor will not prepay, even if there is no prepayment penalty, because (a) prepayment of a debt with a relatively low effective interest rate is to the creditor's advantage, not the debtor's, (b) initiative for prepayment lies wholly with the debtor, and (c) the debtor is clearly unable to prepay at the time of a troubled debt restructuring and may never be able to prepay. If that most probable estimate later proves incorrect, and the debtor does prepay, a change of estimate should be recorded in the period of prepayment.

CREDITOR'S ACCOUNTING FOR SUBSTITUTION OR ADDITION OF DEBTORS

.156 A change between the Exposure Draft and this Statement is that the Exposure Draft dealt with substitutions of debtors only if the debtors were government units. Several respondents to the Exposure Draft suggested that the principles developed there applied to substitutions or additions of nongovernment debtors as well.

.157 The general principle developed in earlier paragraphs is that the accounting for a troubled debt restructuring depends on its substance. The issues raised if a creditor in a troubled debt restructuring accepts, or is required to accept, a new receivable from a different debtor to replace an existing receivable from a debtor experiencing financial difficulties pertains to the circumstances, if any, in which the substitution or addition is in substance similar to a transfer of assets to satisfy a receivable and the circumstances, if any, in which that kind of restructuring is in substance similar to a modification of terms only.

.158 One view expressed by respondents was that the substitution of a receivable from a different debtor for an existing receivable or the addition of another debtor is always a transaction requiring accounting by the creditor for a new asset at its fair value, recognizing gain or loss to the extent that the fair value of the new asset differs from the recorded investment in the receivable it replaces. To some proponents, that view holds regardless of the relationship between the original debtor and the new debtor.

.159 Another view expressed was that the kind of substitution involved in each restructuring must be considered, and the accounting depends on the relationship between the original and new debtors and between the original and new terms.

.160 The Board rejected the view that the substitution or addition of a new debtor is always a transaction requiring recognition of a new asset by the creditor. In some troubled debt restructurings, the substitution or addition may be primarily a matter of form while the underlying debtor-creditor relationship, though modified, essentially continues. For example, to enhance the likelihood that the modified terms of a troubled debt restructuring will be fulfilled, a new legal entity may be created to serve as a custodian or trustee to collect designated revenues and disburse the cash received in accordance with the new debt agreement. The role of that new unit may be similar to that of a sinking fund trustee in an untroubled debt situation. The source of the funds required to fulfill the agreement may be the same, but some or all of those funds may be earmarked to meet specific obligations under the agreement. Similarly, if the new debtor controls, is controlled by, or is under common control with the original debtor, the substance of the relationship is not changed. Each troubled debt restructuring involving a substitution or addition of a debtor should be carefully examined to determine whether the substitution or addition is primarily a matter of form to facilitate compliance with modified terms or primarily a matter of substance.

.161 The Board considers the exchanges of bonds of the Municipal Assistance Corporation (Corporation) for notes of the City of New York (City) described in recent exchange offers[38] to be examples of troubled debt restructurings whose substance to creditors for accounting purposes is a modification of the terms of an existing receivable rather than an acquisition of a new asset (receivable). According to those exchange offers:

---

[38] Municipal Assistance Corporation for the City of New York, "Exchange Offer[s] to Holders of Certain Short-Term Notes of the City of New York," November 26, 1975, May 21, 1976, and March 22, 1977.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

> The Corporation . . . was created in June 1975 . . . for the purposes of assisting the City in providing essential services to its inhabitants without interruption and in creating investor confidence in the soundness of the obligations of the City. To carry out such purposes, the Corporation is empowered, among other things, to issue and sell bonds and notes and to pay or lend funds received from such sale to the City and to exchange the Corporation's obligations for obligations of the City.[39]

The Board's understanding is that: (a) the Corporation receives its funds to meet debt service requirements and operating expenses from tax allocations from New York State's collections of Sales Taxes imposed by the State within the City, Stock Transfer Taxes, and Per Capita Aid (revenue sources previously available to the City); (b) Tax and Per Capita Aid amounts not allocated to the Corporation for its requirements are available to the City under the terms of the applicable statutes; and (c) the primary purpose in creating the Corporation was to enhance the likelihood that the City's debt will be paid, not to introduce new economic resources and activities.

RELATED MATTERS

.162 Several respondents commenting on accounting for contingent future cash payments or receipts indicated a need for some clarification of the accounting described in the Exposure Draft. Accounting for contingent payments or receipts is complicated because it involves four separate situations—(1) accounting by the debtor at the time of restructuring, (2) accounting by the debtor after the time of restructuring, (3) accounting by the creditor at the time of restructuring, and (4) accounting by the creditor after the time of restructuring. It is further complicated because the view of both debtor and creditor shifts between "gain" contingencies and "loss" contingencies as the accounting shifts from the time of restructuring to after the time of restructuring. The accounting in the Exposure Draft and this Statement is governed by the following general principles:

a. Paragraph 17 (gain contingencies) of *FASB Statement No. 5* [section 4311.17] governs a debtor's accounting for contingent cash payments at the time of restructuring (paragraph .018) and a creditor's accounting for contingent cash receipts after the time of restructuring (paragraph .036). Since gain contingencies are not recognized until a gain is realized, (1) a *debtor* should not recognize a gain at the

[39] Municipal Assistance Corporation for the City of New York, "Exchange Offer to Holders of Certain Short-Term Notes of the City of New York," November 26, 1975, p. 15.

time of restructuring that may be offset by future contingent payments, which is equivalent to assuming that contingent future payments will be paid, and (2) a *creditor* should not recognize contingent cash receipts as interest income until they become unconditionally receivable, that is, until both the contingency has been removed and the interest has been earned.

b. Paragraph 8 (loss contingencies) of *FASB Statement No. 5* [section 4311.08] governs a debtor's accounting for contingent cash payments after the time of restructuring (paragraph .022) and a creditor's accounting for contingent cash receipts at the time of restructuring (paragraph .032). Since two conditions must be met to recognize an estimated loss, (1) a *debtor* should recognize an interest expense and payable for contingent payments when it is probable that a liability has been incurred and the amount can be reasonably estimated, and (2) a *creditor* should recognize a loss unless offsetting contingent cash receipts are probable and the amount can be reasonably estimated. Contingent cash receipts are unlikely to be probable at the time of restructuring.

.163 The principles described in the preceding paragraph also apply to other situations in which future cash payments or receipts must be estimated to apply the provisions of the Statement, for example, future interest payments or receipts that are expected to fluctuate because they are based on the prime interest rate or indeterminate total interest payments or receipts because the debt is payable or collectible on demand or becomes payable or collectible on demand after a specified period (paragraphs .018 and .032).

DISCLOSURE

Disclosure by Debtors

.164 Most respondents to the Discussion Memorandum commenting on disclosure by debtors for restructurings advocated essentially the disclosure prescribed for gains or losses from extinguishment of debt in *FASB Statement No. 4* [section 2013]. Paragraph .099 gives the Board's reasons for adopting for gains on troubled debt restructurings the guidelines for income statement classification prescribed in that Statement for gains from extinguishment of debt. Since troubled debt restructurings for which gains are recognized and extinguishments of debts thus use the same guidelines for income statement

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

classification and are similar for disclosure purposes, the Board concluded that the kind of information prescribed in paragraph 9 of *FASB Statement No. 4* [section 2013.09] is generally appropriate for disclosing troubled debt restructurings involving recognition of gains. Since some of those restructurings involve transfers of assets to creditors to settle payables, the Board believes that it is appropriate also to disclose the aggregate net gain or loss recognized on transfers of assets. However, since several respondents to the Exposure Draft indicated that problems would arise in attempting to determine when a debtor's current difficulties began and perhaps in obtaining amounts of earlier losses, this Statement omits a requirement in the Exposure Draft to disclose also "the aggregate loss, if any, recognized on those assets in earlier periods in connection with the debtor's current financial difficulties."

.165 Restructurings not involving recognition of gain or loss at the time of restructuring usually modify the timing, amounts, or both, of interest or face amount the debtor is to pay under the debt's terms (paragraphs .016-.018). In the Board's view, the principal changes in terms should be disclosed to permit an understanding of the financial effects of those modifications.

.166 Paragraph .026, specifying disclosure of the extent to which inclusion of contingent future cash receipts prevented recognizing a gain on restructuring was added in response to suggestions by respondents to the Exposure Draft. The Board agreed that information would be useful in assessing the relation between future cash payments and future interest expenses of the debtor.

Disclosure by Creditors

.167 Most banking and other financial institutions responding to the Discussion Memorandum that commented on disclosure by creditors argued against separate disclosures about restructured receivables. They emphasized that to be the most meaningful to financial statement users information about receivables should disclose the interest rate characteristics of each broad group of earning assets (primarily loan or investment portfolios), by major category. They argued that information limited to receivables that have been restructured would not only be less meaningful than information about entire portfolios of receivables but also could be confusing because the same information is also needed about other receivables, particularly those that are earning no return but have not been restructured (nonearning receivables). Several of those institutions referred to the requirements of the Securities and Exchange Commission and of the banking regulatory agencies,

which recently became effective, both concerning disclosure about categories of loan and investment portfolios—including their maturities, interest rates, and nonearning loans and investments—and the allowance for uncollectible amounts. They indicated that those requirements provide adequate information about the financial effects of restructurings, troubled or nontroubled. Financial analysts responding also recommended disclosure focusing on the characteristics of each broad group of earning assets. They expressed a desire for information about past and expected yields of entire portfolios, by major category, to enable them to make informed judgments about recent and prospective earnings performance.

.168 Some respondents to the Discussion Memorandum that are not financial institutions recommended that the Board require information to be disclosed about each significant troubled debt restructuring in the period that it occurs, primarily the terms of the restructuring, gain or loss recognized, if any, and the related income tax effect. Most of those respondents focused on individual receivables rather than on groups of receivables and proposed that debtors and creditors disclose similar information.

.169 The Board concluded that the information prescribed by paragraph .040 should be disclosed, by major category, for outstanding receivables whose terms have been modified in troubled debt restructurings. The information may be disclosed either separately for those receivables or as part of the disclosure about reduced-earning and nonearning receivables. The Board believes that the appropriate format for that disclosure depends primarily on the characteristics and number of receivables, including the proportion of those receivables that have reduced earning potential. It believes the argument has merit that the most meaningful disclosure about earnings potential for a financial institution typically should focus on entire portfolios of receivables, by major category, rather than only on receivables that have been restructured in troubled situations, but the Board acknowledges that determining appropriate disclosure for receivables in general is beyond the scope of this Statement. Accordingly, paragraphs .040 and .041 specify types of information that shall be disclosed and permit that information to be provided by major category for the aggregate of outstanding reduced-earning and nonearning receivables, by major category for outstanding receivables whose terms have been modified in troubled debt restructurings, or for each significant outstanding receivable that has been so restructured, depending on the circumstances.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.170 This Statement contains three changes from the Exposure Draft concerning disclosure by creditors, all made in response to comments or suggestions from respondents to the Exposure Draft and all in paragraph .040, which was paragraph 34 of the Exposure Draft: (1) disclosure of information more in conformity with SEC Guides 61 and 3 [40] replaces disclosure of the weighted average effective interest rate and the range of maturities, (2) disclosure of the allowance for uncollectible amounts or other valuation allowance applicable to restructured receivables is deleted, and (3) disclosure of a commitment to lend additional funds to debtors owing restructured receivables is added.

.171 Disclosure of commitments to lend additional funds was chosen instead of a penalty suggested by some respondents to the Exposure Draft. They expressed concern that a creditor might avoid recognizing a loss under paragraphs .030-.032 by restructuring a troubled receivable in a way that the specified future cash receipts exceed the recorded investment in the receivable and then agree to lend funds to the debtor to meet those terms. They proposed that irrevocable commitments to lend to the debtor be included in the creditor's recorded investment to determine whether the creditor should recognize a loss at the time of restructuring. Since that test is equivalent to saying that a creditor must recognize a loss unless the restructured terms provide not only for recovery of the outstanding receivable but also for recovery of future loans to the same debtor (because future cash receipts from future loans are ignored), the test is excessively punitive. The Board decided that disclosure of those commitments is adequate. That disclosure may already be required by paragraphs 18 and 19 of *FASB Statement No. 5* [section 4311.18-.19], but paragraph .040(b) makes the disclosure explicit.

.172 Some respondents who advocated that the scope of this Statement exclude restructurings of receivables related to consumer financing activities or to all or certain residential properties (paragraph .063) also argued that, if those restructurings were embraced by this Statement, applicable requirements for disclosure would likely be burdensome and not very meaningful to financial statement users. They point out that the accounting, including information normally disclosed in financial statements or in other reports, for those types of receivables has been tailored to fit special characteristics of the receivables, such as large numbers of relatively small balances, interest rates fixed by state law rather than in a fluctuating

---

[40] SEC, *Securities Exchange Act of 1934 Release No. 12748,* "Guides for Statistical Disclosure by Bank Holding Companies," August 31, 1976.

market, and numerous accounts on which collections are past due. The Board noted the special characteristics of those types of receivables and, since the scope of this Statement does not encompass appropriate disclosure for receivables generally, concluded that paragraphs .040 and .041 should not necessarily apply to those types of receivables that have been restructured.

ACCOUNTING SYMMETRY BETWEEN DEBTORS AND CREDITORS

.173 The Discussion Memorandum contained several questions on whether particular accounting by debtors and creditors should be symmetrical. Most respondents considered a criterion of symmetry between debtors and creditors an insignificant factor in accounting for troubled debt restructurings. Many noted that existing accounting principles for accounting by creditors for receivables after their initial recording and for recognizing losses already differ from those for accounting by debtors for payables and for recognizing gains. Some respondents also noted that differences usually exist between the debtor and creditor in a particular restructuring (for example, differences in the industry or industries in which they are involved, in their financial viability, and in the significance and frequency of that kind of event for them). The accounting for troubled debt restructurings prescribed in this Statement is symmetrical between debtors and creditors in most matters. However, the Board considered the types of differences described above, among other factors, in concluding that different accounting is appropriate for debtors and creditors in matters such as classifying gains or losses recognized at the time of troubled debt restructurings, accounting for contingent interest, and disclosing information about troubled debt restructurings.

EFFECTIVE DATE AND TRANSITION

.174 The Board concluded that prospective application of this Statement is appropriate and that the effective dates in paragraphs .043-.045 are advisable. In the Board's view, comparability of financial statements would not be greatly enhanced by restating past, nonrecurring troubled debt restructurings. Further, difficulties in retroactive application of the provisions of this Statement include identifying restructurings for which fair values would need to be determined and determining those fair values. A number of enterprises that in recent years have had several restructurings of those types would be unlikely to have information available to restate retroactively.

AC Section 5515

Liquidation Preference of Preferred Stock

[Source: APB Opinion No. 10, Par. 10-11, as amended.]

Effective for fiscal periods beginning after December 31, 1966, unless otherwise indicated

.01 Companies at times issue preferred (or other senior) stock which has a preference in involuntary liquidation considerably in excess of the par or stated value of the shares. The relationship between this preference in liquidation and the par or stated value of the shares may be of major significance to the users of the financial statements of those companies and the Board believes it highly desirable that it be prominently disclosed. Accordingly, the Board recommends that, in these cases, the liquidation preference of the stock be disclosed in the equity section of the balance sheet in the aggregate, either parenthetically or "in short," rather than on a per share basis or by disclosure in notes.

.02 In addition, the financial statements should disclose, either on the face of the balance sheet or in notes pertaining thereto:

a. the aggregate or per share amounts at which preferred shares may be called or are subject to redemption through sinking fund operations or otherwise;

b. as called for by section 2011A.05, the aggregate and per share amounts of arrearages in cumulative preferred dividends. [As amended, effective for fiscal periods beginning after Dec. 31, 1968 by APB Opinion No. 15.] (See section 2011.)

AC Section 5516

Convertible Debt and Debt Issued with Stock Purchase Warrants[1]

[Source: APB Opinion No. 14.]

Effective for fiscal periods beginning after December 31, 1966, unless otherwise indicated [2]

CONVERTIBLE DEBT

Discussion

.01 Convertible debt securities discussed herein are those debt securities which are convertible into common stock of the issuer or an affiliated company at a specified price at the option of the holder and which are sold at a price or have a value at issuance not significantly in excess of the face amount. The terms of such securities generally include (1) an interest rate which is lower than the issuer could establish for nonconvertible debt, (2) an initial conversion price which is greater than the market value of the common stock at time of issuance, and (3) a conversion price which does not decrease except pursuant to antidilution provisions. In most cases such securities also are callable at the option of the issuer and are subordinated to nonconvertible debt.

.02 Convertible debt may offer advantages to both the issuer and the purchaser. From the point of view of the issuer, convertible debt has a lower interest rate than does nonconvertible debt. Furthermore, the issuer of convertible debt securities, in planning its long-range financing, may view convertible debt as essentially a means of raising equity capital. Thus, if the market value of the underlying common stock increases sufficiently in the future, the issuer can force conversion of the convertible debt into common stock by calling the issue for redemption. Under these market conditions, the issuer can effectively terminate the conversion option and eliminate the debt. If the market

---

[1] This section supersedes paragraphs 8 and 9 of APB Opinion No. 10 and paragraphs 11-15 of APB Opinion No. 12.

[2] See paragraphs .17 and .18.

value of the stock does not increase sufficiently to result in conversion of the debt, the issuer will have received the benefit of the cash proceeds to the scheduled maturity dates at a relatively low cash interest cost.

.03 On the other hand, the purchaser obtains an option to receive either the face or redemption amount of the security or the number of common shares into which the security is convertible. If the market value of the underlying common stock increases above the conversion price, the purchaser (either through conversion or through holding the convertible debt containing the conversion option) benefits through appreciation. He may at that time require the issuance of the common stock at a price lower than the current market price. However, should the value of the underlying common stock not increase in the future, the purchaser has the protection of a debt security. Thus, in the absence of default by the issuer, he would receive the principal and interest if the conversion option is not exercised.

.04 Differences of opinion exist as to whether convertible debt securities should be treated by the issuer solely as debt or whether the conversion option should receive separate accounting recognition at time of issuance. The views in favor of each of these two concepts are contained in the following paragraphs.

.05 The most important reason given for accounting for convertible debt solely as debt is the inseparability of the debt and the conversion option. A convertible debt security is a complex hybrid instrument bearing an option, the alternative choices of which cannot exist independently of one another. The holder ordinarily does not sell one right and retain the other. Furthermore the two choices are mutually exclusive; they cannot both be consummated. Thus, the security will either be converted into common stock or be redeemed for cash. The holder cannot exercise the option to convert unless he foregoes the right to redemption, and vice versa.

.06 Another reason advanced in favor of accounting for convertible debt solely as debt is that the valuation of the conversion option or the debt security without the conversion option presents various practical problems. In the absence of separate transferability, values are not estab-

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

lished in the marketplace, and accordingly, the value assigned to each feature is necessarily subjective. A determination of the value of the conversion feature poses problems because of the uncertain duration of the right to obtain the stock and the uncertainty as to the future value of the stock obtainable upon conversion. Furthermore, issuers often claim that a subjective valuation of a debt security without the conversion option but with identical other terms (which are usually less restrictive on the issuer and less protective of the holder than those of nonconvertible debt) is difficult because such a security could not be sold at a price which the issuer would regard as producing an acceptable cost of financing. Thus, when the attractiveness to investors of a convertible debt security rests largely on the anticipated increased value of the issuer's stock, the conversion feature may be of primary importance, with the debt feature regarded more as a hedge than as the principal investment objective. Many proponents of the single-element view believe that the practical problems of determining separate values for the debt and the conversion option should not be controlling for purposes of determining appropriate accounting but such problems should be given consideration, particularly if valid arguments exist for each of the two accounting concepts identified in paragraph .04.

.07 The contrary view is that convertible debt possesses characteristics of both debt and equity and that separate accounting recognition should be given to the debt characteristics and to the conversion option at time of issuance. This view is based on the premise that there is an economic value inherent in the conversion feature or call on the stock and that the nature and value of this feature should be recognized for accounting purposes by the issuer. The conversion feature is not significantly different in nature from the call represented by an option or warrant, and sale of the call is a type of capital transaction. The fact that the conversion feature coexists with certain debt characteristics in a hybrid security and cannot be sold or transferred separately from these senior elements or from the debt instrument itself does not constitute a logical or compelling reason why the values of the two elements should not receive separate accounting recognition. Similar separate accounting recognition for disparate features of single

instruments is reflected in, for example, the capitalization of long-term leases—involving the separation of the principal and interest elements—and in the allocation of the purchase cost in a bulk acquisition between goodwill and other assets.

.08 Holders of this view also believe that the fact that the eventual outcome of the option available to the purchaser of the convertible debt security cannot be determined at time of issuance is not relevant to the question of reflecting in the accounting records the distinguishable elements of the security at time of issuance. The conversion option has a value at time of issuance, and a portion of the proceeds should therefore be allocated to this element of the transaction. The remainder of the proceeds is attributable to the debt characteristics, and should be so recognized for accounting purposes.

.09 Holders of this view also believe that the difficulties of implementation—which are claimed by some to justify or to support not recognizing the conversion option for accounting purposes—are not insurmountable and should not govern the conclusion. When convertible debt securities are issued, professional advisors are usually available to furnish estimates of values of the conversion option and of the debt characteristics, which values are sufficiently precise for the purpose of allocating the proceeds. If a nonconvertible debt security could not be sold at an acceptable price, the value of the conversion option is of such material significance that its accounting recognition, even on the basis of an estimate, is essential.

Opinion

.10 The Board is of the opinion that no portion of the proceeds from the issuance of the types of convertible debt securities described in paragraph .01 should be accounted for as attributable to the conversion feature. In reaching this conclusion, the Board places greater weight on the inseparability of the debt and the conversion option (as described in paragraph .05) and less weight on practical difficulties.

DEBT WITH STOCK PURCHASE WARRANTS

Discussion

.11 Unlike convertible debt, debt with detachable warrants to purchase stock is usually issued with the expecta-

 © 1974, American Institute of Certified Public Accountants, Inc.

tion that the debt will be repaid when it matures. The provisions of the debt agreement are usually more restrictive on the issuer and more protective of the investor than those for convertible debt. The terms of the warrants are influenced by the desire for a successful debt financing. Detachable warrants often trade separately from the debt instrument. Thus, the two elements of the security exist independently and may be treated as separate securities.

.12 From the point of view of the issuer, the sale of a debt security with warrants results in a lower cash interest cost than would otherwise be possible or permits financing not otherwise practicable. The issuer usually cannot force the holders of the warrants to exercise them and purchase the stock. The issuer may, however, be required to issue shares of stock at some future date at a price lower than the market price existing at that time, as is true in the case of the conversion option of convertible debt. Under different conditions the warrants may expire without exercise. The outcome of the warrant feature thus cannot be determined at time of issuance. In either case the debt must generally be paid at maturity or earlier redemption date whether or not the warrants are exercised.

.13 There is general agreement among accountants that the proceeds from the sale of debt with stock purchase warrants should be allocated to the two elements for accounting purposes. This agreement results from the separability of the debt and the warrants. The availability of objective values in many instances is also a factor. There is agreement that the allocation should be based on the relative fair values of the debt security without the warrants and of the warrants themselves at time of issuance. The portion of the proceeds so allocated to the warrants should be accounted for as paid-in capital. The remainder of the proceeds should be allocated to the debt security portion of the transaction. This usually results in issuing the debt security at a discount (or, occasionally, a reduced premium).

Opinion

.14 The Board is of the opinion that the portion of the proceeds of debt securities issued with detachable stock purchase warrants which is allocable to the warrants should

be accounted for as paid-in capital. The allocation should be based on the relative fair values of the two securities at time of issuance.[3] Any resulting discount or premium on the debt securities should be accounted for as such.[4] The same accounting treatment applies to issues of debt securities (issued with detachable warrants) which may be surrendered in settlement of the exercise price of the warrant. However, when stock purchase warrants are not detachable from the debt and the debt security must be surrendered in order to exercise the warrant, the two securities taken together are substantially equivalent to convertible debt and the accounting specified in paragraph .10 should apply.

.15 When detachable warrants are issued in conjunction with debt as consideration in purchase transactions, the amounts attributable to each class of security issued should be determined separately, based on values at the time of issuance.[3] The debt discount or premium is obtained by comparing the value attributed to the debt securities with the face amount thereof.

OTHER TYPES OF DEBT SECURITIES

Opinion

.16 The Board recognizes that it is not practicable in this section to discuss all possible types of debt with conversion features, debt issued with stock purchase warrants, or debt securities with a combination of such features. Securities not explicitly discussed in this section should be dealt with in accordance with the substance of the transaction. For example, when convertible debt is issued at a substantial premium, there is a presumption that such premium represents paid-in capital.

EFFECTIVE DATE OF THIS SECTION

.17 This section is effective for fiscal periods beginning after December 31, 1966.[5] However, if a portion of the proceeds of a convertible debt issue covered by paragraph .10

[3] The time of issuance generally is the date when agreement as to terms has been reached and announced, even though the agreement is subject to certain further actions, such as directors' or stockholders' approval.

[4] See sections 5361 and 5362.

[5] This was the effective date of paragraphs 8 and 9 of APB Opinion No. 10 which were temporarily suspended by paragraphs 11-15 of APB Opinion No. 12. The latter Opinion stated that the Board might decide to have the Opinion resolving this question apply retroactively to fiscal periods beginning after December 31, 1966.

 © 1974, American Institute of Certified Public Accountants, Inc.

was allocated to the conversion feature for periods beginning before January 1, 1969 that accounting may be continued with respect to such issues.

.18 Material adjustments resulting from adoption of this section which affect periods beginning prior to January 1, 1969 should be treated as prior period adjustments.

AC Section 5541

Accounting for Treasury Stock

[Source: ARB 43, Chap. 1A, Par. 4.]

Issue date, unless otherwise indicated: 1934 [1]

.01 While it is perhaps in some circumstances permissible to show stock of a corporation held in its own treasury as an asset, if adequately disclosed, the dividends on stock so held should not be treated as a credit to the income account of the company.

The next page is 10,061.

[1] The above rule was adopted by the membership of the Institute in 1934. It had been recommended in 1932 to the New York Stock Exchange by the Institute's committee on cooperation with stock exchanges.

AC Section 5542

Profits or Losses on Treasury Stock

[Source: ARB 43, Chap. 1B, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 Following an inquiry made by the New York Stock Exchange, a predecessor committee on accounting procedure in 1938 issued the following report:

"PROFITS OR LOSSES ON TREASURY STOCK"

.02 "The executive committee of the American Institute of Accountants has directed that the following report of the committee on accounting procedure, which it received at a meeting on April 8, 1938, be published, without approval or disapproval of the committee, for the information of members of the Institute:

TO THE EXECUTIVE COMMITTEE,
AMERICAN INSTITUTE OF ACCOUNTANTS:

.03 "This committee has had under consideration the question regarding treatment of purchase and sale by a corporation of its own stock, which was raised during 1937 by the New York Stock Exchange with the Institute's special committee on cooperation with stock exchanges.

.04 "As a result of discussions which then took place, the special committee on cooperation with stock exchanges made a report which was approved by the committee on accounting procedure and the executive committee, and a copy of which was furnished to the committee on stock list of the New York Stock Exchange. The question raised was stated in the following form:

.05 " 'Should the difference between the purchase and resale prices of a corporation's own common stock be reflected in earned surplus (either directly or through inclusion in the income account) or should such difference be reflected in capital surplus?'

.06 "The opinion of the special committee on cooperation with stock exchanges reads in part as follows:

.07 " 'Apparently there is general agreement that the difference between the purchase price and the stated value of a corporation's common stock purchased and retired should be reflected in capital surplus. Your committee believes that while the net asset value of the shares of common stock outstanding in the hands of the public may be increased or decreased by such purchase and retirement, such transactions relate to the capital of the corporation and do not give rise to corporate profits or losses. Your committee can see no essential difference between (a) the purchase and retirement of a corporation's own common stock and the subsequent issue of common shares, and (b) the purchase and resale of its own common stock.'

.08 "This committee is in agreement with the views thus expressed; it is aware that such transactions have been held to give rise to taxable income, but it does not feel that such decisions constitute any bar to the application of correct accounting procedure as above outlined.

.09 "The special committee on cooperation with stock exchanges continued and concluded its report with the following statement:

.10 " 'Accordingly, although your committee recognizes that there may be cases where the transactions involved are so inconsequential as to be immaterial, it does not believe that, as a broad general principle, such transactions should be reflected in earned surplus (either directly or through inclusion in the income account).'

.11 "This committee agrees with the special committee on cooperation with stock exchanges, but thinks it desirable to point out that the qualification should not be applied to any transaction which, although in itself inconsiderable in amount, is a part of a series of transactions which in the aggregate are of substantial importance.

.12 "This committee recommends that the views expressed be circulated for the information of members of the Institute."

.13 The Board considers that the following accounting practices, in addition to the accounting practices indicated in paragraphs .03-.12 are acceptable, and that they appear to be more in accord with current developments in practice:

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

a. When a corporation's stock is retired, or purchased for constructive retirement (with or without an intention to retire the stock formally in accordance with applicable laws):

  i. *an excess of purchase price over par or stated value* may be allocated between capital surplus and retained earnings. The portion of the excess allocated to capital surplus should be limited to the sum of (a) all capital surplus arising from previous retirements and net "gains" on sales of treasury stock of the same issue and (b) the prorata portion of capital surplus paid in, voluntary transfers of retained earnings, capitalization of stock dividends, etc., on the same issue. For this purpose, any remaining capital surplus applicable to issues fully retired (formal or constructive) is deemed to be applicable prorata to shares of common stock. Alternatively, the excess may be charged entirely to retained earnings in recognition of the fact that a corporation can always capitalize or allocate retained earnings for such purposes.

  ii. *an excess of par or stated value over purchase price* should be credited to capital surplus.

b. When a corporation's stock is acquired for purposes other than retirement (formal or constructive), or when ultimate disposition has not yet been decided, the cost of acquired stock may be shown separately as a deduction from the total of capital stock, capital surplus, and retained earnings, or may be accorded the accounting treatment appropriate for retired stock, or in some circumstances may be shown as an asset in accordance with section 5541. "Gains" on sales of treasury stock not previously accounted for as constructively retired should be credited to capital surplus; "losses" may be charged to capital surplus to the extent that previous net "gains" from sales or retirements of the same class of stock are included therein, otherwise to retained earnings.

[As amended, effective for fiscal periods beginning after December 31, 1965, by APB Opinion

No. 6 and as amended, effective for fiscal periods beginning after October 31, 1970, by APB Opinion No. 16.]

.14 Laws of some states govern the circumstances under which a corporation may acquire its own stock and prescribe the accounting treatment therefor. Where such requirements are at variance with paragraph .13 the accounting should conform to the applicable law. When state laws relating to acquisition of stock restrict the availability of retained earnings for payment of dividends or have other effects of a significant nature, these facts should be disclosed. [As amended, effective for fiscal periods beginning after December 31, 1965, by APB Opinion No. 6.]

AC Section 5561

Stock Dividends and Stock Split-Ups

[Source: ARB 43, Chap. 7B, as amended.]

Issue date, unless otherwise indicated: June, 1953

.01 The term *stock dividend* as used in this section refers to an issuance by a corporation of its own common shares to its common shareholders without consideration and under conditions indicating that such action is prompted mainly by a desire to give the recipient shareholders some ostensibly separate evidence of a part of their respective interests in accumulated corporate earnings without distribution of cash or other property which the board of directors deems necessary or desirable to retain in the business.

.02 The term *stock split-up* as used in this section refers to an issuance by a corporation of its own common shares to its common shareholders without consideration and under conditions indicating that such action is prompted mainly by a desire to increase the number of outstanding shares for the purpose of effecting a reduction in their unit market price and, thereby, of obtaining wider distribution and improved marketability of the shares.

.03 This section is not concerned with the accounting for a distribution or issuance to shareholders of (a) shares of another corporation theretofore held as an investment, or (b) shares of a different class, or (c) rights to subscribe for additional shares or (d) shares of the same class in cases where each shareholder is given an election to receive cash or shares.

.04 The discussion of accounting for stock dividends and split-ups that follows is divided into two parts. The first deals with the problems of the recipient. The second deals with the problems of the issuer.

AS TO THE RECIPIENT

.05 One of the basic problems of accounting is that of income determination. Complete discussion of this problem is obviously beyond the scope of this section. Basically, income is a realized gain and in accounting is recognized, recorded, and stated in accordance with certain principles as to time and amount.

.06 In applying the principles of income determination to the accounts of a shareholder of a corporation, it is generally agreed that the problem of determining his income is distinct from the problem of income determination by the corporation itself. The income of the corporation is determined as that of a separate entity without regard to the equity of the respective shareholders in such income. Under conventional accounting concepts, the shareholder has no income solely as a result of the fact that the corporation has income; the increase in his equity through undistributed earnings is no more than potential income to him. It is true that income earned by the corporation may result in an enhancement in the market value of the shares, but until there is a distribution, division, or severance of corporate assets, the shareholder has no income. If there is an increase in the market value of his holdings, such unrealized appreciation is not income. In the case of a stock dividend or split-up, there is no distribution, division, or severance of corporate assets. Moreover, there is nothing resulting therefrom that the shareholder can realize without parting with some of his proportionate interest in the corporation.

(Note: The Board is of the opinion that paragraph .06 should not be construed as prohibiting the equity method of accounting for substantial intercorporate investments. [As amended, effective for fiscal periods beginning after December 31, 1965, by APB Opinion No. 6.] This method, which is described in section 5131, *The Equity Method of Accounting for Investments in Common Stock,* is required in certain circumstances.)

.07 The foregoing are important points to be considered in any discussion of the accounting procedures to be followed by the recipient of a stock dividend or split-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

up since many arguments put forward by those who favor recognizing stock dividends as income are in substance arguments for the recognition of corporate income as income to the shareholder as it accrues to the corporation, and prior to its distribution to the shareholder; the acceptance of such arguments would require the abandonment of the *separate entity* concept of corporation accounting.

.08 The question as to whether or not stock dividends are income has been extensively debated; the arguments pro and con are well known.[1] The situation cannot be better summarized, however, than in the words approved by Mr. Justice Pitney in *Eisner v. Macomber,* 252 U. S. 189, wherein it was held that stock dividends are not income under the Sixteenth Amendment, as follows:

> "A stock dividend really takes nothing from the property of the corporation and adds nothing to the interests of the stockholders. Its property is not diminished and their interests are not increased . . . the proportional interest of each shareholder remains the same. The only change is in the evidence which represents that interest, the new shares and the original shares together representing the same proportional interests that the original shares represented before the issue of the new ones."

.09 Since a shareholder's interest in the corporation remains unchanged by a stock dividend or split-up except as to the number of share units constituting such interest, the cost of the shares previously held should be allocated equitably to the total shares held after receipt of the stock dividends or split-up. When any shares are later disposed of, a gain or loss should be determined on the basis of the adjusted cost per share.

AS TO THE ISSUER

Stock Dividends

.10 As has been previously stated, a stock dividend does not, in fact, give rise to any change whatsoever in either the corporation's assets or its respective shareholders' proportionate interests therein. However, it can-

[1] See, for instance, Freeman, "Stock Dividends and the New York Stock Exchange," *American Economic Review,* December, 1931 (pro), and Whitaker, "Stock Dividends, Investment Trusts, and the Exchange," *American Economic Review,* June, 1931 (con).

not fail to be recognized that, merely as a consequence of the expressed purpose of the transaction and its characterization as a *dividend* in related notices to shareholders and the public at large, many recipients of stock dividends look upon them as distributions of corporate earnings and usually in an amount equivalent to the fair value of the additional shares received. Furthermore, it is to be presumed that such views of recipients are materially strengthened in those instances, which are by far the most numerous, where the issuances are so small in comparison with the shares previously outstanding that they do not have any apparent effect upon the share market price and, consequently, the market value of the shares previously held remains substantially unchanged. The committee therefore believes that where these circumstances exist the corporation should in the public interest account for the transaction by transferring from earned surplus to the category of permanent capitalization (represented by the capital stock and capital surplus accounts) an amount equal to the fair value of the additional shares issued. Unless this is done, the amount of earnings which the shareholder may believe to have been distributed to him will be left, except to the extent otherwise dictated by legal requirements, in earned surplus subject to possible further similar stock issuances or cash distributions.

.11 Where the number of additional shares issued as a stock dividend is so great that it has, or may reasonably be expected to have, the effect of materially reducing the share market value, the committee believes that the implications and possible constructions discussed in the preceding paragraph are not likely to exist and that the transaction clearly partakes of the nature of a stock split-up as defined in paragraph .02. Consequently, the committee considers that under such circumstances there is no need to capitalize earned surplus, other than to the extent occasioned by legal requirements. It recommends, however, that in such instances every effort be made to avoid the use of the word *dividend* in related corporate resolutions, notices, and announcements and that, in those cases where because of legal requirements this cannot be done, the transaction be described, for example, as a *split-up effected in the form of a dividend.*

© 1974, American Institute of Certified Public Accountants, Inc.

.12 In cases of closely-held companies, it is to be presumed that the intimate knowledge of the corporations' affairs possessed by their shareholders would preclude any such implications and possible constructions as are referred to in paragraph .10. In such cases, the committee believes that considerations of public policy do not arise and that there is no need to capitalize earned surplus other than to meet legal requirements.

.13 Obviously, the point at which the relative size of the additional shares issued becomes large enough to materially influence the unit market price of the stock will vary with individual companies and under differing market conditions and, hence, no single percentage can be laid down as a standard for determining when capitalization of earned surplus in excess of legal requirements is called for and when it is not. However, on the basis of a review of market action in the case of shares of a number of companies having relatively recent stock distributions, it would appear that there would be few instances involving the issuance of additional shares of less than, say, 20% or 25% of the number previously outstanding where the effect would not be such as to call for the procedure referred to in paragraph .10.

.14 The corporate accounting recommended in paragraph .10 will in many cases, probably the majority, result in the capitalization of earned surplus in an amount in excess of that called for by the laws of the state of incorporation; such laws generally require the capitalization only of the par value of the shares issued, or, in the case of shares without par value, an amount usually within the discretion of the board of directors. However, these legal requirements are, in effect, minimum requirements and do not prevent the capitalization of a larger amount per share.

Stock Split-Ups

.15 Earlier in this section a stock split-up was defined as being confined to transactions involving the issuance of shares, without consideration moving to the corporation, for the purpose of effecting a reduction in the unit market price of shares of the class issued and, thus, of obtaining wider distribution and improved marketability of the

shares. Where this is clearly the intent, no transfer from earned surplus to capital surplus or capital stock account is called for, other than to the extent occasioned by legal requirements. It is believed, however, that few cases will arise where the aforementioned purpose can be accomplished through an issuance of shares which is less than, say, 20% or 25% of the previously outstanding shares.

.16 The committee believes that the corporation's representations to its shareholders as to the nature of the issuance is one of the principal considerations in determining whether it should be recorded as a stock dividend or a split-up. Nevertheless, it believes that the issuance of new shares in ratios of less than, say, 20% or 25% of the previously outstanding shares, or the frequent recurrence of issuances of shares, would destroy the presumption that transactions represented to be split-ups should be recorded as split-ups.

AC Section 5581

Quasi-Reorganization or Corporate Readjustment

(Amplification of Institute Rule No. 2 of 1934)

[Source: ARB 43, Chap. 7A.]

Issue date, unless otherwise indicated: June, 1953

.01 A rule was adopted by the Institute in 1934 which read as follows:

> "Capital surplus, however created, should not be used to relieve the income account of the current or future years of charges which would otherwise fall to be made thereagainst. This rule might be subject to the exception that where, upon reorganization, a reorganized company would be relieved of charges which would require to be made against income if the existing corporation were continued, it might be regarded as permissible to accomplish the same result without reorganization provided the facts were as fully revealed to and the action as formally approved by the shareholders as in reorganization."[1]

.02 Readjustments of the kind mentioned in the exception to the rule fall in the category of what are called quasi-reorganizations. This section does not deal with the general question of quasi-reorganizations, but only with cases in which the exception permitted under the rule of 1934 is availed of by a corporation. Hereinafter such cases are referred to as readjustments. The problems which arise fall into two groups: (a) what may be permitted in a readjustment and (b) what may be permitted thereafter.

PROCEDURE IN READJUSTMENT

.03 If a corporation elects to restate its assets, capital stock, and surplus through a readjustment and thus avail itself of permission to relieve its future income account or earned surplus account of charges which would otherwise be made thereagainst, it should make a clear report to its shareholders of the restatements proposed to be made, and obtain their formal consent. It should present a fair bal-

[1] See section 5511.

ance sheet as at the date of the readjustment, in which the adjustment of carrying amounts is reasonably complete, in order that there may be no continuation of the circumstances which justify charges to capital surplus.

.04 A write-down of assets below amounts which are likely to be realized thereafter, though it may result in conservatism in the balance sheet at the readjustment date, may also result in overstatement of earnings or of earned surplus when the assets are subsequently realized. Therefore, in general, assets should be carried forward as of the date of readjustment at fair and not unduly conservative amounts, determined with due regard for the accounting to be employed by the company thereafter. If the fair value of any asset is not readily determinable a conservative estimate may be made, but in that case the amount should be described as an estimate and any material difference arising through realization or otherwise and not attributable to events occurring or circumstances arising after that date should not be carried to income or earned surplus.

.05 Similarly, if potential losses or charges are known to have arisen prior to the date of readjustment but the amounts thereof are then indeterminate, provision may properly be made to cover the maximum *probable* losses or charges. If the amounts provided are subsequently found to have been excessive or insufficient, the difference should not be carried to earned surplus nor used to offset losses or gains originating after the readjustment, but should be carried to capital surplus.

.06 When the amounts to be written off in a readjustment have been determined, they should be charged first against earned surplus to the full extent of such surplus; any balance may then be charged against capital surplus. A company which has subsidiaries should apply this rule in such a way that no consolidated earned surplus survives a readjustment in which any part of losses has been charged to capital surplus.

.07 If the earned surplus of any subsidiaries cannot be applied against the losses before resort is had to capital surplus, the parent company's interest in such earned surplus should be regarded as capitalized by the readjustment

Copyright © 1975, American Institute of Certified Public Accountants, Inc.

just as surplus at the date of acquisition is capitalized, so far as the parent is concerned.

.08 The effective date of the readjustment, from which the income of the company is thereafter determined, should be as near as practicable to the date on which formal consent of the stockholders is given, and should ordinarily not be prior to the close of the last completed fiscal year.

PROCEDURE AFTER READJUSTMENT

.09 When the readjustment has been completed, the company's accounting should be substantially similar to that appropriate for a new company.

.10 After such a readjustment earned surplus previously accumulated cannot properly be carried forward under that title. A new earned surplus account should be established, dated to show that it runs from the effective date of the readjustment, and this dating should be disclosed in financial statements until such time as the effective date is no longer deemed to possess any special significance.[2]

.11 Capital surplus originating in such a readjustment is restricted in the same manner as that of a new corporation; charges against it should be only those which may properly be made against the initial surplus of a new corporation.

.12 It is recognized that charges against capital surplus may take place in other types of readjustments to which the foregoing provisions would have no application. Such cases would include readjustments for the purpose of correcting erroneous credits made to capital surplus in the past. In this statement the committee has dealt only with that type of readjustment in which either the current income or earned surplus account or the income account of future years is relieved of charges which would otherwise be made thereagainst.

The next page is 10,291.

---

[2] See section 5582.

AC Section 5582

Discontinuance of Dating Earned Surplus

[Source: ARB 46.]

Issue date, unless otherwise indicated: February, 1956

.01 Section 5581.10, *Quasi-Reorganization or Corporate Readjustment,* reads as follows:

> After such a readjustment earned surplus previously accumulated cannot properly be carried forward under that title. A new earned surplus account should be established, dated to show that it runs from the effective date of the readjustment, and this dating should be disclosed in financial statements until such time as the effective date is no longer deemed to possess any special significance.

.02 The committee believes that the dating of earned surplus following a quasi-reorganization would rarely, if ever, be of significance after a period of ten years. It also believes that there may be exceptional circumstances in which the discontinuance of the dating of earned surplus could be justified at the conclusion of a period less than ten years.

AC Section 6011

Accounting Principles for Regulated Industries

[Source: APB Opinion No. 2, Addendum.]

Issue date, unless otherwise indicated: December, 1962

The following statement, approved by the Board, originally appeared in *The Journal of Accountancy,* December 1962, p. 67:

.01 The basic postulates and the broad principles of accounting comprehended in the term *generally accepted accounting principles* pertain to business enterprises in general. These include public utilities, common carriers, insurance companies, financial institutions, and the like that are subject to regulation by government, usually through commissions or other similar agencies.

.02 However, differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect in regulated businesses of the rate-making process, a phenomenon not present in nonregulated businesses. Such differences usually concern mainly the time at which various items enter into the determination of net income in accordance with the principle of matching costs and revenues. For example, if a cost incurred by a regulated business during a given period is treated for rate-making purposes by the regulatory authority having jurisdiction as applicable to future revenues, it may be deferred in the balance sheet at the end of the current period and written off in the future period or periods in which the related revenue accrues, even though the cost is of a kind which in a nonregulated business would be written off currently. However, this is appropriate only when it is clear that the cost will be recoverable out of future revenues, and it is not appropriate when there is doubt, because of economic conditions or for other reasons, that the cost will be so recoverable.

.03 Accounting requirements not directly related to the rate-making process commonly are imposed on regulated businesses by orders of regulatory authorities, and occasionally by court decisions or statutes. The fact that such accounting requirements are imposed by the government does not necessarily mean that they conform with generally accepted accounting principles. For example, if a cost, of a kind which in a nonregulated business would be charged to income, is charged directly to surplus pursuant to the applicable accounting requirements of the regulatory authority, such cost nevertheless should be included in operating expenses or charged to income, as appropriate in financial statements intended for use by the public.

.04 The financial statements of regulated businesses other than those prepared for filing with the government for regulatory purposes preferably should be based on generally accepted accounting principles (with appropriate recognition of rate-making considerations as indicated in paragraph .02) rather than on systems of accounts or other accounting requirements of the government.

.05 *Generally Accepted Auditing Standards* lists four standards of reporting, the first of which says that "The report shall state whether the financial statements are presented in accordance with generally accepted principles of accounting." In reporting on the financial statements of regulated businesses, the independent auditor should observe this standard and should deal with material variances from generally accepted accounting principles (with appropriate recognition of rate-making considerations as indicated in paragraph .02), if the financial statements reflect any such variances, in the same manner as in his reports on nonregulated businesses.

AC Section 6021

Financial Accounting and Reporting by Oil and Gas Producing Companies

[Source: FASB Statement No. 19.]

December 1977

INTRODUCTION

.001 This Statement establishes standards of financial accounting and reporting for the oil and gas producing activities of a business enterprise. Those activities involve the acquisition of mineral interests in properties, exploration (including prospecting), development, and production of crude oil, including condensate and natural gas liquids, and natural gas (hereinafter collectively referred to as oil and gas producing activities).

.002 Existing authoritative accounting pronouncements do not explicitly or comprehensively establish standards of financial accounting and reporting for those activities. Numerous alternative accounting practices are presently followed by oil and gas producing companies, and the nature and extent of the information they disclose in their financial statements about their oil and gas producing activities vary considerably from company to company. The Board is issuing this Statement to address the financial accounting and reporting issues that led to the alternative practices.

.003 Appendix A contains background information. Appendix B sets forth the basis for the Board's conclusions, including alternatives considered and reasons for accepting some and rejecting others. Appendix C is a glossary of terms.

.004 The accounting standards in this Statement adhere to the traditional historical cost basis. Although the Board considered both *discovery value* and *current value* as alternative bases of accounting for oil and gas reserves, it determined for the reasons discussed in paragraphs .133-.141 that any decision on applying value accounting to oil and gas companies should await resolution of the broader issue of the general applicability of value accounting in

the Board's project, "Conceptual Framework for Financial Accounting and Reporting."

.005 This Statement supersedes *FASB Statement No. 9* [section 4097], "Accounting for Income Taxes—Oil and Gas Producing Companies."

SCOPE

.006 This Statement applies only to *oil and gas producing* activities; it does not address financial accounting and reporting issues relating to the transporting, refining, and marketing of oil and gas. Also, this Statement does not apply to activities relating to the production of other wasting (nonregenerative) natural resources; nor does it apply to the production of geothermal steam or to the extraction of hydrocarbons as a by-product of the production of geothermal steam and associated geothermal resources as defined in the *Geothermal Steam Act of 1970;* nor does it apply to the extraction of hydrocarbons from shale, tar sands, or coal.

.007 Accounting for interest on funds borrowed to finance an enterprise's oil and gas producing activities is excluded from consideration in this Statement because the broader subject of accounting for interest costs in general is a project presently on the Board's technical agenda.

.008 This Statement prescribes disclosures related to an enterprise's oil and gas producing activities that are considered necessary for fair presentation of the enterprise's financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles. Those disclosures are only part of the information that may be needed for investment, regulatory, or national economic planning and energy policy decisions.

.009 The Addendum to *APB Opinion No. 2* [section 6011], "Accounting for the 'Investment Credit'," states that "differences may arise in the application of generally accepted accounting principles as between regulated and nonregulated businesses, because of the effect in regulated businesses of the rate-making process" and discusses the application of generally accepted accounting principles to regulated industries. Accordingly, the provisions of the Addendum shall govern the application of this Statement to those oil and gas producing operations of a company that are regulated for rate-making purposes on an individual-company-cost-of-service basis.

STANDARDS OF FINANCIAL ACCOUNTING AND REPORTING

Definitions

.010 The glossary in Appendix C defines the following terms as they are used in this Statement:

a. Proved reserves.
b. Proved developed reserves.
c. Proved undeveloped reserves.
d. Field.
e. Reservoir.
f. Exploratory well.
g. Development well.
h. Service well.
i. Stratigraphic test well.
   i. Exploratory-type.
   ii. Development-type.
j. Proved area.

Basic Concepts

.011 An enterprise's oil and gas producing activities involve certain special types of assets. Costs of those assets shall be capitalized when incurred. Those types of assets broadly defined are:

a. *Mineral interests in properties* (hereinafter referred to as *properties*), which include fee ownership or a lease, concession, or other interest representing the right to extract oil or gas subject to such terms as may be imposed by the conveyance of that interest. Properties also include royalty interests, production payments payable in oil or gas, and other nonoperating interests in properties operated by others. Properties include those agreements with foreign governments or authorities under which an enterprise participates in the operation of the related properties or otherwise serves as "producer" of the underlying reserves (see paragraph .053); but properties do not include other supply agreements or contracts that represent the right to *purchase* (as opposed to *extract*) oil and gas. Properties shall be classified as proved or unproved as follows:
   i. *Unproved properties*—properties with no proved reserves.
   ii. *Proved properties*—properties with proved reserves.

b. *Wells and related equipment and facilities*,[1] the costs of which include those incurred to:

---

[1] Often referred to in the oil and gas industry as "lease and well equipment" even though, technically, the property may have been acquired other than by a lease.

i. Drill and equip those exploratory wells and exploratory-type stratigraphic test wells that have found proved reserves.
ii. Obtain access to proved reserves and provide facilities for extracting, treating, gathering, and storing the oil and gas, including the drilling and equipping of development wells and development-type stratigraphic test wells (whether those wells are successful or unsuccessful) and service wells.

c. *Support equipment and facilities used in oil and gas producing activities,* such as seismic equipment, drilling equipment, construction and grading equipment, vehicles, repair shops, warehouses, supply points, camps, and division, district, or field offices.

d. *Uncompleted wells, equipment, and facilities,* the costs of which include those incurred to:
i. Drill and equip wells that are not yet completed.
ii. Acquire or construct equipment and facilities that are not yet completed and installed.

.012 The costs of an enterprise's wells and related equipment and facilities and the costs of the related proved properties shall be amortized as the related oil and gas reserves are produced. That amortization plus production (lifting) costs become part of the cost of oil and gas produced. Unproved properties shall be assessed periodically, and a loss recognized if those properties are impaired.

.013 Some costs incurred in an enterprise's oil and gas producing activities do not result in acquisition of an asset and, therefore, shall be charged to expense. Examples include geological and geophysical costs, the costs of carrying and retaining undeveloped properties, and the costs of drilling those exploratory wells and exploratory-type stratigraphic test wells that do not find proved reserves.

.014 The basic concepts in paragraphs .011-.013 are elaborated on in paragraphs .015-.041.

Accounting at the Time Costs Are Incurred

Acquisition of Properties

.015 Costs incurred to purchase, lease, or otherwise acquire a property (whether unproved or proved) shall be capitalized when incurred. They include the costs of lease bonuses and options to purchase or lease properties, the portion of costs applicable to

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

minerals when land including mineral rights is purchased in fee, brokers' fees, recording fees, legal costs, and other costs incurred in acquiring properties.

Exploration

.016 Exploration involves (a) identifying areas that may warrant examination and (b) examining specific areas that are considered to have prospects of containing oil and gas reserves, including drilling exploratory wells and exploratory-type stratigraphic test wells. Exploration costs may be incurred both before acquiring the related property (sometimes referred to in part as prospecting costs) and after acquiring the property.

.017 Principal types of exploration costs, which include depreciation and applicable operating costs of support equipment and facilities (paragraph .026) and other costs of exploration activities, are:

a. Costs of topographical, geological, and geophysical studies, rights of access to properties to conduct those studies, and salaries and other expenses of geologists, geophysical crews, and others conducting those studies. Collectively, those are sometimes referred to as geological and geophysical or "G&G" costs.

b. Costs of carrying and retaining undeveloped properties, such as delay rentals, *ad valorem* taxes on the properties, legal costs for title defense, and the maintenance of land and lease records.

c. Dry hole contributions and bottom hole contributions.

d. Costs of drilling and equipping exploratory wells.

e. Costs of drilling exploratory-type stratigraphic test wells.[2]

.018 Geological and geophysical costs, costs of carrying and retaining undeveloped properties, and dry hole and bottom hole contributions shall be charged to expense when incurred.

.019 The costs of drilling exploratory wells and the costs of drilling exploratory-type stratigraphic test wells shall be capitalized as part of the enterprise's uncompleted wells, equipment, and facilities pending determination of whether the well has found proved reserves. If the well has found proved reserves (paragraphs .031-.034), the capitalized costs of drilling the well shall become part of the enterprise's wells and related equipment and

[2] While the costs of drilling stratigraphic test wells are sometimes considered to be geological and geophysical costs, they are accounted for separately under this Statement for reasons explained in paragraphs .200-.202.

facilities (even though the well may not be completed as a producing well); if, however, the well has not found proved reserves, the capitalized costs of drilling the well, net of any salvage value, shall be charged to expense.

.020 An enterprise sometimes conducts G&G studies and other exploration activities on a property owned by another party, in exchange for which the enterprise is contractually entitled to receive an interest in the property if proved reserves are found or to be reimbursed by the owner for the G&G and other costs incurred if proved reserves are not found. In that case, the enterprise conducting the G&G studies and other exploration activities shall account for those costs as a receivable when incurred and, if proved reserves are found, they shall become the cost of the proved property acquired.

Development

.021 Development costs are incurred to obtain access to proved reserves and to provide facilities for extracting, treating, gathering, and storing the oil and gas. More specifically, development costs, including depreciation and applicable operating costs of support equipment and facilities (paragraph .026) and other costs of development activities, are costs incurred to:

a. Gain access to and prepare well locations for drilling, including surveying well locations for the purpose of determining specific development drilling sites, clearing ground, draining, road building, and relocating public roads, gas lines, and power lines, to the extent necessary in developing the proved reserves.
b. Drill and equip development wells, development-type stratigraphic test wells, and service wells, including the costs of platforms and of well equipment such as casing, tubing, pumping equipment, and the wellhead assembly.
c. Acquire, construct, and install production facilities such as lease flow lines, separators, treaters, heaters, manifolds, measuring devices, and production storage tanks, natural gas cycling and processing plants, and utility and waste disposal systems.
d. Provide improved recovery systems.

.022 Development costs shall be capitalized as part of the cost of an enterprise's wells and related equipment and facilities. Thus, all costs incurred to drill and equip development wells, development-type stratigraphic test wells, and service wells are development costs and shall be capitalized, whether the well is successful or unsuccessful. Costs of drilling those wells and costs of constructing equipment and facilities shall be included in the enterprise's

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

uncompleted wells, equipment, and facilities until drilling or construction is completed.

Production

.023 Production involves lifting the oil and gas to the surface and gathering, treating, field processing (as in the case of processing gas to extract liquid hydrocarbons), and field storage. For purposes of this Statement, the production function shall normally be regarded as terminating at the outlet valve on the lease or field production storage tank; if unusual physical or operational circumstances exist, it may be more appropriate to regard the production function as terminating at the first point at which oil, gas, or gas liquids are delivered to a main pipeline, a common carrier, a refinery, or a marine terminal.

.024 Production costs are those costs incurred to operate and maintain an enterprise's wells and related equipment and facilities, including depreciation and applicable operating costs of support equipment and facilities (paragraph .026) and other costs of operating and maintaining those wells and related equipment and facilities. They become part of the cost of oil and gas produced. Examples of production costs (sometimes called lifting costs) are:

a. Costs of labor to operate the wells and related equipment and facilities.
b. Repairs and maintenance.
c. Materials, supplies, and fuel consumed and services utilized in operating the wells and related equipment and facilities.
d. Property taxes and insurance applicable to proved properties and wells and related equipment and facilities.
e. Severance taxes.

.025 Depreciation, depletion, and amortization of capitalized acquisition, exploration, and development costs also become part of the cost of oil and gas produced along with production (lifting) costs identified in paragraph .024.

Support Equipment and Facilities

.026 The cost of acquiring or constructing support equipment and facilities used in oil and gas producing activities shall be capitalized. Examples of support equipment and facilities include seismic equipment, drilling equipment, construction and grading equipment, vehicles, repair shops, warehouses, supply points, camps, and division, district, or field offices. Some support equipment or

facilities are acquired or constructed for use exclusively in a single activity—exploration, development, or production. Other support equipment or facilities may serve two or more of those activities and may also serve the enterprise's transportation, refining, and marketing activities. To the extent that the support equipment and facilities are used in oil and gas producing activities, their depreciation and applicable operating costs become an exploration, development, or production cost, as appropriate.

Disposition of Capitalized Costs

.027 The effect of paragraphs .015-.026, which deal with accounting at the time costs are incurred, is to recognize as assets: (a) unproved properties; (b) proved properties; (c) wells and related equipment and facilities (which consist of all development costs plus the costs of drilling those exploratory wells and exploratory-type stratigraphic test wells that find proved reserves); (d) support equipment and facilities used in oil and gas producing activities; and (e) uncompleted wells, equipment, and facilities. Paragraphs .028-.041 which follow deal with disposition of the costs of those assets after capitalization. Among other things, those paragraphs provide that the acquisition costs of proved properties and the costs of wells and related equipment and facilities be amortized to become part of the cost of oil and gas produced; that impairment of unproved properties be recognized; and that the costs of an exploratory well or exploratory-type stratigraphic test well be charged to expense if the well is determined not to have found proved reserves.

Assessment of Unproved Properties

.028 Unproved properties shall be assessed periodically to determine whether they have been impaired. A property would likely be impaired, for example, if a dry hole has been drilled on it and the enterprise has no firm plans to continue drilling. Also, the likelihood of partial or total impairment of a property increases as the expiration of the lease term approaches if drilling activity has not commenced on the property or on nearby properties. If the results of the assessment indicate impairment, a loss shall be recognized by providing a valuation allowance. Impairment of individual unproved properties whose acquisition costs are relatively significant shall be assessed on a property-by-property basis, and an indicated loss shall be recognized by providing a valuation allowance. When an enterprise has a relatively large number of unproved properties whose acquisition costs are not individually significant, it may not be practical to assess impairment on a property-by-property basis, in which case the amount of loss to be recognized and the amount

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

of the valuation allowance needed to provide for impairment of those properties shall be determined by amortizing those properties, either in the aggregate or by groups, on the basis of the experience of the enterprise in similar situations and other information about such factors as the primary lease terms of those properties, the average holding period of unproved properties, and the relative proportion of such properties on which proved reserves have been found in the past.

Reclassification of an Unproved Property

.029 A property shall be reclassified from unproved properties to proved properties when proved reserves are discovered on or otherwise attributed to the property; occasionally, a single property, such as a foreign lease or concession covers so vast an area that only the portion of the property to which the proved reserves relate—determined on the basis of geological structural features or stratigraphic conditions—should be reclassified from unproved to proved. For a property whose impairment has been assessed individually in accordance with paragraph .028, the *net* carrying amount (acquisition cost minus valuation allowance) shall be reclassified to proved properties; for properties amortized by providing a valuation allowance on a group basis, the gross acquisition cost shall be reclassified.

Amortization (Depletion) of Acquisition Costs of Proved Properties

.030 Capitalized acquisition costs of proved properties shall be amortized (depleted) by the unit-of-production method so that each unit produced is assigned a pro rata portion of the unamortized acquisition costs. Under the unit-of-production method, amortization (depletion) may be computed either on a property-by-property basis or on the basis of some reasonable aggregation of properties with a common geological structural feature or stratigraphic condition, such as a reservoir or field. When an enterprise has a relatively large number of royalty interests whose acquisition costs are not individually significant, they may be aggregated, for the purpose of computing amortization, without regard to commonality of geological structural features or stratigraphic conditions; if information is not available to estimate reserve quantities applicable to royalty interests owned (paragraph .050), a method other than the unit-of-production method may be used to amortize their acquisition costs. The unit cost shall be computed on the basis of the total estimated units of proved oil and gas reserves. (Joint production of both oil and gas is discussed in paragraph .038.) Unit-of-production amortization rates shall be revised

whenever there is an indication of the need for revision but at least once a year; those revisions shall be accounted for prospectively as changes in accounting estimates—see paragraphs 31-33 of *APB Opinion No. 20* [section 1051.31-.33], "Accounting Changes."

Accounting When Drilling of an Exploratory Well Is Completed

.031 As specified in paragraph .019, the costs of drilling an exploratory well are capitalized as part of the enterprise's uncompleted wells, equipment, and facilities pending determination of whether the well has found proved reserves. That determination is usually made on or shortly after completion of drilling the well, and the capitalized costs shall either be charged to expense or be reclassified as part of the costs of the enterprise's wells and related equipment and facilities at that time. Occasionally, however, an exploratory well may be determined to have found oil and gas reserves, but classification of those reserves as proved cannot be made when drilling is completed. In those cases, one or the other of the following subparagraphs shall apply depending on whether the well is drilled in an area requiring a major capital expenditure, such as a trunk pipeline, before production from that well could begin:

a. *Exploratory wells that find oil and gas reserves in an area requiring a major capital expenditure, such as a trunk pipeline, before production could begin.* On completion of drilling, an exploratory well may be determined to have found oil and gas reserves, but classification of those reserves as proved depends on whether a major capital expenditure can be justified which, in turn, depends on whether additional exploratory wells find a sufficient quantity of additional reserves. That situation arises principally with exploratory wells drilled in a remote area for which production would require constructing a trunk pipeline. In that case, the cost of drilling the exploratory well shall continue to be carried as an asset pending determination of whether proved reserves have been found only as long as both of the following conditions are met:

    i. The well has found a sufficient quantity of reserves to justify its completion as a producing well if the required capital expenditure is made.

    ii. Drilling of the additional exploratory wells is under way or firmly planned for the near future.

    Thus if drilling in the area is not under way or firmly planned, or if the well has not found a commercially producible quantity

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

of reserves, the exploratory well shall be assumed to be impaired, and its costs shall be charged to expense.

b. *All other exploratory wells that find oil and gas reserves.* In the absence of a determination as to whether the reserves that have been found can be classified as proved, the costs of drilling such an exploratory well shall not be carried as an asset for more than one year following completion of drilling. If, after that year has passed, a determination that proved reserves have been found cannot be made, the well shall be assumed to be impaired, and its costs shall be charged to expense.

.032 Paragraph .031 is intended to prohibit, in all cases, the deferral of the costs of exploratory wells that find some oil and gas reserves merely on the chance that some event totally beyond the control of the enterprise will occur, for example, on the chance that the selling prices of oil and gas will increase sufficiently to result in classification of reserves as proved that are not commercially recoverable at current prices.

Accounting When Drilling of an Exploratory-Type Stratigraphic Test Well Is Completed

.033 As specified in paragraph .019, the costs of drilling an exploratory-type stratigraphic test well are capitalized as part of the enterprise's uncompleted wells, equipment, and facilities pending determination of whether the well has found proved reserves. When that determination is made, the capitalized costs shall be charged to expense if proved reserves are not found or shall be reclassified as part of the costs of the enterprise's wells and related equipment and facilities if proved reserves are found.

.034 Exploratory-type stratigraphic test wells are normally drilled on unproved offshore properties. Frequently, on completion of drilling, such a well may be determined to have found oil and gas reserves, but classification of those reserves as proved depends on whether a major capital expenditure—usually a production platform—can be justified which, in turn, depends on whether additional exploratory-type stratigraphic test wells find a sufficient quantity of additional reserves. In that case, the cost of drilling the exploratory-type stratigraphic test well shall continue to be carried as an asset pending determination of whether proved reserves have been found only as long as both of the following conditions are met:

i. The well has found a quantity of reserves that would justify its completion for production had it not been simply a stratigraphic test well.

ii. Drilling of the additional exploratory-type stratigraphic test wells is under way or firmly planned for the near future.

Thus if associated stratigraphic test drilling is not under way or firmly planned, or if the well has not found a commercially producible quantity of reserves, the exploratory-type stratigraphic test well shall be assumed to be impaired, and its costs shall be charged to expense.

Amortization and Depreciation of Capitalized Exploratory Drilling and Development Costs

.035 Capitalized costs of exploratory wells and exploratory-type stratigraphic test wells that have found proved reserves and capitalized development costs shall be amortized (depreciated) by the unit-of-production method so that each unit produced is assigned a pro rata portion of the unamortized costs. It may be more appropriate, in some cases, to depreciate natural gas cycling and processing plants by a method other than the unit-of-production method. Under the unit-of-production method, amortization (depreciation) may be computed either on a property-by-property basis or on the basis of some reasonable aggregation of properties with a common geological structural feature or stratigraphic condition, such as a reservoir or field. The unit cost shall be computed on the basis of the total estimated units of proved *developed* reserves, rather than on the basis of all proved reserves, which is the basis for amortizing acquisition costs of proved properties. If significant development costs (such as the cost of an offshore production platform) are incurred in connection with a planned group of development wells before all of the planned wells have been drilled, it will be necessary to exclude a portion of those development costs in determining the unit-of-production amortization rate until the additional development wells are drilled. Similarly it will be necessary to exclude, in computing the amortization rate, those proved developed reserves that will be produced only after significant additional development costs are incurred, such as for improved recovery systems. However, in no case should future development costs be anticipated in computing the amortization rate. (Joint production of both oil and gas is discussed in paragraph .038.) Unit-of-production amortization rates shall be revised whenever there is an indication of the need for revision but at least once a year; those revisions shall be accounted for prospectively as changes in accounting estimates—see paragraphs 31-33 of *APB Opinion No. 20* [section 1051.31-.33].

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Depreciation of Support Equipment and Facilities

.036 Depreciation of support equipment and facilities used in oil and gas producing activities shall be accounted for as exploration cost, development cost, or production cost, as appropriate (paragraph .026).

Dismantlement Costs and Salvage Values

.037 Estimated dismantlement, restoration, and abandonment costs and estimated residual salvage values shall be taken into account in determining amortization and depreciation rates.

Amortization of Costs Relating to Oil and Gas Reserves Produced Jointly

.038 The unit-of-production method of amortization requires that the total number of units of oil or gas reserves in a property or group of properties be estimated and that the number of units produced in the current period be determined. Many properties contain both oil and gas reserves. In those cases, the oil and gas reserves and the oil and gas produced shall be converted to a common unit of measure on the basis of their approximate relative energy content (without considering their relative sales values). However, if the relative proportion of gas and oil extracted in the current period is expected to continue throughout the remaining productive life of the property, unit-of-production amortization may be computed on the basis of one of the two minerals only; similarly, if either oil or gas clearly dominates both the reserves and the current production (with dominance determined on the basis of relative energy content), unit-of-production amortization may be computed on the basis of the dominant mineral only.

Information Available after the Balance Sheet Date

.039 Information that becomes available after the end of the period covered by the financial statements but before those financial statements are issued shall be taken into account in evaluating conditions that existed at the balance sheet date, for example, in assessing unproved properties (paragraph .028) and in determining whether an exploratory well or exploratory-type stratigraphic test well had found proved reserves (paragraphs .031-.034).

Surrender or Abandonment of Properties

.040 When an unproved property is surrendered, abandoned, or otherwise deemed worthless, capitalized acquisition costs relating thereto shall be charged against the related allowance for impair-

ment to the extent an allowance has been provided; if the allowance previously provided is inadequate, a loss shall be recognized.

.041 Normally, no gain or loss shall be recognized if only an individual well or individual item of equipment is abandoned or retired or if only a single lease or other part of a group of proved properties constituting the amortization base is abandoned or retired as long as the remainder of the property or group of properties continues to produce oil or gas. Instead, the asset being abandoned or retired shall be deemed to be fully amortized, and its cost shall be charged to accumulated depreciation, depletion, or amortization. When the *last* well on an individual property (if that is the amortization base) or group of properties (if amortization is determined on the basis of an aggregation of properties with a common geological structure) ceases to produce and the entire property or property group is abandoned, gain or loss shall be recognized. Occasionally, the partial abandonment or retirement of a proved property or group of proved properties or the abandonment or retirement of wells or related equipment or facilities may result from a catastrophic event or other major abnormality. In those cases, a loss shall be recognized at the time of abandonment or retirement.

Mineral Property Conveyances and Related Transactions

.042 Mineral interests in properties are frequently conveyed to others for a variety of reasons, including the desire to spread risks, to obtain financing, to improve operating efficiency, and to achieve tax benefits. Conveyances of those interests may involve the transfer of all or a part of the rights and responsibilities of operating a property (operating interest). The transferor may or may not retain an interest in the oil and gas produced that is free of the responsibilities and costs of operating the property (a nonoperating interest). A transaction may, on the other hand, involve the transfer of a nonoperating interest to another party and retention of the operating interest.

.043 Certain transactions, sometimes referred to as conveyances, are in substance borrowings repayable in cash or its equivalent and shall be accounted for as borrowings. The following are examples of such transactions:

a. Enterprises seeking supplies of oil or gas sometimes make cash advances to operators to finance exploration in return for the right to purchase oil or gas discovered. Funds advanced for exploration that are repayable by offset against purchases of oil or gas discovered, or in cash if insufficient oil or gas is pro-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

duced by a specified date, shall be accounted for as a receivable by the lender and as a payable by the operator.

b. Funds advanced to an operator that are repayable in cash out of the proceeds from a specified share of future production of a producing property, until the amount advanced plus interest at a specified or determinable rate is paid in full, shall be accounted for as a borrowing. The advance is a payable for the recipient of the cash and a receivable for the party making the advance. Such transactions, as well as those described in paragraph .047(a) below, are commonly referred to as production payments. The two types differ in substance, however, as explained in paragraph .047(a).

.044 In the following types of conveyances, gain or loss shall not be recognized at the time of the conveyance:

a. A transfer of assets used in oil and gas producing activities (including both proved and unproved properties) in exchange for other assets also used in oil and gas producing activities.
b. A pooling of assets in a joint undertaking intended to find, develop, or produce oil or gas from a particular property or group of properties.

.045 In the following types of conveyances, gain shall not be recognized at the time of the conveyance:

a. A part of an interest owned is sold and substantial uncertainty exists about recovery of the costs applicable to the retained interest.
b. A part of an interest owned is sold and the seller has a substantial obligation for future performance, such as an obligation to drill a well or to operate the property without proportional reimbursement for that portion of the drilling or operating costs applicable to the interest sold.

.046 If a conveyance is not one of the types described in paragraphs .044 and .045, gain or loss shall be recognized unless there are other aspects of the transaction that would prohibit such recognition under accounting principles applicable to enterprises in general.

.047 In accordance with paragraphs .044-.046, the following types of transactions shall be accounted for as indicated in each example.[3] No attempt has been made to include the many variations of those arrangements that occur, but paragraphs .044-.046

[3] Costs of unproved properties are always subject to an assessment for impairment as required by paragraph .028.

shall, where applicable, determine the accounting for those other arrangements as well.

a. Some production payments differ from those described in paragraph .043(b) in that the seller's obligation is not expressed in monetary terms but as an obligation to deliver, free and clear of all expenses associated with operation of the property, a specified quantity of oil or gas to the purchaser out of a specified share of future production. Such a transaction is a sale of a mineral interest for which gain shall not be recognized because the seller has a substantial obligation for future performance. The seller shall account for the funds received as unearned revenue to be recognized as the oil or gas is delivered. The purchaser of such a production payment has acquired an interest in a mineral property that shall be recorded at cost and amortized by the unit-of-production method as delivery takes place. The related reserve estimates and production data shall be reported as those of the purchaser of the production payment and not of the seller (paragraphs .050-.056).

b. An assignment of the operating interest in an unproved property with retention of a nonoperating interest in return for drilling, development, and operation by the assignee is a pooling of assets in a joint undertaking for which the assignor shall not recognize gain or loss. The assignor's cost of the original interest shall become the cost of the interest retained. The assignee shall account for all costs incurred as specified by paragraphs .015-.041 and shall allocate none of those costs to the mineral interest acquired. If oil or gas is discovered, each party shall report its share of reserves and production (paragraphs .050-.056).

c. An assignment of a part of an operating interest in an unproved property in exchange for a "free well" with provision for joint ownership and operation is a pooling of assets in a joint undertaking by the parties. The assignor shall record no cost for the obligatory well; the assignee shall record no cost for the mineral interest acquired. All drilling, development, and operating costs incurred by either party shall be accounted for as provided in paragraphs .015-.041 of this Statement. If the conveyance agreement requires the assignee to incur geological or geophysical expenditures instead of, or in addition to, a drilling obligation, those costs shall likewise be accounted for by the assignee as provided in paragraphs .015-.041 of this Statement. If reserves are discovered, each party shall report its share of reserves and production (paragraphs .050-.056).

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

d. A part of an operating interest in an unproved property may be assigned to effect an arrangement called a "carried interest" whereby the assignee (the carrying party) agrees to defray all costs of drilling, developing, and operating the property and is entitled to all of the revenue from production from the property, excluding any third party interest, until all of the assignee's costs have been recovered, after which the assignor will share in both costs and production. Such an arrangement represents a pooling of assets in a joint undertaking by the assignor and assignee. The carried party shall make no accounting for any costs and revenue until after recoupment (payout) of the carried costs by the carrying party. Subsequent to payout the carried party shall account for its share of revenue, operating expenses, and (if the agreement provides for subsequent sharing of costs rather than a carried interest) subsequent development costs. During the payout period the carrying party shall record all costs, including those carried, as provided in paragraphs .015-.041 and shall record all revenue from the property including that applicable to the recovery of costs carried. The carried party shall report as oil or gas reserves only its share of proved reserves estimated to remain after payout, and unit-of-production amortization of the carried party's property cost shall not commence prior to payout. Prior to payout the carrying party's reserve estimates and production data shall include the quantities applicable to recoupment of the carried costs (paragraphs .050-.056).

e. A part of an operating interest owned may be exchanged for a part of an operating interest owned by another party. The purpose of such an arrangement, commonly called a joint venture in the oil and gas industry, often is to avoid duplication of facilities, diversify risks, and achieve operating efficiencies. Such reciprocal conveyances represent exchanges of similar productive assets, and no gain or loss shall be recognized by either party at the time of the transaction. In some joint ventures which may or may not involve an exchange of interests, the parties may share different elements of costs in different proportions. In such an arrangement a party may acquire an interest in a property or in wells and related equipment that is disproportionate to the share of costs borne by it. As in the case of a carried interest or a free well, each party shall account for its own cost under the provisions of this Statement. No gain shall be recognized for the acquisition of an interest in joint assets, the cost of which may have been paid in whole or in part by another party.

f. In a unitization all the operating and nonoperating participants pool their assets in a producing area (normally a field) to form

a single unit and in return receive an undivided interest (of the same type as previously held) in that unit. Unitizations generally are undertaken to obtain operating efficiencies and to enhance recovery of reserves, often through improved recovery operations. Participation in the unit is generally proportionate to the oil and gas reserves contributed by each. Because the properties may be in different stages of development at the time of unitization, some participants may pay cash and others may receive cash to equalize contributions of wells and related equipment and facilities with the ownership interests in reserves. In those circumstances, cash paid by a participant shall be recorded as an additional investment in wells and related equipment and facilities, and cash received by a participant shall be recorded as a recovery of cost. The cost of the assets contributed plus or minus cash paid or received is the cost of the participant's undivided interest in the assets of the unit. Each participant shall include its interest in reporting reserve estimates and production data (paragraphs .050-.056).

g. If the entire interest in an unproved property is sold for cash or cash equivalent, recognition of gain or loss depends on whether, in applying paragraph .028 of this Statement, impairment had been assessed for that property individually or by amortizing that property as part of a group. If impairment was assessed individually, gain or loss shall be recognized. For a property amortized by providing a valuation allowance on a group basis, neither gain nor loss shall be recognized when an unproved property is sold unless the sales price exceeds the original cost of the property, in which case gain shall be recognized in the amount of such excess.

h. If a part of the interest in an unproved property is sold, even though for cash or cash equivalent, substantial uncertainty usually exists as to recovery of the cost applicable to the interest retained. Consequently, the amount received shall be treated as a recovery of cost.[4] However, if the sales price exceeds the carrying amount of a property whose impairment has been assessed individually in accordance with paragraph .028 of this Statement, or exceeds the original cost of a property amortized by providing a valuation allowance on a group basis, gain shall be recognized in the amount of such excess.

i. The sale of an entire interest in a proved property that constitutes a separate amortization base is not one of the types of

[4] The carrying amount of the interest retained shall continue to be subject to the assessment for impairment as required by paragraph .028.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

conveyances described in paragraph .044 or .045. The difference between the amount of sales proceeds and the unamortized cost shall be recognized as a gain or loss.

j. The sale of a part of a proved property, or of an entire proved property constituting a part of an amortization base, shall be accounted for as the sale of an asset, and a gain or loss shall be recognized, since it is not one of the conveyances described in paragraph .044 or .045. The unamortized cost of the property or group of properties a part of which was sold shall be apportioned to the interest sold and the interest retained on the basis of the fair values of those interests. However, the sale may be accounted for as a normal retirement under the provisions of paragraph .041 with no gain or loss recognized if doing so does not significantly affect the unit-of-production amortization rate.

k. The sale of the operating interest in a proved property for cash with retention of a nonoperating interest is not one of the types of conveyances described in paragraph .044 or .045. Accordingly, it shall be accounted for as the sale of an asset, and any gain or loss shall be recognized. The seller shall allocate the cost of the proved property to the operating interest sold and the nonoperating interest retained on the basis of the fair values of those interests.[5]

l. The sale of a proved property subject to a retained production payment that is expressed as a fixed sum of money payable only from a specified share of production from that property, with the purchaser of the property obligated to incur the future costs of operating the property, shall be accounted for as follows:

    i. *If satisfaction of the retained production payment is reasonably assured.* The seller of the property, who retained the production payment, shall record the transaction as a sale, with recognition of any resulting gain or loss. The retained production payment shall be recorded as a receivable, with interest accounted for in accordance with the provisions of *APB Opinion No. 21* [section 4111], "Interest on Receivables and Payables." The purchaser shall record as the cost of the assets acquired the cash consideration paid plus the present value (determined in accordance with *APB Opinion No. 21* [section 4111]) of the retained production payment, which shall be recorded as a payable. The oil and gas reserve estimates

[5] A retained production payment denominated in money is not a mineral interest (see paragraphs .011(a) and .043).

and production data, including those applicable to liquidation of the retained production payment, shall be reported by the purchaser of the property (paragraphs .050-.056).

ii. *If satisfaction of the retained production payment is not reasonably assured.* The transaction is in substance a sale with retention of an overriding royalty that shall be accounted for in accordance with paragraph .047(k).

m. The sale of a proved property subject to a retained production payment that is expressed as a right to a specified quantity of oil or gas out of a specified share of future production shall be accounted for in accordance with paragraph .047(k).

Disclosure

.048 An enterprise engaged in oil and gas producing activities shall include in a complete set of annual financial statements the disclosures specified in paragraphs .050-.059. Those disclosures may be made within the body of the financial statements, in the notes thereto, or in a separate schedule that is an integral part of the financial statements.

.049 Disclosure of capitalized costs (paragraph .057) shall also be included in a complete set of interim financial statements that present financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles. Disclosures of reserve quantities and of costs incurred as set forth in paragraphs .050-.056 and .058 and .059 are not required in such interim financial statements, though the Board encourages disclosure in those financial statements of information about a major discovery or other favorable or adverse event that causes a significant change from the reserve data reported in the most recent annual financial statements.

Disclosure of Reserve Quantities

.050 Net quantities of an enterprise's interests in proved reserves and proved developed reserves of (a) crude oil (including condensate and natural gas liquids) and (b) natural gas shall be reported as of the beginning and the end of each year for which a complete set of financial statements is presented. "Net" quantities of reserves include those relating to the enterprise's operating and nonoperating interests in properties as defined in paragraph .011(a). Quantities of reserves relating to royalty interests owned shall be included in "net" quantities if the necessary in-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

formation is available to the enterprise; if reserves relating to royalty interests owned are not included because the information is unavailable, that fact and the enterprise's share of oil and gas produced for those royalty interests shall be reported for each year for which a complete set of financial statements is presented. "Net" quantities shall not include reserves relating to interests of others in properties owned by the enterprise.

.051 Changes in the net quantities of an enterprise's proved reserves of oil and of gas during each year for which a complete set of financial statements is presented shall be reported. Changes resulting from each of the following shall be separately shown with appropriate explanation of significant changes:

a. *Revisions of previous estimates.* Revisions represent changes in previous estimates of proved reserves, either upward or downward, resulting from new information (except for an increase in proved acreage) normally obtained from development drilling and production history or resulting from a change in economic factors.
b. *Improved recovery.* Changes in reserve estimates resulting from application of improved recovery techniques shall be separately shown if significant. If not significant, such changes shall be included in revisions of previous estimates.
c. *Purchases of minerals-in-place.*
d. *Extensions, discoveries, and other additions.* Additions to an enterprise's proved reserves that result from (i) extension of the proved acreage of previously discovered (old) reservoirs through additional drilling in periods subsequent to discovery and (ii) discovery of new fields with proved reserves or of new reservoirs of proved reserves in old fields.
e. *Production.*
f. *Sales of minerals-in-place.*

.052 If an enterprise's proved reserves of oil and gas are located entirely within its home country, that fact shall be disclosed. If some or all of its reserves are located in foreign countries, the disclosures of net quantities of reserves of oil and of gas and changes in them required by paragraphs .050 and .051 shall be separately reported for (a) the enterprise's home country (if significant reserves are located there) and (b) each foreign geographic area in which significant reserves are located. Foreign geographic areas are individual countries or groups of countries as appropriate for meaningful disclosure in the circumstances.

.053 Net quantities disclosed in conformity with paragraphs .050-.052 shall not include oil or gas subject to purchase under long-term supply, purchase, or similar agreements and contracts, including such agreements with foreign governments or authorities. However, quantities of oil or gas subject to such agreements with foreign governments or authorities as of the end of each year for which a complete set of financial statements is presented, and the net quantity of oil or gas received under the agreements during each such year, shall be separately disclosed if the enterprise participates in the operation of the properties in which the oil or gas is located or otherwise serves as the "producer" of those reserves, as opposed, for example, to being an independent purchaser, broker, dealer, or importer.

.054 In determining the reserve quantities to be reported in conformity with paragraphs .050-.053:

a. If the enterprise issues consolidated financial statements, 100 percent of the *net* reserve quantities attributable to the parent company and 100 percent of the *net* reserve quantities attributable to its consolidated subsidiaries (whether or not wholly owned) shall be included.
b. If the enterprise's financial statements include investments that are proportionately consolidated, the enterprise's reserve quantities shall include its proportionate share of the investee's net oil and gas reserves.
c. If the enterprise's financial statements include investments that are accounted for by the equity method, the investee's net oil

and gas reserves shall *not* be included in the disclosures of the enterprise's reserves. However, the enterprise's (investor's) share of the investee's net oil and gas reserves shall be separately reported as of the end of each year for which a complete set of financial statements is presented.

.055 In reporting reserve quantities and changes in them, oil reserves (which include condensate and natural gas liquids) shall be stated in barrels, and gas reserves in cubic feet. Disclosures of the type called for by paragraphs .050-.054 are diagrammed on the previous page.

.056 If important economic factors or significant uncertainties affect particular components of an enterprise's proved reserves, explanation shall be provided. Examples include unusually high expected development or lifting costs; the necessity to build a major pipeline or other major facilities before production of the reserves can begin; or contractual obligations to produce and sell a significant portion of reserves at prices that are substantially below those at which the oil or gas could otherwise be sold in the absence of the contractual obligation.

Disclosure of Capitalized Costs

.057 The aggregate amount of capitalized costs relating to an enterprise's oil and gas producing activities (paragraph .011) and the aggregate amount of the related accumulated depreciation, depletion, amortization, and valuation allowances shall be reported as of the end of each period for which financial statements are presented. Paragraph 5 of *APB Opinion No. 12* [section 2043.02], "Omnibus Opinion—1967," requires disclosure of "balances of major classes of depreciable assets, by nature or function." Thus, separate disclosure of the amount of capitalized costs for one or more of asset categories (a) to (d) in paragraph .011 or for a combination of two or more of those categories often may be appropriate.

Disclosure of Costs Incurred in Oil and Gas Producing Activities

.058 The financial statements of an oil and gas producing company shall disclose the amounts of each of the following types of costs for each year for which a complete set of financial statements is presented (whether those costs are capitalized or charged to expense at the time they are incurred under the provisions of paragraphs .015-.026). As defined in the paragraphs cited, exploration, development, and production costs *include* depreciation of support equipment and facilities used in those activities and *do not include* the expenditures to acquire support equipment and fa-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

cilities. Also, as stated in paragraph .025, production (lifting) costs do not include depreciation, depletion, and amortization of capitalized acquisition, exploration, and development costs.

a. Property acquisition costs (paragraph .015).
b. Exploration costs (paragraph .017).
c. Development costs (paragraph .021).
d. Production (lifting) costs (paragraph .024).

.059 If some or all of those costs are incurred in foreign countries, the amounts shall be disclosed separately for each of the geographic areas for which reserve quantities are disclosed (paragraph .052).

Accounting for Income Taxes

.060 Some costs incurred in an enterprise's oil and gas producing activities enter into the determination of taxable income and pretax accounting income in different periods. A principal example is intangible drilling and development costs, which are deductible in determining taxable income when incurred but which, for successful exploratory wells and for all development wells, are capitalized and amortized for financial accounting purposes under the provisions of this Statement. As another example, some geological and geophysical costs, which are charged to expense when incurred under the provisions of this Statement, are deferred and deducted in subsequent periods for income tax purposes.

.061 Comprehensive interperiod income tax allocation by the deferred method, as described in *APB Opinion No. 11* [section 4091], "Accounting for Income Taxes," shall be followed by oil and gas producing companies for intangible drilling and development costs and other costs incurred that enter into the determination of taxable income and pretax accounting income in different periods.

.062 In applying the comprehensive interperiod income tax allocation provision of the preceding paragraph, the possibility that statutory depletion in future periods will reduce or eliminate the amount of income taxes otherwise payable shall not be taken into account. That is, the so-called *interaction* of book/tax timing differences with any anticipated future excess of statutory depletion allowed as a tax deduction over the amount of cost depletion otherwise allowable as a tax deduction shall not be recognized in determining the appropriate periodic provision for income taxes. Accordingly, the excess of statutory depletion over cost depletion for tax purposes shall be accounted for as a permanent difference

in the period in which the excess is deducted for income tax purposes; it shall not be anticipated by recognizing interaction.

Effective Date and Transition

.063 This Statement shall be effective for financial statements for fiscal years beginning after December 15, 1978 and for interim periods within those fiscal years. Accounting changes adopted to conform to the provisions of this Statement, including changes to apply comprehensive interperiod income tax allocation (paragraph .061) and to eliminate the recognition of the interaction of book/tax timing differences with the excess of statutory depletion over cost depletion for tax purposes (paragraph .062), shall be made retroactively by restating the financial statements of prior periods. Financial statements for the fiscal year in which this Statement is first applied, and for interim periods of that year, shall disclose the nature of those accounting changes and their effect on income before extraordinary items, net income, and related per share amounts for each period restated. The disclosures specified by paragraphs .050-.059 shall be included in complete sets of financial statements that have been restated pursuant to the provisions of this paragraph.

.064 Retroactive application of the provisions of this Statement requires the use of estimates and approximations; a provision that would not have a significant effect on prior years' financial statements need not be retroactively applied. Further, retroactive application of some provisions of this Statement may require the use of estimates of a type that the enterprise had not previously made; information that may have become available some time after the year being restated may be taken into account in making those estimates, except that estimates of quantities of oil and gas reserves that had been made in prior years shall not currently be revised in retrospect.

The provisions of this Statement need not be applied to immaterial items.

Appendix A

BACKGROUND INFORMATION

.065 Financial accounting and reporting for oil and gas producing companies has been debated for many years in the United States by the accounting profession, regulatory agencies, industry groups, and the companies themselves. The principal focus in recent years has been on the two widely different methods of accounting followed by those companies—the full cost method and the successful efforts method.

.066 In 1964, the American Institute of Certified Public Accountants commissioned Robert E. Field, a partner of Price Waterhouse & Co., to study the various accounting methods used by companies in the extractive industries and to make recommendations for consideration by the AICPA Accounting Principles Board in formulating a pronouncement. The study was published by the AICPA in 1969 as *Accounting Research Study No. 11,* "Financial Reporting in the Extractive Industries." The recommendations in *ARS No. 11* essentially supported the successful efforts method of accounting.

.067 In 1970, the APB asked its Committee on Extractive Industries to (a) study the recommendations in *ARS No. 11* and (b) "determine the appropriate accounting practices with the intent of narrowing the different accounting practices in the extractive industries." In mid-1971, the Committee drafted a proposed APB Opinion dealing only with determination of the appropriate *cost center,* on the belief that issues associated with the cost center question were at the heart of the full cost/successful efforts controversy. The full APB decided, however, that limiting an Opinion to the cost center question was inappropriate. The APB directed its Committee to prepare a paper containing recommendations on (a) determination of the cost center, (b) accounting for prediscovery and postdiscovery costs, (c) disposition of capitalized costs, and (d) disclosure of supplementary information in financial reports.

.068 The APB Committee paper was published in the fall of 1971 under the title "Accounting and Reporting Practices in the Petroleum Industry." The paper recommended using the *field* as the cost center and capitalizing all prediscovery and postdiscovery costs that could be directly associated with oil and gas reserves, including reinstatement of the costs of exploratory dry holes initially written off but later determined to be in a field. The APB sched-

uled a public hearing for November 1971, with the Committee paper to serve as the basis for the hearing.

.069 While the APB Committee was deliberating and preparing its paper, the Federal Power Commission was studying the accounting practices of natural gas producing companies subject to its jurisdiction. In October 1970, the FPC issued a proposal to require application of the full cost concept in FPC filings by natural gas companies. During the following thirteen months, the FPC weighed arguments for and against its proposal, including a request from the APB that the FPC delay final action until an APB Opinion could be issued. On November 5, 1971, the FPC issued Order No. 440 adopting the full cost method for mineral leases acquired after October 6, 1969 with each country as a cost center. Petitions for rehearing, which were filed on December 5, 1971, were denied by the FPC in Order No. 440-A issued January 5, 1972.

.070 The APB's public hearing was held on November 22 and 23, 1971. At the hearing, the recommendations in the APB Committee paper were opposed not only by advocates of the full cost method, who viewed the proposal to use the field as the cost center as effectively banning the full cost concept, but also by many advocates of successful efforts accounting, who disagreed with various aspects of the recommendations including, among other things, the capitalization of the costs of development dry holes and those exploratory dry holes determined to be in a field. After the hearing, the APB Committee on Extractive Industries continued to work on a proposed Opinion. The testimony given at that public hearing and the written submissions to the APB have been studied by the FASB.

.071 On July 1, 1973, the FASB succeeded the APB as the private sector accounting standards-setting body. The APB Committee prepared for the FASB a detailed report on its activities entitled "Accounting and Reporting Practices in the Oil and Gas Industry." That report is reprinted as an appendix to the FASB Discussion Memorandum on the project.

.072 In January 1973, a group of oil and gas producing companies that use the full cost method formed the Ad Hoc Committee (Petroleum Companies) on Full Cost Accounting. That Committee commissioned a research study by John H. Myers, Professor of Accounting at Indiana University. The study, entitled *Full Cost vs. Successful Efforts in Petroleum Accounting: An*

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Empirical Approach, was published in 1974. Dr. Myers simulated the results of accounting for various types of transactions under each of the two methods and concluded that full cost accounting together with disclosure of data on oil and gas reserves better serves the needs of users of financial statements.

.073 In 1975, Congress substantially reduced or eliminated the percentage depletion deduction for many oil and gas producing companies, which led to the issuance in October 1975 of *FASB Statement No. 9* [section 4097].

.074 The FASB did not place accounting and reporting in the extractive industries on its initial technical agenda in 1973, but the foreign oil embargo of that year and the resulting substantial increases in world oil prices aroused great interest in the oil and gas industry on the part of both the American public and the federal government. With other energy legislation enacted or under active consideration by Congress, the FASB decided that accounting by oil and gas producing companies should receive high priority. In October 1975, it added to its technical agenda a project entitled "Financial Accounting and Reporting in the Extractive Industries."

.075 In December 1975, President Gerald R. Ford signed Public Law 94-163, the *Energy Policy and Conservation Act* [42 U.S. Code, Sec. 6383]. Title V, Section 503 of the Act empowers the Securities and Exchange Commission either:

> to prescribe rules applicable to persons engaged in the production of crude oil or natural gas, or make effective by recognition, or by other appropriate means indicating a determination to rely on, accounting practices developed by the Financial Accounting Standards Board, if the Securities and Exchange Commission is assured that such practice will be observed by persons engaged in the production of crude oil or natural gas to the same extent as would result if the Securities and Exchange Commission had prescribed such practices by rule.

.076 The effect of Section 503 is to require that the contemplated accounting practices be developed by December 22, 1977 (24 months after the Act was signed into law) for all persons engaged either exclusively or partially in the production of crude oil or natural gas in the United States. The Act requires the SEC to provide an opportunity for interested persons to submit written comments on whether the Commission should recognize or otherwise rely on the standards developed by the FASB. That comment period can be after December 22, 1977.

.077 The Act further provides that the SEC shall assure that the accounting practices developed pursuant to Section 503 will, to the greatest extent practicable, permit the compilation of a national energy data base consisting of the following data with domestic and foreign operations treated separately:

(1) The separate calculation of capital, revenue, and operating cost information pertaining to—

(A) prospecting,

(B) acquisition,

(C) exploration,

(D) development, and

(E) production,

including geological and geophysical costs, carrying costs, unsuccessful exploratory drilling costs, intangible drilling and development costs on productive wells, the cost of unsuccessful development wells, and the cost of acquiring oil and gas reserves by means other than development. Any such calculation shall take into account disposition of capitalized costs, contractual arrangements involving special conveyance of rights and joint operations, differences between book and tax income, and prices used in the transfer of products or other assets from one person to any other person, including a person controlled by, controlling, or under common control with such person.

(2) The full presentation of the financial information of persons engaged in the production of crude oil or natural gas, including—

(A) disclosure of reserves and operating activities, both domestic and foreign, to facilitate evaluation of financial effort and result; and

(B) classification of financial information by function to facilitate correlation with reserve and operating statistics, both domestic and foreign.

(3) Such other information, projections, and relationships of collected data as shall be necessary to facilitate the compilation of such data base.

.078 The Board is issuing this Statement under its authority, which exists entirely apart from the Act, and also to assist the SEC in carrying out its obligations as contemplated by Congress under the Act as well as under the federal securities laws.

.079 The FASB appointed a task force of 18 persons in December 1975 to counsel the Board in preparing a Discussion Memorandum analyzing issues related to the project. Members of the task force came from the oil and gas industry, petroleum geology and engineering, other extractive industries, public accounting, banking, securities underwriting, and academe. Professor Horace R. Brock of North Texas State University was engaged by the Board to serve as chairman of the task force and consult-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

ant to the Board during the preparation of the Discussion Memorandum. Meetings of the task force were attended by observers from the following federal agencies and Congressional committee:

a. Cost Accounting Standards Board.

b. Federal Energy Administration.

c. Federal Power Commission.

d. Securities and Exchange Commission.

e. Oversight and Investigations Subcommittee of the Committee on Interstate and Foreign Commerce, United States House of Representatives.

f. United States General Accounting Office.

.080 The task force held its initial meeting in January 1976. Three additional meetings were held during that year. Much of the work of the task force was accomplished by correspondence, with task force members providing the Board with a significant amount of input concerning the accounting and reporting issues that they believed should be addressed in this project. Drafts of all sections of the Discussion Memorandum were sent to task force members and observers for written comment. Although the chairman of the task force and members of the staff of the FASB assumed primary responsibility for drafting the Discussion Memorandum, some sections were initially drafted by task force members expert on the particular matter being discussed.

.081 In February 1976, the FASB concluded, on the basis of a task force recommendation, that the Discussion Memorandum should not be restricted to only the oil and gas industry, but should cover accounting and reporting issues relevant to companies engaged in the search for and production of all wasting (nonregenerative) natural resources. That recommendation was not unanimously supported by the task force. Some members believed that it would be preferable to focus initially on the oil and gas industry, as the APB Committee on Extractive Industries had done. Those members were also concerned that broadening the study could blur important distinctions between oil and gas companies and other extractive industries. The FASB, in accepting the recommendation of a majority of the task force members, concluded that apparent similarities of operations among extractive industries warranted the inclusion of all such industries in the scope of the Discussion Memorandum. The Board noted in the Discussion

Memorandum, however, that inclusion of all extractive industries within the scope of the project at that stage did not mean that the Board intended to issue a single Statement covering all of those industries.

.082 On March 23, 1976, the SEC issued *Accounting Series Release No. 190* amending Regulation S-X to require companies that meet specified size tests to disclose certain replacement cost data relating to "inventories" and "productive capacity" in financial statements filed with the Commission for fiscal years ending on or after December 25, 1976. In that Release, the SEC delayed for one year the effective date of the required replacement cost disclosures for "mineral resource assets." SEC *Staff Accounting Bulletin No. 10* defines mineral resource assets as "those costs shown on the balance sheet representing assets which are directly associated with and which derive value from mineral reserves." In June 1977, the American Petroleum Institute published and submitted to the SEC a study by Professors Glenn A. Welsch and Edward B. Deakin, of the University of Texas at Austin, entitled *Measuring and Reporting the "Replacement" Cost of Oil and Gas Reserves*. In transmitting the study to the SEC, the API stated its view that "the concept of replacement cost as envisioned in ASR 190 is not applicable to oil and gas reserves" and urged the SEC to "permanently exempt oil and gas reserves from replacement cost disclosure."

.083 On May 12, 1976, the SEC issued *Securities Act Release No. 5706,* which requires that information relating to oil and gas properties, reserves, and production be disclosed in registration statements, proxy statements, and reports filed with the Commission.

.084 In preparing the Discussion Memorandum, the task force and the Board considered many research studies and other publications in addition to *ARS No. 11* and the study by Dr. Myers, including the proceedings of the APB's public hearing and studies of accounting and reporting practices in the extractive industries by public accounting firms and industry associations. Approximately 100 recent (generally post-1968) publications on accounting and reporting in the extractive industries were reviewed by the FASB staff; a bibliography is included as an appendix to the Discussion Memorandum. Copies of those publications are in the FASB library.

.085 The Board issued the Discussion Memorandum on December 23, 1976 with written comments due by March 7, 1977. In

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

response to the Discussion Memorandum, the Board received 140 position papers, letters of comment, and outlines (totalling approximately 2,600 pages), copies of which have been available for inspection at the Board's offices since March 14, 1977 and are available for purchase. Copies were made available to each of the observer groups identified in paragraph .079.

.086 On January 31, 1977, in *Securities Act Release No. 5801,* the SEC called attention to publication of the FASB Discussion Memorandum and encouraged interested parties to obtain and comment on the Memorandum and to participate in the FASB public hearing. The Release states that "the Commission, consistent with its policy most recently expressed in Accounting Series Release No. 150, contemplates that the Financial Accounting Standards Board (FASB) will be providing the leadership in establishing financial accounting principles and standards for producers of oil and gas." A part of one of the chapters in the Discussion Memorandum was prepared by the staff of the SEC. It considers matters relating to the SEC's responsibilities regarding the national energy data base.

.087 The Board held a public hearing on the subject on March 30 and 31 and April 1 and 4, 1977. Thirty-nine presentations were made at the hearing. A transcript of the hearing (nearly 1,000 pages in length) is available for inspection or purchase. Copies were made available to each of the observer groups identified in paragraph .079.

.088 Seven days of concentrated preparatory sessions were held by the Board prior to deliberations on the issues. Those sessions were devoted to detailed examination of (a) the nature of acquisition, exploration, development, and production activities in the oil and gas industry; (b) the features and variations of the full cost method, the successful efforts method, discovery value accounting, and current value accounting; (c) reserve definitions and measurement; (d) reserve valuation; and (e) mineral property conveyances and contracts. Outside experts were invited to make presentations or otherwise assist the Board's staff in conducting the sessions. Those experts, eight of whom were task force members, included petroleum engineers and geologists, public accountants, corporate executives from the oil and gas industry, and academicians.

.089 Subsequent to issuance of the Discussion Memorandum, the Board and its staff have maintained close contact with representatives of the SEC who, in turn, have been in contact with the other government agencies concerned with implementing the *Energy Policy and Conservation Act* and other federal energy legislation,

with the mutual objective of keeping all parties informed of the others' activities regarding accounting and reporting by oil and gas producing companies. That close contact has continued after issuance of the FASB's Exposure Draft.

.090 In addition to the Discussion Memorandum and the research studies and other publications mentioned earlier in paragraph .084, two other research efforts were undertaken at the Board's request during its deliberations on the Exposure Draft:

a. Academic consultants conducted interviews to ascertain how investment and credit decisions regarding oil and gas producing companies are reached. The 24 interviewees included loan officers of large and small banks that make loans to large and small oil and gas companies, bank trust department officers, institutional securities underwriters for both large and small companies, securities analysts, and an officer of a bond rating agency. The selection of interviewees from both the Northeast and the Southwest was designed to include organizations that invest or recommend investments in small as well as large companies. While the limited number of interviews did not provide conclusive evidence, the majority of interviewees indicated that the method of accounting would not affect their investment and credit decisions regarding oil and gas producing companies. The key factor in the decisions of a number of interviewees was their own valuations of oil and gas reserves and other assets; others relied heavily on cash flow data rather than earnings; still others took into consideration the method of accounting when evaluating earnings. Several interviewees believed that reduced earnings from accounting changes probably affected some investors and thus could adversely affect some stock prices.

b. A study was made of how *FASB Statement No. 9* [section 4097] was applied in practice. The study found no relationship between the way that Statement was applied and the method of accounting employed or company size.

.091 On June 20, 1977, the SEC issued *Securities Act Release No. 5837* soliciting comments in connection with the Commission's responsibilities under the *Energy Policy and Conservation Act* to assure the development and observance of accounting practices to be followed by U.S. producers of crude oil and natural gas. That Release not only raised questions relating to the reporting of financial and operating data to the Federal Energy Administrator but also solicited comments about the extent to which that data should

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

be "included in filings with the Commission in a manner which would require independent public accountants reporting on registrants' financial statements to be associated with the data." The Release indicated that "the Commission recognizes that the FASB is considering for inclusion in its proposed standard the disclosure of functional financial data and information on oil and gas reserves. The Commission will be cognizant of the FASB's conclusions in this area and will attempt to coordinate the reporting requirements pursuant to the Act and any revisions proposed to the disclosure requirements under the Securities Acts with the disclosures required in financial statements by the FASB. Reporting pursuant to the Act and any changes to the Commission's disclosure rules may encompass matters . . . in addition to or in greater detail than those required by the FASB."

.092 The Board issued an Exposure Draft of a proposed Statement on "Financial Accounting and Reporting by Oil and Gas Producing Companies" on July 15, 1977. It received letters of comment on the Exposure Draft from 195 respondents (totalling approximately 1,300 pages). Copies of the letters were made available to each of the observer groups identified in paragraph .079.

.093 After the Exposure Draft was issued, two additional research studies were conducted at the Board's request:

a. A research consultant, with assistance from the FASB staff, studied the effect of the Exposure Draft on the market prices of common stock issued by both full cost and successful efforts oil and gas producing companies. The research was conducted by Professor Thomas R. Dyckman of Cornell University, using data part of which was supplied by the FASB staff. Two research methodologies were employed. The first required two samples of equal size and was applied to companies that derive more than 50 percent of their revenue from exploration and production activities. The market prices of common shares issued by 22 full cost companies and 22 successful efforts companies were studied for the 11 weeks before and the 11 weeks after the Exposure Draft was issued. The study did not find statistically significant evidence that issuance of the Exposure Draft affected the market prices of securities issued by the full cost companies as compared to those of the successful efforts companies—except for some possible effect on the full cost companies during the week preceding and the week of issuance of the Exposure Draft, but the market soon adjusted, and evidence of a permanent or lingering effect was not found. The second methodology

employed different underlying statistical procedures and was applied to broader samples. Those samples were not limited to companies engaged primarily in exploration and production but were limited to oil and gas companies with annual revenues less than $1 billion each. The samples included 65 full cost companies and 40 successful efforts companies. Again, the evidence did not support the hypothesis that the prices of shares issued by full cost companies were adversely affected, other than for a very brief period, by issuance of the Exposure Draft. Both Professor Dyckman and the Board recognize that statistical testing may not necessarily be conclusive. Following issuance of this Statement, the Board will undertake a similar study with respect to whether this Statement adversely affects the market prices of securities of oil and gas producing companies that heretofore had been using the full cost method as compared to those that had been using the successful efforts method.

b. The Board commissioned a telephone interview survey of senior executive officers of 27 relatively small and medium sized, publicly traded, successful efforts oil and gas producing companies (with annual revenues ranging from $1 million to $441 million, average $68 million). No large integrated oil and gas companies were included. The study was conducted under the direction of Professor Horace R. Brock of North Texas State University. The purpose of the survey was to ascertain whether, in the judgment of those corporate officers, the use of the successful efforts method of accounting has had any negative effect on the ability of their companies to raise the capital necessary to finance their exploration and production activities. Most of the surveyed companies have raised capital externally during the past 10 years from one or more of the following sources: public issue of debt securities, public issue of equity securities, private placement of securities, special conveyances, borrowing from a local bank, international bank, or insurance company, and sale of participations in individual projects. None of the executive officers surveyed indicated that the company's use of successful efforts accounting had hindered its ability to raise capital. Four of the officers did indicate an uncertainty as to whether their continued use of the successful efforts method would affect their ability to raise capital in the future.

.094 On August 31, 1977, the SEC issued *Securities Act Release No. 5861* proposing to amend the Commission's regulations to incorporate therein the accounting standards set forth in the FASB

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Exposure Draft. The Commission stated that the reason for the proposal is to place the Commission in a position to adopt by December 22, 1977 financial accounting and reporting standards for oil and gas producing activities in the unlikely event that the FASB has not adopted final standards by that date. The Release states that the proposed standards would be applicable to both (1) persons filing reports with the Department of Energy and (2) filings with the Commission under federal securities laws. The Commission stated that it proposed the rules pursuant to its authority under the *Energy Policy and Conservation Act* and the federal securities laws. The Release deals only with accounting standards and does not address disclosure matters.

.095 On October 26, 1977, the SEC issued two Releases dealing with disclosures by oil and gas producing companies. The first Release, *Securities Act Release No. 5877,* proposes to amend the Commission's regulations to provide for disclosure in financial statements of certain operating and financial data relating to oil and gas producing activities. Like the proposal mentioned in the preceding paragraph, the disclosure standards proposed in this Release would apply both to (1) filings with the Commission pursuant to federal securities laws and (2) reports filed with the Department of Energy pursuant to the *Energy Policy and Conservation Act.* The SEC's proposed disclosures are generally the same as those proposed in the FASB Exposure Draft.

.096 The second SEC Release of October 26, 1977, *Securities Act Release No. 5878,* deals with replacement cost disclosures for mineral resource assets. The Release proposes (1) to rescind the requirement adopted in *ASR No. 190* for certain registrants to disclose replacement cost information about their mineral resource assets employed in oil and gas producing activities (see paragraph .082 of this Statement) and (2) to require, instead, that registrants with mineral resource assets employed in oil and gas producing activities disclose information based on the present value of future net revenues from estimated production of proved oil and gas reserves. The Release points out that "the proposed disclosures cannot be described as replacement cost information; however, they would provide information on the differences between the historical costs associated with proved oil and gas reserves shown in the financial statements and the future net revenues to be derived from these reserves." That proposal would be effective in filings covering fiscal years end-

ing on or after December 25, 1978. Comments on the proposal are to be submitted to the Commission by March 31, 1978.

Appendix B

BASIS FOR CONCLUSIONS

.097 This Appendix discusses factors deemed significant by members of the Board in reaching the conclusions in this Statement, including alternatives considered and reasons for accepting some and rejecting others.

Scope

.098 Although the Discussion Memorandum for this project analyzed issues and solicited comments on accounting and reporting by companies in all extractive industries, this Statement applies only to the oil and gas producing industry as had been proposed in the Exposure Draft. Some respondents to the Discussion Memorandum and the Exposure Draft said that the mining industries are sufficiently different from the oil and gas industry to warrant separate pronouncements. For instance, some said that in the mining industries the principal emphasis is on the development and operation of existing mines and known deposits whereas in the oil and gas industry the principal emphasis is on the search for new mineral deposits. Also, some respondents said that mining operations involve substantially lower exploration and acquisition costs and substantially higher development and production costs relative to the oil and gas industry, which, they claimed, is characterized by high finding costs and a high proportion of unsuccessful search activities. In the view of those respondents, *discovery* is the critical event leading to the production of oil and gas whereas *development* and *extraction* are the critical events for most other minerals. Many who favored separating the oil and gas industry from other extractive industries pointed out also that the full cost versus successful efforts controversy has little significance in the mining industry while it is the primary issue for the oil and gas industry. Still others noted that there is greater uniformity in current accounting practices within the mining industries than within the oil and gas industry. Thus, they took the position that current generally accepted accounting principles are adequate for the mining industries and do not require the attention of the FASB at this time. The Board has not yet examined in depth those and other claimed dissimilarities between the oil and gas industry and other extractive industries; nor has it decided whether there is a need to address the other extractive industries in a separate pronouncement.

.099 In response to questions raised in letters of comment on the Exposure Draft, paragraph .007 indicates that this Statement does not deal with accounting for interest costs because that matter is being addressed in another Board agenda project.

The Four Basic Accounting Alternatives

.100 Four basic methods of accounting for a company's oil and gas producing activities were considered by the Board:

a. Full costing.

b. Successful efforts costing.

c. Discovery value accounting.

d. Current value accounting.

The principal features of each of those four methods, and variations within each method, are described in paragraphs .104-.127.

.101 Both full costing and successful efforts costing have been considered as conforming to generally accepted accounting principles, and both, in various forms, are widely used today. Discovery value accounting and current value accounting are both proposals that are not presently followed by oil and gas producing companies or by other companies (except in a few specialized industries and then only for certain assets with readily determinable market prices) in preparing their financial statements. The full costing method came into use around 1960 and only since the late 1960s has become widely used. A 1973 survey of nearly 300 oil and gas companies found that roughly half used full cost accounting and half used successful efforts costing.[6] A 1972 survey showed that companies employing the successful efforts method account for approximately 87 percent of U.S. oil and gas production, indicating that full costing has been adopted by relatively more small and medium sized companies than large companies.[7] Testimony given at the Board's public hearing by a spokesperson for an association of independent petroleum producers indicated

that many independent oil and gas companies follow federal income tax accounting practices in preparing their financial statements; income tax accounting is a variation of successful efforts accounting.

Basic Differences between Full Costing and Successful Efforts Costing

.102 The principal difference between full costing and successful efforts costing concerns costs that cannot be directly related to the discovery of specific oil and gas reserves. Under full costing those costs are carried forward to future periods as costs of oil and gas reserves generally; under successful efforts costing those costs are charged to expense. Full costing regards the costs of unsuccessful acquisition and exploration activities as necessary for the discovery of reserves. All of those costs are incurred with the knowledge that many of a company's prospects will not result directly in the discovery of reserves. However, the company expects that the benefits obtained from those prospects that do prove successful together with the benefits from past discoveries will be adequate to recover the costs of all activities, both successful and unsuccessful, and will result in an ultimate profit. Thus, all costs incurred in oil and gas producing activities are regarded as integral to the acquisition, discovery, and development of whatever reserves ultimately result from the efforts as a whole, and are thus associated with the company's reserves. Establishing a direct cause-and-effect relationship between costs incurred and specific reserves discovered is not relevant to full costing. Under successful efforts costing, however, except for acquisition costs of properties, a direct relationship between costs incurred and specific reserves discovered is required before costs are identified with assets; costs of acquisition and exploration activities that are known not to have resulted in the discovery of reserves are charged to expense.

.103 Although many variations exist within the successful efforts method, two principal approaches can be identified. One approach relies on an "area-of-interest" (or "project" or "prospect") as a cost center because the oil and gas reserves in that area-of-interest are deemed to represent the asset for which cost is determined. Under that approach, all costs incurred within that cost center are capitalized; if the area-of-interest is abandoned, the costs are charged to expense; if the area-of-interest proves successful, the capitalized costs are amortized as the reserves are produced. The second approach does not rely on a cost center for capitalization purposes; the accounting treatment is determined by the nature of the costs at the time they are incurred. This approach does not assign costs to oil and gas reserves until they are extracted; prior to then, this approach regards properties, wells, equipment,

and facilities as the assets to which costs relate. Under one variation of this approach, all exploratory costs are charged to expense when incurred, but the cost of an exploratory well is later capitalized by reinstatement if the well is successful. Under the other variation, all exploration costs except the costs of exploratory wells are charged to expense when incurred; the costs of exploratory wells are capitalized as "construction-in-progress" when incurred, to be expensed later if the well is determined to be unsuccessful.

Principal Features of Full Costing

.104 Under the full cost concept, all costs incurred in acquiring, exploring, and developing properties within a relatively large geopolitical (as opposed to geological) cost center (such as a country) are capitalized when incurred and are amortized as mineral reserves in the cost center are produced, subject to a limitation that the capitalized costs not exceed the value of those reserves.

.105 Many variations of the full cost method exist, one of which is in the selection of the cost center. Under the broadest concept of full costing, all acquisition, exploration, and development costs wherever and whenever incurred are capitalized and amortized on a pro rata basis over the production of all of the company's oil and gas reserves wherever and whenever discovered, subject to the aforementioned limitation. This approach is referred to as using a company-wide cost center. Most companies that use full costing, however, adopt a country or a continent as the cost center.

.106 If full costing is applied on a less-than-company-wide basis, the limitation (sometimes called a ceiling) on capitalized costs generally is applied separately to each cost center, though sometimes the comparison of unamortized capitalized costs and reserve values is made on the basis of groups of cost centers or on a company-wide basis. Variations also exist in the categories of reserves used in computing the limitation and in the methods of valuing those reserves.

.107 Under the full cost concept, acquisition, exploration, and development costs are sometimes included in the pool of capitalized costs associated with a cost center when incurred, so that if the cost center is producing, those costs are subject to amortization at once. In some cases, however, certain significant costs, such as those associated with offshore U.S. operations, are de-

ferred separately without amortization until the specific property to which they relate is found to be either productive or nonproductive, at which time those deferred costs and any reserves attributable to the property are included in the computation of amortization in the cost center.

.108 Although most proponents of full costing indicate that the reserve value limitation is an essential condition for use of that method, preproduction costs incurred in a nonproducing cost center (for example, a country or continent in which the company has only recently begun its first exploration activity) are sometimes capitalized without regard to a limitation or ceiling test, based on the expectation that reserves will be discovered in the future sufficient to assure recovery of the capitalized costs.

.109 Under full costing and in many cases under successful efforts costing (if the amortization base comprises a number of properties), the unamortized costs relating to a property that is surrendered, abandoned, or otherwise disposed of are accounted for as an adjustment of accumulated amortization, rather than as a gain or loss that enters into the determination of net income, until *all* of the properties constituting the amortization base are disposed of, at which point gain or loss is recognized. Under full costing, the amortization base is normally a very large cost center —country or continent—whereas under successful efforts costing it is usually either individual properties or groups of properties with a common geological structural feature or stratigraphic condition. Therefore, recognition of gain or loss on abandonment of properties is more likely to be delayed under full costing than under successful efforts costing, although some proponents of full costing would recognize certain unusual or significant losses even before activities in an entire country or continent are discontinued.

.110 Variations within both the full cost method and the successful efforts method exist in (a) the categories of reserves used in computing amortization, (b) whether future development costs are anticipated if capitalized acquisition, exploration, or development costs are amortized on the basis of all proved reserves, (c) the extent to which properties are aggregated for amortization purposes, (d) the bases for determining amortization rates if oil and gas are jointly produced, (e) the categories of reserves and methods of valuation used in computing a limitation on capitalized costs, and (f) allocation of overhead.

Principal Features of Successful Efforts Costing

.111 Under successful efforts costing, except for acquisition costs of properties, a direct relationship between costs incurred and specific reserves discovered is required before costs are identified with assets. An acquired property is regarded as an asset until either a determination is made that it does not contain oil and gas reserves or the property is surrendered. Capitalized costs relating to producing properties are amortized as the reserves underlying those properties are produced.

.112 Many variations of successful efforts accounting exist. As noted in paragraph .103, a conceptual difference centers around the role of the cost center—whether a cost center is needed for cost capitalization purposes or only to compute amortization. For example, some proponents of successful efforts accounting would capitalize all geological and geophysical costs and, possibly, all carrying costs relating to a cost center, such as an area-of-interest, on grounds that any mineral reserves in the cost center represent the asset with which the costs are associated. If mineral reserves are found in that area-of-interest, those capitalized costs are carried forward as the costs of those reserves; otherwise, they are charged to expense. Those proponents of successful efforts thus rely in part on the concept of a cost center for the capitalize/expense decision. Others who favor successful efforts accounting would use a cost center, such as a field or a lease, only for purposes of amortizing costs. They would let the nature of the cost govern the capitalize/expense decision. For example, they might charge all G&G costs and all carrying costs to expense, based on the belief that such costs result in no identifiable future benefits, but they would capitalize all lease bonus expenditures on the basis that an asset (the right to explore for and extract oil and gas) has been acquired.

.113 With respect to property acquisition costs, relatively minor variations exist within the successful efforts method concerning the extent to which such items as brokers' fees, recording fees, legal costs, other direct costs, and allocations of indirect costs are considered acquisition costs. Those minor variations aside, virtually all advocates of successful efforts accounting capitalize all property acquisition costs when incurred, though different accounting methods are used to dispose of those costs subsequent to capitalization.

.114 Under successful efforts accounting, different methods are sometimes used to account for *pre*acquisition and *post*acquisition

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

geological and geophysical costs. With respect to preacquisition G&G, some expense all such costs when incurred; others capitalize preacquisition G&G to the extent that those costs can be related to acquired properties and expense all other such costs. Some follow a practice of reinstating costs charged to expense in a prior period based on events and experience in subsequent periods. Others do not. With respect to postacquisition G&G, alternatives include (a) capitalize all postacquisition G&G as part of the cost of the acquired properties to which the G&G costs relate; (b) charge it all to expense when incurred; and (c) charge it all to expense when incurred but reinstate those costs that relate to reserves that are found. Some persons would capitalize only post*discovery* G&G while expensing when incurred all other postacquisition G&G as well as the preacquisition G&G.

.115 At least two variations can be identified in accounting for the costs of carrying undeveloped properties (delay rentals, *ad valorem* taxes, etc.) under successful efforts accounting: (a) charge all to expense as incurred and (b) charge to expense as incurred but reinstate if subsequently associable with an area-of-interest in which reserves are found.

.116 Some proponents of the successful efforts method defer all exploratory drilling costs as "construction-in-progress" for a period of time until a determination has been made whether reserves have been found, at which time the costs of dry holes are charged to expense. Others expense all exploratory drilling costs as incurred but reinstate costs relating to any reserves that are discovered. The costs of drilling a stratigraphic test well, which is drilled solely to obtain geological information and is not customarily intended to be completed as a producing well, are sometimes charged to expense when incurred; alternatively, those costs are sometimes capitalized to the extent that reserves are found (even though the well is not intended to be used to produce those reserves), with the costs of such wells that did not find reserves charged to expense when that determination is made.

.117 The principal alternative with respect to accounting for development costs within a successful efforts framework concerns the treatment of development dry holes. Some proponents of successful efforts accounting capitalize the costs of drilling unsuccessful development wells on grounds that those costs were incurred as part of the capital investment required to extract reserves that were previously discovered. On the other hand, many

successful efforts proponents take the position that those costs should be charged to expense on the basis that any dry hole, whether exploratory or development, has no future benefit. With respect to other development costs, some companies capitalize all while other companies—principally the smaller and closely held companies—follow the income tax accounting treatment under which intangible development costs are charged to expense as incurred.

.118 Whether capitalized preproduction costs are amortized or otherwise written off before production begins is another area of difference within the successful efforts method. Some companies do not amortize any capitalized costs until production of the related reserves begins. If reserves are not found, the entire cost is written off when the property is surrendered. A variety of methods is used by those companies that do amortize costs before production begins. A distinction normally is made between (a) acquisition costs of unproved properties and (b) preproduction costs relating to properties that become proved. Some companies amortize the acquisition costs of unproved properties or provide an allowance for impairment; other companies carry unproved properties at their cost without regard to diminution of value until either reserves are found or the property is surrendered. With respect to the capitalized preproduction costs relating to proved properties, amortization generally does not begin until production commences. Reinstatement of costs is another accounting alternative, and whether to establish a limitation on capitalized costs of proved properties is yet another area of difference.

.119 A number of other variations within the successful efforts method (which are also variations within full costing) were noted in paragraph .110.

Principal Features of Discovery Value Accounting

.120 Under discovery value accounting as it has generally been proposed, mineral reserves would be recorded at their estimated *value* when the reserves are discovered or, alternatively, when the reserves are developed. Property acquisition costs and other prediscovery costs generally would be deferred and written off when the areas to which the costs apply have been explored and the underlying reserves, if any, evaluated. Subsequent to discovery, the carrying amount of the reserves would not be adjusted for changes in prices; however, the carrying amount would be adjusted for revisions of estimated reserve quantities. The discov-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

ery value would be treated as revenue from the oil and gas exploration activities of the enterprise and would become the recorded value ("cost") of reserves for future accounting purposes. Those discovery value amounts would then be amortized against the revenues resulting from the production and sale of the minerals.

.121 Several variations of discovery value accounting have been proposed. If only proved developed reserves are included in the value computation, generally all development costs associated with the reserves will have been incurred; if additional development costs are incurred, the value of any incremental quantity of reserves discovered is recorded and, simultaneously, the related costs are written off. If undeveloped reserves are included in the value computation, an adjustment must be made for the expected future development costs (generally by reducing the value otherwise attributable to the reserves in the ground). When the development costs are eventually incurred, it is generally proposed that they be added to the carrying value of the reserves.

.122 Determination of the value of oil and gas reserves is critical to both discovery value accounting and current value accounting. Four principal valuation methods that might be used to measure the value of reserves (and other assets) were discussed at length in paragraphs 436-466 of the Discussion Memorandum. Briefly summarized, they are:

a. *Current cost.* Current cost is the amount of cash or its equivalent that would have to be paid if the same asset were acquired currently. The "same asset" may be an identical asset (current reproduction cost or current cost of replacement in kind) or an asset with equivalent productive capacity (current replacement cost).

b. *Current exit value in orderly liquidation.* Current exit value in orderly liquidation is the net amount of cash that could be obtained currently by selling the asset in orderly liquidation (current market value, if a market exists). The value of mineral reserves on a current exit value basis would equal the price at which the reserves could be sold in place by a willing seller to a willing buyer, neither being under any compulsion to sell or buy, both being competent and having reasonable knowledge of the facts.

c. *Expected exit value in due course of business.* Expected exit value in due course of business is the nondiscounted amount of

cash or its equivalent into which an asset is expected to be converted in the due course of business less the direct costs necessary to make that conversion (sometimes referred to as net realizable value). The value of mineral reserves on this basis would be an amount equal to the estimated net cash flows attributable to the reserves.

d. *Present value of expected cash flows.* The present value of expected cash flows is the present value of future cash inflows into which an asset is expected to be converted in the due course of business, less the present value of cash outflows necessary to obtain those inflows. Present value measurements require information about estimated amounts of future cash inflows and outflows, the timing of those expected cash flows, and the appropriate discount rate. Various discount rates that have been proposed include the (i) rate applicable to long-term government bonds issued by the government of the country in which the reserves are located, (ii) prime rate, (iii) company's weighted average or incremental long-term borrowing rate, (iv) company's weighted average cost of capital, and (v) discount rate used by company management internally to make individual investment decisions.

.123 Considerable disagreement exists as to which of those methods, if any, are suitable for valuation of oil and gas reserves, either at the time of discovery or subsequently. Also, under discovery value accounting, a decision must be made as to which categories of reserves enter into the value computation.

.124 Some discovery value accounting proponents would report the value of periodic discoveries of reserves as operating income. Others would segregate the discovery value from realized revenues and gains reported in the income statement. Still others would report the discovery values in a special unrealized income section of stockholders' equity in the balance sheet until realized through the actual production and sale of oil and gas.

Principal Features of Current Value Accounting

.125 Current value accounting involves the continuous use in the financial statements of one of the four methods of valuation identified in paragraph .122, or some other method. (Current value accounting could, of course, be applied to all of an enterprise's assets and liabilities, not just oil and gas reserves, but applying current value accounting beyond oil and gas reserves was not included in the scope of this project. Alternative methods of

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

measurement are to be considered in the Board's project to develop a conceptual framework for financial accounting and reporting.)

.126 Most proponents of current value accounting for oil and gas reserves believe that the reserves should be valued at each financial statement date using the most current information available. Some proponents suggest that periodic changes in reserve values should be reflected directly in the income statement; others would report value changes directly in the stockholders' equity section of the balance sheet, perhaps by segregating or otherwise separately identifying the realized and unrealized amounts. Under current value accounting, separate data might be presented for (a) value increases resulting from new discoveries, (b) value changes resulting from adjustment of reserve quantities, and (c) holding gains and losses resulting from revaluing end-of-period reserve quantities to reflect the change in unit value during the period.

.127 As with discovery value accounting, decisions must be made as to which method of valuation should be used and which reserve categories should be included in the current value computations.

A Single Accounting Method

.128 The proposal that the two presently accepted accounting methods, full costing and successful efforts costing, be allowed to continue as optional alternatives received little support in the letters of comment submitted to the Board in response to the Discussion Memorandum or in the oral presentations made at the public hearing conducted by the Board before the Exposure Draft was issued. It was principally after the Exposure Draft was issued proposing to proscribe the full costing method that support for retaining both methods was expressed to the Board.

.129 The Board has considered the question of accounting alternatives at length, not only in connection with its oil and gas project but also for other projects on its agenda, and has concluded that differences in accounting may be appropriate when significant differences in facts and circumstances exist, but different accounting among companies for the same types of facts and circumstances impedes comparability of financial statements and significantly detracts from their usefulness to financial statement users.

.130 In the Board's judgment, the facts and circumstances surrounding the search for and development and production of oil and gas do not differ because of the size of a company or whether its securities are publicly traded. Similar types of risks of failure

and potential rewards of success prevail among all companies engaged in oil and gas producing activities; only the magnitude and number of projects vary. Although the scale or location of operations may differ among companies, that should not affect the principles underlying recognition of assets, measurement of the cost of those assets, and measurement of earnings. The costs of exploratory dry holes or abandoned properties, for example, should not be included in the costs of assets for some companies and reported as losses by other companies. Yet if full costing and successful efforts costing were both retained as optional accounting alternatives, different principles of asset recognition and measurement and earnings measurement would be regarded as appropriate for companies whose circumstances are substantially similar.

.131 Some respondents to the Exposure Draft cited the existence of other accounting alternatives—for instance, the use of both the last-in, first-out and the first-in, first-out methods in accounting for inventories—as justification for retaining full costing and successful efforts costing as optional alternatives. The Board does not believe that the availability of alternatives in unrelated areas of accounting should bear on a decision that the Board must make for a project on its agenda. In the Board's judgment, accounting for similar circumstances similarly and for different circumstances differently is a desirable objective in establishing standards of financial accounting and reporting. For that reason, the Board rejected the proposal, made by some respondents to the Exposure Draft, that intercompany comparability be achieved by footnote disclosure with retention of both full costing and successful efforts costing. Also, for that reason, the Board rejected the proposal that it simply "clean up" the many variations in full costing and the many variations in successful efforts costing presently used in practice by mandating only one acceptable approach to full costing and one acceptable approach to successful efforts costing and allowing companies to choose one of those two approaches.

.132 One of the principal criticisms of the work of the FASB's predecessors that led to creation of the FASB was that they did not sufficiently narrow or eliminate free choice accounting alternatives. A report entitled *Federal Regulation and Regulatory Reform* (the "Moss Report") issued in 1976 by the Subcommittee on Oversight and Investigations of the U.S. House of Representatives and a report entitled *The Accounting Establishment* (the "Metcalf Report") prepared in 1976 by the staff of the Subcommittee on Reports, Accounting and Management of the U.S. Senate were both strongly critical of the availability of alternative accounting

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

principles. In its November 1977 report, "Improving the Accountability of Publicly Owned Corporations and Their Auditors," Senator Metcalf's Subcommittee concluded that "uniformity in the development and application of accounting standards must be a major goal of the standard-setting system." Moreover, two major financial statement user groups—the Financial Accounting Policy Committee of the Financial Analysts Federation (the national professional association of security analysts) and the Robert Morris Associates (the national professional association of bank lending officers)—have endorsed elimination of optional accounting alternatives not only for oil and gas producing companies but for other industries as well. The Securities and Exchange Commission, in *Securities Act Release No. 5877* (October 26, 1977), took a similar position, stating that the Board's oil and gas project "is expected to result in significant improvement in financial reporting through the establishment of uniform accounting standards so that investors are provided with a valid basis for comparing the financial statements of different companies." In the Board's judgment, when the same or similar facts and circumstances exist, as they do in the search for and development of oil and gas reserves, intercompany comparability requires a single method of accounting. Comparable reporting by companies competing for capital is, in the Board's judgment, in the public interest (see paragraphs .157-.174).

Reasons for Rejecting Discovery Value Accounting

.133 The Board concluded that financial statements of an oil and gas producing company should not be prepared on a discovery value basis for a number of reasons. One group of reasons relates to problems in measuring the value of reserves with reasonable accuracy at the point of discovery. Measurements of discovery value require estimates of (a) the quantity of reserves, (b) the amount and timing of costs to develop the reserves, (c) the timing of production of the reserves, (d) the production costs and income taxes, (e) selling prices, and (f) (for some valuation methods) appropriate discount rates that reflect both an interest element and a risk factor. Those estimates, in turn, might be based on predictions of changes in government regulations and restrictions (both domestic and foreign), technological changes (including not only the technology involved in oil and gas producing activities but also the technology of transportation, refining, and marketing of oil and gas products), and domestic and international economic conditions; or current regulations, technology, and conditions might be assumed to continue indefinitely. The uncertainties inherent in those estimates and predictions tend to make estimates of reserve values highly subjective and relatively unreliable for

the purpose of providing the basis on which to prepare financial statements of an oil and gas producing company.

.134 Under generally accepted accounting principles followed by companies in nearly all industries, revenue is normally recognized only when the earning process is complete or virtually complete and, then, only after an exchange transaction has taken place. The earning process is the continuum of profit-directed activities by which revenue is earned—purchasing, manufacturing, selling a product or rendering a service, delivery, cash collection, etc. The exchange transaction is the specific point at which the earning process is normally regarded as sufficiently complete to justify accounting recognition of revenue.

.135 Discovery value accounting recognizes revenue from exploration activities at the point of discovery even though it may be many years until the property is developed and the oil and gas are produced and sold. That is, the earning process is far from complete, at least as completion of that process is generally determined for other industries. Discovery is certainly a critical event in the search for and extraction of oil and gas, but there are many uncertainties standing between discovery of reserves and the ultimate realization of related revenues. Often many years pass, very substantial amounts of money are spent, and significant revisions are made to estimated quantities of reserves discovered.

.136 Exceptions to the general rule for revenue recognition are found in practice today. *APB Statement No. 4,* "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises," paragraph 152 [section 1026.16], states:

> Sometimes revenue is recognized at the completion of production and before a sale is made. Examples include certain precious metals and farm products with assured sales prices. The assured price, the difficulty in some situations of determining costs of products on hand, and the characteristic of unit interchangeability are reasons given to support this exception.

.137 As noted earlier, reserves often are discovered many years before they are produced, and many dollars often are spent for development and production costs before the oil and gas reserves are extracted. Moreover, while oil and gas may to some extent be regarded as fungible, sales prices, particularly in the present domestic and international economic and regulatory environments, are anything but assured. Thus, the reasons given in support of the special revenue recognition principles for precious metals and farm products that have been produced and have assured sales prices do not apply to oil and gas producing activities.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.138 Proponents of discovery value accounting argue that it provides better information about the success or failure of exploration activities, which activities are the most important ones in oil and gas production. However, discovery value accounting represents a fundamental change from the traditional, historical cost basis of preparing financial statements. Various alternatives to the historical cost measurement basis are under examination as part of the Board's conceptual framework project. Although covered in the Discussion Memorandum for the extractive industries project, valuation methods were addressed by relatively few respondents, and discovery value accounting received only very limited support among respondents. On balance, the Board concluded that estimated discovery values do not provide a satisfactory basis of accounting for oil and gas producing activities for the reasons that (a) values that were current when initially recorded quickly become out-of-date and (b) the mixture of values of minerals measured at different dates of discovery lacks both the verifiability of historical costs and the relevance of current values. The Board believes that issues relating to the accounting measurement basis should await resolution in the conceptual framework project.

Reasons for Rejecting Current Value Accounting

.139 Like discovery value accounting, current value accounting for oil and gas reserves requires estimation of reserve values. The uncertainties inherent in those estimates (discussed in paragraph .133) tend to make them subjective and relatively unreliable for the purpose of providing the underlying basis on which the financial statements of an oil and gas producing company are prepared.

.140 As noted in paragraph .138, the historical cost basis of accounting and certain alternative measurement bases are currently under examination as part of the Board's project on a conceptual framework for financial accounting and reporting. The Board has concluded that it should not attempt to resolve those issues in the narrow context of the extractive industries project.

.141 Moreover, as with discovery value accounting, adoption of current value accounting for oil and gas reserves would require reconsideration of the accounting concept of earnings (discussed in paragraphs .134-.137). Decisions would have to be made as to whether the periodic value changes should be reflected in determining earnings or only in the stockholders' equity section of the balance sheet, and whether realized value changes should be treated differently from unrealized. Those issues, too, are part of the Board's conceptual framework project.

Reasons for Accepting Successful Efforts Accounting and for Rejecting Full Costing

.142 None of the assenting or dissenting members of the Board consider it appropriate to capitalize costs of exploration efforts in a geological area in which no reserves are found simply because the company previously discovered valuable reserves in an unrelated geological area.

Successful Efforts Accounting Is Consistent with the Present Accounting Framework

.143 In the presently accepted financial accounting framework, an asset is an economic resource that is expected to provide future benefits, and nonmonetary assets generally are accounted for at the cost to acquire or construct them. Costs that do not relate directly to specific assets having identifiable future benefits normally are not capitalized—no matter how vital those costs may be to the ongoing operations of the enterprise. If costs do not give rise to an asset with identifiable future benefits, they are charged to expense or recognized as a loss.

.144 In the Board's judgment, successful efforts costing is consistent with that accounting framework, and full costing is not. Under full costing, even costs that are known *not* to have resulted in identifiable future benefits are nonetheless capitalized as part of the cost of assets to which they have no direct relationship.

.145 In the oil and gas industry, ultimately the expected future benefits that an enterprise is attempting to obtain through its acquisition, exploration, and development activities are represented by oil and gas reserves. But, other than by purchasing minerals-in-place, an enterprise does not acquire reserves directly. Rather, it acquires properties (rights to extract any reserves that may be discovered in the future) and it acquires (develops) systems capable of producing the oil and gas reserves that are discovered. Costs that are known *not* to relate directly to the discovery of oil and gas reserves or in the development of a system for the extraction of previously discovered reserves should not be capitalized. To capitalize them is inconsistent with the presently accepted accounting framework based on measuring the historical cost of an asset.

.146 Present accounting concepts place boundaries on the assets to be accounted for—boundaries determined by the transaction in which the asset was acquired, by physical attributes of the asset,

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

by legal attributes of the asset, or by the way in which the asset is used. Full costing aggregates all oil and gas reserves within very broad cost centers (countries or continents), wherever those reserves may be located in the cost center and whenever discovered, and accounts for that aggregation as a single asset. All acquisition, exploration, and development costs incurred in that cost center are deemed to be the cost of the aggregate asset, even if those costs relate to activities that are known *not* to have been successful in acquiring, discovering, or developing reserves.

.147 The successful efforts method, on the other hand, circumscribes the boundaries of, and accounts separately for, individual assets. Under the "area-of-interest" approach to successful efforts costing, oil and gas reserves located in an individual area-of-interest are the assets accounted for. Under the approach to successful efforts in which no cost center is used for the capitalize/expense decision, individual properties or groups of geologically related properties and wells, equipment, and facilities are the assets accounted for. Either way, boundaries are placed on the assets being accounted for. Only those exploration and development costs that relate directly to specific oil and gas reserves are capitalized; costs that do not relate directly to specific reserves are charged to expense. The successful efforts method of accounting conforms to the traditional concept of the historical cost of an asset.

.148 Under the successful efforts method, certain types of costs may be capitalized as "construction-in-progress" pending further information about the existence of future benefits, but as soon as the additional information becomes available, and it is known whether future benefits exist, those costs are either reclassified as an amortizable asset or charged to expense.

Financial Statements Should Reflect Risk and Unsuccessful Results

.149 The function of the nation's capital markets is to direct capital to companies and institutions through decisions to invest and lend. Financial accounting and reporting provides one important source of information on which investment, lending, and related decisions are made.

.150 Enterprises seeking capital operate in varying circumstances of possible success or failure. That is, they offer varying degrees of risk and opportunity to those supplying capital. Although in-

vestors and lenders differ among themselves with regard to the risks they are willing to accept, they have one thing in common: They seek a higher expected return for accepting higher risk. Business enterprises seeking capital offer different risks. Capital is equitably allocated if the prices paid are commensurate with the risk.

.151 In the production of oil and gas, significant risks and returns arise in the search for reserves. In other words, discovery of oil and gas reserves is a critical event in determining failure or success, for assessing risks and returns. Because it capitalizes the costs of unsuccessful property acquisitions and unsuccessful exploratory activities as part of the costs of successful acquisitions and activities, full costing tends to obscure failure and risk. Successful efforts accounting, on the other hand, highlights failures and the risks involved in the search for oil and gas reserves by charging to expense costs that are known not to have resulted in identifiable future benefits.

.152 Neither full costing nor successful efforts costing reflects success at the time of discovery. Under both methods, success is reported at the time of sale. It might be said, therefore, that both methods tend to obscure, or at least delay, the reporting of success, but that is the consequence of the historical cost basis of accounting, and its adherence to the realization concept. The obscuring of failure, however, results only from the full cost method. Under successful efforts accounting, unsuccessful costs are charged to expense and not carried forward as assets. In the Board's judgment, financial statements prepared on the successful efforts basis, including disclosures (as required by this Statement) of capitalized costs and costs incurred in oil and gas producing activities (to provide an indication of effort) and of reserve quantities and changes therein (to provide an indication of accomplishment) will provide investors with important information about success as well as failure.

.153 Investors and creditors look to financial statements as an important source of information about companies' risks and returns. Investors and creditors focus on earnings—and in particular on earnings variability—as an indicator of risks and returns. As the Board noted in summarizing its *Tentative Conclusions on Objectives of Financial Statements of Business Enterprises:*[8]

[8] FASB Discussion Memorandum, "Conceptual Framework for Financial Accounting and Reporting: Elements of Financial Statements and Their Measurement," December 2, 1976, paragraph 4.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

Earnings (or profits or net income) of a business enterprise are the focal point of the information communicated in financial statements. Earnings are a major motivating force in the economic activities of business enterprises and a major motivating force in the economic activities of those who lend to business enterprises, those who invest in them, and those who manage them. In general, earnings reduce the risk of those who lend funds to an enterprise or acquire its debt securities. Earnings also enable an enterprise to pay cash dividends to those who invest in its equity securities and enhance the prospects for increases in the market price of its stock. Thus, investors and creditors are generally more willing to commit funds to profitable enterprises than to unprofitable ones. Expectations of earnings, often based on a history of earnings, enable an enterprise to obtain both equity and debt financing.

.154 Some persons criticize successful efforts accounting on grounds that a company's earnings tend to fluctuate more under that method than under full cost accounting, depending on the level and degree of success or failure of the company's acquisition and exploration activities in a given accounting period. While fluctuating earnings may, indeed, be a *characteristic* of successful efforts accounting, it is not a *fault*. The successful efforts method enables investors and lenders to observe the impact of the risks inherent in oil and gas producing activities on a company's results of operations from period to period.

.155 A similar issue arose in connection with the Board's project on accounting by enterprises in the development stage. The Board concluded in *FASB Statement No. 7* [section 2062], "Accounting and Reporting by Development Stage Enterprises," that a development stage enterprise should not be permitted to capitalize costs that would be charged to expense when incurred by an established operating enterprise because to do so would tend to obscure, in financial statements, the impact of risks inherent in starting up a new company.

.156 The same issue has arisen in a number of other Board projects, for example, the projects on self-insurance, catastrophe losses, expropriations, and other contingencies and on foreign currency translation. A basic issue in each of those projects, as it is in the oil and gas project, was whether financial accounting standards should be adopted to normalize or average the effects of events that are inevitable over extended periods but occur at infrequent and relatively unpredictable intervals. Consistent with its conclusion in this Statement, the Board concluded in those projects that financial statements should report the effects of risk and not attempt to normalize them.

Ability to Raise Capital

.157 Many proponents of full costing have said, in written submissions in response to the Discussion Memorandum, at the public hearing, and in comment letters on the Exposure Draft, that adoption of the successful efforts method of accounting will inhibit the ability of oil and gas producing companies to raise capital to finance their exploration activities. In particular, they contend, small exploration companies will have special difficulties in obtaining capital because, under a successful efforts approach, their income statements will be more likely to report earnings fluctuations and in some cases net losses, and their balance sheets could even show cumulative deficits. Potential suppliers of capital will not understand those fluctuations, losses, and deficits, it is argued, and sources of capital will diminish or be more costly. Those results, they say, are at variance with national economic goals. A particular national economic goal they cite is to encourage additional oil and gas exploration.

.158 In the Board's judgment, the arguments put forth by those who say that adoption of successful efforts accounting and proscription of full costing will prevent them from raising the capital needed to finance their exploration and production activities are not persuasive. In a free enterprise economy in which capital is allocated among enterprises largely on the basis of individual investors' decisions, if a company is an economically successful enterprise, it will continue to attract capital. Its financial statements should provide those who supply capital with information that assists them in determining whether the expected returns on that capital are commensurate with the risks involved. In the Board's judgment, financial statements that are prepared in conformity with the provisions of this Statement will provide investors and creditors with that type of information. Many small oil and gas producing companies use the successful efforts method, not full costing; have done so for many years; and have generally been able to obtain capital to finance their exploration activities. Indeed, full costing is a relatively recent development in accounting for oil and gas producing activities. The 1973 survey (cited in paragraph .101 of this Statement), which was sponsored by a group of full costing petroleum companies, identified only *one* instance of its use prior to 1960, and it was not until the late 1960s that the use of full costing became relatively widespread.

.159 In examining the ability-to-raise-capital issue, the Board focused in particular on three distinct types of small exploration companies:

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

a. Privately owned exploration companies. (A representative of the Independent Petroleum Association of America at the Board's public hearing estimated that there are 10,000 such companies in the United States.)

b. Publicly owned exploration companies. (A 1977 list of companies whose securities are registered with the SEC identifies 214 companies in the "petroleum and natural gas extraction" Standard Industrial Classification.)

c. Oil and gas exploration subsidiaries and divisions of companies that are mainly in other lines of business.

.160 As noted in paragraphs .101 and .117, a great many *privately* owned exploration companies follow federal income tax accounting practices in preparing their financial statements. Income tax accounting is a variation of successful efforts accounting. Those companies have for many years been able to obtain capital from external sources, including loans from local and international banks and insurance companies, from knowledgeable individual investors, and from private placements of securities.

.161 Many publicly owned oil and gas exploration companies follow the successful efforts method. In connection with the research study described in paragraph .093(a) of this Statement, the staff of the FASB identified 79 oil and gas companies that (a) have securities currently traded on a securities exchange or in the over-the-counter market and (b) derive more than 50 percent of their revenue from exploration and production. (The latter criterion eliminates virtually all of the major integrated companies from the group.) Of the publicly owned companies so identified, 41 percent use successful efforts accounting.

.162 Some responses to the Exposure Draft were from companies that are mainly in lines of business other than oil and gas but that have oil and gas exploration subsidiaries and divisions that use the full cost method. A number of the responses came from electric and gas public utility companies with oil and gas exploration subsidiaries recently formed or under active consideration. Those respondents urged retention of full costing for their subsidiaries and divisions on grounds that investors and lenders who supply capital to the enterprise do not regard the enterprise as an oil and gas producing company and thus would not understand the fluctuations of reported earnings or losses that, in their view, would more likely result from using successful efforts accounting, especially by a newly formed exploration subsidiary. In the Board's judgment, however, that is not an appropriate reason for allowing those subsidiaries and divisions to adopt or continue to use full costing. By choosing to seek the rewards of engaging in oil and

gas exploration activities, those enterprises have assumed the risks associated with the search for oil and gas reserves, and their financial statements should provide information about those risks and not obscure them. Investors and creditors seek a return on their capital commensurate with the risks involved, and financial statements should assist them in assessing those risks. One would expect that those who supply capital for a high-risk activity such as oil and gas exploration would demand a higher return than for capital invested in less risky activity.

.163 The telephone interview survey described in paragraph .093(b) provides additional evidence about the ability of small, publicly owned, successful efforts companies to raise capital. Professor Horace R. Brock of North Texas State University, or a person working under his direction, asked a senior executive officer of each of 27 small, publicly owned, successful efforts companies whether, in the officer's opinion, use of the successful efforts method has affected the company's ability to obtain the capital necessary to finance its exploration and production activities. None of the executive officers surveyed felt that the company's use of successful efforts accounting had hindered its ability to raise capital. Most of the surveyed companies raised capital externally during the past 10 years from public sales of equity and debt securities, loans from banks and insurance companies, private placements, investments by individual investors, or other outside sources. Those corporate officers were also asked whether they felt that their companies were denied access to any particular source of capital and, if so, whether the company's accounting method was a significant factor in any such situation. Again, they said that successful efforts accounting did not adversely affect their companies' ability to obtain capital from a desired source.

.164 Interviews with suppliers of capital to oil and gas producing companies resulted in a similar finding. As described in paragraph .090(a), 24 bank loan officers, bank trust department officers, and securities underwriters, all of whom work directly with oil and gas companies, were interviewed to ascertain how investment and credit decisions regarding such companies are reached. The majority of interviewees indicated that the method of accounting would not affect their investment and credit decisions regarding oil and gas producing companies.

.165 Some who favor retention of full costing argue that use of that method by newly formed exploration companies is essential to their viability, because investors will be disinclined to provide capital to those companies if their financial statements report net

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

losses from operations and cumulative deficits. The Board found, however, in the course of its deliberations on *FASB Statement No. 7* [section 2062], that those who supply capital to companies in the development stage understand the special circumstances of those companies and the possibility that their financial statements will report losses and deficits. In connection with that project, the Board surveyed officers of 15 venture capital companies that provide capital to development stage enterprises (though not necessarily to oil and gas ventures). Those officers said that whether a development stage enterprise defers preoperating costs or charges them to expense has little effect on (a) the amount of venture capital to be provided to that enterprise and (b) the terms under which any venture capital is provided. That survey and related economic impact considerations were supported by a study conducted by the U.S. Department of Commerce, which is described in paragraph 50 of Statement No. 7 [section 2062.50].

.166 Most proponents of full costing indicate that the reserve value ceiling on capitalized costs is an essential condition for use of that method. Except for those new companies that find relatively large quantities of proved reserves in their initial exploration efforts or that purchase interests in proved properties, it seems likely that many new exploration companies would be reporting operating losses and cumulative deficits under full costing as well as under successful efforts costing.

.167 A few respondents to the Exposure Draft have said that their own companies' property acquisition and exploratory drilling programs would be sharply curtailed if they were forced to change from the full cost method of accounting to the successful efforts method. However, since the prospects of finding commercially recoverable reserves, the prices at which those reserves would be sold, the costs that would be incurred, and the income taxes that would be paid are totally unaffected by the method of accounting for the costs incurred, a decision not to go ahead with an otherwise commercially attractive project simply because successful efforts reporting is required would seem to be unlikely for the vast majority of companies. Conversely, a venture that is not otherwise commercially attractive does not become so simply because a particular method will be used to account for that venture in the company's financial statements. While a few respondents representing full cost companies did say that their companies would expect to reduce their exploration efforts because successful efforts accounting would reduce reported earnings, other companies that use full costing have said that an FASB Statement mandating successful efforts accounting will not affect their exploration plans.

For example, one such company has publicly stated that while a mandated change to successful efforts accounting would have a substantial effect on previously reported earnings, it would not change the value of the company's assets, its reserves, or its cash flow, and that the company had decided not to change its exploration program if successful efforts accounting is required.

.168 In support of their claim that adopting the successful efforts method will impair their companies' ability to raise capital and thereby reduce exploration activity, some persons have said that in November 1971 the Federal Power Commission adopted its Order No. 440 (which supports the full cost concept) to stimulate the search for and development of new natural gas supplies. (Order No. 440 is described in paragraph .069 of this Statement.) The petitions for rehearing of that Order that were filed with the FPC in December 1971 alleged, among other things, that the Commission had failed to reach any conclusion on what was stated to be the primary factor resulting in issuance of Order No. 440—namely, how full cost accounting would provide a stimulus for companies under the FPC's jurisdiction to conduct a search for and develop new gas supplies. In its Order No. 440-A denying the request for rehearing, the FPC stated: "Since we concluded that full-cost accounting on its merits should be adopted, it is not necessary for us to proceed further and reach a finding as to whether the accounting, as such, would provide a stimulus to discover and develop new gas supplies." (The Federal Power Commission is now the Federal Energy Regulatory Commission, a part of the Department of Energy.)

.169 Some advocates of full costing apparently feel that the securities markets, which bring together those who provide capital and those who seek it, will not understand financial results reported by the successful efforts method. They imply that investors' willingness to provide capital to a given company or industry is affected by that company's or industry's use of a particular method of accounting. However, a number of research studies indicate that the securities markets generally recognize and compensate for intercompany differences in accounting practices for the same or similar events and transactions. In a 1973 summary of the findings of the then-extant research, Stanford University Professor William H. Beaver noted:[9]

> The prevailing opinion in the accounting profession is that the market reacts naively to financial statement information.

---

[9] Beaver, William H., "What Should Be the FASB's Objectives?", *The Journal of Accountancy*, August 1973, pp. 49-56.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

> This view is reinforced by the anecdotal data of the sort described earlier, and by the obvious fact that the market is populated with several million uninformed, naive investors, whose knowledge or concern for the subtleties of accounting matters is nil. However, in spite of this obvious fact, the formal research in this area is remarkably consistent in finding that the market, at least as manifested in the way in which security prices react, is quite sophisticated in dealing with financial statement data.

.170 The research undertaken at the Board's request to examine the effect of the oil and gas Exposure Draft on the market prices of common stock issued by both full cost and successful efforts companies (described in paragraph .093(a) of this Statement) corroborates that the securities markets are generally able to assimilate financial information and to understand the underlying economics of the oil and gas exploration and production industry. That study did not find statistically significant evidence that issuance of the Exposure Draft affected the market prices of common shares issued by full cost companies as compared to successful efforts companies—except for some possible effect on the full cost companies during the week preceding and the week of issuance of the Exposure Draft, but the market soon adjusted, and evidence of a permanent or lingering effect was not found. (As noted in paragraph .093(a), the Board will undertake a similar study of the impact of this Statement following its issuance.)

.171 The Board acknowledges that not all empirical evidence supports the view that the securities markets are entirely able to take into account the differences in accounting methods used by different companies. The studies referred to in paragraph .169 provide evidence only with respect to the securities markets as a whole; those researchers readily admit (and other research substantiates) the likelihood that decisions of individual investors in individual securities can be affected by accounting differences. As noted in paragraph .170, a Board-sponsored study found that the oil and gas Exposure Draft may have affected the prices of full cost companies' securities during the two weeks surrounding its issuance, though the effect was of brief duration. That finding supports the conclusions of other researchers that investors are sometimes unable to properly evaluate the impact of alternative accounting methods. Further, in situations in which accounting changes may have had a long-term effect on securities prices (as

opposed to a temporary disruption), that result might well be viewed as an equitable adjustment of the cost of capital.[10]

.172 Some respondents to the Exposure Draft said that adopting the successful efforts method and proscribing the full costing method would likely have anticompetitive effects and would be contrary to national economic or policy goals. Any national economic or policy goal that involves the use of data reported in or derived from financial statements can, in the Board's judgment, be best pursued if the relevant financial statements are prepared on a common basis, so that lenders, investors, government regulators, and others involved directly or indirectly in allocating capital can analyze and reach informed decisions on the basis of consistent and comparable financial data. To the extent that furtherance of competition in oil and gas exploration and production and the availability of increased capital resources to finance those efforts are perceived as national economic or policy goals and in the interest of the general public, those goals can best be fostered—and the likelihood of their attainment substantially increased—if all competitors disclose financial data in a marketplace free from the burdens of inconsistency, noncomparability, and misunderstanding, a marketplace in which risks and rewards are reported as objectively and as evenhandedly as possible.

.173 Financial accounting should attempt to report the results of business decisions as nearly as those results can be determined in accordance with the accepted framework of accounting for all enterprises. If an enterprise's operations are subject to economic influences that are manifested in fluctuating earnings, financial statements should report those fluctuations and not obscure them. If the economic influences that affect an enterprise's operations are manifested in only minor fluctuations, that too should be portrayed. Otherwise, accounting is not evenhanded, for it fails to distinguish different characteristics of enterprises that investors

[10] The contradictory conclusions of the various studies on accounting and securities prices and the implications of those conclusions are discussed in considerable depth in *Tentative Conclusions on Objectives of Financial Statements of Business Enterprises,* which was issued by the Board in December 1976. A number of specific studies are cited in Chapter 2, "Investors and Creditors," of *Tentative Conclusions;* additional studies are identified in the bibliography of the extractive industries Discussion Memorandum. Chapter 2 of *Tentative Conclusions* discusses both the traditional view of investors' and creditors' information needs (which concentrates on analysis of individual securities and enterprises that issue them) and the more recent capital market theory (which concentrates on portfolios and the extent to which individual securities increase or decrease the level of risk of a portfolio). An appendix to *Tentative Conclusions* provides an even more technical discussion of recent capital market theory.

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

may perceive as involving different risks. That evenhandedness becomes especially important for equitable allocation of capital. If financial reporting obscures differences that may be perceived as representing differences in risk or creates differences where none exist, it may contribute to channeling some capital into enterprises with expected returns and risks that are disparate—in effect, subsidizing the cost of capital to some companies at the expense of other companies.

.174 As explained in paragraphs .157-.173, the Board has not been presented with or able to obtain persuasive information indicating that adoption of successful efforts accounting and proscription of full costing will inhibit competition in exploration for and production of oil and gas reserves or in financing those activities. Indeed, the Board is of the view that, far from inhibiting competition, the removal of one of two significantly different optional alternative methods of accounting in similar situations will facilitate competition. The weight of the evidence before the Board is that independent oil and gas producing companies using successful efforts accounting do compete successfully and conduct effective exploration and production programs that they are able to finance through a variety of capital sources.

The "Cover" Concept Is Inconsistent with the Present Accounting Framework

.175 Under the full cost method, all costs incurred in acquiring, exploring, and developing properties within a relatively large geopolitical cost center (usually a country or a continent) are capitalized when incurred as costs of obtaining whatever reserves have been found in that cost center as long as the aggregate capitalized costs do not exceed the aggregate value of those reserves. If the value of previously discovered reserves exceeds the aggregate unamortized capitalized costs, unsuccessful acquisition and exploration costs are said to be adequately "covered" by the value of the previously discovered reserves, and a loss need not be recognized. In other words, current failures are "covered" and are not reported to the extent of past successes. Further, an increase in the market prices of previously discovered reserves in a cost center can enhance the amount of "cover" and further delay recognition of failures (losses) in that cost center.

.176 In the Board's judgment, the "cover" concept is inconsistent with the present accounting framework, and it also obscures risk (see paragraphs .149-.156). Reserves that may have been discovered ten, twenty, thirty, forty, or more years ago by a company

under completely different management, with very different technology, and in very different domestic and international economic and political circumstances, should not be used, as they are under the full cost method, to justify nonrecognition of current failures. Similarly, reserves located in, say, West Texas should not be used to "cover" unsuccessful acquisition and exploration efforts in Louisiana, Alaska, or Canada, or in the offshore U.S. waters.

Successful Efforts Is Comparable to Accounting In Other Extractive Industries

.177 Although not usually labeled as such, successful efforts accounting generally is followed in extractive industries other than the oil and gas industry. Because of its wide acceptance in those industries, requiring it for all oil and gas producing companies is likely to bring about greater comparability of financial statements among companies in the various extractive industries.

The Matching Concept Does Not Justify Full Costing

.178 Some persons contend that full costing is justified because a "better matching" of revenues and expenses is achieved if all costs incurred in acquisition, exploration, and development activities are amortized on a pro rata basis as total reserves are produced. Proponents of full costing argue that it is impossible to discover oil and gas reserves without incurring the costs of some unsuccessful acquisition, exploration, and development activities, and they sometimes compare those activities with manufacturing operations in which spoilage or breakage is unavoidable. They argue that "proper matching" requires that the costs incurred in unavoidable unsuccessful efforts be accounted for as reasonable and necessary costs of successful efforts in the same way that the costs of unavoidable spoilage or breakage are accounted for as costs of good products.

.179 Three pervasive principles by which revenues and expenses are matched are described in paragraphs 156-160 of *APB Statement No. 4* [section 1026.20-.24], as follows:

> *Associating Cause and Effect.* Some costs are recognized as expenses on the basis of a presumed direct association with specific revenue . . . recognizing them as expenses accompanies recognition of the revenue.
>
> *Systematic and Rational Allocation* . . . . If an asset provides benefits for several periods its cost is allocated to the periods

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

in a systematic and rational manner in the absence of a more direct basis for associating cause and effect.

Immediate Recognition. Some costs are associated with the current accounting period as expenses because (1) costs incurred during the period provide no discernible future benefits, (2) costs recorded as assets in prior periods no longer provide discernible benefits, or (3) allocating costs either on the basis of association with revenue or among several accounting periods is considered to serve no useful purpose.

.180 A direct cause and effect justification for associating unsuccessful acquisition and exploration costs with revenues derived from successful activities has not been demonstrated. A direct cause and effect association can be said to exist between the costs of nonproductive fields and the revenues from reserves in productive fields, or between costs applicable to unsuccessful ventures and costs applicable to successful ventures, if there is a *reliable* association between total costs and reserves discovered as a direct result of incurring those costs. Only then could it be said that a cost gives rise to revenues, that is, causes revenues. Although some persons claim that *industry-wide* statistics indicate a general predictable relationship between total number of wells or total footage drilled and total reserves added, those relationships have not been constant, particularly over a relatively short period of time such as a year, and there can be no assurance that they will apply to the future. More importantly, to the best of the Board's knowledge no such relationship has been demonstrated to be predictable for an *individual company*. Accounting is done for individual companies, not for an industry as a whole, and for companies a direct association between finding costs and mineral reserves emerges only at the level of an individual property unit or within a given field or other localized geological structure. Even that association often is not evident at the time the costs are incurred, and that is when accounting decisions must be made.

.181 Systematic and rational allocation likewise does not justify attributing unsuccessful acquisition and exploration costs to the results of successful activities. As *APB Statement No. 4* [sections 1021-1029] states, allocation of an asset's cost is justified "if an asset provides benefits for several periods." In the full costing versus successful efforts costing controversy, the question is not whether or how to allocate capitalized costs but which costs to capitalize.

.182 The "immediate recognition" principle referred to in *APB Statement No. 4* [sections 1021-1029] is appropriate for unsuc-

cessful acquisition and exploration costs. According to that principle, costs are associated with the current period as expenses if they provide no discernible future benefits (for example, geological and geophysical costs) or, if previously capitalized, they no longer provide discernible benefits (for example, acquisition costs of abandoned properties). The application of the immediate recognition principle in this Statement is consistent with its application by the Board in other pronouncements. In paragraph 49 of *FASB Statement No. 2* [section 4211.49], "Accounting for Research and Development Costs," for example, the Board stated that "the general lack of discernible future benefits at the time the costs are incurred indicates that the 'immediate recognition' principle of expense recognition should apply."

.183 In *FASB Statement No. 2* [section 4211], moreover, the Board considered and rejected the argument that research and development costs be capitalized when incurred and amortized on a company-wide basis. Paragraphs 51 and 52 [sections 4211.51-.52] state:

> 51. Enterprises undertake research and development activities with the hope of future benefits. If there were no such hope, the activities would not be conducted. Some persons take the position that the accounting treatment for research and development costs should be determined by considering in the aggregate all of the research and development activities of an enterprise. In their view, if there is a high probability of future benefits from an enterprise's total research and development program, the entire cost of those activities should be capitalized without regard to the certainty of future benefits from individual projects.
>
> 52. The Board believes, however, that it is not appropriate to consider accounting for research and development activities on an aggregate or total-enterprise basis for several reasons. For accounting purposes the expectation of future benefits generally is not evaluated in relation to broad categories of expenditures on an enterprise-wide basis but rather in relation to individual or related transactions or projects. . . .

Value Ceiling Is Subjective

.184 Limiting capitalized costs to the estimated value of reserves, which is an integral part of the full cost method of accounting, requires estimation of reserve quantities, development costs, production costs, the timing of development and production, selling prices, and appropriate discount rates. The uncertainties inherent in those estimates and projections tend to make estimates of reserve values highly subjective, and estimates of value made by trained experts can differ markedly. Under the successful efforts method, the need to limit capitalized costs is much less crucial

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

because the costs of unsuccessful efforts, which may represent a large part of the total capitalized costs under the full cost method, will have been charged to expense as incurred or recognized as a loss when the effort was determined to be unsuccessful.

Full Costing Does Not Represent Current Value on the Balance Sheet

.185 Some persons contend that by using full costing, asset carrying amounts reported in the balance sheet will be closer to the current values of most companies' oil and gas reserves than they would under successful efforts costing. In the Board's judgment, however, under neither method do the *costs* to acquire, explore, and develop mineral properties indicate the *values* of reserves discovered. Those values change continually, depending on revisions of estimates of reserve quantities, development costs, production costs, income taxes, the timing of future development and production, selling prices, and appropriate discount rates. The capitalized costs, however, do not change. Neither full costing nor successful efforts costing is intended to portray current values; both of those methods are based on historical costs.

The Ability to Manage Earnings Is Not Unique to Successful Efforts Accounting

.186 Some proponents of full costing contend that the ability of management to subjectively influence reported earnings is reduced under full costing. In their view, under successful efforts accounting, management may be inclined to smooth or average periodic reported earnings by (a) deciding to delay final determination of the outcome of a project or to delay the write-off of an unsuccessful venture, thus postponing loss recognition, (b) incurring larger or smaller amounts of costs that are charged to expense as incurred, such as in exploration, and (c) postponing or moving forward the times at which such costs are to be incurred.

.187 While a transaction-oriented accounting framework—which is the presently accepted framework—allows opportunities to postpone or accelerate earnings effects, those opportunities are not unique to the oil and gas industry. Nor are they unique to successful efforts accounting since full costing itself may be viewed as a method for averaging reported earnings over long periods of time. Most importantly, the Board does not believe that the potential actions described in the preceding paragraph should bear importantly on the accounting decisions confronting the

Board in this project. Even if accounting results were to influence some managers' decisions, it does not follow that accounting standards should be designed to accomplish or prevent an action by management. That type of accounting standard would require a judgment by the Board as to which potential actions are desirable and which are undesirable. Accounting should evenhandedly report economic actions taken, regardless of motivation. Accounting should not obscure the effect of actions and events in order to prevent what some believe to be "uneconomic" actions.

Simplicity Is Not the Overriding Criterion for Selection of Accounting Method

.188 Some persons advocate full costing on grounds that it reduces the amount of procedural and mechanical accounting work, thus saving time, effort, and cost in maintaining accounting records. They claim that since all costs incurred in acquisition, exploration, and development are capitalized, there is less need to make arbitrary cost allocations or to prepare separate computations of amortization on individual properties. The Board disagrees. Firstly, individual property records must be maintained for purposes of determining royalties, computing taxable income, and making management decisions to commit funds, abandon properties, and so forth, so the amount of additional effort that may be required under successful efforts accounting is not expected to be burdensome. More importantly, in the Board's judgment, accounting simplicity should not justify nonrecognition of losses at the time they are incurred.

Reasons for Specific Conclusions within the Successful Efforts Method

.189 Paragraphs .142-.188 set forth the Board's reasons for rejecting full cost accounting and accepting successful efforts accounting. As explained in paragraphs .111-.119, however, there are many variations within the successful efforts method. Paragraphs .190-.214 which follow explain the Board's conclusions regarding the principal variations considered.

Rejection of Area-of-Interest Approach

.190 Some proponents of successful efforts accounting believe that a cost center (such as an area-of-interest) has a central role in accumulating certain types of prediscovery costs prior to the time that a reasonable determination can be made as to whether future benefits will result from having incurred those costs. They would capitalize some or all prediscovery costs relating to an area-of-interest until it is determined whether that area contains proved

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

reserves. If it is determined that the area-of-interest does not contain reserves, the costs are written off and a loss is recognized. Even among proponents of the area-of-interest approach there are differences as to which prediscovery costs relating to an area-of-interest should be capitalized. Some proponents would capitalize prediscovery drilling costs but not G&G; others would capitalize the G&G as well. Other successful efforts proponents use a cost center only for computing amortization rates. They believe that the nature of a cost, and not the nature of a cost center, should be the primary consideration in the capitalize/expense decision (discussed further in paragraph .103).

.191 The Board has adopted the latter view. Until discovery, delineation of the boundaries of a cost center such as an area-of-interest is arbitrary, and intercompany differences in defining cost centers are likely to be significant and unavoidable. Many years often elapse before reserves are discovered in an area-of-interest, if they are discovered at all. Thus, depending on the extent to which an area-of-interest proponent would capitalize prediscovery costs, exploration costs that have no identifiable future benefits may be carried forward as assets potentially for many years. The Board concluded that exploration expenditures that do not directly result in the acquisition of an asset having identifiable future benefits should not be capitalized simply because they fall within lines drawn on a map by individual companies, that is, lines drawn to circumscribe an area-of-interest or, as some would say, a project.

.192 Some persons who advocate capitalization of all costs associated with an area-of-interest say that doing so is essential for financial statements to reflect the total "historical cost" of a project that ultimately proves successful. Many projects, however, do not ultimately prove successful, and determination of success or failure of an area-of-interest often takes a number of years. In the Board's judgment, periodic reporting of financial position and results of operations to investors and creditors is an overriding consideration that precludes the indefinite accumulation of costs of unknown future benefit. The Board reached a similar conclusion in *FASB Statement No. 2* [section 4211], "Accounting for Research and Development Costs," in which the Board rejected the indefinite deferral of R&D costs on a project basis pending determination of success or failure of the project.

Charging G&G to Expense

.193 This Statement requires that geological and geophysical costs, whether incurred before or after acquisition of the related

property, be charged to expense when incurred. Those costs are information costs very much like research costs. To a considerable extent, G&G costs are incurred before any properties are acquired, and in the majority of cases the acreage surveyed is either never acquired or, if acquired, is ultimately abandoned or surrendered. It is difficult, and in many cases impossible, to correlate geological and geophysical expenditures with a specific discovery made many months or years later, even with the benefit of hindsight; such correlation clearly cannot be done at the time the G&G expenditures are incurred, which is when accounting decisions are made. For those reasons, the Board has concluded that G&G costs shall be charged to expense when incurred. While the costs of drilling stratigraphic test wells are sometimes considered to be geological and geophysical costs, they are accounted for separately under this Statement for reasons explained in paragraphs .200-.202.

.194 In response to recommendations made by commentators on the Exposure Draft, this Statement makes clear that dry hole contributions and bottom hole contributions are included in exploration costs (paragraph .017(c)). Also, in response to comments on the Exposure Draft, paragraph .020 has been added to provide for capitalization of contractually reimbursable G&G and other exploration costs.

Charging Carrying Costs to Expense

.195 Costs of carrying and retaining undeveloped properties do not increase the potential of those properties to contain oil and gas reserves. Carrying costs are incurred to *maintain* an enterprise's rights, not to *acquire* those rights. In a sense, they are penalties for having delayed drilling and development activities and, thereby, having delayed potential production of oil and gas. Because carrying costs do not enhance the future benefits from the enterprise's properties and other assets, they are charged to expense when incurred under the provisions of this Statement.

Charging the Costs of Drilling Unsuccessful Exploratory Wells to Expense

.196 Charging the costs of drilling unsuccessful exploratory wells to expense is generally regarded as an inherent part of the successful efforts method of accounting. Not all successful efforts proponents agree, however, on what constitutes unsuccessful exploratory wells, and there is also disagreement over the timing of expense recognition. Under this Statement, success is defined in terms of whether proved oil and gas reserves have been found. As to timing, under this Statement the costs of drilling exploratory

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

wells are initially capitalized when incurred and are subsequently either charged to expense or reclassified as part of the enterprise's wells and related equipment and facilities when the determination is made as to whether proved reserves have been found. Further, this Statement establishes guidelines for determining whether the costs of drilling exploratory wells may continue to be carried as an asset pending determination of whether proved reserves have been found.

.197 Several alternatives regarding the timing of expense recognition are proposed by successful efforts advocates. Some persons, on grounds that the majority of all exploratory wells (73 percent for the U.S. as a whole in 1976) are unsuccessful, would charge all costs of drilling exploratory wells to expense when incurred, rather than regard them as "construction-in-progress" pending determination of success or failure. Some would subsequently "reinstate" the costs of drilling an exploratory well that is determined to have been successful. In the Board's judgment, however, reinstatement of costs previously charged to expense is inconsistent with generally accepted accounting principles for other industries. For example, the Board has previously rejected the notion of cost reinstatement with respect to research and development costs (paragraph 57 of *FASB Statement No. 2* [section 4211.57]). Consequently, the Board concluded that a method of accounting for oil and gas producing activities based on cost reinstatement is inappropriate.

.198 The best accounting, in the Board's judgment, is to capitalize as "construction-in-progress" the costs of drilling all exploratory wells pending determination of success or failure, that is, pending determination of whether proved reserves are found. The length of time it takes to drill an exploratory well is relatively short—generally a matter of weeks or months, although a few occasionally take a year or longer—so the period during which costs of undetermined future benefit are capitalized usually is relatively brief, and this Statement requires that the costs be charged to expense as soon as a determination is made that proved reserves have not been found. In the Board's judgment, it is appropriate that the costs of drilling exploratory wells be treated differently from G&G and similar exploration costs because, first, determination of success or failure is much more clear-cut for exploratory drilling than it is for G&G and similar exploration costs, and, second, because successful exploratory wells result directly in the discovery of proved reserves whereas G&G does not.

.199 The quantity of oil and gas reserves found by an exploratory well is normally estimated on or shortly after completion of drill-

ing; occasionally that assessment takes a matter of weeks or months, rarely longer. If, however, a major capital expenditure is required before production could begin—such as for construction of a trunk pipeline—the reserves found may not be classifiable as proved unless sufficient quantities of additional reserves are found as a result of additional exploratory drilling. The additional exploratory drilling might take several years to complete. Paragraph .031 of this Statement therefore divides exploratory wells that find oil and gas reserves into two types: Those that are not drilled in an area requiring a major capital expenditure such as a trunk pipeline before production could begin and those that are drilled in such an area. For the former type, when classification of the reserves that are found cannot be made at the time drilling is completed, a one-year capitalization period is provided if that is necessary to allow a reasonable period of time for determining whether to classify those reserves as proved. Recognizing, however, that the decision to make a major capital expenditure, such as for a trunk pipeline, must sometimes await the results of additional exploratory wells, the Board concluded not to impose the one-year presumption of impairment on exploratory wells drilled in areas requiring a major capital expenditure before production could begin. Instead, paragraph .031(a) establishes two conditions for continued capitalization that take into account the realities and economics of exploratory drilling in remote areas and, at the same time, prohibit the indefinite deferral of the costs of exploratory wells merely on the hope that the selling prices of oil and gas will increase or on the possibility that unplanned exploratory drilling activity in the indefinite future might find additional quantities of reserves.

Stratigraphic Test Wells Treated Similarly to Exploratory Wells and Development Wells

.200 Stratigraphic test wells are drilled to obtain information. They are not normally intended to be completed for hydrocarbon production and are customarily abandoned after drilling is completed and the information is obtained. Normally, stratigraphic test wells are drilled offshore to determine whether an offshore property contains sufficient reserves to justify the cost of constructing and installing a production platform and to determine where to locate such a platform.

.201 Under this Statement, stratigraphic test wells are divided into two types—exploratory-type and development-type—and the standards of accounting for the two types parallel the accounting for exploratory wells and development wells, respectively. Thus, an

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

exploratory-type stratigraphic test well is accounted for in a manner similar to an exploratory well drilled in an area requiring a major capital expenditure before production could begin: The costs of drilling the exploratory-type stratigraphic test well are capitalized pending determination of whether proved reserves are found, subject to the condition that those costs not continue to be carried as assets indefinitely if stratigraphic test drilling activity in the area has ceased or if the quantity of reserves found would not justify completion of the well for production had it not been simply a stratigraphic test well. The capitalized costs either are reclassified as part of the cost of the enterprise's wells and related equipment and facilities if proved reserves are found or are charged to expense if proved reserves are not found. Thus if an exploratory-type stratigraphic test well discovers reserves that are classified as proved and facilities are to be installed to produce those reserves, the cost of the exploratory-type stratigraphic test well is accounted for as part of the cost of the facilities even though the particular well itself may be abandoned. Accounting for the other type of stratigraphic test well—development-type—is identical to accounting for development wells and other development costs generally: capitalize as part of the cost of an enterprise's wells and related equipment and facilities (reasons therefor discussed in paragraph .207).

.202 The method of accounting for exploratory-type stratigraphic test wells described in the preceding paragraph represents a change from the Exposure Draft, which had proposed that the costs of all stratigraphic test wells be charged to expense when incurred on grounds that they are similar to G&G costs. A number of respondents to the Exposure Draft pointed out that an important difference exists between the costs of stratigraphic test wells and G&G costs: G&G information, no matter how persuasive, does not provide sufficient evidence to classify reserves as proved; reserves are classified as proved only after an exploratory well or a stratigraphic test well has been drilled. Thus a stratigraphic test well can result directly in the discovery of proved reserves whereas information obtained from geological and geophysical studies cannot. Discovery of proved reserves establishes the existence of future benefits and justifies the continued capitalization of the costs of those stratigraphic test wells that find proved reserves. Because of the foregoing differences, the costs of exploratory-type stratigraphic test wells are more like the costs of drilling exploratory wells than they are like G&G costs. The Board agrees with that view, and this Statement reflects the appropriate modification from the Exposure Draft. Further, paragraph .034 provides for

deferral of the costs of exploratory-type stratigraphic test wells that find commercially producible quantities of reserves, even though those wells cannot be used to produce the reserves. That provision reflects the realities and economics of offshore drilling. Producible exploratory wells often are prohibitively expensive in offshore waters, and offshore exploratory drilling generally involves non-producible, expendable wells.

All Development Costs Capitalized

.203 Under this Statement, discovery of oil and gas reserves is viewed as the single most critical event in the search for and extraction of oil and gas. Discovery of proved reserves establishes the existence of future benefits and justifies the capitalization of the costs of successful exploratory wells and exploratory-type stratigraphic test wells as amortizable assets. After discovery, development costs are incurred to obtain additional access to those proved reserves and to provide facilities for extracting, treating, gathering, and storing the oil and gas. Those development costs result in the creation of a producing system of wells and related equipment and facilities—a system much like the production system of a manufacturing company.

.204 After discovery, all costs incurred to build that producing system, including the costs of drilling unsuccessful development wells and development-type stratigraphic test wells, are capitalized as part of the cost of that system under the provisions of this Statement. With respect to development dry holes, some persons take the position that no costs incurred in drilling a dry hole—exploratory or development—can provide future benefits, and therefore the costs of all dry holes, including development dry holes, should be charged to expense.

.205 In the Board's judgment, however, there is an important difference between exploratory dry holes and development dry holes. The purpose of an exploratory well is to search for oil and gas. The existence of future benefits is not known until the well is drilled. Future benefits depend on whether reserves are found. A development well, on the other hand, is drilled as part of the effort to build a producing system of wells and related equipment and facilities. Its purpose is to extract previously discovered proved oil and gas reserves. By definition (Appendix C, paragraph .274), a development well is a well drilled *within the proved area* of a reservoir to a *depth known to be productive*. The existence of future benefits is discernible from reserves already proved at the time the well is drilled. An exploratory well, because it is drilled

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

outside a proved area, or within a proved area but to a previously untested horizon, is not directly associable with specific proved reserves until completion of drilling. An exploratory well must be assessed on its own, and the direct discovery of oil and gas reserves can be the sole determinant of whether future benefits exist and, therefore, whether an asset should be recognized. Unlike an exploratory well, a development well by definition is associable with known future benefits before drilling begins. The cost of a development well is a part of the cost of a bigger asset—a producing system of wells and related equipment and facilities intended to extract, treat, gather, and store known reserves.

.206 Moreover, because they are drilled only in proved areas to proved depths, the great majority of development wells are successful; a much smaller percentage (22 percent in the United States in 1976), as compared to exploratory wells (73 percent in the United States in 1976) are dry holes. Development dry holes occur principally because of a structural fault or other unexpected stratigraphic condition or because of a problem that arose during drilling, such as tools or equipment accidentally dropped down the hole, or simply the inability to know precisely the limits and nature of a proven reservoir. Development dry holes are similar to normal, relatively minor "spoilage" or "waste" in manufacturing or construction. The Board believes that there is a significant difference between the *exploration for* and the *development of* proved reserves. Therefore, in the Board's judgment, it is appropriate to account for the costs of development dry holes different from exploratory dry holes.

.207 For similar reasons, the Board believes that the costs of development-type stratigraphic test wells should be accounted for as other development costs. Development-type stratigraphic test wells are drilled *after* proved reserves have been discovered, and they are drilled *within* the proved area, generally either to assess more accurately the quantity of reserves that has been found or to provide information as to where best to locate the production platform. The existence of future benefits is discernible from reserves already proved at the time the development-type stratigraphic test well is drilled. The costs of drilling the well are part of the costs of developing a system that will produce those reserves. In the Board's judgment, it is inappropriate to account for the costs of development-type stratigraphic test wells different from other development costs. As explained in paragraph .202, the method of accounting for stratigraphic test wells in this Statement

represents a change from the proposal in the Exposure Draft as a result of comments made by respondents to the Exposure Draft.

Impairment Test for Unproved Properties

.208 When unproved properties are acquired, their acquisition costs are capitalized when incurred. Whether the unproved property will ultimately provide future benefits—that is, whether it contains proved oil and gas reserves—is unknown at the time of acquisition. However, a *property right* is acquired. That property right, and the underlying *right to search for and extract* oil and gas reserves, in themselves are in the Board's judgment a sufficient future benefit to justify capitalizing the acquisition cost of an unproved property at the time it is incurred. Because a purchase price has been paid, there is a presumption that the property right has an independent market value at the time equivalent to the purchase price. Thereafter, either as a result of unsuccessful exploration activities including those of other parties on nearby or adjacent properties or as the expiration of the property right approaches, the future benefits inherent in the right to search for and extract oil and gas in an unproved property may diminish or disappear entirely, with no offsetting benefits in terms of oil and gas discovered. Consequently, this Statement requires that unproved properties be assessed periodically and a loss recognized if those properties have been impaired. Many respondents to the Exposure Draft recommended that for practical reasons the Board should permit recognition of impairment of individually insignificant properties by amortizing their costs, either in the aggregate or by groups, on the basis of the experience of the enterprise and other information. This Statement reflects the appropriate modification of the Exposure Draft to permit amortization of individually insignificant properties.

Question of a Limitation Test for Proved Properties and Capitalized Exploration and Development Costs

.209 As explained in paragraphs .190 and .191, a cost center is not the primary consideration in the capitalize/expense decision under the approach to successful efforts accounting adopted by the Board in this Statement. Under that approach, the assets to which the capitalized acquisition, exploratory drilling, and development costs relate are *properties, wells, equipment, and facilities.* The question of whether to write down the carrying amount of productive assets to an amount expected to be recoverable through future use of those assets is unsettled under present generally accepted accounting principles. This is a pervasive issue that the Board has not addressed. Consequently, this Statement is not

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

intended to change practice by either requiring or prohibiting an impairment test for proved properties or for wells, equipment, and facilities that constitute part of an enterprise's oil and gas producing systems.

Unit-of-Production Amortization

.210 Nearly all respondents to the Discussion Memorandum and the Exposure Draft favored unit-of-production amortization for capitalized acquisition, exploratory drilling, and development costs. There was some disagreement, however, as to the appropriate reserve categories on which to base amortization. Some persons favor using the same reserve categories for all amortizations. Within that group, some would use only *proved developed* reserves while others would use *all proved* reserves. Some who would use all proved reserves would include estimated future development costs in the amortization computation; others would use only actual costs incurred. Some persons would use different reserve categories for different types of capitalized costs.

.211 The Board believes that using estimated future development costs to compute amortization rates introduces an unnecessary and subjective element into the financial accounting and reporting process. Only development costs incurred to date should be amortized. Further, in the Board's judgment, costs should be amortized on the basis of estimates of quantities of proved reserves to which those costs relate. Proved developed reserves, by definition, relate to the costs of wells and related equipment and facilities. Acquisition costs relating to proved properties, on the other hand, were incurred to obtain not only the proved reserves that are already developed but also those proved reserves remaining to be developed. Accordingly, this Statement requires that acquisition costs of proved properties be amortized on the basis of all proved reserves, developed and undeveloped, and that capitalized exploratory drilling and development costs (wells and related equipment and facilities) be amortized on the basis of proved developed reserves.

.212 Respondents to the Exposure Draft cited three important aspects of its provisions regarding unit-of-production amortization that, in their view, required clarification or modification. The Board agrees that clarification or modification is needed for each of those matters, and the following changes have been made in this Statement:

a. Paragraph .029 has been modified to permit reclassification from unproved to proved of only a portion of an unusually

large property to which proved reserves have been attributed. The acquisition cost of the portion remaining as unproved will therefore not be subject to unit-of-production amortization, though it will continue to be subject to assessment for impairment.

b. Paragraph .035 has been modified to permit amortization of natural gas cycling and processing plants by other than the unit-of-production method if another method is deemed more appropriate in the circumstances.

c. Paragraph .035 has been modified to provide for exclusion of certain large front-end development costs that relate to an entire planned group of wells as a whole from immediate early amortization pending completion of drilling the additional wells; similarly, that paragraph now provides for exclusion from the amortization rate determination those proved developed reserves that will be produced only after significant expenditures are made.

.213 Two principal approaches were considered by the Board for equating, in computing amortization rates, oil and gas that are jointly produced from a property or group of properties. One is to equate the oil and gas on the basis of their relative energy content—their heat content based on the British Thermal Unit (BTU). The other approach is to equate oil and gas on the basis of their relative sales values.

.214 The relative energy content approach stresses the physical relationship of oil and gas. The relative sales value method is intended to emphasize their economic relationship. The Board rejected the relative sales value method principally because of problems in determining and using relative sales values. For example, because market prices of much of the oil and gas sold are regulated, sometimes with widely disparate prices prevailing for the same commodity and with relatively significant year-to-year fluctuations, the economic relationship as of a given date could be quite artificial and quite different from a similar determination made for the same reserves as of some prior or future date. Consequently, the Board rejected the relative sales value method.

Importance of the Definition of Proved Reserves

.215 Under the provisions of this Statement, capitalization and asset classification decisions hinge on whether *proved* reserves

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

have been found. For that reason, the definition of proved reserves in Appendix C of this Statement assumes great importance. That definition is the one set forth in the rules and regulations of the Securities and Exchange Commission. The Board chose that definition, rather than definitions proposed by others and rather than creating a definition of its own, because the SEC definition is already required to be used in practice by oil and gas producing companies whose securities are publicly traded. The Board believes that conformity of the reserve definitions used in filings with the SEC, in information reported to the Department of Energy for the national energy data base, and in financial statements prepared in conformity with generally accepted accounting principles is desirable.

.216 Under paragraph .011 of this Statement, properties are classified as either unproved or proved depending on whether those properties have proved reserves. Although some oil and gas producing companies currently make a developed/undeveloped or producing/nonproducing distinction among properties, in the Board's judgment *discovery,* rather than development or production, is the single most critical event in an enterprise's oil and gas producing activities. The Board recognizes that some companies presently refer to properties with no proved reserves as *undeveloped* or *nonproducing,* for disclosure purposes; conversely, some companies heretofore have referred to properties with proved reserves as *developed* or *producing* properties even though some or all of a property's proved reserves may not be developed or producing.

Information Available after the Balance Sheet Date

.217 In response to questions raised in letters of comment on the Exposure Draft, paragraph .039 has been added to this Statement to clarify that information that becomes available after the balance sheet date but before the financial statements are issued shall be taken into account in evaluating conditions that existed at the balance sheet date, for example, in assessing unproved properties and in determining whether a well has found proved reserves. The Board believes that this position is consistent with the concepts in *FASB Statement No. 5* [section 4311], "Accounting for Contingencies."

Mineral Property Conveyances and Related Transactions

.218 Mineral property conveyances and related transactions may be classified according to their nature as a sale, a borrowing, an exchange of nonmonetary assets, a pooling of assets in a joint

undertaking, or some combination thereof. In the Board's judgment, the accounting principles set forth in the authoritative accounting literature and otherwise generally accepted in current practice for similar transactions in other industries should apply to the oil and gas industry. Paragraphs .043 and .047 apply accepted accounting practices to some of the more common types of conveyances.

.219 The transactions described in paragraph .043(a) are classified as borrowings because the funds advanced are repayable in cash or its equivalent. Although the purpose of advancing funds for exploration is to obtain future supplies, successful exploration is not assured, and to the extent production is inadequate to satisfy the obligation, the balance is payable in cash. Accordingly, the transaction is in substance a borrowing.

.220 A production payment repayable in cash out of the proceeds from a specified share of production until the amount advanced has been recovered with interest (paragraph .043(b)), is in substance a borrowing. Some hold the view that the recipient of the advance has no liability except to the extent that oil or gas is produced and that, accordingly, the recipient should account for the advance as deferred revenue. The Board did not find that reasoning persuasive. Normally, the advances are made by banks (often through an intermediary) or by other lenders under conditions that leave little doubt that the proved reserves are more than adequate to recover the funds advanced plus interest. The intent of the transaction is to obtain funds and not to sell oil or gas for future delivery. The recipient of the advance is at risk for any change in the price of oil or gas and for the cost of operating the property. The transaction is in substance a loan secured by reserves and is without recourse to other assets of the party receiving the advance. The reserves and production involved are reported by the recipient, not by the lender.

.221 The Exposure Draft had proposed that neither gain nor loss be recognized at the time of conveyance if a part of an interest owned is sold and either (a) substantial uncertainty exists about recovery of the costs applicable to the retained interest or (b) the seller has a substantial obligation for future performance. While agreeing that because of those uncertainties recognition of a *gain* is not appropriate in those situations, some respondents to the Exposure Draft said that recognition of a *loss* should not be prohibited. The Board agrees, and paragraph .045 of this Statement prohibits only the recognition of a gain in those situations. In addition, the phrase "substantial obligation for future per-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

formance" in paragraph .045(b) has been expanded to include examples, as suggested by some respondents to the Exposure Draft.

.222 A production payment to be satisfied by delivery of a specified quantity of oil or gas out of a specified share of production (paragraph .047(a)) is a sale for which income is not recognized because the earning process is not complete. The seller still has to perform the production and delivery function. Unlike the production payment payable in cash, the amount payable is not fixed, there is no specified or determinable rate of interest, and the risks of price changes rest with the purchaser rather than the seller. The purchaser, not the seller, reports the reserves and production because the substance of the transaction is the purchase of a mineral interest rather than the lending of cash.

.223 In some transactions, the owner of an operating interest in an unproved property arranges for another party to assume some or all of the exploration, drilling, development, and operating obligations in return for a share of the rewards if those efforts are successful. This Statement addresses three types of such arrangements: (a) assignment of the operating interest with retention of a nonoperating interest in return for which the assignee assumes the drilling, development, and operating obligations (paragraph .047(b)); (b) assignment of a part of an operating interest in return for assumption by the assignee of the obligation to drill one or more exploratory wells at assignee's cost, after which the property is to be jointly owned and operated if the drilling is successful (paragraph .047(c)); and (c) a carried interest arrangement by which the assignee assumes all the exploration drilling and development risk in return for a fractional operating interest but recovers the cost incurred, if the venture is successful, before the assignor shares in the production from the property (paragraph .047(d)).

.224 While the three types of conveyances described in the preceding paragraph have different features, in each instance one party has provided the property and the other party has agreed to incur certain high risk costs, and the benefits, if any, are to be shared in agreed proportions. The Board concluded that all those transactions represent a pooling of assets in a joint undertaking. The investment of each party in the joint operations consists of the carrying amount of the assets contributed by it. Each party will share in the resulting benefits, if any, according to the terms of the agreement. The cost of those benefits to the recipient is the amount of its investment. At the time of the transaction the earning process is incomplete and no gain or loss has been realized by either party. Each party records only its own costs and revenues and does not make a reassignment of costs to reflect the

interest that it obtains, or may obtain, in assets contributed by the other party. Each party looks upon its earning assets as those contributed by it.

.225 Some support the view that when part of an interest in an unproved property is relinquished to obtain another type of interest in the same property or an interest in wells and equipment, both parties to the transaction should reassign the cost each has incurred so that their accounts will reflect some cost for each type of asset. The Board rejected that view because there is no true exchange of assets in this type of transaction. As stated above each party's earning assets are those contributed by it, and the carrying amounts of those assets should be retained at their historical cost.

.226 In applying the above conclusions to carried interests, the Board recognizes that before payout a carried party will reflect no income and that at payout the carried party will own an interest in wells and related equipment and facilities, but its accounts will reflect only the original investment in the property. The Board believes, however, that the pooling concept best reflects the substance of the agreement between the parties. At the time expenditures are made it is not known whether payout will occur, and many carried interests, even in properties where production is obtained, do not pay out. The Board's conclusions in respect to accounting for this type of transaction are that a carried party has no revenue until payout and no cost of assets beyond the original leasehold cost; a carrying party's accounts reflect the investment, operating costs, and revenue that are at its risk or for its benefit; and the disclosures of reserves and production should be consonant with that basis of accounting.

.227 Because an exchange of fractional operating interests in undeveloped mineral properties upon formation of a joint venture (paragraph .047(e)) is a nonmonetary exchange of similar productive assets, accounting as prescribed in *APB Opinion No. 29*, "Accounting for Nonmonetary Transactions," paragraph 21(b) [section 1041.21(b)] is appropriate. In response to requests for clarification of gain or loss recognition in disproportional cost sharing arrangements paragraph .047(e) was expanded to provide that each party to a joint venture shall record its cost and that gain shall not be recognized if an interest in a property or other assets is acquired without cost or at a cost disproportionate to the interest acquired. This accounting is compatible with that prescribed for a free well or a carried interest.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.228 The Board considered the transactions carried out to effect the unitization of oil and gas properties (paragraph .047(f)) to be a pooling of assets for which the earning process is incomplete. Unitizations result in a group of separate properties being combined and operated as a single property. Each participant normally has essentially the same quantity of oil and gas reserves immediately following the unitization as before. A payment of money to equalize the contributions of wells, equipment, and facilities does not in the Board's judgment change the substance of the transaction.

.229 Paragraph .047(g) has been added to this Statement to clarify the appropriate accounting for the sale of an entire interest in an unproved property. Recognition of gain or loss on the sale of a property whose impairment has been assessed individually is consistent with accounting for the sales of assets generally. Nonrecognition of gain or loss on the sale of a property whose impairment has been assessed by amortizing its cost as part of a group is compatible with the normal accounting for a partial retirement of assets subject to group depreciation; paragraph .047(g) also provides for recognizing gain when the sales price exceeds the original cost of the property sold, a circumstance that does not normally arise in the usual group depreciation situation for other types of assets.

.230 The sale of a part of an interest in an unproved property for cash (paragraph .047(h)) is viewed by some as the sale of an asset that results in a gain or loss. The Board does not agree with that view. The objective of the parties in this type of transaction is generally to diversify risks and jointly participate in any future costs and benefits. Since this Statement requires continuing evaluation of unproved properties for impairment, no loss need be recognized as stemming directly from the sale of a fractional interest. The Board concluded that because of the uncertainty of the recovery of costs applicable to the interest retained in an unproved property, the transaction should be accounted for as a recovery of cost and that a gain should be recognized only to the extent that proceeds from the fractional interest sold exceed the carrying amount of the property. The proposal in the Exposure Draft has been revised to clarify the question of gain recognition if the unproved property in which part or all of an interest is sold is part of a group for which an impairment allowance is provided in the aggregate.

.231 The risk of nonrecovery of the remaining cost is usually not significant if proved properties or parts of interests in proved properties are sold (paragraph .047(i)-(m)). Accordingly, the Board concluded that gain or loss should normally be recognized in those transactions consistent with other sales of capital assets.

.232 Paragraphs .047(l) and .047(m) have been added to clarify that accounting for the sale of a property with retention of a production payment shall be compatible with the accounting for the sale of production payments with retention of the operating interest. A retained production payment expressed in money may sometimes be so large that it is highly improbable that the production payment will be satisfied before the reserves are fully depleted. In those situations, therefore, paragraph .047(l) provides that the retained production payment shall be treated as an overriding royalty interest rather than as a receivable or payable.

Disclosure

.233 In establishing the disclosure standards in paragraphs .048-.059 of this Statement, the Board relied on the following general guidelines:

a. The disclosures in financial statements do not and cannot include all information that may be needed for investment, credit, regulatory, or national economic planning and energy policy decisions, although the accounting standards established by this Statement should contribute importantly to the reliability and uniformity of financial data used in those types of decisions. Financial statements are intended to present fairly an enterprise's financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles. Thus, financial statement disclosures are those disclosures that are considered necessary for such a fair presentation. Criteria such as relevance, reliability, verifiability, freedom from bias, and comparability provide guidance in considering which disclosures are necessary for fair financial statement presentation.

b. Oil and gas producing companies currently disclose a considerable amount of information about their oil and gas producing activities in annual reports to shareholders, in published statistical summaries, in filings with the SEC, Department of Energy, and other regulatory agencies, and in other publicly available documents. Most of that information is currently presented outside the scope of the companies' financial state-

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

ments. This Statement will result in some of that information being included in financial statements and, for many companies, will result in changes in the bases of preparing the information.

c. The disclosures required by this Statement relate only to those activities (acquisition, exploration, development, and production) for which this Statement establishes accounting standards; therefore, this Statement does not prescribe disclosures related to transporting, refining, and marketing of oil and gas or other activities of an oil and gas producing company.

d. As a general proposition, disclosures required for companies engaged in oil and gas producing activities should be similar to those required for companies in other industries.

e. As elaborated on in paragraphs .149-.152, financial statements by themselves do not adequately portray the success of a company in finding and developing oil and gas reserves under either of the two historical cost methods of accounting for oil and gas producing activities—full costing or successful efforts costing. Under both methods, earnings are recognized at the time of sale, not at the time of discovery or production. Therefore, an important objective of the disclosures included in financial statements prepared by either of those historical cost methods should be to help the user of those statements relate a company's *efforts* (in terms of costs incurred in searching for and developing oil and gas reserves) and *accomplishments* (in terms of reserves discovered and developed).

f. The disclosure requirements must be consistent with and derived from the accounting standards established by this Statement. That is, a principal purpose of the disclosures should be to aid in understanding of the information *shown* in the financial statements of an oil and gas producing company. The disclosures should not be designed to present information that *might have been shown* in the financial statements had different accounting standards been established by this Statement.

Disclosures in Interim Financial Statements

.234 This Statement does not require that the disclosures of reserve quantities and of acquisition, exploration, development, and production costs be included in interim financial statements, though they are required in annual financial statements. The Board reached that conclusion principally because problems in gathering

data of that type on a timely basis become especially acute at interim reporting dates and, for some companies, the costs of that effort may be unduly burdensome. The Board presently has on its agenda a project on interim financial reporting in which the nature and extent of disclosures in interim financial statements are issues.

Disclosure of Information about Reserves

.235 Most of the respondents to the Discussion Memorandum and most of the interviewees in the research effort described in paragraph .090(a) of Appendix A said that information about quantities of oil and gas reserves is essential to understand and interpret the financial statements of an oil and gas producing company. Many felt that reserve information is the single most important type of disclosure that could be required of an oil and gas producing company. They said that discovery of reserves is the critical event in the oil and gas production cycle and that reserves and changes in reserves are key indicators of the success of a company. In general, the Board agrees with those views. None of the methods of accounting considered by the Board in this project, not even discovery value or current value accounting, would, in the Board's judgment, result in financial statements that would not need to be accompanied by disclosures of reserves and reserve changes. This Statement requires disclosure of information with respect to a company's oil and gas reserves.

.236 The Board does not agree with the view, expressed by some, that mineral reserve information is not accounting information and, if disclosed at all, should not be included in financial statements. Those who take that position argue that while reserve information may indeed be important, it is too subjective, too frequently revised, too unreliable, too "soft" to be reported in financial statements. In the Board's judgment, however, certain reserve information has the qualities of verifiability, reliability, freedom from bias, comparability, and the like to a sufficiently reasonable degree to warrant its inclusion in financial statements. Accordingly, the Board concluded that reserve information is so helpful and essential to an understanding of the financial position, results of operations, and changes in financial position of an oil and gas producing company that the added relevance of the financial statements from including the information more than compensates for the lack of precision of estimates of reserves.

.237 The Board considered the following broad areas of disclosure of information regarding oil and gas reserves:

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

a. Disclosure of reserve quantities:

   i. Estimated reserve quantities, by categories and types of reserves.

   ii. Changes in estimated reserve quantities, by categories and types of reserves.

   iii. Other disclosures relating to estimated reserve quantities, such as geographic locations, ownership characteristics, quality of reserves, and unusual risks and uncertainties.

b. Disclosure of reserve values:

   i. Estimated value of reserves.

   ii. Changes in estimated reserve values.

c. Description of assumptions and difficulties in estimating quantities or values of oil and gas reserves.

Disclosure of Reserve Quantities

.238 This Statement relies on estimates of proved reserves and proved developed reserves for a number of capitalization and amortization determinations, and for the reasons discussed in paragraphs .235 and .236 disclosure of quantities of those categories of reserves, and of changes in those quantities, is required. In the Board's judgment, the constraints imposed on the estimator by the definitions of proved reserves and proved developed reserves in paragraph .271 of Appendix C will keep the subjectivity of the estimates to an acceptably low level for financial reporting purposes.

.239 Reserve increases that result from successful exploration and development efforts and from purchases of minerals-in-place, net of decreases from production and sales of minerals-in-place, represent the *physical* expansion or contraction of the quantity of the company's reserves from the beginning to the end of the period. Revisions of previous estimates, on the other hand, represent a change to the quantity that was *perceived* to have existed at the beginning of the period. The categories of changes in reserve quantities required to be separately reported by paragraph .051 are intended to reflect those differences. Some respondents to the Exposure Draft disagreed with the inclusion of changes in reserves resulting from application of improved recovery techniques among other additions; they pointed out that such changes are normally classified by industry practice as revisions of previous estimates. This Statement reflects a change from the Exposure Draft in response to the foregoing concerns. Paragraph .051 provides for separate disclosure of changes resulting from improved recov-

ery techniques if significant and for inclusion of those changes as revisions of previous estimates if not significant. Also, in response to comments on the Exposure Draft, paragraph .050 provides for exclusion of reserves relating to royalty interests owned if the reserve information is not available to the royalty owner. Also, paragraph .054(c) reflects a modification of the Exposure Draft to provide for separate disclosure of the investor's share of oil and gas reserves owned by an investee accounted for by the equity method.

.240 Because enterprises' interests in foreign oil and gas reserves are affected by political, economic, and environmental risks and considerations that are often significantly different from the risks associated with domestic reserves, this Statement requires that reserve quantities and changes in them be reported separately for each geographic area in which significant reserves are located. That requirement comports with the conclusions of the Board in *FASB Statement No. 14* [section 2081], "Financial Reporting for Segments of a Business Enterprise," which requires that the financial statements of a company that operates in different geographic areas report certain key information by geographic area.

.241 Some persons propose that disclosure be required of estimated future development costs relating to proved undeveloped reserves. In the Board's view, disclosure of cost projections of that nature and tentativeness should not be required in financial statements of oil and gas producing companies. The question is not unique to the oil and gas industry—indeed, the whole area of disclosure of forecasts is unsettled. To provide some indication of the extent to which development of proved reserves has been accomplished, paragraph .050 requires the separate reporting of year-end quantities of proved developed reserves. Further, the Board believes that estimates of reserves that are not classified as proved but that are regarded as probable reserves or possible reserves are too subjective to be required for inclusion in financial statements. Some persons have suggested that disclosure of those quantities be required.

.242 Some foreign governments have nationalized or otherwise taken over, in whole or in part, certain properties in which oil and gas producing companies previously had mineral interests. Some of those interests have been converted into long-term supply, purchase, or similar agreements with the foreign government or a government authority. In some countries, oil and gas producing companies can obtain access to oil and gas reserves only through such agreements, and not through direct acquisition of a traditional

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

type of mineral interest in a property. If an oil and gas producing company participates in the operation of a property subject to such an agreement or otherwise serves as "producer" of the reserves from the property, it is the Board's judgment that the reserve quantities identified with, and quantities of oil or gas received under, agreements with foreign governments or authorities should be disclosed in the company's financial statements. In view of the different nature of those agreements, however, paragraph .053 requires that those reserve quantities be separately reported from the company's regular proved reserves. The fact that the reserves are available to the company under agreements that differ from domestic agreements does not justify excluding those reserves from the accounting and disclosure provisions of this Statement as long as the foreign agreements, in substance, represent the right to *extract* oil and gas.

.243 Although the Exposure Draft had proposed to include in an investor's reserve quantities, for purposes of the disclosures required by paragraphs .050-.056 of this Statement, the investor's share of reserves owned by an investee accounted for by the equity method, some respondents to the Exposure Draft pointed out that the investor's financial statements do not include the investee's individual assets, liabilities, revenues, or expenses. They questioned therefore the propriety of including the investee's reserves in the investor's. The Board is persuaded that the better approach is not to commingle the investee's and investor's reserves in the investor's disclosures but, rather, to require separate disclosure of the investee's reserves at year end. Paragraph .054(c) reflects the revised requirement.

.244 Some persons believe that information about ownership characteristics (for example, whether reserves are owned in fee, by domestic lease agreement, or by concession from a foreign government) and about quality of reserves (for example, sulphur or paraffin content or specific gravity) should accompany disclosure of reserve quantities. Because of differences from property to property in those types of characteristics, for many companies the disclosures either would be so broad and general that they would be of little or no value to financial statement users or they would be so detailed and voluminous that they could overwhelm or confuse financial statement users rather than inform them. Consequently, the Board believes that explanations of that type should not be required in general purpose financial statements. For similar reasons, this Statement does not require a description of the as-

sumptions used and difficulties involved in estimating quantities of oil and gas reserves.

Disclosure of Reserve Values

.245 The fact that the Board rejected both discovery value and current value as bases of accounting for oil and gas reserves did not, of itself, mean that the Board automatically had rejected estimated reserve values as additional financial statement disclosures. The Board viewed the use of estimated reserve values as the basis of accounting for oil and gas producing companies and the disclosure of estimated reserve values as part of the financial statements of those companies as separable decisions, although, of course, many common considerations are involved.

.246. The measurement problems discussed in paragraph .133 were important reasons for not requiring disclosure of estimated reserve values, as they were for not accepting discovery value or current value accounting. They were not, however, the only reasons.

.247 As noted in paragraphs .138 and .140, various bases of accounting measurement, including both historical cost and current value measurements, are under consideration as part of the Board's conceptual framework project. The Discussion Memorandum on "Financial Accounting and Reporting in the Extractive Industries" did raise issues relating to methods of valuing mineral reserves. Relatively few respondents supported the use of discovery value or current value accounting or the disclosure of estimated reserve values, and the Board received only limited response to the valuation issues. The Board has decided not to resolve those issues for the limited purpose of this Statement.

.248 The SEC's consideration of whether replacement cost disclosures or other reserve value disclosures can be applied to mineral resource assets (discussed in paragraphs .082 and .096 of Appendix A to this Statement) is another reason that led the Board to reject disclosure of estimated reserve values at this time. The Welsch and Deakin study (paragraph .082) has two fundamental conclusions: that the replacement cost concept of SEC *Accounting Series Release No. 190* is not relevant to oil and gas reserves and that the preferred surrogate for replacement cost is a present value method that the study calls "Equivalent Purchase Cost." In its June 15, 1977 letter transmitting that study to the SEC, though, the American Petroleum Institute, sponsor of the study, stated:

> We see in the Equivalent Purchase Cost method many of the deficiencies which caused the research team to conclude that

Copyright © 1977, American Institute of Certified Public Accountants, Inc.

> replacement cost is not relevant with respect to oil and gas reserves. The theoretical cost of a stream of future income fails to recognize that revenue sources cannot be replaced in kind and that they will originate in different environments with characteristics substantially different from the current revenue stream.
>
> The large majority of our Accounting Committee members cannot support this method on the grounds that the data provided would make little, if any, contribution to an investor's understanding of the economics of the business and, indeed, could be misleading.

.249 In *Securities Act Release No. 5837,* dated June 20, 1977, the Commission stated:

> The Commission's staff has recently received, and is currently reviewing, the results of the research study together with recommendations of the American Petroleum Institute. No comments are being solicited on the disclosure of current value and current cost data until the evaluation of the American Petroleum Institute project is completed.

.250 On October 26, 1977, in *Securities Act Release No. 5878,* the Commission proposed to rescind the requirement in *ASR No. 190* that certain registrants disclose replacement cost information about their mineral resource assets employed in oil and gas producing activities and, instead, to require registrants with mineral resource assets employed in oil and gas producing activities to disclose, in filings covering fiscal years ending on or after December 25, 1978, information based on the present value of future net revenues from estimated production of proved oil and gas reserves. The Commission has asked that comments on the proposal be submitted by March 31, 1978.

.251 The FASB will be holding a public hearing beginning January 16, 1978 on the broad subject of accounting measurement, including the question of whether one or more of the various types of "current value" measurements should be reported in financial statements of companies generally.

.252 The Board believes, therefore, that a decision as to whether reserve value information should be required to be included in financial statements should await consideration of the comments on the SEC proposal referred to in paragraph .250 and the written submissions and oral presentations in connection with the public hearing referred to in paragraph .251.

Disclosure of Capitalized Costs and of Costs Incurred

.253 The disclosures of capitalized costs (paragraph .057) and of costs incurred (paragraphs .058 and .059) are intended to com-

plement the disclosures of reserve quantities and changes therein. The reserve quantity disclosures are an indicator of *accomplishment.* Capitalized costs and costs incurred provide an indication of *effort.*

.254 Reserves are considered the focal point for assessing *accomplishment* because of the importance of discovery as the most critical event in the oil and gas production cycle and of development as the next most important event. Similarly, *effort* is much more a function of incurring costs than it is a function of disbursing cash. As a consequence, the disclosures required by paragraphs .058 and .059 include not only expenditures for acquisition, exploration, development, and production but also the *depreciation* of support equipment and facilities that are *used* in those activities. It is not the *purchase* of seismic equipment or a drilling rig, for example, but rather the *use* of that seismic equipment and the drilling rig in exploration and development activities that is an indication of effort. Thus, as paragraph .058 points out, exploration, development, and production costs include the *depreciation* of the seismic equipment and drilling rig but exclude the *expenditures* to acquire that equipment. Likewise, it is the incurrence of acquisition, exploration, and development costs that best indicates effort in terms of *finding and developing reserves.*

.255 The Exposure Draft had proposed to require certain special disclosures for a rate-regulated company that, under the Addendum to *APB Opinion No. 2* [section 6011], follows an accounting policy that involves capitalizing or amortizing costs on a basis different from that otherwise required by this FASB Statement. Since the Exposure Draft, the Board has begun work on a project that involves reconsideration of the Addendum to *APB Opinion No. 2* [section 6011]. Because the question of special disclosures such as those proposed in the Exposure Draft will be considered as part of that project, the Board has determined not to require the special disclosures that had been proposed.

Disclosure of Other Functional and Operating Data

.256 Some persons propose that aggregate revenues and expenses for oil and gas producing activities be disclosed in financial statements. In the Board's view, a serious doubt exists as to whether those aggregate revenue and expense disclosures will contribute to an understanding of an enterprise's profitability as reflected in its financial statements. Many oil and gas producing companies do not derive revenue from oil and gas producing activities but rather from the sale of refined oil and gas products. For those companies,

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

even if practicable, information about the results of operations of oil and gas producing activities standing alone, without similar information for the company's transportation, refining, and marketing activities and for its other operations, would represent only a fragment of the overall picture of the company.

.257 Moreover, under the provisions of *FASB Statement No. 14* [section 2081], the combined activities of acquisition, exploration, development, and production are not considered to be an industry segment of an integrated oil and gas company. Paragraph 10(a) [section 2081.010(a)] of that Statement defines an industry segment as a "component of an enterprise engaged in providing a product or service or a group of related products and services *primarily to unaffiliated customers* (i. e., customers outside the enterprise) for a profit." (Emphasis added.) That paragraph goes on to say that "by defining an industry segment in terms of products and services that are sold primarily to unaffiliated customers, this Statement does not require the disaggregation of the vertically integrated operations of an enterprise." The Board reconsidered that decision as part of its project on the extractive industries and concluded that *FASB Statement No. 14* [section 2081] should not be amended to apply to oil and gas producing companies a disclosure requirement not required of companies in other industries.

.258 For the reasons in paragraphs .256 and .257 this Statement does not require disclosure of functional data for oil and gas producing activities beyond the disclosures of capitalized costs and of costs incurred.

.259 The Board considered various types of operating data as possible financial statement disclosures, in addition to the required disclosures relating to reserve quantities, including gross and net undeveloped acreage, gross and net productive acreage, and gross and net producing wells and well completions, and has concluded that those disclosures need not be included for a fair presentation of financial position, results of operations, and changes in financial position in conformity with generally accepted accounting principles.

Accounting for Income Taxes

.260 This Statement reaffirms the conclusion of *FASB Statement No. 9* [section 4097] that oil and gas producing com-

panies should apply interperiod income tax allocation, as described in *APB Opinion No. 11* [section 4091], for all timing differences, including those relating to intangible drilling and development costs. *FASB Statement No. 9* [section 4097], which this Statement supersedes, had permitted companies to recognize the interaction of book/tax timing differences with an anticipated future excess of statutory depletion over cost depletion in applying interperiod income tax allocation. As indicated in paragraph 16 of *FASB Statement No. 9* [section 4097.16], the question of whether interaction should be recognized was left unresolved by the Accounting Principles Board in *APB Opinion No. 11* [section 4091] and was not addressed by the Financial Accounting Standards Board in *FASB Statement No. 9* [section 4097]. Although recognition of interaction was permitted by *FASB Statement No. 9* [section 4097], it was not required. This Statement prohibits the recognition of interaction.

.261 The Board has rejected the concept of interaction for several reasons. First, an excess of statutory depletion over the amount of cost depletion otherwise allowable as a tax deduction becomes a benefit only when it is actually realized via income tax deduction. The interaction concept anticipates the possible future benefit by recognizing it as a reduction of book income tax expense in advance of realization. In the Board's judgment, the uncertainties described in the next paragraph make it inappropriate to anticipate the possible future tax benefit in advance of realization.

.262 Statutory depletion was eliminated or virtually eliminated for many companies by the *Tax Reduction Act of 1975* and was substantially reduced for many other companies by that Act. Further reductions are scheduled under that Act and subsequent legislation. Also, the law imposes certain limitations to statutory depletion that depend on future production, future sales prices, and future costs, all of which are difficult to estimate but which must be estimated if interaction is to be recognized. The uncertainties identified in this paragraph cause serious concern about anticipating tax benefits from future statutory depletion.

.263 Moreover, the interaction concept is inconsistent with the deferred method of income tax allocation described in paragraphs 19 and 34-37 of *APB Opinion No. 11* [section 4091.18 and section 4091.33-.36]. Although the recognition of interaction is consistent, in some respects, to the "partial allocation" theory discussed in paragraphs 26-28 [sections 4091.25-.27] of that Opinion, the APB rejected the partial allocation theory in favor of comprehensive income tax allocation by the

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

deferred method (paragraphs 29-32 [section 4091.28-.31] of that Opinion).

.264 The concept of interaction is, essentially, a "cover" concept: Deferred income taxes that otherwise relate to *current* period pre-tax accounting income need not be recognized to the extent of offsetting possible *future* income tax benefits from excess statutory depletion. The Board has expressly rejected the "cover" concept in reaching certain decisions in this Statement (see paragraphs .175 and .176) and in *FASB Statement No. 8,* "Accounting for the Translation of Foreign Currency Transactions and Foreign Currency Financial Statements" (see paragraphs 174-180 [section 1083.174-.180] of that Statement).

Effective Date and Transition

.265 This Statement was made effective for fiscal years beginning after December 15, 1978 to allow an oil and gas producing company sufficient time to gather the necessary data, modify its accounting systems, and otherwise prepare for transition to the accounting standards established by this Statement. The Exposure Draft had proposed a June 15, 1978 effective date; the change to December 15, 1978 is intended to give all companies at least one year to prepare for the change and to explain any impact it may have to investors and creditors. Voluntary adoption of the provisions of this Statement prior to its effective date is not prohibited by this Statement.

.266 For several reasons, the Board has concluded that the provisions of this Statement should be applied retroactively by restating the financial statements of prior periods. First, unlike FASB pronouncements that deal with a comparatively narrow accounting question, the standards established by this Statement prescribe the fundamental basis by which the financial statements of an oil and gas producing company shall be prepared. Moreover, because many variations of successful efforts accounting have heretofore been applied in practice, this Statement is likely to have an impact on the financial statements of a great many oil and gas producing companies, not just those companies presently using the full cost method. In the Board's judgment, because of the magnitude and pervasiveness of the impact of this Statement, restatement will result in the most meaningful and comparable financial statements of all oil and gas producing companies.

.267 Further, in paragraph 27 of *APB Opinion No.* 20 [section 1051.27], the Accounting Principles Board cited a change to or from the full cost method of accounting in the extractive industries as one of three special types of changes in accounting principle that should be reported by applying retroactively the new method in restatements of prior periods.

.268 The Board recognizes that some companies may encounter some difficulties in accumulating the necessary data or in making after-the-fact estimates or judgments to apply the provisions of this Statement retroactively. The Board believes, however, that the added interperiod and intercompany comparability thus obtained outweighs any cost-saving advantages of prospective application or the cumulative effect method. Further, because of (a) the diversity of cost capitalization and amortization practices heretofore followed by both full cost and successful efforts companies and (b) the fact that amortization of some previously capitalized costs could continue for ten, twenty, thirty, forty, or more years, the Board concluded that prospective application of the standards established by this Statement is inappropriate.

.269 With regard to some of the restatement problems cited by some respondents to the Exposure Draft, paragraph .064 points out that a provision of this Statement that would not have a significant effect on prior years' financial statements need not be retroactively applied. Also, in response to questions raised in letters of comment on the Exposure Draft, paragraph .064 allows the use of "hindsight" information in making the retroactive restatements except that reserve estimates should not now be revised in retrospect.

Appendix C

GLOSSARY

.270 This glossary defines certain terms as they are used in this Statement.

.271 The definitions of categories of *reserves* used in this Statement are those set forth in the regulations of the Securities and Exchange Commission:[11]

> *Proved reserves.* Those quantities of crude oil, natural gas, and natural gas liquids which, upon analysis of geologic and engineering data, appear with reasonable certainty to be recoverable in the future from known oil and gas reservoirs under existing economic and operating conditions. Proved reserves are limited to those quantities of oil and gas which can be expected, with little doubt, to be recoverable commercially at current prices[12] and costs, under existing regulatory practices and with existing conventional equipment and operating methods. Depending upon their status of development, such proved reserves are subdivided into "proved developed reserves" and "proved undeveloped reserves."
>
> *Proved developed reserves.* Reserves which can be expected to be recovered through existing wells with existing equipment and operating methods. Proved developed reserves include both (a) proved developed *producing* reserves (those that are expected to be produced from existing completion intervals now open for production in existing wells) and (b) proved developed *nonproducing* reserves (those that exist behind the casing of existing wells, or at minor depths

[11] Adopted May 12, 1976 in *Securities Act Release No. 5706*, which deals with disclosure of estimates of oil and gas reserves in registration statements, proxy statements, and reports filed with the Commission.

[12] The term *current prices* is elaborated on by the SEC in *Securities Act Release No. 5837* as follows: "Current prices include consideration of changes in existing prices provided by contractual arrangements, by law, or by regulatory agencies, where applicable; and for changes in prices for gas to be produced subsequent to termination or expiration of existing contracts, which latter prices should be based on current prices plus escalation for similar production subject to the entity's or other entities' recent contracts." The term "escalation" is further elaborated on in *SEC Release No. 5877* as follows: "The 'escalation' referred to in these releases is limited to specific escalation provisions in recent contracts. Escalations to reflect future price expectations are not permitted."

below the present bottom of such wells, which are expected to be produced through these wells in the predictable future, where the cost of making such oil and gas available for production should be relatively small compared to the cost of a new well). Additional oil and gas expected to be obtained through the application of fluid injection or other improved recovery techniques for supplementing the natural forces and mechanisms of primary recovery should be included as "proved developed reserves" only after testing by a pilot project or after the operation of an installed program has confirmed through production response that increased recovery will be achieved.

Proved undeveloped reserves. Reserves which are expected to be recovered from new wells on undrilled acreage, or from existing wells where a relatively major expenditure is required for recompletion. Reserves on undrilled acreage shall be limited to those drilling units offsetting productive units, which are reasonably certain of production when drilled. Proved reserves for other undrilled units can be claimed only where it can be demonstrated with certainty that there is continuity of production from the existing productive formation. Under no circumstances should estimates for proved undeveloped reserves be attributable to any acreage for which an application of fluid injection or other improved recovery technique is contemplated, unless such techniques have been proved effective by actual tests in the area and in the same reservoir.

.272 The following is the definition of a *field* used in this Statement:

Field. An area consisting of a single reservoir or multiple reservoirs all grouped on or related to the same individual geological structural feature and/or stratigraphic condition. There may be two or more reservoirs in a field which are separated vertically by intervening impervious strata, or laterally by local geologic barriers, or by both. Reservoirs that are associated by being in overlapping or adjacent fields may be treated as a single or common operational field. The geological terms "structural feature" and "stratigraphic condition" are intended to identify localized geological features as opposed to the broader terms of basins, trends, provinces, plays, areas-of-interest, etc.

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.273 The foregoing definition of a field relies, in turn, on the definition of a reservoir. The following definition shall be used for purposes of this Statement:

> *Reservoir.* A porous and permeable underground formation containing a natural accumulation of producible oil or gas that is confined by impermeable rock or water barriers and is individual and separate from other reservoirs.

.274 For purposes of this Statement, the following definitions of wells shall be used:

> *Exploratory well.* An exploratory well is a well that is not a development well, a service well, or a stratigraphic test well as those terms are defined below.
>
> *Development well.* A development well is a well drilled within the proved area of an oil or gas reservoir to the depth of a stratigraphic horizon known to be productive.
>
> *Service well.* A service well is a well drilled or completed for the purpose of supporting production in an existing field. Wells in this class are drilled for the following specific purposes: gas injection (natural gas, propane, butane, or flue gas), water injection, steam injection, air injection, salt-water disposal, water supply for injection, observation, or injection for in-situ combustion.
>
> *Stratigraphic test well.* A stratigraphic test is a drilling effort, geologically directed, to obtain information pertaining to a specific geologic condition. Such wells customarily are drilled without the intention of being completed for hydrocarbon production. This classification also includes tests identified as core tests and all types of expendable holes related to hydrocarbon exploration. For purposes of this Statement, stratigraphic test wells (sometimes called "expendable wells") are classified as follows:
>
> 1. *Exploratory-type stratigraphic test well.* A stratigraphic test well not drilled in a proved area.
>
> 2. *Development-type stratigraphic test well.* A stratigraphic test well drilled in a proved area.

.275 The term *proved area* is used in the foregoing definitions of development well, exploratory-type stratigraphic test well and development-type stratigraphic test well. As used therein, a *proved area* is the part of a property to which proved reserves have been specifically attributed.

INTERNATIONAL ACCOUNTING STANDARDS

Introduction

In June, 1973, the American Institute of Certified Public Accountants became one of the founding members of the International Accounting Standards Committee. The objectives of IASC as set out in paragraph 1 of the revised Agreement are "to formulate and publish in the public interest, standards to be observed in the presentation of audited financial statements and to promote their worldwide acceptance and observance. . . ."

One of the provisions of the Agreement and Constitution of the IASC calls for the members of IASC

"to use their best endeavours:

(i) to ensure that published financial statements comply with these standards or that there is disclosure of the extent to which they do not and to persuade governments, the authorities controlling securities markets and the industrial and business community that published financial statements should comply with these standards;

(ii) to ensure (1) that the auditors satisfy themselves that the financial statements comply with these standards or, if the financial statements do not comply with these standards, that the fact of non-compliance is disclosed in the financial statements, (2) that in the event of non-disclosure reference to non-compliance is made in the audit report;

(iii) to ensure that, as soon as practicable, appropriate action is taken in respect of auditors whose audit reports do not meet the requirements of (ii) above . . ."

Statements of International Accounting Standards do not establish standards enforceable under the Code of Professional Ethics of the American Institute of Certified Public Accountants.

The following sets forth the views of the AICPA Board of Directors regarding the work of the International Accounting Standards Committee and compliance with the AICPA's commitment under the "best endeavours" clause set forth in the Agreement and Constitution of the IASC.

Work of the International Accounting Standards Committee

A. The Board of Directors subscribes to the philosophy of, and practical need for, harmonisation of basic accounting and reporting standards. The Board recognises that such harmonisation will not happen of its own accord and, therefore, supports the work of the International Accounting Standards Committee to formulate and publish basic international standards. They believe that the IASC should be supported to the maximum extent practicable and given every opportunity of fulfilling its purpose.

B. The Board believes that although the IASC is a relatively new body it is expected to have a significant impact on accounting and reporting standards worldwide. If such goal is to be achieved, it is essential that the confidence and respect for the work of the IASC must be gained as a result of a demonstrated capacity to produce timely and high quality standards responsive to the international needs of the professional and business communities throughout the world.

Implementation of "Best Efforts"

A. The Preface to Statements of International Accounting Standards [section 9000] states that national regulations or pronouncements govern financial reporting in each country. To achieve such acceptance in the United States, international accounting standards will have to be specifically adopted by the Financial Accounting Standards Board. In this regard, when an international accounting standard is issued it will be compared with U. S. practice to find out whether there are significant differences between the two.

B. If there are no significant differences, financial statements which comply with U. S. generally accepted accounting principles will automatically comply with the international accounting standards with respect to those subjects.

C. If there are significant differences, the AICPA will urge the FASB to give early consideration to such differences with a view to achieving harmonisation of those areas in which a significant difference exists.

D. Published pronouncements of the IASC will be included in this volume of AICPA PROFESSIONAL STANDARDS together with an indication of whether there are any significant differences between international standards and United States GAAP.

E. Continued effort will be made to ensure that the status of international accounting standards vis-à-vis accounting and reporting practices generally accepted in the U. S. and devel-

> opments therein are clearly understood by government authorities, securities commissions, stock exchanges and the business community. It is important that such groups be encouraged to put forth their views on drafts of the IASC since collectively they represent a broad base of experience and diversity of background which will add significantly to the process of harmonisation of U. S. and international accounting standards.

Accordingly, each Standard is followed by a summary of those situations in which the Standards established by the IASC are more demanding than or conflict with accounting principles generally accepted in the United States. This volume does not identify those matters with respect to which International Accounting Standards permit, but do not require, the use of a practice that is contrary to accounting principles generally accepted in the United States.

Preface to Statements of International Accounting Standards

This Preface is issued to set out the objectives and operating procedures of the International Accounting Standards Committee (IASC) and to explain the scope and authority of the Statements of International Accounting Standards. The Preface was approved in October 1977 for publication in March 1978 and supersedes the Preface published in January 1975. The approved text of this Preface is that published by the International Accounting Standards Committee in the English language.

.01 The International Accounting Standards Committee (IASC) came into existence on 29 June, 1973 as a result of an agreement by the leading professional bodies of Australia, Canada, France, Germany, Japan, Mexico, the Netherlands, the United Kingdom and Ireland, and the United States of America. A revised Agreement and Constitution was signed on 10 October, 1977. Under the terms of the revised Constitution,* accountancy bodies which were Associate Members become members of IASC and other accountancy bodies may become members. The business of the committee is conducted by a Board comprising representatives of the Founder Member bodies and from not more than two Member bodies.

THE OBJECTIVES

.02 The relationship which existed between IASC and the International Co-ordination Committee for the Accountancy Profession is carried forward to the International Federation of Accountants on the same general basis. IASC continues to be the body having responsibility and authority to issue, in its own name, pronouncements on International Accounting Standards.

.03 The objectives of IASC as set out in paragraph 1 of the 1977 Agreement* are "to formulate and publish in the public interest, standards to be observed in the presentation of audited financial statements and to promote their worldwide acceptance and observance".

* Note. Copies of the 1977 Agreement and Constitution may be obtained on request by application to the secretary of the International Accounting Standards Committee.

.04 By the same Agreement, the Members agree to support these objectives by undertaking the following obligations:

"(a) to support the standards promulgated by the Committee;

(b) to use their best endeavours:

(i) to ensure that published financial statements comply with these standards or that there is disclosure of the extent to which they do not and to persuade governments, the authorities controlling securities markets and the industrial and business community that published financial statements should comply with these standards;

(ii) to ensure (1) that the auditors satisfy themselves that the financial statements comply with these standards or, if the financial statements do not comply with these standards, that the fact of non-compliance is disclosed in the financial statements, (2) that in the event of non-disclosure reference to non-compliance is made in the audit report;

(iii) to ensure that, as soon as practicable, appropriate action is taken in respect of auditors whose audit reports do not meet the requirements of (ii) above;

(c) to seek to secure similar general acceptance and observance of these standards internationally."

AUDITED FINANCIAL STATEMENTS

.05 The term "financial statements" used in paragraphs .03 and .04 covers balance sheets, income statements or profit and loss accounts, statements of changes in financial position, notes and other statements and explanatory material which are identified as being part of the financial statements. Usually, financial statements are made available or published once each year and are the subject of a report by an auditor. International Accounting Standards apply to such financial statements of any commercial, industrial, or business enterprise.

.06 The management of such an enterprise may prepare financial statements for its own use in a number of different ways best suited for internal management purposes. When financial statements are issued to other persons, such as shareholders, creditors, employees, and the public at large, they should conform to International Accounting Standards.

.07 The responsibility for the preparation of financial statements and for adequate disclosure is that of the management of the enterprise. The auditor's responsibility is to form his opinion and to report on the financial statements.

ACCOUNTING STANDARDS

.08 Within each country, local regulations govern, to a greater or lesser degree, the issue of financial statements. Such local regulations include accounting standards which are promulgated by the regulatory bodies and/or the professional accountancy bodies in the countries concerned.

.09 The accounting standards already published in many countries, as referred to in paragraph .08, sometimes differ in form and content. IASC takes cognisance of exposure drafts, or of accounting standards already issued on each subject and in the light of such knowledge produces an International Accounting Standard for worldwide acceptance. One of the objects of the formation of IASC was to harmonise as far as possible the diverse accounting standards and accounting policies at present in use in different countries.

.10 In carrying out this task of adaptation of existing standards, and in formulating International Accounting Standards on new subjects, it is the intention of IASC to concentrate on essentials. It therefore endeavours not to make the International Accounting Standards so complex that they cannot be applied effectively on a world wide basis. In the years to come it is to be expected that the International Accounting Standards issued by IASC will undergo revision and a greater degree of sophistication may then be appropriate.

.11 International Accounting Standards promulgated by IASC do not override the local regulations, referred to in paragraph .08 above, governing the issue of financial statements in a particular country. If the International Accounting Standards issued by IASC conform with local regulations on a particular subject, the financial statements issued in that country which comply with the local regulations will automatically comply with the International Accounting Standards in respect of that subject. The obligations undertaken by the Members of IASC, as explained in this Preface, are designed to ensure that when the International Accounting Standards differ from, or are in conflict with, the local regulations, either the financial statements or the auditor's report will indicate, in accordance with paragraph .04(b)(i) and (ii) of this Preface, in what respects the International Accounting Standards have not been observed.

THE SCOPE OF THE STANDARDS

.12 Any limitation of the applicability of specific International Accounting Standards is made clear in the statements of those Standards. International Accounting Standards are not intended

to apply to immaterial items. An International Accounting Standard applies from a date specified in the Standard and unless indicated to the contrary is not retroactive.

WORKING PROCEDURE—EXPOSURE DRAFTS AND STANDARDS

.13 The agreed working procedure is to select certain subjects for detailed study by Steering Committees. As a result of this work an exposure draft is prepared on a particular subject for consideration by the Board. If approved by a two-thirds majority, the exposure draft is addressed to professional accountancy bodies and to such governments, securities markets, regulatory and other agencies as the Board may determine. Adequate time is allowed for each exposure draft to be considered by the persons or organisations to whom it is sent for comment.

.14 The comments and suggestions received as a result of this exposure are then examined by the Board and the exposure draft is revised as necessary. Provided that the revised draft is approved by at least three-quarters of the total voting rights of the Board, it is issued as a definitive International Accounting Standard and becomes operative from a date stated in the Standard.

VOTING

.15 For the purpose of voting referred to in paragraphs .13 and .14 above, each country represented on the Board has one vote.

LANGUAGE

.16 The approved text of any exposure draft or Standard is that published by IASC in the English language. Members are responsible, under the authority of the Board, for preparing translations of exposure drafts and Standards so that, where appropriate, such translations may be issued in the languages of their own countries. These translations indicate the name of the accountancy body that prepared the translation and that it is a translation of the approved text.

THE AUTHORITY ATTACHING TO THE STANDARDS

.17 It is important to observe the degree of authority which attaches to the issue of the definitive International Accounting Standards when published in accordance with the procedure indicated above.

.18 The accounting profession cannot normally impose its views except upon its own members and the task therefore is to persuade by example, leadership, and exhortation, the classes of persons

referred to in paragraph .04(b)(i) above to support the Standards. In most countries of the world, the accounting profession has a prestige and standing which is of great significance in successfully achieving this task of persuasion. This explains, in this context, the use of the words "to use their best endeavours".

.19 Under the obligations referred to in paragraph .04(b)(ii) and (iii), Members of IASC must use their best endeavours to ensure that auditors comply with the provisions of paragraph .04(b)(ii) and that appropriate action, which may be of a disciplinary character, can be taken, in accordance with paragraph .04(b)(iii) if they do not comply. This is the most important and serious obligation which Members of IASC have undertaken.

CONCLUSION

.20 The Members of IASC believe that the adoption in their countries of International Accounting Standards, or disclosure of the extent to which they have not been observed will, over the years, have an important effect. It is to be expected that the quality of presentation of financial statements will be improved and that there will be an increasing degree of uniformity. Information will be provided as a routine which is necessary for a proper understanding of financial statements.

AC Section 9001

Disclosure of Accounting Policies

Issue date, unless otherwise indicated: January, 1975

INTRODUCTION

.01 This Statement deals with the disclosure of all significant accounting policies which have been adopted in the preparation and presentation of financial statements.

.02 The purpose of International Accounting Standards and the authority attaching to them are set out in the Preface to Statements of International Accounting Standards [section 9000].

.03 The definition of *financial statements* as presently set out in the Preface to Statements of International Accounting Standards [section 9000] is repeated here for convenience. The term *financial statements* covers balance sheets, income statements or profit and loss accounts, statements of changes in financial position, notes and other statements and explanatory material which are identified as being part of the financial statements. International Accounting Standards apply to the financial statements of any commercial, industrial, or business enterprise.

.04 The management of such an enterprise may prepare financial statements for its own use in a number of different ways best suited for internal management purposes. When financial statements are issued to other persons, such as shareholders, creditors, employees, and the public at large, they should conform to International Accounting Standards.

.05 Usually, financial statements are made available once each year and are the subject of a report by an auditor.

Fundamental Accounting Assumptions

.06 Certain fundamental accounting assumptions underlie the preparation of financial statements. They are usually not specifically stated because their acceptance and use are assumed. Disclosure is necessary if they are not followed, together with the reasons.

.07 The following are recognised by the International Accounting Standards Committee as fundamental accounting assumptions:

(a) Going Concern

The enterprise is normally viewed as a going concern, that is, as continuing in operation for the foreseeable future. It is assumed that the enterprise has neither the intention nor the necessity of liquidation or of curtailing materially the scale of its operations.

(b) Consistency

It is assumed that accounting policies are consistent from one period to another.

(c) Accrual

Revenues and costs are accrued, that is, recognised as they are earned or incurred (and not as money is received or paid) and recorded in the financial statements of the periods to which they relate. (The considerations affecting the process of matching costs with revenues under the accrual assumption are not dealt with in this Statement.)

Accounting Policies

.08 Accounting policies encompass the principles, bases, conventions, rules, and procedures adopted by managements in preparing and presenting financial statements. There are many different accounting policies in use even in relation to the same subject; judgment is required in selecting and applying those which, in the circumstances of the enterprise, are best suited to present properly its financial position and the results of its operations.

.09 Three considerations should govern the selection and application by management of the appropriate accounting policies and the preparation of financial statements:

(a) Prudence

Uncertainties inevitably surround many transactions. This should be recognised by exercising prudence in preparing financial statements. Prudence does not, however, justify the creation of secret or hidden reserves.

(b) Substance Over Form

Transactions and other events should be accounted for and presented in accordance with their substance and financial reality and not merely with their legal form.

(c) Materiality

Financial statements should disclose all items which are material enough to affect evaluations or decisions.

EXPLANATION

.10 Financial statements must be clear and understandable. They are based on accounting policies which vary from enterprise to enterprise, both within a single country and among countries. Disclosure of the significant accounting policies on which the financial statements are based is therefore necessary so that they may be properly understood. The disclosure of these policies should be an integral part of the financial statements; it is helpful to users if they are all disclosed in one place. Sometimes a wrong or inappropriate treatment is adopted for items in balance sheets, income statements or profit and loss accounts, or other statements. Disclosure of the treatment adopted is necessary in any case, but disclosure cannot rectify a wrong or inappropriate treatment.

Users of Financial Statements

.11 Financial statements give information which is used by a variety of users, especially shareholders and creditors (present and potential) and employees. Other important categories of users include suppliers, customers, trade unions, financial analysts, statisticians, economists, and taxing and regulatory authorities.

.12 The users of financial statements require them as part of the information needed, among other purposes, for making evaluations and financial decisions. They cannot make reliable judgments on these matters unless the financial statements clearly disclose the significant accounting policies which have been adopted in preparing them.

Variations in Accounting Policies and in their Disclosure

.13 The task of interpreting financial statements is complicated by the adoption of diverse policies in many areas of accounting. There is no single list of accepted policies to which users may refer and the diverse accounting policies that are presently available for adoption can produce significantly different sets of financial statements based on the same events and conditions. The following are examples of areas in which differing accounting policies exist and which therefore require disclosure of the treatment selected:

General

Consolidation policy

Conversion or translation of foreign currencies including the disposition of exchange gains and losses

Overall valuation policy (e. g., historical cost, general purchasing power, replacement value)
Events subsequent to the balance sheet date
Leases, hire purchase, or instalment transactions and related interest
Taxes
Long term contracts
Franchises

Assets

Receivables
Inventories (stock and work in progress) and related cost of goods sold
Depreciable assets and depreciation
Growing crops
Land held for development and related development costs
Investments: subsidiary companies, associated companies, and other investments
Research and development
Patents and trademarks
Goodwill

Liabilities and provisions

Warranties
Commitments and contingencies
Pension costs and retirement plans
Severance and redundancy payments

Profits and losses

Methods of revenue recognition
Maintenance, repairs, and improvements
Gains and losses on disposals of property
Reserve accounting, statutory or otherwise, including direct charges and credits to surplus accounts.

.14 Accounting policies are not at present regularly and fully disclosed in all financial statements. Considerable variation in format, clarity, and completeness of disclosure exists among and within those countries in which accounting policies are disclosed. In a single set of financial statements some significant accounting policies may be disclosed while other significant policies are not. Even in countries where disclosure of all significant accounting policies is required, guidelines to secure uniformity in the method of disclosure are not always available. The growth of international enterprises and finance has increased the neces-

sity for greater uniformity of financial statements across national boundaries.

.15 Financial statements should show corresponding figures for the preceding period. If a change in an accounting policy is made which has a material effect it is necessary to disclose that a change has been made and to qualify the effect. A change in an accounting policy which may not have a material effect in the current year should nevertheless be disclosed if it may have a material effect in subsequent years.

INTERNATIONAL ACCOUNTING STANDARD 1

DISCLOSURE OF ACCOUNTING POLICIES

International Accounting Standard 1 comprises paragraphs .16—.23 of this Statement. The Standard should be read in the context of paragraphs .01—.15 of this Statement and of the Preface to Statements of International Accounting Standards [*section 9000*].

.16 Going concern, consistency, and accrual are fundamental accounting assumptions. Where fundamental accounting assumptions are followed in financial statements, disclosure of such assumptions is not required. If a fundamental accounting assumption is not followed, that fact should be disclosed together with the reasons.

.17 Prudence, substance over form, and materiality should govern the selection and application of accounting policies.

.18 Financial statements should include clear and concise disclosure of all significant accounting policies which have been used.

.19 The disclosure of the significant accounting policies used should be an integral part of the financial statements. The policies should normally be disclosed in one place.

.20 Wrong or inappropriate treatment of items in balance sheets, income statements or profit and loss accounts, or other statements is not rectified either by disclosure of accounting policies used or by notes or explanatory material.

.21 Financial statements should show corresponding figures for the preceding period.

.22 A change in an accounting policy that has a material effect in the current period or may have a material effect in subsequent periods should be disclosed together with the reasons.

The effect of the change should, if material, be disclosed and quantified.

.23 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1975.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 1 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Paragraph 21 of International Accounting Standard 1 states "Financial statements should show corresponding figures for the preceding period." Generally accepted accounting principles in the U. S. do not require the presentation of comparative financial statements. However, U. S. companies ordinarily issue comparative financial statements, and the benefits to users of presenting amounts for the preceding period for comparative purposes are widely recognized. In this regard, Chapter 2A of ARB 43 [section 2041] states:

> "The presentation of comparative financial statements in annual and other reports enhances the usefulness of such reports and brings out more clearly the nature and trends of current changes affecting the enterprise. Such presentation emphasizes the fact that statements for a series of periods are far more significant than those for a single period and that the accounts for one period are but an installment of what is essentially a continuous history."

AC Section 9002

Valuation and Presentation of Inventories in the Context of the Historical Cost System

Issue date, unless otherwise indicated: October, 1975

INTRODUCTION

.01 This Statement deals with the valuation and presentation of inventories[1] in financial statements in the context of the historical cost system, which is the most widely adopted basis on which financial statements are presented.

.02 The Committee is aware of other systems that are proposed or used in financial statements, including systems that are based on replacement costs or other current values. Inventory valuation and presentation in the context of those other systems are beyond the scope of this Statement. International Accounting Standard 1, *Disclosure of Accounting Policies* [section 9001], requires that the system adopted must be clearly stated.

.03 This Statement does not deal with inventories accumulated under long-term construction contracts and with inventory treatment of by-products.

Definitions

.04 The following terms are used in this Statement with the meanings specified.

Inventories are tangible property (a) held for sale in the ordinary course of business, (b) in the process of production for such sale, or (c) to be consumed in the production of goods or services for sale.

Historical cost of inventories is the aggregate of costs of purchase, costs of conversion, and other costs incurred in bringing the inventories to their present location and condition.

Costs of purchase comprise the purchase price including import duties and other purchase taxes, transport and handling costs,

[1] The term "inventories" is used throughout this Statement; in some countries inventories are described as "stock and work in progress."

and any other directly attributable costs of acquisition less trade discounts, rebates, and subsidies.

Costs of conversion are those costs, in addition to the costs of purchase, that relate to bringing the inventories to their present location and condition.

Net realisable value is the estimated selling price in the ordinary course of business less costs of completion and less costs necessarily to be incurred in order to make the sale.

EXPLANATION

.05 Inventories comprise a significant portion of the assets of many enterprises. The valuation and presentation of inventories therefore have a significant effect in determining and presenting the financial position and results of operations of those enterprises.

Determination of Historical Cost

.06 In determining historical cost as defined in paragraph .04, different interpretations arise in practice as regards production overhead, other overheads, and the cost formula to be used.

Production Overhead

.07 Production overhead is comprised of costs incurred for production other than direct materials and labour. Examples are indirect materials and labour, depreciation and maintenance of factory buildings and equipment, and the cost of factory management and administration.

.08 Production overhead requires analysis to determine the portion related to bringing the inventories to their present location and condition and thus to be included in the costs of conversion when determining the historical cost of inventories.

.09 Both fixed and variable production overhead incurred during production are usually allocated to costs of conversion. That practice is based on the view that they are both incurred in putting inventories in their present location and condition. Fixed production overhead is sometimes excluded in whole or in part from costs of conversion on the grounds that it is not considered to relate directly to putting inventories in their present location and condition.

.10 In a period of low production or if there is idle plant, it is customary to restrict the allocation of fixed production overhead to the costs of conversion by relating it to the capacity of the production facilities and not to the actual level of throughput. Capacity of the production facilities is variously interpreted, for example, as the normal production expected to be achieved over

a number of periods or seasons or as the maximum production that as a practical matter can be achieved. The interpretation is determined in advance and applied consistently, and is not modified for temporary conditions.

.11 Similarly, exceptional amounts of waste—material, labour, or other expenses—which do not relate to bringing the inventories to their present location and condition are excluded from conversion costs.

Other Overheads

.12 Overheads other than production overhead are sometimes incurred in bringing inventories to their present location and condition, for example, expenditures incurred in designing products for specific customers. On the other hand, selling expenses, general administrative overheads, research and development costs, and interest are usually considered not to relate to putting the inventories in their present location and condition.

Cost Formula Used

.13 Several different formulas with widely different effects are in current use for the purpose of assigning costs, including the following:

(a) First-in, first-out (FIFO)
(b) Weighted average cost
(c) Last-in, first-out (LIFO)
(d) Base stock
(e) Specific identification
(f) Next-in, first-out (NIFO)
(g) Latest purchase price.

.14 The FIFO, weighted average cost, LIFO, base stock, and specific identification formulas use costs that have been incurred by the enterprise at one time or another. The NIFO and latest purchase price methods use costs that have not all been incurred and are therefore not based on historical cost.

.15 Specific identification is a formula that attributes specific costs to identified items of inventory. This is an appropriate treatment for goods that have been bought or manufactured and are segregated for a specific project. If it is used, however, in respect of items of inventory which are ordinarily interchangeable, the selection of items could be made in such a way as to obtain predetermined effects on profit.

Valuation of Inventories Below Historical Cost

.16 The historical cost of inventories may not be realisable if their selling prices have declined, if they are damaged, or if they have become wholly or partially obsolete. The practice of writing inventories down below historical cost to net realisable value accords with the view that current assets should not be carried in excess of amounts expected to be realised. Declines in value are computed separately for individual items, groups of similar items, an entire class of inventory (for example, finished goods), or items relating to a class of business, or they are computed on an overall basis for all the inventories of the enterprise. The practice of writing inventories down based on a class of inventory, on a class of business, or on an overall basis results in offsetting losses incurred against unrealised gains.

.17 In some countries, writedowns are made which are not based on the practices described in paragraph .16. For example, writedowns below historical cost are arrived at by applying an arbitrary percentage to the amounts otherwise computed or by undisclosed reductions that result in secret reserves; these produce inappropriate effects on financial statements.

Presentation of Inventories

.18 The sub-classification of inventories in financial statements informs readers of the amounts held in different categories and the extent of the changes from period to period. Common sub-classifications are materials, work in progress, finished goods, merchandise, and production supplies.

.19 "Inventories" in balance sheets usually consist of items included in the definition of inventories in paragraph .04. Other items are sometimes shown under the heading "Inventories", for example, nonproduction supplies and research and development supplies.

INTERNATIONAL ACCOUNTING STANDARD 2

VALUATION AND PRESENTATION OF INVENTORIES IN THE CONTEXT OF THE HISTORICAL COST SYSTEM

International Accounting Standard 2 comprises paragraphs .20—.36 of this Statement. The Standard should be read in the context of paragraphs .01—.19 of this Statement and of the Preface to Statements of International Accounting Standards [*section 9000*].

.20 Inventories should be valued at the lower of historical cost and net realisable value.

Ascertainment of Historical Cost

.21 The historical cost of manufactured inventories should include a systematic allocation of those production overhead costs that relate to putting the inventories in their present location and condition. Allocation of fixed production overhead to the costs of conversion should be based on the capacity of the facilities. If fixed production overhead has been entirely or substantially excluded from the valuation of inventories on the grounds that it does not directly relate to putting the inventories in their present location and condition, that fact should be disclosed.

.22 Overheads other than production overhead should be included as part of inventory cost only to the extent that they clearly relate to putting the inventories in their present location and condition.

.23 Exceptional amounts of wasted material, labour, or other expenses should not be included as part of inventory cost.

.24 Except as set out in paragraphs .25 and .26, the historical cost of inventories should be accounted for using the FIFO formula or a weighted average cost formula.

.25 Inventories of items that are not ordinarily interchangeable or goods manufactured and segregated for specific projects should be accounted for by using specific identification of their individual costs.

.26 The LIFO or base stock formulas may be used provided that there is disclosure of the difference between the amount of the inventories as shown in the balance sheet and either (a) the lower of the amount arrived at in accordance with paragraph .24 and net realisable value or (b) the lower of current cost at the balance sheet date and net realisable value.

.27 Techniques such as the standard cost method of valuing products or the retail method of valuing merchandise may be used for convenience if they approximate consistently the results that would be obtained in accordance with paragraph .20.

Ascertainment of Net Realisable Value

.28 Estimates of net realisable value should be based not on temporary fluctuations of price or cost but on the most reliable evidence available at the time the estimates are made as to what the inventories are expected to realise.

.29 Inventories should be written down to net realisable value item by item or by groups of similar items; whichever method is used should be consistently applied.

.30 The net realisable value of the quantity of inventory held to satisfy firm sales contracts should be based on the contract price. If the sales contracts are for less than the inventory quantities held, net realisable value for the excess should be based on general market prices.[2]

.31 Normal quantities of materials and other supplies held for incorporation in the production of goods should not be written down below historical cost if the finished products in which they will be incorporated are expected to be realised at or above historical cost. Nevertheless, a decline in the price of materials may indicate that the historical cost of finished products to be produced will exceed net realisable value in which event a writedown of the materials inventories should be made; in this event, replacement cost may be the best available measure of the net realisable value of those materials.

Presentation in the Financial Statements

.32 The profit and loss of the period should be charged with the amount of inventories sold or used (unless allocated to other asset accounts) and with the amount of any writedown in the period to net realisable value.

.33 Inventories should be sub-classified in balance sheets or in notes to the financial statements in a manner which is appropriate to the business and so as to indicate the amounts held in each of the main categories.

.34 The accounting policies adopted for the purpose of valuation of inventories, including the cost formula used, should be disclosed. A change in an accounting policy related to inventories that has a material effect in the current period or may have a material effect in subsequent periods should be disclosed together with the reasons. The effect of the change should, if material, be disclosed and quantified. (See International Accounting Standard 1, Disclosure of Accounting Policies [section 9001].)

.35 If items are shown under the caption "Inventories" other than those comprehended by the definition in paragraph .04, their nature, amounts and basis of valuation should be disclosed.

Effective Date

.36 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1976.

---

[2] Firm sales contracts beyond inventory quantities held, and firm purchase contracts are beyond the scope of this Statement.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 2 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Valuation of Inventories at the Lower of Cost or Market

Paragraphs 20 and 31 of International Accounting Standard 2 state:

> "Inventories should be valued at the lower of historical costs and net realisable value.
>
> * * * * *
>
> "Normal quantities of materials and other supplies held for incorporation in the production of goods should not be written down below historical cost if the finished products in which they will be incorporated are expected to be realised at or above the historical cost. Nevertheless, a decline in the price of materials may indicate that the historical cost of finished products to be produced will exceed net realisable value in which event a writedown of the materials inventories should be made; in this event, replacement cost may be the best available measure of the net realisable value of those materials."

On the other hand, Statement 6 in Chapter 4 of ARB 43 [section 5121] provides that inventory is to be valued at the lower of cost or market as follows:

> "As used in the phrase *lower of cost or market* the term *market* means current replacement cost (by purchase or by reproduction, as the case may be) except that:
>
> (1) Market should not exceed the net realizable value (i. e., estimated selling price in the ordinary course of business less reasonably predictable costs of completion and disposal); and
>
> (2) Market should not be less than net realizable value reduced by an allowance for an approximately normal profit margin."

Thus, literal application of the provision of ARB 43 that inventories be written down to replacement cost where replacement cost is less than net realizable value (but not less than net realizable value reduced by an allowance for an approximately normal profit margin) conflicts with the international standard (except where replacement cost is the best available measure of net realizable value).

As noted in FASB Interpretation No. 17 [section 1083-2], the discussion in Chapter 4 of ARB 43 [section 5121] states "because of the many variations of circumstances encountered in inventory pricing, Statement 6 is intended as a guide rather than a literal rule."

Valuation of Inventories at Quoted Market Prices

Chapter 4 of ARB 43 [section 5121] provides an exception to the general rule that inventories be valued at the lower of cost or market. The exception is as follows:

> "Only in exceptional cases may inventories properly be stated above cost. For example, precious metals having a fixed monetary value with no substantial cost of marketing may be stated at such monetary value; any other exceptions must be justifiable by inability to determine appropriate approximate costs, immediate marketability at quoted market price, and the characteristic of unit interchangeability. Where goods are stated above cost this fact should be fully disclosed."

International Accounting Standard 2 provides no exceptions to its basic requirement that inventories be valued at the lower of historical cost or net realizable value.

AC Section 9003

Consolidated Financial Statements

Issue date, unless otherwise indicated: June, 1976

INTRODUCTION

.01 The subject of this Statement is the presentation of consolidated financial statements for a group of companies under the control of one parent company. Consolidated financial statements have been developed to meet the need for information concerning the financial position and results of operations of a group of companies.

.02 This Statement also establishes as an International Accounting Standard the use of the equity method of accounting for the presentation of certain types of long-term investments in the consolidated financial statements. It does not deal with the equity method in the presentation of other forms of financial statements.

.03 This Statement does not deal with the following specialised subjects:

(a) Methods of accounting for business mergers or combinations and their effects on consolidation

(b) Accounting for goodwill

(c) Accounting for bonus share issues (stock dividends)

(d) Accounting for step-by-step acquisitions and disposals of subsidiaries and associated companies

(e) Accounting for shares issued by a subsidiary

(f) Accounting for reciprocal shareholdings when two companies in the group hold shares in each other

(g) Methods of translating financial statements expressed in foreign currencies

(h) Disclosure by product lines or activities in the financial statements of diversified companies

(i) Accounting for joint ventures.

Definitions

.04 The following terms are used for the purpose of this Statement.

An *investor* is a company that holds an interest in the voting power of another company (the investee).

An *investee* is a company in whose voting power an interest is held by another company (the investor).

A *subsidiary* is a company which is controlled by another company (known as the parent company).

A *parent company* is a company that has one or more subsidiaries.

Consolidated financial statements are statements which present the assets, liabilities, shareholders' accounts, revenue, and expenses of a parent company and its subsidiaries as those of a single enterprise.

Control is ownership, directly, or indirectly through subsidiaries, of more than one half of the voting power [1] of a company.

A *group* is a parent company and all its subsidiaries.

Minority interest is that part of the net results of operations, or of net assets, of a subsidiary attributable to shares owned other than by the parent company or another subsidiary.

Equity capital is the issued share capital of a company which is neither limited nor preferred in its participation in distributions of the profits of a company or in the ultimate distribution of its assets.

An *associated company* is an investee company that is not a subsidiary and in respect of which

(a) the investor's interest in the voting power of the investee is substantial, and

(b) the investor has the power to exercise significant influence over the financial and operating policies of the investee, and

(c) the investor intends to retain its interest as a long-term investment.

Significant influence is participation in the financial and operating policy decisions of the investee but not control of those policies. An investor may exercise significant influence in several ways, usually by representation on the board of directors but also by participation in policy making processes, material intercompany transactions, interchange of managerial person-

[1] Voting power refers to the rights attaching to voting shares issued and outstanding, that is, shares other than those held as "treasury stock". Treasury stock are a company's own shares which have been acquired by the issuing company and are legally available for reissue. This practice is not permitted in some countries.

nel, or dependency on technical information. If the investor holds less than 20% of the voting power of the investee, it should be presumed that the investor does not have the power to exercise significant influence, unless such power can be clearly demonstrated.

The *equity method* is a method of accounting by an investor for certain types of long-term investments in associated companies and for certain unconsolidated subsidiaries. Under the equity method, the investment account of the investor is adjusted in the consolidated financial statements for the change in the investor's share of net assets of the investee. The income statement reflects the investor's share of the results of operations of the investee.

DISCUSSION

Consolidated Financial Statements

Need for Consolidated Financial Statements

.05 Certain parties with interests in the parent company of a group, such as present and potential shareholders, employees, customers, and in some circumstances creditors, are concerned with the fortunes of the entire group. Consequently, they need to be informed about the results of operations and the financial position of the group as a whole.

.06 This need is served by consolidated financial statements, which present financial information concerning the group as that of a single enterprise without regard for the legal boundaries of the separate legal entities. The consolidated financial statements normally include the parent company and all its subsidiaries. In certain rare circumstances companies other than subsidiaries are treated as subsidiaries in the consolidated financial statements of a company that:

(a) owns a majority of the equity capital, but less than a majority of the voting power, or

(b) has the power to control by statute or contract the financial and operating policies of those companies. These policies are controlled, for example, by the power to nominate a majority of the board of directors, by management contract or by court decree.

.07 The needs of those interested in the financial position of a parent company or of individual subsidiaries, in particular, creditors and minority interests, are served by the separate financial statements of the parent company or of those subsidiaries.

Exclusion from Consolidation

.08 Subsidiaries are commonly excluded from consolidation in circumstances in which control is likely to be temporary or the ability of the parent company to control the assets is impaired.

.09 In some countries, it is considered appropriate to exclude from consolidation a subsidiary whose business activities are so dissimilar from those of the other companies within the group that the presentation of separate subsidiary financial statements with the consolidated financial statements would provide better information for the parent company shareholders and other users of the statements. An alternative to exclusion in such cases is the grouping, by type of business, of the assets and liabilities within the consolidated balance sheet and the revenue and expenses within the consolidated income statement.

.10 Further grounds considered by some as sufficient for excluding a subsidiary from consolidation include impracticability of consolidation, the likelihood of disproportionate expense or delay, or the opinion of the directors that the effect of consolidation would be misleading or harmful. Exclusions on these grounds are often subjective and may result in wide variations in practice among companies accounting for similar situations.

Consolidation Procedures

.11 In the consolidated financial statements, the accounts of the parent company and its subsidiaries are combined on a line by line basis by adding together like items of assets, liabilities, revenue, and expenses. The following are eliminated in consolidation:

(a) intercompany balances and intercompany transactions, including intercompany sales, intercompany charges, and intercompany dividends

(b) the cost to the parent of its investment in each subsidiary and the parent company's portion of share capital, preacquisition reserves, and preacquisition profits and losses of each subsidiary.[2]

.12 Unrealised profits resulting from intercompany transactions which are included in the carrying value of assets, such as inventories and fixed assets, are eliminated.[3] The portion of un-

---

[2] The preacquisition reserves, and preacquisition profits and losses are not eliminated under the method of accounting for business combinations described as "mergers" or "pooling of interests", which is used in some countries.

[3] In some countries intercompany profits and losses of public utilities are not eliminated to the extent that they are recognised in the determination of the rates charged to consumers in accordance with regulations determined by government authorities.

realised profits arising in the current period is charged against consolidated income after giving appropriate consideration to minority interests. However, the profits are realised profits in the accounts of the selling company and therefore may be subject to tax. Since the tax relates to income which will not be reported in the consolidated financial statements until subsequent periods, the applicable tax expense is carried forward until the profit is so reported. If intercompany transactions have resulted in assets being stated in the consolidated financial statements at an amount lower than cost to the group, then the resulting unrealised losses and any related tax effects are eliminated on consolidation unless cost cannot be recovered.

.13 At the date of acquisition the cost of a parent company's investment in a subsidiary is allocated, if possible, to the subsidiary's individual identifiable assets and liabilities on the basis of their values, and the allocated amounts serve as the basis on which the subsidiary's assets and liabilities are reported in the parent company's consolidated financial statements subsequent to the acquisition. Any difference between the cost of the parent company's investment and the parent company's share in the amounts allocated to individual identifiable assets and liabilities is shown in the consolidated balance sheet appropriately described.[4]

.14 Taxes payable by either the parent company or by subsidiaries on distribution to the parent company of the undistributed profits of subsidiaries are accrued if it is reasonable to assume that any part of those profits will eventually be distributed, by way of dividend or otherwise, and will result in a tax liability at the time of remittance. If taxes are not accrued in respect of undistributed profits, there is sometimes disclosure of the cumulative amount of the undistributed profits on which taxes have not been recognised by the parent company because of the parent company's intention and power to undertake the long-term reinvestment of those profits.

.15 It is preferable that the parent company and its subsidiaries should have a common financial reporting period. If financial statements with different reporting dates are consolidated, significant transactions or events which have occurred in the intervening period are recognised through adjustments or disclosure. If a difference exists, the dates to which the financial statements of the subsidiaries have been prepared are disclosed. The consistency principle dictates that the length of the reporting periods

[4] Not applicable to mergers or pooling of interests referred to in footnote 2.

and any difference in the balance sheet dates should be consistent from period to period.

.16 The results of operations of a subsidiary for the financial reporting period in which the subsidiary is acquired are included in the consolidated income statement only from the date of its acquisition.[5] Similarly, the results of operations are included in consolidated income in the period of disposal only to the date of disposal.

.17 The losses applicable to the minority interest in a consolidated subsidiary may exceed the minority interest in the shareholders' equity of the subsidiary. The excess and any further losses applicable to the minority interest are charged against the majority interest except to the extent that the minority interest has a binding obligation to make good the losses. If future profits are reported by the subsidiary, the majority interest is credited with all such profits until the minority's share of losses previously absorbed by the majority has been recovered.

.18 If a subsidiary has outstanding cumulative preferred shares which are held outside the group, the investor computes its share of profits or losses after adjusting for the subsidiary's preferred dividends, whether or not dividends have been declared.

Investments in Associated Companies and Unconsolidated Subsidiaries

.19 There are two principal methods of accounting for investments in associated companies and in unconsolidated subsidiaries: the "cost" method and the "equity" method.

The Cost Method

.20 Under the cost method, an investor records an investment in the shares of an investee at cost; income is recognised only to the extent that dividends are distributed from net accumulated profits of the investee arising subsequent to the date of acquisition by the investor. Dividends received in excess of such subsequent profits are considered a recovery of investment and are recorded as reductions of the cost of the investment.

The Equity Method

.21 If an investor holds an investment in an associated company, the recognition of income on the basis of dividends received may not be an adequate measure of the income earned on the investment because the receipt of dividends may bear little relationship to the performance of the investee. The application of the equity method of accounting results in more informative reporting of the net assets and income of the investor.

[5] Not applicable to mergers or pooling of interests referred to in footnote 2.

.22 Under the equity method, the carrying amount of an investment in the shares of an investee is increased or decreased to recognise the investor's share of the profits or losses of the investee after the date of acquisition. Adjustments in the carrying amount of the investment may also be necessary to account for alterations in the investor's proportionate interest in the investee as a consequence of changes in the investee's share capital. Dividends received from an investee reduce the carrying amount of the investment.

Other Considerations

.23 If an investee ceases to fall within the definition of a subsidiary but the former parent company retains the power to exercise significant influence over the investee, the investment is accounted for as an associated company. However, an investee ceases to fall within the definition of a subsidiary and does not become an associated company if the investor loses both control and the power to exercise significant influence over the investee. Also, an investee ceases to fall within the definition of an associated company if the investor loses the power to exercise significant influence over the investee. For example, loss of control and the power to exercise significant influence might occur if the investee were placed under the control of a court or if bankruptcy or insolvency proceedings were instituted against it.

.24 Under the equity method as well as under the cost method of accounting, if the value of the investment is below the carrying amount for other than a temporary period, the investor's assets are overstated unless there is appropriate recognition of the decline in value.

Application of the Equity Method

.25 Many of the procedures appropriate for the application of the equity method of accounting are similar to those which are applicable in the consolidation of investments in subsidiaries.

.26 The investor's share of profits or losses is adjusted to eliminate unrealised profits and losses included in the carrying amounts of assets acquired by either the investor or the investee through intercompany transactions, after appropriate recognition of outside interests.

.27 The most recent available financial statements are used by the investor in applying the equity method. If the investor's and the investee's financial statements do not have a common date, significant transactions or events which have occurred in the intervening period are recognised through adjustments or disclosure. If a difference exists, the dates to which the financial

statements of the investees have been prepared are disclosed. The consistency principle dictates that the length of the reporting periods and any differences in the balance sheet dates should be consistent from period to period.

.28 In order to determine in subsequent financial periods the appropriate amount of the investor's share of the investee's income to be included in the consolidated income statement, the broad concepts underlying the consolidation procedures used on the acquisition of a subsidiary are adopted on the acquisition of an associated company. The consolidation procedures to be applied on the acquisition of a subsidiary are described in paragraph .13.

.29 Taxes that would be payable on distribution to the investor of the investor's share of the undistributed profits of the investee or on the disposal of the investment are accrued when the profits are recognised by the investor since taxes can be expected to become payable upon later dividend distribution or on disposal of the investment.

.30 If an investor's share of losses of an investee equals or exceeds the carrying amount of an investment accounted for by the equity method, the investor ordinarily discontinues applying the equity method. The investment is recorded at nil value. Additional losses are then provided for only if the investor has guaranteed obligations of the investee or is otherwise committed to provide further financial support of the investee. If the investee subsequently reports net income, the investor resumes applying the equity method only after its share of that net income equals the share of net losses not recognised during the period when the equity method was suspended.

.31 If the carrying amount of an investment is written down to recognise the decline in its value, the write-down is charged to consolidated income and deducted from the carrying amount of the related investment.

.32 If an investee has outstanding cumulative preferred shares, which are held outside the group, an investor computes its share of profits or losses after adjusting for the investee's preferred dividends, whether or not the dividends have been declared.

Disclosure

.33 Consolidated financial statements show the aggregate financial position and results of operations for a group of companies. In order that users of financial statements may obtain a clear understanding of the group's affairs, it may be necessary to pro-

vide additional information showing the composition of the group and an analysis of certain balances in the financial statements. In a large diversified group it may be helpful to disclose the name, nature of business, and proportion of voting power held of each significant subsidiary and associated company. It may also be important to present an analysis of retained income as related to the parent, subsidiaries, and associated companies and to disclose any statutory or contractual restrictions on the distribution of profits because this may affect the ability of the parent company to distribute dividends. In international companies an analysis of the geographical distribution of assets and liabilities may be useful in assessing the group's exposure to exceptional risks of operating in other countries, including the risk of foreign currency exchange rate fluctuations.

INTERNATIONAL ACCOUNTING STANDARD 3

CONSOLIDATED FINANCIAL STATEMENTS

International Accounting Standard 3 comprises paragraphs .34—.52 of this Statement. The Standard should be read in the context of paragraphs .01—.33 of this Statement and of the Preface to Statements of International Accounting Standards [*section 9000*].

Consolidated Financial Statements

.34 A parent company should issue consolidated financial statements, except that it need not do so when it is a wholly-owned subsidiary.

.35 A parent company which issues consolidated financial statements should consolidate all subsidiaries, foreign and domestic, as defined in paragraph .04, other than those referred to in paragraphs .36 and .37.

.36 A subsidiary should be excluded from consolidation if:

(a) control is to be temporary, or

(b) the subsidiary operates under conditions in which severe long-term restrictions on the transfer of funds impair control by the parent company over the subsidiary's assets and operations.

.37 A subsidiary may be excluded from consolidation if its activities are so dissimilar from those of the other companies in the group that better information for the parent company shareholders and other users of the statements would be provided by presenting separate financial statements in respect of such subsidiary with the consolidated financial statements.

.38 A company in which a group does not have control, but in which a group:

(a) owns more than half the equity capital, but less than half the voting power, or

(b) has the power to control, by statute or agreement, the financial and operating policies of the management of the company, with or without more than one half of the equity interest,

may be treated as a subsidiary and consolidated in the consolidated financial statements. In such circumstances, the reasons for consolidating the company should be disclosed.

.39 Uniform accounting policies should preferably be followed by companies in the consolidated financial statements. There should be disclosure of different accounting policies used, and of the proportion of assets and liabilities to which different accounting policies have been applied if they are included in a single balance sheet classification.

The Equity Method of Accounting for Investments

.40 Investments in associated companies as defined in paragraph .04 and in subsidiaries which are not consolidated for the reasons stated in paragraph .37 should be included in the consolidated financial statements under the equity method of accounting.

.41 As from the date that

(a) a subsidiary ceases to be consolidated for the reason stated in paragraph .36(b), or

(b) an investee ceases to fall within the definition of a subsidiary and does not become an associated company, or an investee ceases to fall within the definition of an associated company,

the investment should be stated in the consolidated balance sheet at the carrying amount under the equity method at that date. From that date, the investor should discontinue accruing its share of the subsequent profits or losses of the investee.

.42 If the carrying amount of an investment dealt with under the equity method, and of investments referred to in paragraph .41, exceeds the value of the investment and that difference is other than temporary, there should be appropriate recognition of the decline in value. Provision should be made for a decline in value of each such investment; individual investments should not be aggregated for evaluation in total.

Financial Statement Presentation

.43 The minority interest in the equity of consolidated companies should be classified in the consolidated balance sheet as a separate item and should not be shown as part of shareholders' equity. The minority interest in the profits or losses of such companies should be shown separately in the consolidated income statement.

.44 Investments accounted for under the equity method of accounting should be appropriately classified in the consolidated balance sheet and the investor's share of profits or losses should be disclosed as a separate item in the consolidated income statement. If the profits or losses for the period include unusual items, the investor's share of the unusual items should be shown separately in accordance with the accounting policies applicable to the investor.

.45 A gain or loss on a sale of shares in an investee by an investor should be recognised in the consolidated income statement. The amount recognised should be the difference at the time of sale between the proceeds of sale and the carrying amount in the consolidated financial statements of the shares sold.

Disclosure

.46 The disclosure of accounting policies—see International Accounting Standard 1, Disclosure of Accounting Policies [section 9001]—should include a description of the bases on which subsidiaries and associated companies have been dealt with.

.47 The following disclosures should be made in the consolidated financial statements:

(a) An appropriate listing and description of significant subsidiaries and associated companies and, in respect of such companies, differences in reporting dates from that of the parent company, unless disclosed in statements accompanying the consolidated financial statements.

(b) The reasons for not consolidating a subsidiary.

(c) The nature of the relationship between the parent company and a company that is not a subsidiary but is treated as a subsidiary in consolidation, as described in paragraph .38.

(d) The amounts relating to any significant unadjusted transactions occurring between the dates of investors' and investees' financial statements.

(e) An analysis of the amounts under each significant balance sheet and income statement caption if necessary to provide

a fair disclosure of the exposure to exceptional risks of operating in other countries, including the risk of foreign currency exchange rate fluctuations.

(f) The extent to which there are statutory or contractual restrictions on the distribution of the accumulated retained income of the group.

.48 When a subsidiary is excluded from consolidation in accordance with paragraph .37, separate financial statements in respect of that subsidiary should supplement the consolidated financial statements. The supplementary statements may be presented in condensed form provided they give adequate disclosure, including particulars of intra-group balances and the nature of transactions with the remainder of the group. There should be a reconciliation of the amount at which the results of operations of the excluded subsidiary are stated in the supplementary financial statements, and the amount included in the consolidated income statement in respect of that subsidiary. For the purposes of this supplementary disclosure the financial statements of two or more subsidiaries with similar operations may be combined.

.49 If a subsidiary is excluded from consolidation because of the restriction described in paragraph .36(b), the following disclosures should be made with respect to such investment:

(a) the name of the investee and the group's share in the net assets of the investee,

(b) the carrying value of the investment in the consolidated financial statements,

(c) the dividends received by the group during the period,

(d) the profits or losses for the period, with unusual items separately stated, and

(e) the amounts of any write-downs or adjustments to consolidated net income in the current period.

Transitional Provisions

.50 On the first occasion that consolidated financial statements are presented, comparative figures should be shown in respect of the consolidated balance sheet but need not be shown in respect of the consolidated income statement if it is not practicable to do so. In all subsequent years full comparative figures should be shown—see International Accounting Standard 1, Disclosure of Accounting Policies [section 9001].

.51 On the first occasion of the application of the equity method, there should be disclosure of the investee's income of earlier

periods which is attributable to the investor, and of any write-down of the investment at that time to recognise a decline in its value.

Effective Date

.52 The provisions of this International Accounting Standard become operative for financial statements covering periods beginning on or after 1 January 1977.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 3 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Paragraph 39 of International Accounting Standard 3 states:

> "Uniform accounting policies should preferably be followed by companies in the consolidated financial statements. There should be disclosure of different accounting policies used, and of the proportion of assets and liabilities to which different accounting policies have been applied if they are included in a single balance sheet classification."

Generally accepted accounting principles in the U. S. do not require disclosure "of the proportion of assets and liabilities to which different accounting policies have been applied if they are included in a single balance sheet classification."

The next page is 11,107.

AC Section 9004

Depreciation Accounting

Issue date, unless otherwise indicated: October, 1976

INTRODUCTION

.01 This Statement deals with depreciation accounting and applies to all depreciable assets except:

(a) forests and similar regenerative natural resources

(b) expenditures on the exploration for and extraction of minerals, oil, natural gas and similar non-regenerative resources

(c) expenditures on research and development

(d) goodwill.

Definitions

.02 In this Statement the following terms are used with the meanings specified.

Depreciation is the allocation of the depreciable amount of an asset over its estimated useful life. Depreciation for the accounting period is charged to income either directly or indirectly.

Depreciable assets are assets which

(a) are expected to be used during more than one accounting period, and

(b) have a limited useful life, and

(c) are held by an enterprise for use in the production or supply of goods and services, for rental to others, or for administrative purposes.

Useful life is either (a) the period over which a depreciable asset is expected to be used by the enterprise; or (b) the number of production or similar units expected to be obtained from the asset by the enterprise.

Depreciable amount of a depreciable asset is its historical cost or other amount substituted for historical cost [1] in the financial statements, less the estimated residual value.

[1] This Statement does not deal with the differences which arise when revaluations are substituted for historical cost.

EXPLANATION

.03 Depreciable assets comprise a significant portion of the assets of many enterprises. Depreciation can therefore have a significant effect in determining and presenting the financial position and results of operations of those enterprises.

.04 The view is sometimes expressed that if the value of an asset has increased over the amount at which it is carried in the financial statements, it is unnecessary to provide for depreciation. It is considered, however, that depreciation should be charged in each accounting period on the basis of the depreciable amount irrespective of an increase in the value of the asset.

Useful Life

.05 Estimation of the useful life of a depreciable asset or a group of similar depreciable assets is a matter of judgment ordinarily based on experience with similar types of assets. For an asset using new technology or used in the production of a new product or in the provision of a new service with which there is little experience, estimation of the useful life is more difficult but is nevertheless required.

.06 The useful life of a depreciable asset for an enterprise may be shorter than its physical life. In addition to physical wear and tear, which depends on operational factors such as the number of shifts for which the asset is to be used and the repair and maintenance programme of the enterprise, other factors need to be taken into consideration. These include obsolescence arising from technological changes or improvements in production, obsolescence arising from a change in the market demand for the product or service output of the asset, and legal limits such as the expiry dates of related leases.

Residual Value

.07 The residual value of an asset is often insignificant and can be ignored in the calculation of the depreciable amount. If the residual value is likely to be significant, it is estimated at the date of acquisition, or the date of any subsequent revaluation of the asset, on the basis of the realisable value prevailing at that date for similar assets which have reached the end of their useful lives and have operated under conditions similar to those in which the asset will be used. The gross residual value in all cases is reduced by the expected costs of disposal at the end of the useful life of the asset.

Depreciation Methods

.08 Depreciable amounts are allocated to each accounting period during the useful life of the asset by a variety of systematic methods. Whichever method of depreciation is selected its consistent use is necessary, irrespective of the level of profitability of the enterprise and of taxation considerations, in order to provide comparability of the results of operations of the enterprise from period to period.

Land and Buildings

.09 Land normally has an indefinite useful life and is not usually regarded as a depreciable asset. However, land which does have a limited useful life for the enterprise is treated as a depreciable asset.

.10 Buildings are depreciable assets because they fall within the definition in paragraph .02.

.11 Some enterprises have not treated buildings as depreciable assets for the reason that the aggregate value of the building and the land on which it stands does not decline. As land and buildings are separate assets, recognition for accounting purposes of any increased value of the land is a different issue from the determination of the depreciable amount of the buildings.

Disclosure

.12 The selection of an allocation method and the estimation of the useful life of a depreciable asset are matters of judgment. The disclosure of the methods adopted and of the estimated useful lives or depreciation rates used provides users of financial statements with information which allows them to review the policies selected by management and enables comparisons to be made with other enterprises. For similar reasons, it is necessary to disclose the depreciable amount allocated in a period and the accumulated depreciation at the end of that period.

INTERNATIONAL ACCOUNTING STANDARD 4

DEPRECIATION ACCOUNTING

International Accounting Standard 4 comprises paragraphs .13—.19 of this Statement. The Standard should be read in the context of paragraphs .01—.12 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.13 The depreciable amount of a depreciable asset should be allocated on a systematic basis to each accounting period during the useful life of the asset.

.14 The depreciation method selected should be applied consistently from period to period unless altered circumstances justify a change. In an accounting period in which the method is changed, the effect should be quantified and disclosed and the reason for the change should be stated.

.15 The useful life of a depreciable asset should be estimated after considering the following factors:

(a) expected physical wear and tear

(b) obsolescence

(c) legal or other limits on the use of the asset.

.16 The useful lives of major depreciable assets or classes of depreciable assets should be reviewed periodically and depreciation rates adjusted for the current and future periods if expectations are significantly different from the previous estimates. The effect of the change should be disclosed in the accounting period in which the change takes place.

.17 The valuation bases used for determining the amounts at which depreciable assets are stated should be included with the disclosure of other accounting policies—see International Accounting Standard 1, Disclosure of Accounting Policies [section 9001].

.18 The following should be disclosed for each major class of depreciable asset:

(a) the depreciation methods used

(b) the useful lives or the depreciation rates used

(c) total depreciation allocated for the period

(d) the gross amount of depreciable assets and the related accumulated depreciation.

Effective Date

.19 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1977.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 4 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Paragraph 18 of International Standard 4 requires the disclosure, for each major class of depreciable asset, of certain information including "the useful lives or the depreciation rates used," "total depreciation allocated for the period," and "accumulated depreciation."

Generally accepted accounting principles in the U. S. do not require such information to be disclosed for each major class of depreciable assets. APB Opinion No. 12 [section 2043] requires disclosure of "depreciation expense for the period," but not by asset class. That Opinion also requires disclosure of "accumulated depreciation, either by major classes, of depreciable assets or in total." Disclosure of "the rates used in computing" depreciation is required by Regulation S-X but not by generally accepted accounting principles.

The next page is 11,117.

AC Section 9005

Information to Be Disclosed in Financial Statements

Issue date, unless otherwise indicated: October, 1976

INTRODUCTION

.01 This Statement deals with information to be disclosed in financial statements which include a balance sheet, an income statement, notes, and other statements and explanatory material which are identified as part of the financial statements.

.02 Financial statements are required, among other purposes, for making evaluations and financial decisions. Users cannot make reliable judgments unless the financial statements are clear and understandable. The information needed for this purpose will often extend beyond the minimum necessary to meet the requirements of local law or regulatory authorities.

.03 Certain minimum disclosures are set out in this Standard. These disclosures may be amplified by detailed disclosure requirements included in other International Accounting Standards which deal with specific accounting subjects.

.04 This Standard does not propose a particular format for the presentation of financial statements. The layout and groupings used in the Standard are based on the significant items affecting the financial statements of most industrial and commercial enterprises. A different layout and grouping may be appropriate for enterprises such as financial and insurance companies.

.05 In this Standard the definitions of parent company, subsidiary company and associated company are the same as those used in International Accounting Standard 3, Consolidated Financial Statements [section 9003].

INTERNATIONAL ACCOUNTING STANDARD 5

INFORMATION TO BE DISCLOSED IN FINANCIAL STATEMENTS

International Accounting Standard 5 comprises paragraphs .06—.19 of this Statement. The Standard should be read in the context of paragraphs .01—.05 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

General Disclosures

.06 All material information should be disclosed that is necessary to make the financial statements clear and understandable.

.07 The name of the enterprise, the country of incorporation, the balance sheet date, and the period covered by the financial statements should be stated. A brief description of the nature of the activities of the enterprise, the legal form of the enterprise, and the currency in terms of which the financial statements are expressed should be given if they are not otherwise apparent.

.08 The amounts and classifications of items should be supplemented if necessary by additional information to make their meanings clear. Significant items should not be included with, or offset against, other items, without separate identification.

.09 Financial statements should show corresponding figures for the preceding period.

Specific Disclosures—Balance Sheet

General

.10 The following disclosures should be made:

(a) Restrictions on the title to assets
(b) Security given in respect of liabilities
(c) The methods of providing for pension and retirement plans
(d) Contingent assets and contingent liabilities, quantified if possible
(e) Amounts committed for future capital expenditure.

Long-Term Assets

.11 *Property, plant and equipment*—The following items should be disclosed:

(a) Land and buildings
(b) Plant and equipment
(c) Other categories of assets, suitably identified
(d) Accumulated depreciation.

Separate disclosure should be made of leaseholds and of assets being acquired on instalment purchase plans.

.12 *Other long-term assets*—The following items should be disclosed separately, including, if applicable, the method and period of depreciation and any unusual write-offs during the period:

(a) Long-term investments
Investments in subsidiaries

Investments in associated companies

Other investments, stating the market value of listed investments, if different from the carrying amount in the financial statements

(b) Long-term receivables

Accounts and notes receivable—trade

Receivables from directors

Intercompany [1] receivables

Associated company receivables

Other

(c) Goodwill

(d) Patents, trademarks, and similar assets

(e) Expenditures carried forward, for example, preliminary expenses, reorganisation expenses, and deferred taxes.

Current Assets

.13 The following items should be disclosed separately:

(a) Cash

Cash includes cash on hand and current and other accounts with banks. Cash which is not immediately available for use, for example, balances frozen in foreign banks by exchange restrictions, should be disclosed.

(b) Marketable securities, other than long-term investments

The market value should be disclosed if different from the carrying amount in the financial statements.

(c) Receivables

Accounts and notes receivable—trade

Receivables from directors

Intercompany receivables

Associated company receivables

Other receivables and prepaid expenses

(d) Inventories

Long-Term Liabilities

.14 The following items should be disclosed separately, excluding the portion repayable within one year:

---

[1] The term "intercompany" used in this Statement refers to the presentation in the financial statements of balances or transactions between:

(a) A parent company and its subsidiaries

(b) A subsidiary and its parent company or other subsidiaries in the group.

(a) Secured loans
(b) Unsecured loans
(c) Intercompany loans
(d) Loans from associated companies.

A summary of the interest rates, repayment terms, covenants, subordinations, conversion features and amounts of unamortised premium or discount should be shown.

Current Liabilities

.15 The following items should be disclosed separately:

(a) Bank loans and overdrafts
(b) Current portions of long-term liabilities
(c) Payables
  Accounts and notes payable—trade
  Payables to directors
  Intercompany payables
  Associated company payables
  Taxes on income
  Dividends payable
  Other payables and accrued expenses

Other Liabilities and Provisions

.16 The significant items included in other liabilities and in provisions and accruals should be separately disclosed. Examples of such items are deferred taxes, deferred income and provisions for pensions.

Shareholders' Interests

.17 The following disclosures should be made separately:

(a) Share capital
  For each class of share capital:
    The number or amount of shares authorised, issued and outstanding [2]
    The par or legal value per share
    The capital not yet paid in
    The movement in share capital accounts during the period
    The rights, preferences, and restrictions with respect to the distribution of dividends and to the repayment of capital
    Cumulative preferred dividends in arrears

[2] Shares outstanding refers to shares other than those held as "treasury stock." Treasury stock are a company's shares which have been acquired by the issuing company or a consolidated subsidiary company and are legally available for reissue or resale. This practice is not permitted in some countries.

Reacquired shares

Shares reserved for future issuance under options and sales contracts, including the terms and amounts.

(b) Other equity, indicating the movement for the period and any restrictions on distribution

Capital paid in excess of par value (share premium)

Revaluation surplus

Reserves

Retained earnings.

Specific Disclosures—Income Statement

.18 The following information should be disclosed:

(a) Sales or other operating revenues
(b) Depreciation
(c) Interest income
(d) Income from investments
(e) Interest expense
(f) Taxes on income
(g) Unusual charges
(h) Unusual credits
(i) Significant intercompany transactions
(j) Net income.

Effective Date

.19 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1977.

AC Section 9006

Accounting Responses to Changing Prices

Issue date, unless otherwise indicated: June, 1977

EXPLANATION

.01 This Statement deals with accounting responses to changing prices.

Changes in the Relationships Between Prices and in the General Level of Prices

.02 Prices do not remain constant. They change over time as the result of various economic and social forces. A change in the general level of prices, as measured by a general price index, reflects changes in the general purchasing power of money. Individual prices may change significantly, independently of each other, and even during times of relative stability in the general level of prices.

.03 Most financial statements are prepared without regard either for changes in the general level of prices, or for changes in specific prices except to the extent that they are reflected in the amounts realised by sale of goods or in the net realisable value of inventories which have fallen below historical cost. The need to remedy the shortcomings of the traditional accounting approach has focused attention on (a) specific price changes and (b) changes in the general level of prices.

Specific Price Changes

.04 The specific prices of goods or other assets held by an enterprise may change while such assets are held. The expression "specific prices" includes buying prices and selling prices. These prices may change whether or not there is a significant change in the general level of prices.

.05 The questions posed by changes in specific prices include:

(a) should assets held at the balance sheet date be presented at historical cost or at a current value, and how should the changes in prices be reflected in the financial statements?

(b) for assets sold or consumed during the accounting period, how should changes in prices of those assets while they were held be dealt with in the financial statements?

.06 There are enterprises which prepare financial statements that recognise both increases and decreases in the replacement prices of assets while they are held. That practice involves the presentation of assets in the balance sheet at their current replacement prices, the recognition in owners' equity of the effects of changes in those prices, and the recognition in the income statement of current replacement prices of assets sold or used. That practice and others, including some that involve recognition of increases and decreases in selling prices of assets during the period they are held, have been advocated for adoption in place of the historical cost system.

.07 Some proposals recommend the presentation of selected financial statement items based on current prices. This may be done through the adjustment of these items within the financial statements, by the presentation of supplementary information, or by disclosure in the notes to the financial statements.

Changes in the General Level of Prices

.08 Financial statements are traditionally stated in units of money. During inflation or deflation, the value of a unit of money changes—its general purchasing power decreases (inflation) or increases (deflation). The instability of conventional units of money in terms of general purchasing power has led to questions as to whether financial statements should continue to be prepared without regard for changes in the general purchasing power of money.

.09 Proposals have been made for enterprises which issue historical cost financial statements to prepare and present supplementary financial statements in which all items are stated in terms of the general purchasing power of the unit of money at a given date. Some enterprises have adopted these proposals.

.10 Other proposals recommend that the enterprise disclose the effect of changes in the general purchasing power of money on the shareholders' net equity interest only. This disclosure is usually made as supplementary information or by way of note.

Responding to the Problem of Changing Prices

.11 Financial information intended as a response to the problem of changing prices could be prepared in a number of different ways.

.12 Financial information could be prepared in units of money using current values in place of historical costs. This financial

information would recognise changes in specific prices of assets while they are held but would not recognise inflation or deflation as such.

.13 Financial information could be prepared on the basis of historical costs but with amounts stated in terms of general purchasing power. This financial information would recognise inflation or deflation but would not recognise changes in specific prices of assets while they are held.

.14 Financial information could be prepared by combining features of each of the responses described in paragraphs .12 to .13. This financial information would recognise both changes in specific prices and the influence of inflation or deflation.

.15 There is not yet an international consensus on a single method to reflect the impact of changing prices on financial statements. Many proposals have been issued throughout the world[1] and financial statements are being prepared on the bases suggested in some of these proposals. The development and application of the proposed methods will lead to a considerable improvement in the information provided by financial statements.

.16 At this time harmonisation of the accounting methods on this subject can best be aided by increased disclosure and description of the accounting treatments adopted. It should be expected that a further International Accounting Standard will be issued on the subject of reflecting the impact of changing prices in the financial statements.

INTERNATIONAL ACCOUNTING STANDARD 6

ACCOUNTING RESPONSES TO CHANGING PRICES

International Accounting Standard 6 comprises paragraphs .17—.18 of this Statement. The Standard should be read in the context of paragraphs .01—.16 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.17 In complying with International Accounting Standard 1, Disclosure of Accounting Policies [section 9001], enterprises should present in their financial statements information that describes the procedures adopted to reflect the impact on the financial statements of specific price changes, changes in the general level of prices, or of both. If no such procedures have been adopted that fact should be disclosed.

[1] The proposals that have been issued in IASC Member countries as at 30 November 1976 are briefly described in a Discussion Paper entitled "Treatment of Changing Prices in Financial Statements: A Summary of Proposals" issued 1 March 1977. The Discussion Paper is available from the IASC Member accountancy bodies.

.18 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1978.

The next page is 11,137.

AC Section 9007

Statement of Changes in Financial Position

Issue date unless
otherwise indicated:
October, 1977

INTRODUCTION

.01 This Statement deals with the presentation of a statement which summarises for the period the resources made available to finance the activities of an enterprise and the uses to which such resources have been put. The title "Statement of Changes in Financial Position" is descriptive of a statement with that objective.[1]

EXPLANATION

.02 A statement of changes in financial position is often presented with the balance sheet and the income statement as an integral part of the financial statements. The inclusion of such a statement is useful to improve the understanding of the operations and activities of an enterprise for the reporting period.

.03 The statement of changes in financial position is prepared from financial data generally identifiable in the income statement, balance sheet and related notes. However, the statement of changes in financial position presents information which may not be readily available in a usable form in the other two statements. Sufficient information is generally given to enable the reconciliation of the amounts in the statement of changes in financial position to the related amounts in the other statements.

.04 For purposes of this Statement, the term "funds" generally refers to cash, to cash and cash equivalents, or to working capital. In a statement of changes in financial position the particular use of the term is made clear.

Funds Provided From or Used in Operations

.05 Funds provided from or used in the operations of an enterprise are normally shown separately in the statement of changes in financial position. This information indicates the extent to which an enterprise has generated funds from or used funds in its operations.

---

[1] The title "Statement of Changes in Financial Position" is used throughout this Statement; in some countries "Statement of Source and Application of Funds", or a similar title, is used.

.06 Items which do not relate to the ordinary activities of an enterprise are often presented in the income statement separately from income from the ordinary activities. This practice improves the usefulness of the financial statements. For similar reasons such items are presented separately in the statement of changes in financial position either individually or as a single amount. For the purpose of this Statement these items are referred to as "unusual items".

.07 Different forms of presentation can be used to present the amount of funds provided from or used in the operations of an enterprise. A method commonly used is to show the net income (or loss) and to make adjustments for those revenues or expenses that do not involve a movement of funds in the current period (for example, depreciation). An alternative method is to begin with revenues that provided funds during the period and deduct the costs and expenses that involve a movement of funds. The resulting amount is described as funds from operations.

.08 When unusual items are presented separately in a statement of changes in financial position, they also are adjusted to the extent that they do not involve a movement of funds in the current period.

Other Sources and Uses of Funds

.09 Other sources and uses of funds are stated separately from the funds provided from or used in the operations. These include, for example:

(a) proceeds from the sale of long-term assets
(b) outlays for the purchase of long-term assets
(c) dividends in cash or other assets
(d) issue of long-term debt
(e) redemption and repayment of long-term debt
(f) issue of shares for cash or other assets
(g) redemption or repurchase of shares for cash or other assets.

.10 Some financing transactions of an enterprise involve the exchange of one form of security for another. When such exchanges are equivalent to the issue of one security and the redemption of the other, these transactions are part of the financing and investing activities of an enterprise and are disclosed in the statement of changes in financial position. An example of such a transaction is the conversion of long-term debt to common or ordinary shares.

.11 To achieve the objective of the statement of changes in financial position, it may be necessary to disclose separately the

investment and financing aspects of each type of transaction. For example, the proceeds on disposal of long-term assets are presented separately from the outlay for acquisition of long-term assets and, when an asset is acquired through the issue of long-term debt or equity, the issue of debt or equity and the acquisition of the asset are separately disclosed.

Consolidated Statement of Changes in Financial Position

.12 If a consolidated balance sheet and a consolidated income statement are presented, a statement of changes in financial position may be presented only on a consolidated basis. Under some circumstances it may also be appropriate to present a statement of changes in financial position with respect to the financial statements of the parent company.

Investments Accounted for Using the Equity Method

.13 In the statement of changes in financial position there are two methods of dealing with income from an investee company accounted for using the equity method of accounting.

.14 The amounts included in funds provided from or used in the operations as a result of such an investment may be restricted to the dividends received or currently receivable. This method is based on the view that the unremitted earnings of such an investee company do not represent current resources available to the investor. Under this method the adjustments described in paragraph .07 include the portion of the income from the investee company that does not involve a movement of funds.

.15 Alternatively, the investor's entire share of investee earnings can be included in funds provided from or used in operations and no adjustment is required in determining funds provided from or used in the operations. Under this method, the unremitted portion of the income from the investee company is shown separately as a use of funds.

Acquisition or Disposal of Subsidiaries[3]

.16 The acquisition or disposal of subsidiaries may be presented in the statement of changes in financial position as a single amount. Alternatively, the amounts of the individual assets and liabilities acquired or disposed of may be included with the separate sources and uses of funds of each asset and liability dealt with in the statement.

.17 Under both methods of presenting the acquisition or disposal of subsidiaries the following supplementary information is presented

[3] Not applicable to business combinations described as mergers or poolings of interest.

either in the statement of changes in financial position or by way of note:

(a) the total purchase or disposal price of the subsidiary,
(b) the portion of the purchase or disposal price discharged by cash and cash equivalents,
(c) the amount of cash and other working capital items in the subsidiary acquired or disposed of,
(d) the amounts of the other assets and liabilities in the subsidiary acquired or disposed of, summarised by each major category.

Presentation

.18 Several forms of presentation are used for the statement of changes in financial position. For example, the statement may show the sources of funds as equal to the uses of funds. Another form of presentation is to show a difference between the sources and the uses of funds which represents the net increase or decrease either in cash and cash equivalents or in working capital. No particular form of presentation is preferable for all enterprises, but the enterprise selects the form of presentation considered most informative in the circumstances.

.19 When a net change in working capital is presented as a single amount in the statement of changes in financial position, additional disclosure regarding changes in individual working capital items is often presented.

INTERNATIONAL ACCOUNTING STANDARD 7

STATEMENT OF CHANGES IN FINANCIAL POSITION

International Accounting Standard 7 comprises paragraphs .20—.23 of this Statement. The Standard should be read in the context of paragraphs .01—.19 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.20 A statement of changes in financial position should be included as an integral part of the financial statements. The statement of changes in financial position should be presented for each period for which the income statement is presented.

.21 Funds provided from or used in the operations of an enterprise should be presented in the statement of changes in financial position separately from other sources or uses of funds. Unusual items which are not part of the ordinary activities of the enterprise should be separately disclosed in the statement.

.22 Each enterprise or group of enterprises should adopt the form of presentation for the statement of changes in financial position which is most informative in the circumstances.

Effective Date

.23 This International Accounting Standard becomes operative for financial statements covering reporting periods beginning on or after 1 January 1979.

The next page is 11,151.

AC Section 9008

Unusual and Prior Period Items and Changes in Accounting Policies

Issue date, unless otherwise indicated: February, 1978

INTRODUCTION

.01 International Accounting Standard 5 [section 9005], *Information to be Disclosed in Financial Statements,* requires certain specific information to be disclosed in the income statement, including the identification of an amount described as net income [1] for the period. This Statement deals with the treatment in the income statement [2] of unusual items, prior period items, and changes in accounting policies and estimates.

.02 This Statement does not deal with the treatment of revaluations in excess of historical cost or depreciated historical cost, nor does it deal with the treatment of the tax effects of unusual items, prior period items, and changes in accounting policies and estimates.

Definitions

.03 For purposes of this Statement, the following terms are used:

Unusual items are gains or losses that derive from events or transactions that are distinct from the ordinary activities of the enterprise and therefore are not expected to recur frequently or regularly.

Prior period items are charges or credits that arise in the current period as a result of errors or omissions in the preparation of the financial statements of one or more prior periods.

EXPLANATION

.04 The income statement is the principal financial statement used to present the results of operations of an enterprise for a period. Two views are commonly expressed about which items should be included in the amount described as net income for the period. They are commonly referred to as "the current operating performance concept" and "the all inclusive concept".

---

[1] Terms such as earnings or net profit may also be used; if a loss is incurred the term employed is net loss.

[2] This financial statement may also be known as a profit and loss account.

.05 Under *the current operating performance concept,* non-recurring items are excluded from reported net income. These items are shown after the determination of net income or as adjustments to retained earnings. Some consider that this approach facilitates comparisons between the current and prior periods because only items related to the recurring operations of the enterprise are included in the income statement. However, there is a danger that the importance of items excluded from reported net income may not be clearly recognised by users of the financial statements.

.06 Under *the all-inclusive concept,* transactions causing a net increase or decrease in shareholders' interests during the period, other than dividends and other transactions between the enterprise and its shareholders, are included in the net income for the period. Non-recurring items, including unusual items arising in the current period, prior period items, or adjustments related to changes in accounting policies, are included in net income but there may be separate disclosure of the individual amounts.

.07 Advocates of the all-inclusive concept claim that reporting in the income statement of items affecting the shareholders' interests during the period, other than dividends and other transactions between the enterprise and its shareholders, provides more useful information for the users of financial statements to enable them to evaluate the importance of the items and their effects on operating results. Although the all-inclusive concept is generally supported, there are circumstances in which it may be considered desirable to report certain items outside the income statement for the current period. However, unusual items are generally included in net income.

Income Attributable to Ordinary Activities

.08 Under both concepts referred to in paragraph .04, income from the ordinary activities of the enterprise generally is identified separately from unusual items. The fact that an item, otherwise typical of the ordinary activities of the enterprise, is abnormal in amount or infrequent in occurrence does not qualify the item as unusual. It remains a part of income from the ordinary activities although separate disclosure of its nature and amount may be appropriate. An example of such an item would be the write-off of a very large receivable from a regular trade customer.

Unusual Items

.09 Items described in some countries as extraordinary or special items are included within the term "unusual item" as used in this Statement. In those countries the terms extraordinary or special items have a defined meaning and a requirement

normally exists for the incorporation of a sub-total within the income statement described as "income before extraordinary (or special) items". This Statement does not set forth the specific format of the income statement. Instead it places emphasis on the separate disclosure of unusual items with an explanation of their nature.

.10 The gains or losses that may require separate disclosure as unusual items are not determined solely by the nature of the event or transaction but by the nature of the event or transaction in relation to the business ordinarily carried on by the enterprise. For example, in an enterprise which regularly trades in properties, the gains or losses arising on the sale of property would not be an unusual item.

Prior Period Items

.11 In rare circumstances, events come to light in the current financial period which show that the financial statements of one or more previous periods were prepared and presented on a wrong or inaccurate basis as a result of an error or an omission. The financial adjustments arising out of such events are referred to in this Statement as prior period items. Prior period items should not be confused with accounting estimates which are, by their nature, approximations that may need correction as additional information becomes known in subsequent periods. The charge or credit arising on the outcome of a contingency, which at the time of occurrence could not be estimated accurately, does not constitute the correction of an error but rather a change in estimate. Such an item is not treated as a prior period item.

.12 Prior period items are sometimes reported by adjusting opening retained earnings in the financial statements for the current period and amending the comparative information in respect of prior years which is included in the financial statements. Sometimes prior period items are reported as unusual items in the determination of net income for the current period. Supplementary information may be presented on a pro forma basis to show what the effect on income in prior periods would have been if the items had been reported in the period to which they relate.

.13 In order to facilitate comparisons between one period and another, amendment of the comparative information which is included in financial statements in respect of prior periods is useful to correct erroneous financial information presented in the previous financial statements. Whichever method is adopted, there is full disclosure of the amount and nature of the prior period items.

Changes in Accounting Policies

.14 A fundamental accounting assumption is that accounting policies are consistently applied—see International Accounting Standard 1 [section 9001], *Disclosure of Accounting Policies.* A change in an accounting policy used for reporting purposes is made only if the adoption of a new accounting policy is required by statute or by an accounting standard setting body, or if it is considered that the change would result in a more appropriate presentation of the financial statements of an enterprise. In all cases, it is necessary to present an explanation of the reason for a change.

.15 A change in an accounting policy can be introduced into the financial statements in different ways. The new policy may be applied:

(a) to the current and future financial statements. When practicable, supplementary information is presented on a pro forma basis to show what the effect on income in prior periods would have been if the new policy had then been in use;

(b) retroactively, as though it had always been in use. When a new policy is applied retroactively, the statements of income for all periods presented may be adjusted to reflect the new policy; or

(c) by presenting as a single item in the income statement for the current period the amount of the cumulative effect on retained earnings at the beginning of the period in which the change is made. Pro forma information is ordinarily presented to show what the effect on income of prior periods would have been if the new policy had then been in use.

Changes in Accounting Estimates

.16 The preparation of financial statements involves making estimates which are based on the circumstances existing at the time when the financial statements are prepared. For example, estimates are required of uncollectable receivables, inventory obsolescence, and the useful lives of depreciable assets. It may be necessary to revise an estimate in a subsequent period if there is a change in the circumstances on which the estimate was based. Revision of an estimate does not bring the resulting amount within the definition either of an unusual item or of a prior period item. Revision of an estimate that relates to an item that was treated as an unusual item is itself reported as unusual. A change in an accounting estimate sometimes has so material an effect on the income trend of the enterprise that there is a need to disclose the effects of the change.

.17 It is sometimes difficult to distinguish between a change in an accounting policy and a change in an accounting estimate. For example, an enterprise may change from deferring and amortising a cost to reporting it as an expense when incurred because the estimated future benefits have become uncertain. In those cases where it is difficult to draw a clear distinction, it is usual for such changes to be treated as changes in accounting estimates, with appropriate disclosure.

INTERNATIONAL ACCOUNTING STANDARD 8

UNUSUAL AND PRIOR PERIOD ITEMS AND CHANGES IN ACCOUNTING POLICIES

International Accounting Standard 8 comprises paragraphs .18—.24 of this Statement. The Standard should be read in the context of paragraphs .01—.17 of this Statement and of the Preface to Statements of International Accounting Standards [*section 9000*].

.18 Income from the ordinary activities of the enterprise during the period should be disclosed in the income statement as part of net income [3]. Unusual items should be included in net income; the nature and amount of each such item should be separately disclosed.

.19 Prior period items and the amount of the adjustments, if any, resulting from changes in accounting policies should be either:

(a) reported by adjusting opening retained earnings in the financial statements for the current period and amending the comparative information in respect of prior years which is included in the financial statements, or

(b) separately disclosed in the current income statement as part of net income.

In either case the disclosure relating to these items should be adequate to facilitate comparisons of the figures for the periods presented.

.20 A change in an accounting policy should be made only if the adoption of a different accounting policy is required by statute or by an accounting standard setting body or if it is considered that the change would result in a more appropriate presentation of the financial statements of an enterprise.

.21 If there is a change in an accounting policy that has a material effect in the current period, or may have a material effect in subsequent periods, the effect of the change should be

[3] Terms such as earnings or net profit may also be used; if a loss is incurred, the term employed is net loss.

disclosed and quantified together with the reasons for the change (see International Accounting Standard 1 [section 9001], *Disclosure of Accounting Policies*).

.22 A change in an accounting estimate should be accounted for as part of income from the ordinary activities of the enterprise in:

(a) the period of change if the change affects the period only, or

(b) the period of change and future periods if the change affects both.

Revision of an estimate that relates to an item that was treated as an unusual item should itself be reported as unusual.

.23 If there is a change in an accounting estimate that has a material effect in the current period, or may have a material effect in subsequent periods, the effect of the change should be disclosed and quantified.

Effective Date

.24 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1979.

AC Section 9009

Accounting for Research and Development Activities

Issue date, unless
otherwise indicated:
July, 1978

INTRODUCTION

.01 This Statement deals with accounting for research and development activities.

.02 The Statement does not deal with the following specialised activities:

(a) research and development activities conducted for others under a contract

(b) exploration for oil, gas and mineral deposits

(c) research and development activities of development stage enterprises.

Definitions

.03 The following terms are used in this Statement with the meanings specified:

Research is original and planned investigation undertaken with the hope of gaining new scientific or technical knowledge and understanding.

Development is the translation of research findings or other knowledge into a plan or design for the production of new or substantially improved materials, devices, products, processes, systems or services prior to the commencement of commercial production.

EXPLANATION

.04 An enterprise undertakes a programme of creative work to increase the stock of its scientific and technical knowledge and to devise new applications which will contribute to the maintenance of its business and its competitive position. The accounting treatment and disclosure of the costs of research and development activities are therefore important for users of financial statements.

The Costs of Research and Development Activities

.05 There can be practical difficulties in deciding the amounts of the costs specifically attributable to research and development activities. In order to achieve a reasonable degree of comparability between enterprises, and between accounting periods of the same enterprise, it is necessary to identify the elements comprising research and development costs.

.06 The costs incurred for research and development activities include the following:

(a) salaries, wages and other related costs of personnel

(b) the costs of materials and services consumed

(c) the depreciation of equipment and facilities

(d) a reasonable allocation of overhead costs. This allocation is made on bases similar to those used in allocating overhead costs to inventories (see International Accounting Standard 2 [section 9002], Valuation and Presentation of Inventories in the Context of the Historical Cost System)

(e) other costs, such as the amortisation of patents and licences.

.07 Costs incurred to maintain production or to promote sales of existing products are excluded from the costs of research and development activities. Thus, the costs of routine or periodic minor modifications to existing products, production lines, manufacturing processes and other ongoing operations as well as routine or promotional costs of market research activities are excluded.

.08 However, market research activities undertaken prior to the commencement of commercial production to establish the usefulness of a product or the existence of a potential market are similar to development activities. In these cases, the related costs are sometimes treated in the same way as development costs and are written off or deferred based on the same considerations.

The Accounting Treatment of Research and Development Costs

.09 The allocation of the costs of research and development activities to accounting periods is determined by their relationship to the expected future benefits to be derived from these activities. In most cases there is little, if any, direct relationship between the amount of current research and development costs and future benefits because the amount of such benefits, and the periods over which they will be received, are usually too uncertain. Research and development costs are therefore usually

charged to expense in the period in which they are incurred.

.10 If it can be demonstrated, however, that the product or process is technically and commercially feasible and that the enterprise has adequate resources to enable the product or process to be marketed, the uncertainties referred to in paragraph .09 may be significantly reduced. In such circumstances, it may be appropriate to defer the costs of development activities to future periods. Development costs previously written off are not reinstated because they were incurred at a time when the technical and commercial feasibility of the project was too uncertain to establish a relationship with future benefits and they were therefore proper charges to those past periods.

.11 Deferred development costs are amortised on a systematic basis, either by reference to the sale or use of the product or process or by reference to a reasonable time period. Technological and economic obsolescence creates uncertainties that restrict the number of units and the time period over which deferred costs are to be amortised.

Disclosure

.12 The accounting policy adopted for the costs of research and development activities is included in the statement of accounting policies (see International Accounting Standard 1 [section 9001], Disclosure of Accounting Policies). When applicable, information about amortisation practices is also required (see International Accounting Standard 5 [section 9005], Information to Be Disclosed in Financial Statements).

.13 The disclosure of (a) research and development costs, including the amortisation of deferred development costs, charged as an expense of each period, and (b) the unamortised balance, if any, of deferred development costs, enables the users of financial statements to consider the significance of such activities in relation to those of other enterprises as well as to the other activities of the enterprise itself.

.14 Further information which might usefully be provided could include a general description of the project, the stage which the project has reached, and the estimated future costs to complete it.

INTERNATIONAL ACCOUNTING STANDARD 9

ACCOUNTING FOR RESEARCH AND DEVELOPMENT ACTIVITIES

International Accounting Standard 9 comprises paragraphs .15-.25 of this Statement. The Standard should be read in the context of paragraphs .01-.14 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.15 Research and development costs should include:

(a) the salaries, wages and other related costs of personnel engaged in research and development activities

(b) the costs of materials and services consumed in research and development activities

(c) the depreciation of equipment and facilities to the extent that they are used for research and development activities

(d) overhead costs related to research and development activities,

(e) other costs related to research and development activities, such as the amortisation of patents and licences.

.16 The amount of the research and development costs described in paragraph .15 should be charged as an expense of the period in which they are incurred except to the extent that development costs are deferred in accordance with paragraph .17.

.17 Development costs of a project may be deferred to future periods if all the following criteria are satisfied:

(a) the product or process is clearly defined and the costs attributable to the product or process can be separately identified;

(b) the technical feasibility of the product or process has been demonstrated;

(c) the management of the enterprise has indicated its intention to produce and market, or use, the product or process;

(d) there is a clear indication of a future market for the product or process or, if it is to be used internally rather than sold, its usefulness to the enterprise can be demonstrated; and

(e) adequate resources exist, or are reasonably expected to be available, to complete the project and market the product or process.

.18 The deferral of development costs of a project under the criteria in paragraph .17 should be limited to the amount that, taken together with further development costs, related production costs, and selling and administrative costs directly incurred in marketing the product, can reasonably be expected to be recovered from related future revenues.

.19 If an accounting policy of deferral of development costs is adopted, it should be applied to all development projects that meet the criteria in paragraph .17.

.20 If development costs of a project are deferred, they should be allocated on a systematic basis to future accounting periods by reference either to the sale or use of the product or process or to the time period over which the product or process is expected to be sold or used.

.21 The deferred development costs of a project should be reviewed at the end of each accounting period. When the criteria of paragraph .17, which previously justified the deferral of the costs, no longer apply, the unamortised balance should be charged as an expense immediately. When the criteria for deferral continue to be met but the amount of deferred development costs (and other relevant costs as set out in paragraph .18) that can reasonably be expected to be recovered from related future revenues is exceeded by the unamortised balance of such costs, the excess should be charged as an expense immediately.

.22 Development costs once written off should not be reinstated even though the uncertainties which had led to their being written off no longer exist.

Disclosure

.23 The total of research and development costs, including amortisation of deferred development costs, charged as expense should be disclosed.

.24 The movement in and the balance of unamortised deferred development costs should be disclosed. The basis, proposed or adopted, for the amortisation of the unamortised balance should also be disclosed.

Effective Date

.25 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1980.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 9 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Paragraph 11 of Statement of Financial Accounting Standards No. 2 [section 4211.11] provides that the costs of research and development activities shall include the costs of materials, equipment, facilities, and intangibles that are acquired for a particular research and development project and have no alternative future use. Those costs are to be charged to expense when the items are acquired even if that precedes the period in which they are consumed or used.

In describing the costs of research and development activities, International Accounting Standard 9 makes no distinction between the cost of items that are acquired for a particular research and development project and have no alternative future use and the cost of other items acquired for research and development activities.

Paragraph 6 of International Accounting Standard 9 states:

> "The costs incurred for research and development activities include the following . . .
> (b) the costs of materials and services consumed
> (c) the depreciation of equipment and facilities . . .
> (e) other costs, such as the amortisation of patents and licences."

Thus, the cost of items that are acquired for a particular research and development project and have no alternative future use (in other research and development projects or otherwise) are, according to Statement of Financial Accounting Standards No. 2 [section 4211], to be expensed when the items are acquired and, according to International Accounting Standard 9, are to be expensed when the items are consumed.

AICPA ACCOUNTING INTERPRETATIONS

During the time the Accounting Principles Board was in existence, the Institute staff was authorized to issue interpretations of accounting questions having general interest to the profession. The purpose of the interpretations was to provide guidance on a timely basis without the formal procedures required for an APB Opinion and to clarify points on which past practice may have varied and been considered generally accepted. These interpretations, which were reviewed with informed members of the profession, were not pronouncements of the Board and did not establish standards enforceable under the Institute's Code of Professional Ethics. Responsibility for their preparation rested with RICHARD C. LYTLE, *at that time administrative director of the Accounting Principles Board. Unless otherwise stated, the interpretations were not intended to be retroactive.*

AC Section U1051

Accounting Changes: Accounting Interpretations of Section 1051

1. Changing EPS Denominator for Retroactive Adjustment to Prior Period

.001 *Question*—Section 1051.27 specifies that certain accounting changes should be reported by retroactively restating all prior periods presented. Section 1051.28 requires that the effect of these changes on the prior periods' earnings per share amounts be disclosed. The anti-dilution prohibitions of sections 2011.30 and 2011.40 require the exclusion from earnings per share computations of securities whose conversion, exercise, or other contingent issuance would have the effect of increasing the earnings per share amount or decreasing the loss per share amount. If these securities were originally included in the earnings per share computation in a prior period but would have been excluded if the retroactively restated amount had been reported in the prior period, should the securities be included or excluded when computing the restated earnings per share amount?

.002 *Interpretation*—A retroactively restated earnings per share amount should always be computed as if the restated income or loss had been originally reported in the prior period. Common stock assumed to be issued for exercise, conversion, etc., and included in the original earnings per share denominator should, therefore, in circumstances such as those described below be excluded from the denominator in computing the restated earnings per share amount.

.003 For example, assume that a corporation which reported $200,000 net income in the immediately preceding year changes its method of accounting for long-term construction-type contracts from the completed contract method to the percentage of completion method. In applying this change retroactively (see section 1051.27), the net income originally reported for the immediately preceding year is decreased $290,000 and restated as a net loss of

$90,000. Further assume that in the prior year the corporation had 900,000 shares of common stock and 150,000 warrants outstanding for the entire year. Each warrant could be exercised to purchase one share of common stock for $10 while the market price of common was $30 throughout the year. Earnings per share were originally reported as $.20 based on $200,000 net income divided by a denominator of 1,000,000 common shares (900,000 shares outstanding plus 100,000 shares for warrants computed under the treasury stock method). The assumption of exercise of warrants is anti-dilutive when there is a loss, so the restated amount would be reported as a net loss of $.10 per share based on $90,000 net loss divided by a denominator of 900,000 common shares outstanding.

.004 Note that retroactive restatement could also cause securities originally determined to be anti-dilutive to become dilutive. For example, assume the same facts as given in the preceding illustration except a $90,000 net loss was originally reported and is restated as $200,000 net income. Exercise of the warrants would not have been assumed in the original per share computation because the result would have been anti-dilutive but would be assumed in computing the restated earnings per share because the result is dilutive.

.005 Retroactive restatement may also cause the earnings per share numerator to change by an amount different from the amount of the retroactive adjustment. For example, assume that a corporation changes from the LIFO method of inventory pricing to the FIFO method, retroactively increasing net income for the immediately preceding year by $400,000 (see section 1051.27). Further assume that the corporation originally reported a net income of $800,000 in the prior year and had 800,000 shares of common stock outstanding. In addition, 200,000 shares of preferred stock were outstanding which were convertible into common stock on a one-for-one basis. The preferred stock is a common stock equivalent and paid a dividend of $1 per share. Earnings per share were originally reported as $.75 based on an earnings per share numerator of $600,000 ($800,000 net income less $200,000 preferred dividends) and a denominator of 800,000 common shares. The assumption

 © 1974, American Institute of Certified Public Accountants, Inc.

of conversion in the original computation would have been anti-dilutive. Restated net income is $1,200,000 and restated earnings per share is $1.20 based on a numerator of $1,200,000 and a denominator of 1,000,000 shares (800,000 common shares outstanding plus 200,000 common shares for the assumed conversion of preferred stock). Although restatement increased net income and, therefore, the earnings per share numerator $400,000 in this case, the assumed conversion of the preferred stock increased the earnings per share numerator by another $200,000.

.006 In addition to a retroactive adjustment for a change in accounting principle under section 1051.27, the guidelines given above in this Interpretation apply to (a) retroactive restatement under section 1051.29-.30, (b) restatement of prior periods for a change in the reporting entity as described in section 1051.34-.35, (c) the correction of an error in previously issued financial statements as described in section 1051.36-.37, and (d) a prior period adjustment as described in sections 2010.17, 2014.11 and 2014.13-.14. These guidelines will likewise apply whenever an APB Opinion requires that it be applied retroactively, including Opinions which may be issued in the future.

.007 Also, these guidelines should be applied in computing the pro forma earnings per share amounts for the types of changes in accounting principle described in section 1051.19. Although these types of changes in accounting principle are not applied retroactively, sections 1051.19d and 1051.21 require that the pro forma effects of retroactive application be disclosed.

.008 A change in the earnings per share denominator (and perhaps numerator) from that originally used in the computation may create certain complications in reporting the effect of a retroactive change. These complications may be illustrated by considering the data in the table below, for the examples presented earlier in this Interpretation.

	Warrant Example	Convertible Preferred Stock Example
Net income as previously reported	$ 200,000	$ 800,000
Adjustment for retroactive change	(290,000)	400,000
Net income (loss) as adjusted	$ (90,000)	$1,200,000
Earnings per share amounts:		
As previously reported	$ .20[a]	$ .75[c]
Effect of retroactive change	(.30)	.45
As adjusted	$(.10)[b]	$1.20[d]

Computational Notes:

(a) $200,000 ÷ (900,000 + 100,000) shares

(b) $90,000 ÷ 900,000 shares

(c) ($800,000 — $200,000) ÷ 800,000 shares

(d) $1,200,000 ÷ (800,000 + 200,000) shares

.009 In both of the above examples, the earnings per share amounts shown for "effect of retroactive change" are computed by subtracting the previously reported amounts from the adjusted amounts. Determining the per share amount of the change by subtraction comprehends the effects of any necessary changes in the denominator and the numerator by reason of retroactive application.

[Issue Date: March, 1973]

2. EPS for "Catch-up" Adjustment

.010 *Question*—Section 1051.20 requires the per share amount of the cumulative effect of most accounting changes (see sections 1051.18 and 1051.19) to be shown on the face of the income statement similar to the manner in which an extraordinary item would be shown. Footnote 10, section 2011.30, giving an exception to the anti-dilution prohibition in primary earnings per share computations, states that: The presence of a common stock equivalent or other dilutive securities together with income from continuing operations and extraordinary items may result in diluting one of the per share amounts which are required to be disclosed on

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

the face of the income statement—i.e., income from continuing operations, income before extraordinary items and before the cumulative effect of accounting changes, if any, and net income—while increasing another. In such a case, the common stock equivalent or other dilutive securities should be recognized for all computations even though they have an anti-dilutive effect on one of the per share amounts. Footnote 16, section 2011.40, gives a similar reference for fully diluted computations. How does reporting the cumulative effect of an accounting change in a manner similar to an extraordinary item affect the application of these two footnotes in computing earnings per share?

.011 *Interpretation*—The cumulative effect of an accounting change (sometimes referred to as a "catch-up" adjustment) is considered the same as an extraordinary item, whether or not extraordinary items are present, in computing earnings per share. Therefore, a common stock equivalent which has a dilutive effect on the primary earnings per share computation for (a) income from continuing operations, if discontinued operations are reported, or (b) income before extraordinary items (if any) and the cumulative effect of a change in accounting principle or (c) net income should be recognized in all computations of primary earnings per share for the period. Likewise, a common stock equivalent or other potentially dilutive security which has a dilutive effect on the fully diluted earnings per share computation for either (a) income from continuing operations, if discontinued operations are reported, or (b) income before extraordinary items (if any) and cumulative effect of a change in accounting principle or (c) net income should be recognized in all computations of fully diluted earnings per share for the period. Note that, under these exceptions to the anti-dilution prohibitions of section 2011, a common stock equivalent or other potentially dilutive security may have an anti-dilutive effect on "a", "b" or "c" but not on all. The per share amount of an extraordinary item or a "catch-up" adjustment is always computed by using the same denominator used to compute the other earnings per share amounts. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

.012 However, the exceptions to the anti-dilution prohibitions do not permit an assumed exercise, conversion,

etc., to cause fully diluted net income (loss) per share to be anti-dilutive in relation to primary net income (loss) per share. That is, the assumed exercise, conversion, etc., of a security may have an anti-dilutive effect within primary earnings per share or within fully diluted earnings per share, but the assumed exercise, conversion, etc., should not have the effect of increasing (decreasing) the fully diluted net income (loss) per share amount to more (less) than the primary net income (loss) per share amount. (See footnote 5, section U2011.016, *Computing Earnings per Share.*)

.013 Although the "catch-up" adjustment is considered the same as an extraordinary item in computing earnings per share, the earnings per share reporting requirement for the two items is different. Section 2011 does not require that per share amounts be reported for extraordinary items, although this presentation may generally be desirable (see Interpretation 16, section U2011.084-.086, *Computing Earnings per Share*). Section 1051.20 does require per share data for a "catch-up" adjustment to be shown on the face of the income statement. Preferably, when both an extraordinary item and a "catch-up" adjustment are reflected in net income for a period, per share data for both should be presented on the face of the income statement.

AC Section U1091

Accounting for Business Combinations: Accounting Interpretations of Section 1091

1. Ratio of Exchange

.001 *Question*—Section 1091.46a defines the initiation date for a business combination as the earlier of (1) the date the major terms of a plan, including the ratio of exchange of stock, are announced publicly or otherwise formally made known to the stockholders of any one of the combining companies or (2) the date that stockholders of a combining company are notified in writing of an exchange offer. Does the announcement of a formula by which the ratio of exchange will be determined in the future constitute the initiation of a plan of combination?

.002 *Interpretation*—Yes, the actual exchange ratio (1 for 1, 2 for 1, etc.) need not be known to constitute initiation of a business combination so long as the ratio of exchange is absolutely determinable by objective means in the future. A formula would usually provide such a determination.

.003 A formula to determine the exchange ratio might include factors such as earnings for some period of time, market prices of stock at a particular date, average market prices for some period of time, appraised valuations, etc. The formula may include upper and/or lower limits for the exchange ratio and the limits may provide for adjustments based upon appraised valuations, audit of the financial statements, etc. Also, the formula must be announced or communicated to stockholders as specified by section 1091.46a to constitute initiation.

.004 If a formula is used after October 31, 1970 to initiate a business combination which is intended to be accounted for by the pooling of interests method, the actual exchange ratio would have to be determined by the consummation date and therefore no later than one year after the initiation date to meet the conditions of section 1091.47a.

Also, changing the terms after October 31, 1970 of a formula used to initiate a business combination before November 1, 1970 would constitute the initiation of a new plan of combination (see section 1091.47, footnote 6).

[Issue Date: December, 1970.]

2. Notification to Stockholders

.005 *Question*—Section 1091.46a specifies that a business combination is initiated on the earlier of (1) the date major terms of a plan are formally announced or (2) the date that stockholders of *a* combining company are notified in writing of *an* exchange offer. Does communication in writing to a corporation's own stockholders that the corporation plans a future exchange offer to another company without disclosure of the terms constitute initiation of a business combination?

.006 *Interpretation*—No. Section 1091.46a defines "initiation" in terms of two dates. The first date is for the announcement of an exchange offer negotiated between representatives of two (or more) corporations. The second date is for a tender offer made by a corporation directly or by newspaper advertisement to the stockholders of another company. It is implicit in the circumstances of a tender offer that the plan is not initiated until the stockholders of the other company have been informed as to the offer and its major terms, including the ratio of exchange.

.007 Therefore, in the second date specified for initiation in section 1091.46a, "*a* combining company" refers to the company whose stockholders will tender their shares to the issuing corporation. "*An* exchange offer" means the major terms of a plan including the ratio of exchange (or a formula to objectively determine the ratio).

.008 A corporation may communicate to its own stockholders its intent to make a tender offer or to negotiate on the terms of a proposed business combination with another company. However, intent to tender or to negotiate does not constitute "initiation." A business combination is not initiated until the major terms are "set" and announced publicly or formally communicated to stockholders.

[Issue Date: December, 1970.]

© 1974, American Institute of Certified Public Accountants, Inc.

3. Intercorporate Investment Exceeding 10 Per Cent Limit

.009 *Question*—Section 1091.46b (the "independence" condition) states that the pooling of interests method of accounting for a business combination may not be applied if *at* the dates the plan of combination is initiated and consummated the combining companies hold as intercorporate investments more than 10 per cent in total of the outstanding voting common stock of any combining company. Would an intercorporate investment of 10 per cent or less *at* the initiation and consummation dates but exceeding 10 per cent *between* these dates (for example, through a cash purchase and subsequent sale of the voting common stock of a combining company) prohibit accounting for a business combination under the pooling of interests method?

.010 *Interpretation*—Section 1091.46b would not be met if *between* the initiation and consummation dates combining companies hold as intercorporate investments more than 10 per cent of the outstanding voting common stock of any combining company even though the intercorporate investments do not exceed 10 per cent *at* either the initiation or consummation date. Although the section mentions only the initiation and consummation dates, intercorporate investments exceeding 10 per cent in the interim would violate the spirit of the independence condition and the business combination would be an acquisition accounted for under the purchase method. For the 10 per cent computation, however, intercorporate investments exclude voting common stock that is acquired after the date the plan of combination is initiated in exchange for the voting common stock issued to effect the combination.

[Issue Date: December, 1970.]

4. Consummation Date for a Business Combination

.011 *Question*—Sections 1091.46-.48 specify certain conditions which require a business combination to be accounted for by the pooling of interests method. Among these conditions in sections 1091.46b and 1091.47b are quantitative measurements which are to be made on the consummation date. When does the "consummation date" occur for a business combination?

.012 *Interpretation*—A plan of combination is consummated on the date the combination is completed, that is,

the date assets are transferred to the issuing corporation. The quantitative measurements specified in sections 1091.46b and 1091.47b are, therefore, made on the date the combination is completed. If they and all of the other conditions specified in sections 1091.46-.48 are met on that date, the combination must be accounted for by the pooling of interests method.

.013 It should not be overlooked that section 1091.47a states the plan of combination must be *completed* in accordance with a specific plan within one year after it is initiated unless delay is beyond the control of the combining companies as described in that paragraph. Therefore, ownership of the issuing corporation's common stock must pass to combining stockholders and assets must be transferred from the combining company to the issuing corporation within one year after the initiation date (unless the described delay exists) if the business combination is to be accounted for by the pooling of interests method. Physical transfer of stock certificates need not be accomplished on the consummation date so long as the transfer is in process.

.014 If any of the conditions specified in sections 1091.46-.48 are not met, a business combination is an acquisition which must be accounted for by the purchase method. Section 1091.93 specifies that the date of acquisition should ordinarily be the date assets are received and other assets are given or securities are issued, that is, the consummation date. However, this paragraph allows the parties for convenience to designate the end of an accounting period falling between the initiation and consummation dates as the effective date for the combination.

.015 The designated effective date is not a substitute for the consummation date in determining whether the purchase or pooling of interests method of accounting applies to the combination. In designating an effective date as some date prior to the consummation date, the parties would automatically be anticipating that the business combination would be accounted for as a purchase since sections 1091.51 and 1091.61 specify that a business combination accounted for by the pooling of interests method must be recorded as of the date the combination is consummated.

[Issue Date: December, 1970.]

 © 1974, American Institute of Certified Public Accountants, Inc.

5. Pooling Not Completed Within One Year

.016 *Question*—Section 1091.47a specifies that a condition for a business combination to be accounted for by the pooling of interests method is for the combination to be completed in accordance with a specific plan within one year after the plan is initiated unless delay is beyond the control of the combining companies. This paragraph also indicates that new terms may be offered if earlier exchanges of stock are adjusted to the new terms. If completion of a business combination is delayed beyond one year, would the offering of new terms during the delay period meet the condition of paragraph .47-a for a business combination to be accounted for by the pooling of interests method?

.017 *Interpretation*—New terms may be offered under the conditions of paragraph .47-a more than one year after the initiation date if delay in completion is beyond the control of the combining companies because of certain circumstances and earlier exchanges of stock are adjusted to the new terms (but see section 1091.47, footnote 6 for plans in effect on October 31, 1970). However, the only delays permitted under paragraph .47-a are proceedings of a governmental authority and litigation.

.018 Proceedings of a governmental authority for this purpose include deliberations by a federal or state regulatory agency on whether to approve or disapprove a combination where the combination cannot be effected without approval. They do *not* include registration of the securities with the SEC or a state securities commission. Litigation for this purpose means, for example, an antitrust suit filed by the Justice Department or a suit filed by a dissenting minority stockholder to prohibit a combination.

[Issue Date: December, 1970.]

6. Registered Stock Exchanged for Restricted Stock

.019 *Question*—The pooling of interests method of accounting for a business combination is required by section 1091 if the conditions specified in paragraphs .46 through .48 are met showing that stockholder groups have combined their rights and risks. Would the exchange of unrestricted voting common stock of the issuing corporation for the shares owned by a substantial common stockholder of a combining company whose stock was restricted as to voting

or public sale indicate the conditions were not met if the stock issued could be sold immediately?

.020 *Interpretation*—Stockholder groups have combined their rights and risks so long as stockholders holding substantially all classes of the voting common stock in the combining company receive shares of the majority class of voting common stock of the issuing corporation exactly in proportion to their relative voting common stock interest before the combination was effected. The fact that unrestricted voting common stock is exchanged for stock previously held in a voting trust would not negate accounting for a business combination by the pooling of interests method. Likewise, the fact that "registered" voting common stock of the issuing corporation is exchanged for "restricted" voting common stock of the combining corporation also would not negate accounting for a business combination by the pooling of interests method.

[Issue Date: December, 1970.]

7. Pooling Under "Old Rules"

.021 *Question*—Section 1091.97 states that business combinations initiated before November 1, 1970 and consummated on or after that date under the terms prevailing on October 31, 1970 may be accounted for in accordance with section 1091 *or* the applicable previous pronouncements of the Board or its predecessor committee. Paragraph .97 also contains a reference to paragraph .47-a which, among other things, states that a combination must be completed within one year after the plan is initiated to be accounted for by the pooling of interests method. Does this mean a business combination initiated before November 1, 1970 must be consummated within one year after it was initiated to be accounted for as a pooling of interests under the "old rules"?

.022 *Interpretation*—No, a business combination initiated before November 1, 1970 need only be consummated under the terms in effect on October 31, 1970 to be accounted for under the "old rules." There is no time limit for consummating the combination.

.023 The reference to paragraph .47-a is intended to call attention to the discussion of a change in terms in that

 © 1974, American Institute of Certified Public Accountants, Inc.

paragraph and to footnote 6 which specifies that an adjustment after October 31, 1970 in the terms of exchange in effect on October 31, 1970 always constitutes initiation of a new plan. A new plan of combination, naturally, would be subject to the provisions of section 1091.

.024 To require a business combination initiated before November 1, 1970 to be consummated within one year after initiation would be retroactive application of section 1091. For example, a business combination initiated on December 31, 1969 would need to be consummated no later than December 31, 1970 if the section were retroactive. The section was not intended to be retroactive and retroactive application is in fact prohibited by paragraph .98 for business combinations consummated before November 1, 1970.

[Issue Date: December, 1970.]

8. Applying Purchase Accounting

.025 *Question*—Section 1091 clearly applies when one corporation obtains at least 90 per cent of the voting common stock of another corporation, whether through a purchase or a pooling of interests. Does the section also apply when one corporation acquires less than 90 per cent of the voting common stock of another corporation?

.026 *Interpretation*—Section 1091 discusses a 90 per cent "cutoff" (paragraph .47-b) only as one of the conditions to be met to account for a business combination by the pooling of interests method. If this condition—or any other condition in paragraphs .46 through .48—is not met, a business combination must be accounted for by the purchase method.

.027 The section does not create new rules for purchase accounting. The purchase section (paragraphs .66 through .96) merely discusses valuation techniques in much greater detail than is given in prior APB Opinions and Accounting Research Bulletins. Thus, section 1091 provides more guidance for the application of purchase accounting, whether the item purchased is an entire company, a major portion of the stock of a company or a manufacturing plant and regardless of whether the consideration given is cash, other assets, debt, common or preferred stock or a combination of these.

.028 An investment by a corporation in the voting common stock of another company which does not meet the 90 per cent condition must be accounted for as a purchase. The purchase method of accounting applies even though the investment is acquired through an exchange of the voting common stock of the companies.

.029 The acquisition by a corporation of voting control over another corporation creates a parent-subsidiary relationship. Generally, domestic subsidiaries either are consolidated or are included in consolidated financial statements under the equity method of accounting (see sections 5131 and 2051).

.030 Since a controlling interest is usually considered to be more than 50 per cent of the outstanding voting stock in another corporation, the fair value of the assets and liabilities of the subsidiary would be determined when control is acquired if the resulting subsidiary is either consolidated in the financial statements or included under the equity method of accounting. Also, section 5141 specifies the appropriate accounting for intangible assets, if any, recognized for these cases.

.031 In addition, the subsequent acquisition of some or all of the stock held by minority stockholders of a subsidiary is accounted for by the purchase method (see sections 1091.05 and 1091.43). Thus, after a business combination has been completed or a controlling interest in a subsidiary has been obtained, the acquisition of some or all of the remaining minority interest is accounted for by the purchase method. The purchase method applies even though the minority interest is acquired through an exchange of common stock for common stock, including the acquisition of a minority interest remaining after the completion of a business combination accounted for by the pooling of interests method.

[Issue Date: April, 1971.]

9. "Two-Year" Provisions at Effective Date

.032 *Question*—Sections 1091.46a and 1091.47c specify conditions to be met for two years prior to the initiation of a business combination which is to be accounted for by the pooling of interests method. Since the section applies to combinations initiated after October 31, 1970, must the con-

 © 1974, American Institute of Certified Public Accountants, Inc.

ditions of paragraph .46-a (each company is autonomous) and paragraph .47-c (no changes in equity interests) be met for a combination initiated in November 1970 to be accounted for by the pooling of interests method?

.033 *Interpretation*—No, a corporation which has had a change in the equity interest in its voting common stock or which was a division that was spun-off as a separate corporation prior to November 1, 1970 could be a party to a business combination initiated on or after that date and meet the conditions for accounting by the pooling of interests method without regard to the two-year period.

[Issue Date: April, 1971.]

10. Effect of Termination

.034 *Question*—Section 1091.46a defines the initiation of a plan of combination as the date the major terms of an exchange offer are announced publicly or communicated to stockholders even though the plan is still subject to approval of stockholders and others. What is the effect of termination of a plan of combination prior to approval by stockholders and the subsequent resumption of negotiations between the parties?

.035 *Interpretation*—Paragraph .47-a specifies that a combination must be completed in accordance with *a specific plan*. Therefore, if negotiations are formally terminated after a plan has been initiated (as defined in paragraph .46-a), the subsequent resumption of negotiations always constitutes a new plan. Formal announcement of the major terms of the new plan constitutes a new initiation, even if the terms are the same as the terms of the old plan. Any shares of stock exchanged under the old plan become subject to the conditions of paragraphs .46-b and .47-b (the 10 per cent and 90 per cent tests) upon initiation of the new plan.

[Issue Date: April, 1971.]

11. Use of Restricted Stock to Effect a Business Combination

.036 *Question*—Section 1091.47b states as a condition for accounting for a business combination by the pooling of interests method that a corporation may issue only common stock with rights *identical* to those of the majority of its outstanding voting common stock in exchange for the voting

common stock of another company. Would restrictions on the sale of the shares of common stock issued result in different rights for these shares?

.037 *Interpretation*—The "rights" pertinent to paragraph .47-b are those involving relationships between stockholders and the corporation rather than between the stockholders and other parties. The "rights" therefore pertain to voting, dividends, liquidation, etc., and not necessarily to a stockholder's right to sell stock. Restrictions imposed on the sale of the stock to the public in compliance with governmental regulations do not ordinarily cause the "rights" to be different, but other restrictions may create different rights.

.038 For example, voting common stock issued by a publicly held corporation to effect a business combination may be restricted as to public sale until a registration with the SEC or a state securities commission becomes effective. If a registration were in process or the issuing corporation agreed to register the stock subsequent to the combination, the rights of the stock would not be different because of the restriction.

.039 However, a restriction imposed by the issuing corporation upon the sale of the stock in the absence of a governmental regulation would probably create different rights between previously outstanding and newly issued stock. Such a restriction might also indicate the previously separate stockholder groups would not be sharing the same risks in the business combination (see paragraph .45 and introductory statements in paragraphs .46 and .47). Likewise, a restriction upon the sale of the stock to anyone other than the issuing corporation or an affiliate would not meet the "absence of planned transactions" condition specified in paragraph .48-a.

[Issue Date: April, 1971.]

12. Warrants May Defeat Pooling

.040 *Question*—May a business combination be accounted for by the pooling of interests method if the issuing corporation exchanges voting common stock *and* warrants for the voting common stock of a combining company?

.041 *Interpretation*—Section 1091.47b specifies that in a business combination accounted for by the pooling of

 Copyright © 1976, American Institute of Certified Public Accountants, Inc.

interests method a corporation may issue *only* common stock in exchange for at least 90 per cent of the common stock of another company. Therefore, a *pro rata* distribution of warrants of the issuing corporation to all stockholders of a combining company would not meet this condition and the business combination would be accounted for as a purchase.

.042 In some cases, however, warrants may be used in a business combination accounted for by the pooling of interests method. Warrants (as well as cash or debt) could be used, for example, to acquire up to 10 per cent of the common stock of a combining company under paragraph .47-b and the combination could still qualify as a "pooling" so long as the common stock acquired plus other intercorporate investments plus any remaining minority interest would allow the 90 per cent test to be met.

.043 Warrants may be issued in exchange for the combining company's outstanding preferred stock or debt.

.044 The issuing corporation may exchange its warrants for the combining company's outstanding warrants. Any warrants issued could not provide for the purchase of a greater number of shares than could be obtained if the warrants were exercised. For example, if the issuing corporation will exchange three of its common shares for each of the combining company's common shares outstanding and the combining company has warrants outstanding allowing the holders to purchase two common shares per warrant, each warrant issued in exchange for the outstanding warrants could provide for the purchase of no more than six of the issuing corporation's common shares. (It should be noted that warrants issued by either company in contemplation of effecting the combination might not meet the conditions of paragraph .47-c.)

[Issue Date: April, 1971.]

13. Two-Class Common for Pooling

.045 *Question*—Section 1091.47b specifies that a corporation must issue common stock "with rights identical to those of the majority class of its outstanding voting common stock" in a business combination which is to be accounted for by the pooling of interests method. Could the

common stock issued be designated as a class of stock different from majority class (for example, Class A if the majority class has no class designation) and meet this condition?

.046 *Interpretation*—Paragraph .47-b does not prohibit designating the common stock issued as a different class if it has *rights identical* to those of the majority class of outstanding voting common stock. Thus, the different class must have the same voting, dividend, liquidation, preemptive, etc., rights as the majority class with the stipulation that these rights cannot be changed unless a corresponding change is made in the rights of the majority class.

.047 Issuing a different class of common stock with rights identical to other common stock would generally serve no useful purpose. It would be suspected that the parties might have secretly agreed that they would in the future change the rights of the different class to restrict voting; grant a preference in liquidation; or increase, guarantee or limit dividends.

[Issue Date: April, 1971.]

14. Contingent Shares Defeat Pooling

.048 *Question*—Section 1091.47g specifies that in a business combination to be accounted for by the pooling of interests method a corporation may not (1) agree to issue additional shares of stock at a later date or (2) issue to an escrow agent shares which will later be transferred to stockholders or returned to the corporation. Would this condition be met if the corporation issued some maximum number of shares to stockholders of the combining company under an agreement that part of the shares would be returned if future earnings are below a certain amount or the future market price of the stock is above a stipulated price?

.049 *Interpretation*—No, contingent shares based on earnings, market prices and the like require a business combination to be accounted for as a purchase. Paragraph .47-g states that the combination must be "resolved at the date the plan is consummated."

The only contingent arrangement permitted under paragraph .47-g is for settlement of a contingency pending at consummation, such as the later settlement of a lawsuit. A contingent arrangement would also be permitted for an

 © 1974, American Institute of Certified Public Accountants, Inc.

additional income tax liability resulting from the examination of "open" income tax returns.

[Issue Date: April, 1971.]

15. Paragraph .99 Is Not Mandatory

.050 *Question*—Section 1091 requires business combinations meeting the conditions of paragraphs .46 through .48 to be accounted for by the pooling of interests method and all other business combinations to be accounted for by the purchase method. However, paragraph .99 provides a "grandfather clause" permitting certain exceptions to the pooling conditions for business combinations which meet the conditions of that paragraph. Under paragraph .99 the accounting treatment is: (1) the excess of cost of the investment in common stock acquired prior to November 1, 1970 over equity in net assets when the stock investment was acquired is allocated to identifiable assets and goodwill regardless of the percentage of ownership on October 31, 1970 and (2) the pooling of interests method is applied for the common stock issued in the combination if the combination meets the conditions for accounting by the pooling of interests method. That is, the combination is accounted for as a "part-purchase, part-pooling." Is the application of paragraph .99 mandatory for a busines combination meeting the conditions of that paragraph?

.051 *Interpretation*—No, the accounting described in paragraph .99 is an election available to an issuing corporation to apply the pooling of interests method to account for a business combination not otherwise meeting the conditions of paragraphs .46-b and .47-b. Paragraph .99 specifies "the resulting business combination *may* [emphasis added] be accounted for by the pooling of interests method provided. . . ."

.052 Paragraph .99 applies only for intercorporate investments held at October 31, 1970. The provision was inserted to avoid retroactivity by allowing pooling of interest accounting for a combination that would not have met the conditions of paragraphs .46-b and .47-b because an intercorporate investment held at October 31, 1970 then was near or exceeded 10 per cent of the outstanding voting common stock of the combining company. [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

.053 A business combination meeting all of the conditions of paragraphs .46 through .48 as well as the conditions of paragraph .99 would be accounted for by the pooling of interests method. Paragraph .99 would not apply and the intercorporate investment would be accounted for as described in paragraph .55. A business combination meeting the conditions of paragraph .99 but not otherwise meeting the conditions of paragraphs .46-b and .47-b may either be accounted for as a "part-purchase, part-pooling" as described in paragraph .99 or as a purchase.

[Issue Date: April, 1971.]

16. Changes in Intercorporate Investments

.054 *Question*—How do sales of investments in another corporation's voting common stock owned at October 31, 1970 and acquisitions of additional investments of the same class of stock after that date affect computations under the "grandfather clause" in section 1091.99?

.055 *Interpretation*—Sales after October 31, 1970 of investments in another corporation's voting common stock which was owned at that date are always considered as reductions of the common stock to which the "grandfather clause" in paragraph .99 applies, in other words, on a first-in, first-out basis. This reduction is made even though the common stock sold is identified as having been acquired after October 31, 1970.

.056 The "grandfather clause" in paragraph .99 does not apply to acquisitions after October 31, 1970 of voting common stock of the same class as was owned at that date. Any stock so acquired is therefore subject to the conditions of paragraphs .46-b and .47-b.

[Issue Date: April, 1971.]

17. Intercorporate Investment at 10/31/70

.057 *Question*—Section 1091.99 contains a "grandfather clause" which exempts minority interests held on October 31, 1970 from certain provisions of the section in business combinations initiated after that date. The paragraph is written in terms of an intercorporate investment owned by the corporation which effects the combination by issuing voting common stock. Does this paragraph also apply to stock of the issuing corporation which is owned by the other combining company on October 31, 1970? [As amended,

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

.058 *Interpretation*—Paragraph .99 was intended to exempt intercorporate investments owned on October 31, 1970 by all of the parties to the business combination in the circumstances described. Thus, stock of the issuing corporation which is owned by the other combining company on October 31, 1970 may be ignored in computing the 90 per cent condition described in paragraph .47-b.

.059 For example, assume that on October 31, 1970 Baker Company owned 500,000 of the 3,000,000 shares of the voting common stock of Adam Corporation. Subsequently, Adam Corporation initiated a business combination by offering the stockholders of Baker Company one share of Adam common for each share of Baker common outstanding. The combination was consummated in a single transaction within one year after initiation. Of the 1,000,000 Baker common shares outstanding at initiation and consummation, 950,000 shares were tendered to Adam Corporation. Assume also that the combination meets all of the conditions of paragraphs .46 through .48 to be accounted for by the pooling of interests method except the conditions of paragraph .46-b (no more than 10 per cent intercorporate investments) and paragraph .47-b (the 90 per cent condition). [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

.060 Under paragraph .99 as interpreted here, the business combination may be accounted for by the pooling of interests method since the 500,000 Adam shares owned by Baker Company need not be considered in applying the conditions of paragraphs .46-b and .47-b. Under the pooling of interests method, the 500,000 Adam shares would become treasury stock of Adam Corporation as specified by paragraph .55.

[Issue Date: April, 1971.]

18. Wholly Owned Subsidiary

.061 *Question*—Section 1091.46a states that a wholly owned subsidiary may distribute voting common stock of its parent corporation in a "pooling" combination if its parent would have met all of the conditions in paragraphs .46-.48 had the parent issued its stock directly to effect the

combination. As a practical matter, a parent may be unable to own all of a subsidiary's stock. State laws generally require a certain number of the directors of a corporation to own some of the corporation's shares, so a parent would not legally own a few "qualifying directors' shares" registered in the names of "inside" directors. Also, even though a parent attempts to purchase all of a subsidiary's shares owned by outsiders, a few shareholders may never be located and others may refuse to sell their shares for a reasonable amount. If a parent company owns *substantially all* of the outstanding voting stock of a subsidiary, will the subsidiary be considered "wholly" owned for purposes of applying paragraph .46-a?

.062 *Interpretation*—Yes, a subsidiary is considered "wholly" owned under paragraph .46-a if its parent owns substantially all of the subsidiary's outstanding voting stock. The subsidiary may therefore "pool" with another company by distributing the parent company's voting common stock if the parent would have met the conditions of paragraphs .46-.48 in a direct issuance.

.063 What constitutes "substantially all" of a subsidiary's voting stock will vary according to circumstances. Generally, the shares not owned by the parent would be expected to be an insignificant number, such as qualifying directors' shares. A parent might also be considered as owning "substantially all" of a subsidiary's voting stock if the parent had attempted to buy all of the stock but some owners either could not be located or refused to sell a small number of shares at a reasonable price. In no case, however, would less than 90 percent be considered "substantially all" (see section 1091.47b) and generally the percentage would be expected to be much higher.

.064 The reason for using the subsidiary as the combining company would also be important in determining if "substantially all" of its voting stock is owned by the parent. A parent would be expected to own all but a few of its subsidiary's shares, other than qualifying directors' shares, in a combination in which either the parent or subsidiary could engage if the parent is to be considered as owning "substantially all" of its subsidiary's voting stock. A somewhat greater percentage of outside owner-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

ship would be acceptable in a combination between a subsidiary authorized to operate in a state where the parent is not authorized to operate and another company operating in that state. An even larger outside ownership (but not more than 10 percent) would be acceptable in a regulated industry (where a subsidiary in the industry—but not its parent outside the industry—could combine with another company in the industry) when a subsidiary engages in a combination that its parent could not undertake directly.

[Issue Date: September, 1971.]

19. Equity and Debt Issued for Common Before Pooling

.065 *Question*—Section 1091.47b states that the issuing corporation may exchange only voting common stock for outstanding equity and debt securities of the other combining company that have been issued in exchange for voting common stock of that company during a period beginning two years preceding the date a ''pooling'' combination is initiated. What is the purpose of this provision?

.066 *Interpretation*—Section 1091.47c prohibits accounting for a business combination by the pooling of interests method if equity and/or debt securities have been issued by a combining company in exchange for or to retire its voting common stock in contemplation of effecting the combination within two years before the plan of combination was initiated or between the dates of initiation and consummation. In paragraph .47-b, there is an implied presumption that all such transactions of the other combining company were made in contemplation of effecting a combination, thereby violating the condition of paragraph .47-c. However, the issuance of voting common stock of the issuing corporation to the holders of such equity and debt securities of the other combining company in exactly the same ratio as their former holdings of voting common stock of the other combining company will restore the holders of the securities to their former position and, hence, will ''cure'' the violation of the condition of paragraph .47-c.

[Issue Date: September, 1971.]

20. Treasury Stock Allowed with Pooling

.067 *Question*—Section 1091.47d states as a condition for "pooling" that each of the combining companies may reacquire shares of voting common stock (as treasury stock) only for purposes other than business combinations. Also, paragraphs .47-c and .47-d of section 1091 include provisions related to the reacquisition of treasury stock within two years prior to initiation and between initiation and consummation of a business combination which is planned to be accounted for by the pooling of interests method. For what purposes may treasury stock be reacquired during this period?

.068 *Interpretation*—The statement "for purposes other than business combinations" means combinations initiated under section 1091 which are to be accounted for by the pooling of interests method. Therefore, acquisitions of treasury stock for specific purposes that are not related to a particular business combination which is planned to be accounted for by the pooling of interests method are not prohibited by the conditions of either paragraph .47-c or .47-d.

.069 In the absence of persuasive evidence to the contrary, however, it should be presumed that all acquisitions of treasury stock during the two years preceding the date a plan of combination is initiated (or from October 31, 1970 to the date of initiation if that period is less than two years) and between initiation and consummation were made in contemplation of effecting business combinations to be accounted for as a pooling of interests. Thus, lacking such evidence, this combination would be accounted for by the purchase method regardless of whether treasury stock or unissued shares or both are issued in the combination.

.070 The specific purposes for which treasury shares may be reacquired prior to consummation of a "pooling" include shares granted under stock option or compensation plans, stock dividends declared (or to be declared as a recurring distribution), and recurring distributions as provided in paragraph .47-d. Likewise, treasury shares reacquired for issuance in a specific "purchase" or to resolve an existing contingent share agreement from a prior business combination would not invalidate a concurrent "pool-

 © 1974, American Institute of Certified Public Accountants, Inc.

ing." Treasury shares reacquired for these purposes should be either reissued prior to consummation or specifically reserved for these purposes existing at consummation.

.071 To the extent that treasury shares reacquired within two years prior to initiation or between initiation and consummation have not been reissued or specifically reserved, an equivalent number of shares of treasury stock may be sold prior to consummation to "cure" the presumed violation of paragraphs .47-c and .47-d. If the number of shares not reserved or disposed of prior to consummation of a combination is material in relation to the number of shares *to be issued* to effect the combination, the combination should be accounted for by the purchase method.

.072 Treasury shares reacquired more than two years prior to initiation may be reissued in a "pooling." Also, "tainted" treasury shares purchased within two years prior to initiation or between intiation and consummation and not disposed of or reserved may be reissued in a "pooling" if not material in relation to the total number of shares issued to effect the combination. Treasury shares reissued in a "pooling" should be accounted for as specified in section 1091.54.

.073 It should be noted that earnings and market price contingencies were permitted in both "purchases" and "poolings" under "old rules." These contingencies in a combination consummated under section 1091 require the combination to be accounted for as a "purchase." Although "liability-type" contingencies may exist in a "pooling" as specified in paragraph .47-g, treasury stock may not be reacquired to satisfy such a contingency.

[Issue Date: September, 1971.]

21. Pooling with "Bailout"

.074 *Question*—Section 1091.48a specifies that a combined corporation may not agree to directly or indirectly retire or reacquire all or part of the common stock issued to effect a business combination and paragraph .48-b specifies that a combined corporation may not enter into financial arrangements for the benefit of the former stockholders of a combining company if a business combination

is to be accounted for by the pooling of interests method. Would an arrangement whereby a third party buys all or part of the voting common stock issued to stockholders of a combining company immediately after consummation of a business combination cause the combination to not meet these conditions?

.075 *Interpretation*—The fact that stockholders of a combining company sell voting common stock received in a business combination to a third party would not indicate failure to meet the conditions of paragraphs .48-a and .48-b. "Continuity of ownership interests," a criterion for a pooling of interests under ARB No. 48, is *not* a condition to account for a business combination by the pooling of interests method under section 1091. The critical factor in meeting the conditions of paragraphs .48-a and .48-b is that the voting common stock issued to effect a business combination remains outstanding outside the combined corporation without arrangements on the part of any of the corporations involving the use of their financial resources to "bailout" former stockholders of a combining company or to induce others to do so.

.076 Either the combined corporation or one of the combining companies may assist the former stockholders in locating an unrelated buyer for their shares (such as by introductions to underwriters) so long as compensation or other financial inducements from the corporation are not in some way involved in the arrangement. If unregistered stock is issued, the combined corporation may also agree to pay the costs of initial registration.

[Issue Date: September, 1971.]

22. Disposition of Assets to Comply with an Order

.077 *Question*—As a condition to account for a business combination by the pooling of interests method, section 1091.48c prohibits the planned disposal of a significant part of the assets of the combining companies within two years after the consummation date other than disposals in the ordinary course of business and eliminations of duplicate facilities or excess capacity. Likewise, paragraph .47-c prohibits a change in the equity interests of the voting common stock—such as through the "spin-off" of a division or a subsidiary—in contemplation of effecting a "pooling"

 © 1974, American Institute of Certified Public Accountants, Inc.

combination either within two years before initiation or between initiation and consummation. Does a prior or a planned disposition of a significant part of the assets of a combining company to comply with an order of a governmental authority or judicial body constitute a violation of this condition?

.078 *Interpretation*—No. The prior or planned disposition of a significant part of the assets of a combining company (even though in contemplation of effecting or planned subsequent to a combination) does not negate accounting for a business combination as a "pooling" if the disposition is undertaken to comply with an order of a governmental authority or judicial body or to avoid circumstances which, on the basis of available evidence, would result in the issuance of such an order. This is generally consistent with paragraph .46-a (autonomy of combining companies) which permits subsidiaries disposed of in compliance with an order of a governmental authority or judicial body to be considered autonomous for purposes of that condition.

.079 Any gain or loss resulting from a disposal within two years after consummation of a pooling of interests should be accounted for in accordance with sections 1091.59-.60.

[Issue Date: September, 1971.]

23. Retroactive Disclosure of Pooling

.080 *Question*—Section 1091.61 specifies that a business combination accounted for by the pooling of interests method should be recorded as of the date the combination is consummated. This paragraph prohibits a combining company from retroactively reflecting in the financial statements for the current year a combination consummated after the close of the year but before financial statements are issued. However, this paragraph requires a corporation to disclose *as supplemental information, in notes to financial statements or otherwise, the substance of a combination consummated before financial statements are issued and the effects of the combination on reported financial position and results of operations.* Could this disclosure be in the form of a statement with side-by-side columns reporting financial data for (1) the issuing corporation and (2) the

combined corporations, and, perhaps, (3) the other combining company?

.081 *Interpretation*—Section 1091 does not prohibit the side-by-side columnar format described above, nor alternatively, does it prohibit an above-and-below columnar format. The term *or otherwise* included in paragraph .61 is sufficiently broad to permit disclosure of the information on the face of the financial statements in either side-by-side or above-and-below columns.

.082 Because section 1091 prohibits retroactive pooling for a combination completed after the close of the year but before the financial statements are issued, however, the individual columns in the presentation should be separately identified as primary or supplemental information. That is, data for the issuing corporation would be identified as the primary financial statements and data for the combined corporation would be identified as supplemental information. If presented, data for the combining company would also be identified as supplemental information.

.083 It might be noted that a side-by-side presentation will disclose information in greater detail than is required by paragraph .65 (which requires that only revenue, net income, earnings per share and the effects of anticipated changes in accounting methods be disclosed as if the combination had been consummated at the date of the financial statements). Although both paragraphs .61 and .65 specify disclosure in *notes* to the financial statements and paragraph .65 specifies only *note* disclosure without the *or otherwise* provision, this paragraph refers back to paragraph .61 so the columnar format is not prohibited by paragraph .65 as long as the information is properly identified as primary and supplemental.

.084 Information for the combined corporation identified as supplemental information (as described above) would be reported as primary information in statements for the following period when the combination was consummated if comparative financial statements are presented. Reporting and disclosure requirements for the period when a business combination is consummated and for prior periods are contained in paragraphs .51-.58, .63 and .64.

 © 1974, American Institute of Certified Public Accountants, Inc.

.085 Notes to the statements and other disclosures which are included in the statements are a part of the financial statements. Accordingly, the auditor's opinion—unless appropriately modified—would apply to disclosure (in notes to the statements or in columnar format) of the substance of a combination consummated after the close of the year but before the financial statements were issued. The auditor's opinion might be modified, however, to disclaim an opinion on the supplemental information if it had not been included in the auditor's examination.

[Issue Date: September, 1971.]

24. "Grandfather" for Subsidiaries

.086 *Question*—Section 1091.46a prohibits use of pooling accounting for a business combination initiated after October 31, 1970 (the effective date of section 1091) which involves an entity which was a "subsidiary." However, notes to APB Opinions state that they are not intended to be retroactive. Section 1091.46a appears to impose a retroactive effect on subsidiaries with significant minority interests that may have been considering engaging in pooling combinations. Was this intended?

.087 *Interpretation*—Section 1091.46a was not intended to have the retroactive effect described above. Subsidiaries which had a *significant* outstanding minority interest at October 31, 1970 may take part in a pooling combination providing the significant minority also exists at the initiation of the combination. In addition, the combination must meet all of the other pooling conditions specified in sections 1091.46 through 1091.48 both directly and indirectly (i. e., the parent company cannot take actions on behalf of the subsidiary that the subsidiary could not take itself). [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

.088 For purposes of this Interpretation, a significant minority means that at least 20 percent of the voting common stock of the subsidiary is owned by persons not affiliated with the parent company.

.089 This "grandfathering" is consistent with section 1091.99 and applies both to combinations where the subsidiary with a significant minority interest is the issuing

corporation and those where it is the other combining company. However, it does not permit a pooling between a subsidiary and its parent.

[Issue Date: November, 1971.]

25. All Shares Must Be Exchanged to Pool

.090 *Question*—Section 1091.47b specifies that an issuing corporation must exchange only voting common stock for at least 90 percent of the voting common stock interest of a combining company to account for the combination as a pooling of interests. Section 1091.47 permits cash or other consideration to be exchanged for the remaining shares or they may continue outstanding as a minority interest. Under section 1091.47b, assuming the issuing corporation exchanges common stock for at least 90 percent of the common stock of the combining company, may an individual common shareholder of the combining company exchange some of his shares for shares of the issuing corporation and either retain the balance of his shares or sell the shares to the issuing corporation for cash?

.091 *Interpretation*—If a business combination is to be accounted for as a pooling of interests, each common shareholder of the combining company must either agree to exchange *all* of his shares for common shares of the issuing corporation or refuse to exchange *any* of his shares.

.092 It would be contrary to the "pooling" concept expressed in section 1091 for an individual shareholder of a combining company to exchange some of his shares and keep some of his shares in a pooling of interests or for the issuing corporation to exchange common stock for some of an individual shareholder's shares and pay cash for some of his shares. The "pooling" concept would be violated in these cases even though the issuing corporation exchanged its common stock for at least 90 percent of the common stock of the combining company as required by section 1091.47b.

.093 Theoretically two or more *entire* common stockholder groups join together as a single entity in a pooling of interests to share the combined risks and rights represented by the previously independent interests without the distribution of corporate assets to *any* of the common stock-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

holders (see section 1091.45). Section 1091.46 states as an attribute of "pooling" that independent ownership interests are combined in their entirety. Section 1091.46 indicates that combining only selected assets or ownership interests would be more akin to disposing of or acquiring interests than to sharing rights and risks. Section 1091.47 states that acquisitions of common stock for assets or debt and other transactions that reduce the common stock interest are contrary to the idea of combining existing stockholder interests.

.094 Section 1091 permits the theoretical concept of "pooling" to be modified only within strict limits to accommodate practical obstacles that may be encountered in many combinations. Thus, the 90 percent "test" in section 1091.47b recognizes that, as a practical matter, some shareholders of a combining company may refuse to exchange their shares even though most shareholders agree to a combination.

.095 Section 1091.47b permits cash or other consideration to be distributed by the issuing corporation for shares held by these dissenting shareholders of the combining company. However, a shareholder who assents to exchange part of his shares can hardly be considered a dissenting shareholder.

.096 In addition, the exchange by an individual shareholder of a combining company of only part of his shares for common stock of the issuing corporation would not meet section 1091.47e. Section 1091.47e states that each individual shareholder who exchanges his stock must receive a voting common stock interest in proportion to his relative voting common stock interest in the combining company before the combination.

.097 Usually the determination of whether or not a shareholder of a combining company is exchanging all of his shares for common stock of the issuing corporation will be made at consummation. However, transactions prior to consummation between the issuing corporation and a shareholder of a combining company who exchanges shares at consummation may also preclude a "pooling." In the absence of persuasive evidence to the contrary, it should be presumed that the purchase was made in contemplation of

effecting the combination (see section 1091.47c) if the issuing corporation purchased shares of a combining company within two years prior to initiation and before consummation from a shareholder who also exchanges shares at consummation.

.098 To overcome another purely practical problem, section 1091.47b also allows cash or other consideration to be distributed by the issuing corporation in lieu of fractional shares. There is no essential difference between the payment of cash to a common shareholder for a fraction of a share and the payment of cash for some of his shares. Therefore, the payment of more than a reasonable amount of cash to a shareholder for a fractional share would also be contrary to the "pooling" concept expressed in section 1091. Thus, the payment for fractional shares among shareholders must be reasonable in amount and should be proportional to each shareholder's fractional share interest.

[Issue date: November, 1971.]

26. Acquisition of Minority Interest

.099 *Question*—How should a corporation account for the acquisition of all or part of the minority interest of a subsidiary?

.100 *Interpretation*—Section 1091.05 states, "The acquisition of some or all of the stock held by minority shareholders of a subsidiary is not a business combination, but paragraph .43 of this section specifies the applicable method of accounting." Paragraph .43 states that the acquisition of some or all of the stock held by minority stockholders of a subsidiary—whether acquired by the parent, the subsidiary itself, or another affiliate—should be accounted for by the purchase method. Thus, purchase accounting applies when (a) a parent exchanges its common stock or assets or debt for common stock held by minority shareholders of its subsidiary, (b) the subsidiary buys as treasury stock the common stock held by minority shareholders, or (c) another subsidiary of the parent exchanges its common stock or assets or debt for common stock held by the minority shareholders of an affiliated subsidiary.

 © 1974, American Institute of Certified Public Accountants, Inc.

.101 In addition, section 1091.46b precludes pooling when the combining companies hold as intercorporate investments more than 10 percent of the outstanding voting common stock of any combining company (except when section 1091.99 applies, as discussed later). Therefore, pooling is precluded in the exchange by a subsidiary of its common stock for the outstanding voting common stock of its parent (usually referred to as a "downstream merger"). Instead, purchase accounting applies and the transaction should be accounted for as if the parent had exchanged its common stock for common stock held by minority shareholders of its subsidiary. (Whether a parent acquires the minority or a subsidiary acquires its parent, the end result is a single shareholder group, including the former minority shareholders, owning the consolidated net assets.) The same would be true if a new corporation exchanged its common stock for the common stock of the parent and the common stock of the subsidiary held by minority shareholders.

.102 An exception to the requirement for purchase accounting in the acquisition of a minority interest may exist in some rare cases under section 1091.99. This paragraph permits pooling accounting to be elected on a "grandfather" basis under certain conditions, one condition being a combination in which one corporation owns no more than 50 percent of the voting *common* stock of the other combining company. Since a parent company may control a subsidiary even though the parent owns less than 50 percent of the subsidiary's voting common stock (e.g., by owning voting preferred stock in addition to voting common stock—see section 2051.03), the exchange by the parent of its voting common stock for the voting common stock of the subsidiary owned by outsiders could qualify for pooling accounting. However, it should be noted that section 1091.99 would require the parent to allocate the excess of the cost of its previously existing investment over its proportionate equity in the subsidiary's net assets to the subsidiary's identifiable assets (and to goodwill, if any) based on fair values at the consummation date.

[Issue Date: December, 1971]

27. Entities Under Common Control in a Business Combination

.103 *Question*—Section 1091.05 states that the provisions of section 1091 should be applied as a general guide in a business combination involving one or more unincorporated businesses. Section 1091.46a requires that each company in a pooling be autonomous and have not been a subsidiary or division for two years prior to initiation. How does section 1091 apply to a combination involving one entity controlled by one or a few individuals who control several other entities?

.104 *Interpretation*—A proprietorship or a partnership may be a party to a business combination accounted for under section 1091 as stated in the first sentence of section 1091.05. Many of these entities are very similar, except for legal form of organization, to a closely held corporation. Often a single individual may own one or more proprietorships and also may own the controlling interest in one or more corporations and in addition may have an interest in one or more partnerships.

.105 Considerable judgment will usually be required to determine the substance of a combination involving one (or more) of several companies under common control. For example, it may be necessary to look beyond the form of the legal organizations to determine substance when an unincorporated business or a closely held corporation owned by one or a few individuals who also control other entities is involved since the dividing lines may not be as "sharp" as they would be in publicly held corporations with wide ownership interests.

.106 An individual who owns two separate businesses organized as corporations theoretically is a "parent" with two "subsidiaries." The same would be true if the businesses were organized as two proprietorships or as one proprietorship and one corporation. To apply section 1091.46a to a combination involving one of these businesses, however, the relationship between the two businesses is more important than the fact that each business is theoretically a subsidiary, because section 1091.46a precludes fragmenting a business and pooling only a part of the business. The following examples demonstrate these points.

 © 1974, American Institute of Certified Public Accountants, Inc.

.107 If both businesses are grocery stores, a combination involving only *one* business should presumably be accounted for as a purchase because the two stores presumably are part of a single kind of business and the two separate legal organizations should be ignored.

.108 On the other hand, if one business is a grocery store and the other is an automobile dealership, a combination involving only one business would be accounted for as a pooling of interests if all other conditions of sections 1091.46-.48 are met because the individual is operating two unrelated businesses. In these examples, a "line of business" is an indicator of a single business.

.109 Also, a combination involving two or more businesses owned by one individual must be accounted for by a single method. For example, if both the grocery store and the automobile dealership are to be combined with another unrelated company, one could *not* be a purchase and the other a pooling. (Section 1091.47b discusses a combination of more than two companies and section 1091.43 states the two methods are not alternatives in accounting for the same combination.)

.110 In general, the same guidelines apply to a business with a few owners rather than an individual owner. They would apply, for example, to two partnerships having the same partners, two closely held corporations having the same stockholders, or to a partnership and a closely held corporation whose stockholders are the partners in the partnership. If the various individuals are all members of one family, the effect may be the same (but is not always the same) as if there were only an individual owner rather than several partners and/or several stockholders.

.111 Because the ratios of ownership of the different businesses may differ or the ownership groups may overlap but be different, however, several owners of different businesses create complexities which are not present if there is a single owner. Because of the diversity of the situations which might be encountered in practice, stating guidelines beyond those given above is impossible.

[Issue Date: December, 1971]

28. Pooling by Subsidiary of Personal Holding Company

.112 *Question*—A single individual may control other corporations (for federal income tax reasons) through a personal holding company. Section 1091.46a requires that each company in a pooling be autonomous and have not been a subsidiary or division for two years prior to the initiation of a combination. Does this preclude a pooling by a corporation which is controlled by a personal holding company?

.113 *Interpretation*—The legal form may sometimes be ignored in a combination involving a subsidiary of a personal holding company. Under section 1091.46a a personal holding company is technically a parent corporation and the corporations it controls are technically subsidiaries. In many cases, a parent-subsidiary relationship does in fact exist and should be considered as such in applying section 1091.46a if the personal holding company or any of its subsidiaries is involved in a business combination.

.114 In other cases, a personal holding company is a convenience established for federal income tax reasons and the various "subsidiaries" are in fact operated by the "owners" as if the personal holding company did not exist. In a combination involving such a "subsidiary," the personal holding company may be disregarded and the various "subsidiaries" considered autonomous in applying section 1091.46a. However, the guidelines described in Accounting Interpretation No. 27, "Entities Under Common Control in a Business Combination," should be applied in determining the appropriate method of accounting for the combination and all other conditions of sections 1091.46-.48 must be met in a pooling.

[Issue Date: December, 1971]

29. Option May Initiate Combination

.115 *Question*—Section 1091.46a specifies the requirements for initiation of a business combination. Does an option to exchange substantially all of their shares at a future date (for example, three years hence) granted by the shareholders of a closely held company to another company constitute the initiation of a business combination?

 © 1974, American Institute of Certified Public Accountants, Inc.

.116 *Interpretation*—An option that *requires* unilateral performance by either party or bilateral performance by both parties constitutes initiation. Thus, if one company is required to issue stock upon the tendering of shares by the shareholders of another company or if the shareholders are required to tender their shares upon demand, the date the option is granted is the initiation date. The combination must be consummated within one year thereafter to be accounted for by the pooling of interests method (see section 1091.47a).

.117 However, an agreement which grants only the right of "first refusal" does not constitute initiation. This would be the case, for example, where the stockholders of a closely held company agree to negotiate with one company before negotiating with any other company if the shareholders should in the future decide to consider entering into a business combination. Neither party may be obligated to perform, however, or to pay damages in the absence of performance.

.118 The payment of cash or other consideration by either company for a "first refusal" agreement would also be contrary to the pooling concept expressed in section 1091. Individual shareholders, however, may pay cash to obtain the agreement so long as company resources are not directly or indirectly involved.

[Issue Date: December, 1971]

30. Representations in a Pooling

.119 *Question*—Section 1091.47g specifies that in a business combination accounted for as a pooling of interests there can be no agreement to contingently issue additional shares of stock or other consideration at a later date and no escrowing of shares until a contingency is resolved. This paragraph allows, however, revision of the number of shares issued upon the settlement of a contingency at an amount different from that recorded by a combining company. May an issuing company reserve or escrow some shares against the representations of the management of a combining company in a pooling?

.120 *Interpretation*—Section 1091.47g is intended to require purchase accounting when an earnings or market

price contingency agreement is present in a business combination. However, this paragraph does not prohibit certain kinds of contingency agreements in a pooling so long as they provide for the sharing of rights and risks arising after consummation and are not in effect earnings or market price contingency agreements.

.121 A contingency agreement which is not prohibited in a pooling may provide for the reservation by the issuing company of a portion of the shares being issued, the issuance of additional shares, the return of shares by former shareholders of the combining company, or the issuance of shares to an escrow agent who will subsequently transfer them to the former shareholders of the combining company or return them to the issuing company. (Note that the former shareholders of the combining company must be able to vote any shares issued, reserved, or escrowed to meet the condition of section 1091.47f.)

.122 The most common type of contingency agreement *not* prohibited in a pooling by section 1091.47g is the "general management representation" which is present in nearly all business combinations. In such a representation, management of a combining company typically warrants that the assets exist and are worth specified amounts and that all liabilities and their amounts have been disclosed. The contingency agreement usually calls for an adjustment in the total number of shares exchanged up to a relatively small percentage (normally about 10 percent) for variations from the amounts represented, but actual adjustments of the number of shares are rare.

.123 A contingency agreement for a "general management representation" does not violate section 1091.47g if it provides for a substantial sharing of rights and risks beginning with consummation and the complete sharing within a reasonable period of time. In this light, the contingency agreement is merely a device to provide time for the issuing company to determine that the representations are accurate so it does not share risks arising prior to consummation. Although the time required will vary with circumstances, these determinations should be completed within a few months following consummation of the combination. In any case, the maximum time should not extend

 © 1974, American Institute of Certified Public Accountants, Inc.

beyond the issuance of the first independent audit report on the company making the representations following consummation of the combination. Thereafter, the combined shareholder interests share the risks of inventory obsolescence, collection of receivables, etc. However, if the complete sharing of risks is unduly delayed or if the risk sharing is not substantial at consummation, a "general management representation" may in effect indicate an earnings contingency agreement.

.124 Section 1091.47g specifically allows certain contingency agreements in a pooling to cover specific situations whose outcome cannot be reasonably determined at consummation and perhaps even for several years thereafter. Although management of a combining company may make specific representations as to these contingencies that are known at the consummation of a pooling and as to those which may arise within a reasonable period thereafter, the combined shareholder interests are expected to share the risks and rights of all other contingencies if section 1091.47g is to be met. Likewise, the former shareholders of a combining company must be able to vote any shares issued, reserved, or escrowed for a specific contingency until it is finally resolved if section 1091.47f is to be met. The contingency agreement may provide, however, that any dividends during the contingency period on contingent shares "follow" the shares when the contingency is resolved.

.125 It should also be noted that any change in the number of shares (as originally recorded for a pooling of interests) upon the final resolution of either a general or a specific representation contingency is recorded as an adjustment to stockholders' equity (see section 1091.53). The effect of the resolution of a contingency involving an asset or liability, whether or not previously recorded,

→ *The next page is 12,633-3.* ←

is reflected currently in net income or as a prior period adjustment in accordance with section 2014. In no case may a contingency agreement for either a general or a specific representation in a pooling be used as a means of relieving current or prior net income of an amount which should be reflected therein. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

[Issue Date: December, 1971]

31. Employment Contingencies in a Pooling

.126 *Question*—Section 1091.47g stipulates that in a business combination accounted for as a pooling of interests there can be no agreement for contingent issuance of additional shares of stock or distribution of other consideration to the former stockholders of a combining company. Would the granting of an employment contract or a deferred compensation plan by the combined corporation to former stockholders of a combining company cause this condition to not be met?

.127 *Interpretation*—An employment contract or a deferred compensation plan granted by the combined corporation to former stockholders of a combining company would not automatically constitute failure of section 1091.47g. The critical factors would be the reasonableness of the arrangement and restriction of the arrangement to continuing management personnel. Generally, reasonable contracts or plans entered into for valid business purposes would meet section 1091.47g. Substance, however, is more important than form.

.128 As an example, the granting of employment contracts to former stockholders of a combining company who were active in its management and who will be active in management of the combined corporation would meet section 1091.47g if the contracts are reasonable in relation to existing contracts granted by the issuing corporation to its management. However, the granting of employment contracts to former stockholders of a combining company who were not or will not be active in management probably indicates a contingent pay-out arrangement. Likewise,

"consultant" contracts for former stockholders might also indicate a contingent pay-out arrangement.

.129 Employment contracts and deferred compensation plans entered into by a combining company between the initiation and consummation dates may also cause a business combination to not meet section 1091.47g. For example, a combining company may not enter into a "contingency-type" compensation agreement *in contemplation* of the combination and meet section 1091.47g if the issuing corporation could not also enter into the same agreement under the paragraph.

[Issue Date: December, 1971]

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

32. Stock Options in a Pooling

.130 *Question*—Section 1091.47g states that in a business combination accounted for as a pooling of interests the combined corporation may not agree to contingently issue additional shares of stock to the former stockholders of a combining company. Would this condition be violated if the combined corporation granted stock options to these stockholders?

.131 *Interpretation*—Generally, stock options granted by the combined corporation as current compensation to former stockholders of a combining company would not violate section 1091.47g. That is, the former stockholders of a combining company who are employees or directors of the combined corporation may participate in a stock option plan adopted by the combined corporation for its employees and/or directors.

.132 Section 1091.47g would be violated, however, if the stock option plan in reality is an arrangement to issue additional shares of stock at a relatively low cost to these former stockholders of the combining company to satisfy a contingency agreement. Also, a stock option plan to accomplish the same result adopted by the combining company prior to consummation but *in contemplation* of the combination would not meet sections 1091.47c and 1091.47g.

[Issue Date: December, 1971]

33. Costs of Maintaining an "Acquisitions" Department

.133 *Question*—A corporation maintains an "acquisitions" department to find, evaluate, and negotiate with possible merger candidates. The president of the corporation also spends a considerable portion of his time negotiating business combinations. Cost records are excellent and the total cost is determined for each investigation and negotiation, whether it is successful or unsuccessful. What accounting is specified by section 1091 for these costs?

.134 *Interpretation*—All "internal" costs associated with a business combination are deducted *as incurred* in determining net income under section 1091. This answer applies to costs incurred for both "poolings" (see section 1091.58) and "purchases" (see section 1091.76). Naturally, costs incurred in unsuccessful negotiations are also deducted as incurred.

.135 Section 1091.76 specifies that in a business combination accounted for by the purchase method the cost of a company acquired includes the *direct* costs of acquisition. These direct costs, however, are "out-of-pocket" or incremental costs rather than recurring internal costs which may be directly related to an acquisition. The direct costs which are capitalized in a purchase therefore include, for example, a finder's fee and fees paid to outside consultants for accounting, legal, or engineering investigations or for appraisals, etc. All costs related to effecting a pooling of interests, including the direct costs listed above, are charged to expense as specified in section 1091.58.

[Issue Date: December, 1971]

34. Forced Sale of Stock

.136 *Question*—A publicly held corporation wants to effect a business combination with a large closely held corporation and to account for the combination as a pooling of interests. Because management of the publicly held corporation prefers not to have a single stockholder owning a large block of its stock, the agreement to combine requires the majority stockholder of the closely held corporation to sell 25 percent of the voting common stock he receives immediately following consummation and to sell another 25 percent within one year thereafter. The stock is to be sold in public offerings and all of the shares will remain outstanding outside the combined corporation. Since section 1091 does not have the "continuity of ownership interests" criterion of ARB No. 48 as a condition for pooling, should this combination be accounted for as a pooling of interests or as a purchase?

.137 *Interpretation*—The combination is a purchase because of the *requirement* imposed on a shareholder to sell some of the voting common stock received. Any requirement imposed on a stockholder (other than by a government authority) either *to sell* or *to not sell* stock received in a business combination is contrary to the pooling concept expressed in section 1091 of the sharing of rights and risks by the previously independent stockholder interests. While such a requirement does not violate any spe-

 © 1974, American Institute of Certified Public Accountants, Inc.

cific condition for pooling described in sections 1091.46-48, it violates the whole pooling concept of section 1091.

[Issue Date: January, 1972]

35. Registration Costs in a Purchase

.138 *Question*—If a company issues previously *registered* equity securities in a business combination accounted for by the purchase method, the fair value of the securities issued is credited to the capital accounts of the issuing corporation. However, if the securities issued have not been previously registered, section 1091.76 specifies that the costs of registering and issuing equity securities are a reduction of the otherwise determinable fair value of the securities. How should a corporation account for the costs of a registration which will not be undertaken until after the securities are issued?

.139 *Interpretation*—A publicly held company issuing *unregistered* equity securities in an acquisition with an agreement for subsequent registration should credit the fair value of the securities (the otherwise determinable fair value less registration costs) to its capital accounts. The present value of the estimated costs of registration should be accrued as a liability at the date of acquisition (see section 1091.88h) with an immediate charge to the assets acquired (in most cases, to "goodwill"). Any difference between the actual costs of registration and the amount accrued at the payment date (the original accrual plus imputed interest) would be an adjustment to the recorded goodwill. Total assets (including goodwill) and total capital will thereby be recorded at the same amounts as if previously registered securities had been issued except for any difference in fair value ascribed to restrictions prohibiting sale of the securities at time of issuance.

.140 Agreements for the subsequent registration of unregistered securities issued in business combinations often specify that the securities will be registered "piggyback" (that is, included in the registration of a planned future offering of other securities). In such a case, only the incremental costs of registering the equity securities issued in the acquisition would be accrued or subsequently charged to "goodwill" as described above and amortized

prospectively over the remaining term of the period of amortization of the initial goodwill.

[Issue Date: January, 1972]

36. No Pooling with Wholly Owned Sub

.141 *Question*—Company A initiated a combination by making a tender offer for Company B which was at the time an independent company. Company C, which owned a large interest in, but not control of, Company B, subsequently and without Company A's knowledge purchased all of the remaining outstanding voting common stock of Company B and operated Company B as a wholly owned subsidiary. Within one year of the date Company A made the tender offer, Company C tendered all of the voting common stock of Company B to Company A in exchange for voting common stock of Company A at the ratio of exchange of the tender offer. Section 1091.46a generally precludes accounting for a business combination by the pooling of interests method if one of the combining companies has been a subsidiary of another corporation within two years prior to initiation of the combination. Does the fact that Company B became a wholly owned subsidiary of Company C following initiation of the combination by Company A preclude pooling in this case?

.142 *Interpretation*—Yes, pooling is precluded and Company A should account for the combination as a purchase. (Company C, in effect, sold its wholly owned subsidiary B to Company A.) Section 1091.46a provides that a wholly owned subsidiary may pool only by distributing the stock of its parent company.

.143 Although section 1091.46a refers to not being a subsidiary "within two years before the plan of combination is initiated," the intent of the paragraph is that a combining company in a pooling has not been a subsidiary during a period beginning two years prior to initiation and ending at consummation of a combination.

[Effective for combinations consummated after May 31, 1972]

37. Combination Contingent on "Bailout"

.144 *Question*—Accounting Interpretation No. 21, section U1091.074-.076, "Pooling with 'Bailout'," issued in

 © 1974, American Institute of Certified Public Accountants, Inc.

September 1971 indicates that former shareholders of a combining company may sell voting common stock received in a business combination accounted for as a pooling of interests. Would the accounting for a combination be affected by the fact that its consummation is contingent upon the purchase by a third party or parties of all or part of the voting common stock to be issued in the combination?

.145 *Interpretation*—Yes. A business combination should be accounted for as a purchase if its consummation is contingent upon the purchase by a third party or parties of *any* of the voting common stock to be issued. This would be the case, for example, if the parties to the combination have agreed that consummation of the combination will not occur until there is a commitment by a third party for a private purchase, a firm public offering, or some other form of a guaranteed market for all or part of the shares to be issued. Including such a contingency in the arrangements of the combination, either explicitly or by intent, would be considered a financial arrangement which is precluded in a pooling by section 1091.48(b).

.146 It should be noted that this accounting interpretation does not modify the previous interpretation, "Pooling with 'Bailout'," which states that shareholders may sell stock received in a pooling and that the corporation may assist them in locating an unrelated buyer for their shares. Although shareholders may sell stock received in a pooling, consummation of the business combination must first occur without regard to such a sale and cannot be contingent upon a firm commitment by the potential purchaser of the shares to be issued.

[Issue Date: November, 1972]

38. Several Companies in a Single Business Combination

.147 *Question*—How does section 1091 apply when more than two companies are involved in a single business combination?

.148 *Interpretation*—When more than two companies negotiate a combination which is contingent upon the mutual agreement by the several companies to the terms, the resulting combination is deemed a single business combination regardless of the number of companies involved. Each

company must meet all of the conditions of section 1091.46-.48 if the combination is to be accounted for by the pooling of interests method. In particular, sections 1091.46b and 1091.47b specify how the 10 percent and 90 percent tests should be made when more than two companies are involved in a single combination.

.149 Section 1091.43 specifies that a single method should be applied to account for an entire combination. Therefore, if any condition in section 1091.46-.48 is not met by any company, the entire combination would be accounted for by the purchase method.

.150 However, it should be noted that a corporation may be involved in more than one business combination at the same time and that different methods of accounting may apply to the different combinations.

[Issue Date: March, 1973]

39. Transfers and Exchanges Between Companies Under Common Control

.151 *Question*—Section 1091.05 states section 1091 does not apply to a transfer of net assets or to an exchange of shares between companies under common control. What are some examples of the types of transactions excluded from section 1091 by this provision and what accounting should be applied?

.152 *Interpretation*—In general, section 1091.05 excludes transfers and exchanges that do not involve outsiders. For example, a parent company may transfer the net assets of a wholly owned subsidiary into the parent company and liquidate the subsidiary, which is a change in legal organization but not a change in the entity. Likewise, a parent may transfer its interest in several partially owned subsidiaries to a new wholly owned subsidiary, which is again a change in legal organization but not in the entity. Also, a parent may exchange its ownership or the net assets of a wholly owned subsidiary for additional shares issued by the parent's partially owned subsidiary, thereby increasing the parent's percentage of ownership in the partially owned subsidiary but leaving all of the existing minority interest outstanding.

 © 1974, American Institute of Certified Public Accountants, Inc.

.153 None of the above transfers or exchanges is covered by section 1091. The assets and liabilities so transferred would be accounted for at historical cost in a manner similar to that in pooling of interests accounting.

.154 It should be noted, however, that purchase accounting applies when the effect of a transfer or exchange is to acquire all or part of the outstanding shares held by the minority interest of a subsidiary (see section 1091.43). The acquisition of all or part of a minority interest, however acquired, is never considered a transfer or exchange by companies under common control. (See Interpretation No. 26, section U1091.099-.102, "Acquisition of Minority Interest.")

AC Section U2010

Reporting the Results of Operations: Accounting Interpretations of Section 2010

1. Losses Caused by Bankruptcies

.001 *Question*—Recent railroad bankruptcies raise the question of whether companies holding receivables from these railroads should account for losses arising from charging off such assets as ordinary losses or as extraordinary losses in determining net income. The Interstate Commerce Commission has ruled that railroads must write off certain past due payments from other railroads (e. g., interline receivables) as extraordinary losses. Is this accounting treatment appropriate in the annual reports to railroads' shareholders and in the annual reports to shareholders of other (nonrailroad) companies?

.002 *Interpretation*—No, section 2012.23 specifies that losses from receivables do *not* constitute extraordinary losses. The fact that the loss arises from a receivable from a company in bankruptcy proceedings does not alter this answer in any way. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

.003 Regulatory authorities often rule on the accounting treatment to be applied by companies under their jurisdiction. The above question is covered by section 6011.03-.04. An auditor should in his opinion take an exception to any loss from an interline receivable classified as an extraordinary item in a railroad's annual report to shareholders.

AC Section U 2011

Computing Earnings per Share: Accounting Interpretations of Section 2011, Earnings per Share*

Issue date, unless otherwise indicated: July, 1970

INTRODUCTION

Comparison of APB Opinion No. 9 and Section 2011

.001 Section 2011, *Earnings per Share,* is an extension of the issues discussed in Part II, ''Computation and Reporting of Earnings Per Share,'' of APB Opinion No. 9.

.002 APB Opinion No. 9 included certain ''residual'' securities as the equivalent of common stock in earnings per share computations, established ''supplementary pro forma'' earnings per share for reporting what the effect on earnings per share would have been if all residual and contingently issuable securities had been issued, and strongly recommended that both earnings per share and supplementary pro forma earnings per share be disclosed in the income statement.

.003 Section 2011 supersedes Part II of APB Opinion No. 9, modifies the concept of residual securities and replaces the term *residual securities* with the new designation *common stock equivalents.* Under section 2011, dilutive common stock equivalents are included with outstanding common stock in computing ''primary'' earnings per share. Common stock, dilutive common stock equivalents and other potentially dilutive securities are included in computing ''fully diluted'' earnings per share.

.004 Section 2011 requires that earnings per share be presented on the face of corporate income statements or summaries of such statements with both the primary and fully diluted amounts presented when potential dilution of earnings per share exists. Also, section 2011 specifically

* See section 2083, *Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*

prohibits including anti-dilutive[1] securities in earnings per share computations (except in special situations to be discussed later) while APB Opinion No. 9 discussed dilution but did not specifically prohibit anti-dilution.

Interpretation of Section 2011

.005 These Accounting Interpretations are intended to explain the provisions of section 2011. They do not in any way amend or modify section 2011. They do not presume to answer all questions which might be raised in applying section 2011 but rather are addressed to questions raised since section 2011 was issued.

.006 Some Interpretations are concerned with simple situations; others are concerned with rather complex situations. And just as APB Opinions are not necessarily applicable to immaterial items, these Interpretations do not necessarily apply to immaterial items. In many cases the refinements described will be material, but in many other cases they will not. When the difference is not significant, the refinements need not be applied. For example, the quarterly share averaging procedure for options and warrants described in Interpretations 58-62 need not be used when the market price of common stock is stable throughout the year and always above the exercise price. In such a case the treasury stock method could be applied on an annual basis.

.007 Although the Interpretations are not binding on Institute members, they reflect informed consideration of the situations posed and express what the Institute staff believes to be the preferred practices for earnings per share computations under section 2011.

Arrangement

.008 These Interpretations of section 2011 are divided into two parts. Part I is an overview of section 2011. Although Part I summarizes the basic provisions of section 2011, familiarity with section 2011 is assumed and terms used in section 2011 are not defined in this part. Part I also serves as a brief description of the underlying concepts of section 2011. Part II contains definitional Interpretations followed by individual Interpretations in question and answer form. The Interpretations are numbered sequentially and are arranged generally in the order in

[1] See Interpretation 5 for the definition of an anti-dilutive security.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

which the topics appear in Part I. Exhibits follow Part II. A cross-reference table which lists each section 2011 paragraph cited (as explained below) and the location of the citation, is included in Appendix D, page 5841.

.009 Numbers appearing in brackets at the end of paragraphs indicate references (in numerical order) to paragraph numbers in section 2011 (and its appendixes) relevant to the material being discussed.

PART I: AN OVERVIEW OF SECTION 2011

Presentation of Earnings per Share

.010 Section 2011 requires nearly all corporations[2] to report earnings per share data on the face of income statements or earnings summaries issued for periods beginning after December 31, 1968. Each presentation must include per share data for income or loss before extraordinary items (if extraordinary items are reported on the income statement) and per share data for net income or loss. Corporations with capital structures containing securities that do not, in the aggregate, dilute earnings per share 3% or more need present only earnings per common share. This exception for corporations whose securities do not dilute earnings per share by at least 3% is based upon the immateriality of dilution of less than 3%. In section 2011 the Board specified the point at which dilution becomes material rather than allowing different judgments to determine different levels of materiality. All other corporations are required to have the "dual" presentation of primary earnings per share and fully diluted earnings per share. All computations of earnings per share data are to be based on a weighted average of shares assumed to be outstanding during the period. [*.12, .13, .14, .15, 2011A.02*]

Assumptions

.011 Earnings per share computations for corporations with complex capital structures are based on various assumptions which are required by section 2011. These assumptions are made to reflect (1) what a corporation's earnings per share would have been if common stock had been issued to replace all dilutive securities considered to be the equivalent of common stock and (2) the additional

[2] See Interpretation 9 for the exceptions.

dilution which would have resulted if common stock had been issued to replace all of the corporation's other potentially dilutive securities.[3] [*.20, .24-.27, .41*]

.012 Assumptions to be made are specified for exercise, conversion, and issuance of securities, prices to be used, and methods to be applied to reflect the dilution which would have resulted if the transactions and events underlying those assumptions had actually occurred. Although specific methods for applying the assumptions are designated, the Board realized that the events and transactions assumed for the computations might not actually occur. Rather, the Board specified the assumptions and the methods as a practical approach to obtaining comparable determinations of earnings per share. [*.34, .36*]

Classification of Securities

.013 The advent of securities which are not common stock in form but which enable their holders to obtain common stock modifies some of the traditional relationships among securities. While common stock is regarded as the basic equity security and nonconvertible preferred stock and nonconvertible debt are regarded as senior securities, those securities which enable their holders to obtain common stock are classified as either *common stock equivalents* or as *other potentially dilutive securities* for earnings per share computations. This classification is made at time of issuance and does not change thereafter.[4] [*.25, .28, .41*]

.014 A security is classified solely for purposes of determining earnings per share. The accounting for securities, their presentation in the financial statements, and the determination of book value per share are not affected by the classification of securities for earnings per share computations. [*.39*]

.015 Common stock equivalents are included in both primary and fully diluted earnings per share computations. Other potentially dilutive securities are included only in fully diluted earnings per share computations. However, common stock equivalents and other potentially dilutive

[3] See Interpretation 3 for the special context in which the term *other potentially dilutive securities* is used in these Accounting Interpretations of section 2011. The term is not used in section 2011.

[4] Except as explained in Interpretations 29 and 30.

 © 1974, American Institute of Certified Public Accountants, Inc.

securities are included in the *computations* only when their effect is dilutive. Both are excluded from the *computations* whenever their effect is anti-dilutive except in the situations described in the following paragraph. Thus, a security retains its status as a common stock equivalent or as an other potentially dilutive security after its classification has been determined, but it may enter earnings per share computations in one period and not in another period. [*.15, .30*]

Anti-dilutive Securities

.016 Anti-dilutive securities are excluded from earnings per share computations unless (1) common stock was issued during the period on an anti-dilutive exercise or conversion or (2) a security is anti-dilutive in earnings per share for income before extraordinary items but is dilutive in earnings per share for net income or vice versa [5] or (3) an aggregate computation is required which has a net dilutive effect but which may include anti-dilutive securities or anti-dilutive computations.[6] All other anti-dilutive securities are excluded from earnings per share computations even when some anti-dilutive securities are included in the computation because of one or more of the above exceptions. In an aggregate computation, only when the net result is dilutive may anti-dilutive securities be included in the earnings per share computation. [*.14, .30, .30 fn. 10, .38, .40, .41*]

Primary Earnings per Share

.017 Primary earnings per share data are based upon outstanding common stock and common stock assumed to

[5] Note that primary earnings per share for income from continuing operations or primary earnings per share for income before extraordinary items and the cumulative effect of accounting changes may be anti-dilutive when common stock equivalents are present together with discontinued operations, and/or extraordinary items and/or accounting changes. The common stock equivalents may have an anti-dilutive effect upon one of these amounts so long as the effect is dilutive upon the other amounts. The same type of anti-dilution may be reflected *within* fully diluted earnings per share when common stock equivalents and other potentially dilutive securities are present together with discontinued operations, and/or extraordinary items and/or accounting changes. However, fully diluted earnings per share for net income would *not* be anti-dilutive with respect to primary earnings per share for net income unless the anti-dilution is caused by actual exercises or conversions. (See also section 2011.30, footnote 10.) [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

[6] For example, an aggregate computation is required by section 2011.38 when the number of common shares issuable upon the exercise of all options, warrants, and their equivalents exceed 20% of the number of common shares outstanding at the end of the period for which the computation

be outstanding to reflect the dilutive effect of common stock equivalents. Convertible securities which yield less than two-thirds of the bank prime interest rate at the time of issuance are classified as common stock equivalents. Convertible securities issued with the same terms as those of an outstanding common stock equivalent are classified as common stock equivalents regardless of their yield. Outstanding convertible securities which are not common stock equivalents become common stock equivalents if another convertible security with the same terms is issued and is classified as a common stock equivalent. [*.28, .33*]

.018 Convertible securities which allow or require the payment of cash at conversion are considered the equivalents of warrants. Options, warrants and their equivalents, stock purchase contracts, and certain agreements to issue common stock in the future are classified as common stock equivalents. Some participating securities and two-class common stocks are also classified as common stock equivalents. [*.27, .37*]

Fully Diluted Earnings per Share

.019 Fully diluted earnings per share data are based on outstanding common stock and common stock assumed to be outstanding to reflect the maximum dilutive effect of common stock equivalents and other potentially dilutive securities. Thus, convertible securities, options, warrants, stock purchase contracts, participating securities, two-class common stocks and agreements to issue stock in the future are included in the computation of fully diluted earnings per share. The difference between the primary and the fully diluted earnings per share amounts is the additional dilution resulting from other potentially dilutive securities outstanding. [*.16, .40*]

Earnings Applicable to Common Stock

.020 To compute earnings per share, net income must often first be adjusted to determine earnings applicable to common stock. The adjustments to net income do not in any way change reported net income but rather are made to compute the earnings for the period to which common stock has a claim. Corporations with nonconvertible pre-

---

is being made. An aggregate computation would also be made for an anti-dilutive option which must be exercised before a dilutive option may be exercised. (See Interpretation 49.)

 © 1974, American Institute of Certified Public Accountants, Inc.

ferred stock, for example, must deduct any preferred dividends paid, declared, or accumulated for the period in adjusting net income to determine earnings applicable to common stock. [*.39, 2011A.05*]

.021 Only dividends which are applicable to the period covered by the income statement would be deducted. Dividends declared or accumulated during a prior period and paid during the period covered by the income statement are not deducted since they were considered in computing earnings applicable to common stock during the prior period and their payment merely retires the liability.

.022 Corporations with common stock equivalents or other potentially dilutive securities may have to make more complex adjustments or may not make some adjustments which would otherwise be made. For example, interest, less tax effect, on convertible bonds deducted in arriving at net income would be added back to net income to determine earnings applicable to common stock when the convertible bonds are assumed to be converted. Since dividends on convertible preferred stock are not deducted in arriving at net income, they would not be added back to net income to determine earnings applicable to common stock when convertible preferred stock is assumed to be converted. [*2011A.06, 2011A.07*]

Convertible Securities

.023 Convertible securities are included in earnings per share computations under the "if converted" method. Under this method, the security is assumed to have been converted into common stock at the beginning of the period being reported upon (or time of issuance of the security, if later). The common stock which would have been issued upon conversion is considered outstanding from the date of the assumed conversion. Interest deductions applicable to convertible debt reduced by the income taxes attributable to such interest are added back to net income because the interest would not have been incurred if the debt had been converted into common stock. Nondiscretionary adjustments based on net income or income before taxes (for items such as profit sharing or royalty agreements, etc.) are recomputed after the interest adjustment is made. Any difference (less income tax) from the amount originally computed is also included in the adjusted net income. [*2011A.06*]

.024 Convertible securities which *require* the payment of cash at conversion are considered the equivalent of warrants for computational purposes. Both the treasury stock method and the if converted method must be applied. Convertible securities which *permit* the payment of cash as an alternative at conversion are also considered the equivalent of warrants. But when conversion without the payment of cash would be more advantageous to the holder with this alternative, only the if converted method is applied. No proceeds would be received to which the treasury stock method could be applied. [*.35, .37*]

.025 When conversion is not assumed because the result would be anti-dilutive, dividends declared for the period (or accumulated for the period even though not declared) are deducted from net income to determine earnings applicable to common stock. [*.30, .40, 2011A.05*]

Options and Warrants

.026 The basic method for including options and warrants and their equivalents in earnings per share computations is the treasury stock method. Under this method, exercise of options and warrants and their equivalents is assumed at the beginning of the period (or time of issuance, if later). Shares of common stock are assumed to be issued and the proceeds from exercise are assumed to be used to purchase common stock at the exercise date. Common stock outstanding is assumed to increase by the difference between the number of shares issued and the number of shares purchased. The provision against reflecting antidilution in earnings per share computations generally prohibits the assumption of exercise of any option or warrant or their equivalents when the assumed purchased price of the common stock is below the exercise price of the option or warrant. [*.36, .42*]

.027 Section 2011 recommends as a practical matter that exercise not be assumed for earnings per share computations until the market price of the common stock has been higher than the exercise price for substantially all of three consecutive months ending with the last month of the period for which the share computation is being made. Thus, exercise need not be assumed until this three-month test has once been met. [*.36*]

 © 1974, American Institute of Certified Public Accountants, Inc.

.028 After the test has been met, however, an ending market price which is above the average market price is used for fully diluted computations if the result is dilutive. Therefore, options and warrants may be reflected in fully diluted earnings per share even though they are not reflected in primary earnings per share. Options and warrants may also be included in the computations in some periods but not be included in other periods. [*.42*]

.029 Some warrants require or permit the tendering of debt or other securities in payment of all or part of the exercise price. Upon the assumed exercise of such warrants, the debt or other securities are assumed to be tendered (unless tendering cash would be more advantageous to the warrant holder when permitted and the treasury stock method is applied). Interest, net of income tax, on any debt tendered is added back to net income. The treasury stock method is applied for proceeds assumed to be received in cash. [*.37*]

.030 The proceeds from the exercise of some warrants must be applied to retire debt under the terms of the debt. Upon the assumed exercise of such warrants, the proceeds are applied to purchase the debt at its market price rather than to purchase common stock under the treasury stock method. The treasury stock method is applied, however, for excess proceeds from the assumed exercise. Interest, net of income tax, on any debt assumed to be purchased is added back to net income.

.031 Some convertible securities require or permit the payment of cash upon conversion and are considered the equivalent of warrants. The treasury stock method must be applied to purchase common stock from proceeds assumed to be received. The if converted method must also be applied for the convertible security.

.032 The application of the treasury stock method is modified when the number of common shares which would be issued if all outstanding options and warrants and their equivalents were exercised exceeds 20% of the number of common shares outstanding at the end of the period. This 20% test is based only on common shares actually outstanding, not considering any assumed conversion or contingently issuable shares. [*.38*]

.033 When the 20% test is met, *all* options and warrants and their equivalents are assumed to be exercised (or converted) regardless of whether each would be dilutive or anti-dilutive. The treasury stock method is first applied to purchase no more than 20% of the number of common shares outstanding at the end of the period with the proceeds from exercise. The balance of any proceeds remaining after applying the treasury stock method is then applied to reduce any short-term or long-term debt of the issuer to the extent that the debt may be retired. Finally, any remaining balance of proceeds is assumed to be invested in U. S. government securities or commercial paper. Appropriate recognition is given to any necessary interest adjustments (and related income tax effect) for both debt retirement and investment in determining earnings applicable to common stock. [*.35, .38*]

.034 The results of the foregoing computations are then aggregated. If the net aggregate effect is dilutive, *all* of these computations enter into earnings per share computations. However, *all* are omitted if the net aggregate effect is anti-dilutive. (See Interpretation 74 for a description of the distinction between the 20% test and the 20% limitation.)

Delayed Effectiveness and Changing Rates or Prices

.035 Some convertible securities are not convertible until a future date or their conversion rates may increase or decrease in the future. Similarly, some options or warrants are not exercisable until a future date or their exercise prices may increase or decrease in the future. [*2011A.11*]

.036 For primary earnings per share computations, the conversion rate or exercise price in effect for the period presented is used. If the holder does not have the right to convert or exercise the security until after that period, the earliest effective conversion rate or exercise price during the five years following the close of the period is used. [*2011A.12*]

.037 For fully diluted earnings per share computations, the most advantageous conversion rate or exercise price (to the security holder) becoming effective within ten years following the close of the period being reported upon is used. [*2011A.13*]

 © 1974, American Institute of Certified Public Accountants, Inc.

Other Securities

.038 Although section 2011 does not describe in depth the treatment to be accorded to other types of securities, they were contemplated by section 2011 and some guidelines given. The earnings per share treatments of two-class common stock, participating securities, common stock issuable in the future upon the satisfaction of specified conditions, securities of subsidiaries, and options or warrants to purchase convertible securities are discussed in the Interpretations which follow in Part II. Situations or securities not expressly covered in section 2011 should be dealt with in accordance with their substance following the guidelines and criteria of section 2011 and these Accounting Interpretations. [*.43*]

Restatement of Previously Reported Data

.039 The earnings per share amounts reported in a prior period generally will be reported at the same amounts when that prior period is included in a later comparative income statement. Section 2011 specifically prohibits retroactive restatement (1) for changes in market prices of common stock when the treasury stock method has been applied for options and warrants, (2) when conversion rates of convertible securities or exercise prices of options or warrants change, (3) when convertible securities are actually converted, and (4) for primary earnings per share, when the number of shares issued upon the attainment of increased earnings levels differs from the number of shares previously considered outstanding. [*.22, .36, .41, 2011A.12, 2011A.17*]

.040 Section 2011 requires retroactive restatement (1) to give effect to prior period adjustments,[7] (2) to give effect to stock dividends, stock splits, and reverse splits, including those occurring after the close of the period being reported upon, (3) to give effect to a pooling of interests, (4) to give effect to changes in the number of shares contingently issuable or issued when such changes are caused by changes in market prices of the stock, and (5) to give effect to a reduction in the number of shares contingently issuable

[7] See section 2014, Prior Period Adjustments. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

when the term of an agreement to issue additional shares expires and the conditions have not been met.[8] [*.18, 2011A.03, 2011A.04, 2011A.17, 2011A.18*]

.041 Section 2011 recommends retroactive restatement of earnings per share data for periods beginning before January 1, 1969 when such data are presented in comparative income statements including a period beginning after December 31, 1968 and election "b" of section 2011.46 has been made. Retroactive restatement of such data is required, however, when election "a" of section 2011.46 has been made. Otherwise, part of the data would conform to the provisions of Part II of APB Opinion No. 9 which is superseded by section 2011. [*.45, .46*]

Business Combinations and Reorganizations

.042 A business combination accounted for as a purchase of another business should, in the weighted average of shares, give effect to additional securities issued only from the date of acquisition. Results of operations of the acquired business are also included in the statement of income only from the date of acquisition. [*2011A.04*]

.043 In a pooling of two or more corporations, the weighted average outstanding securities of the constituent corporations adjusted to the equivalent securities of the surviving corporation should be used for the earnings per share computation for all periods presented. The results of operations of the constituent businesses are also combined for all periods presented.

.044 After a reorganization or quasi-reorganization, the earnings per share computations should be based on an analysis of the particular transaction applying the guidelines of section 2011.

Disclosure

.045 Disclosure is required to explain the rights and privileges of the holders of the various securities outstanding; the bases upon which primary and fully diluted earnings per share were computed; the number of shares issued upon conversion, exercise or satisfaction of required con-

[8] But note that restatement is prohibited for primary earnings per share when increased earnings levels are attained and shares are issued which were not previously considered outstanding for prior primary computations. (See point 4 in the preceding paragraph and section 2011A.17.)

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

ditions; and other information necessary for a clear understanding of the data presented. (For example, if the fully diluted amount is the same as the primary amount because certain anti-dilutive securities which are not common stock equivalents are omitted from the fully diluted computation, that fact would be disclosed.) [*.15-.16, .19, .20*]

Supplementary Data

.046 Supplementary earnings per share data [9] are to be furnished for the latest period when conversion occurs and primary earnings per share would have increased or decreased at least 3% if the conversion had occurred at the beginning of the period. Supplementary data are also to be furnished when common stock or common stock equivalents are sold and the proceeds are used to retire preferred stock or debt. It may also be desirable to furnish supplementary earnings per share data for each period presented giving the cumulative retroactive effect of all such issuances. [*.14 fn. 4, .22-.23*]

.047 Supplementary data show what primary earnings per share would have been if the situations described above had occurred at the beginning of the period being reported upon rather than during the period. Thus, supplementary data are helpful for reflecting the trend of earnings per share data when primary amounts are affected by an increase in the number of shares included in the computation without an increase in the capital employed in the business.

Effective Date

.048 Section 2011 is effective for fiscal periods beginning after December 31, 1968. Earnings per share must therefore be reported on the faces of all income statements for periods beginning January 1, 1969 and thereafter. Securities are to be classified under the provisions of section 2011 regardless of the time of issuance except that an election is granted for securities with a time of issuance prior to June 1, 1969 for computing primary earnings per share to either:

[9] Supplementary earnings per share data should not be confused with fully diluted earnings per share. As used in section 2011, "supplementary earnings per share data" are additional data which are disclosed in a note. (APB Opinion No. 9 used the term "supplementary pro forma earnings per share" to describe data which are described as "fully diluted earnings per share" in section 2011.)

(a) classify all such securities under the provisions of section 2011, i. e., apply section 2011 retroactively regardless of when the securities were issued, or

(b) classify all securities outstanding[10] at May 31, 1969 as common stock equivalents if they were residual securities under APB Opinion No. 9.

All securities subject to the election must be classified under election "a" or all securities must be classified under election "b." The election may not be changed after it is made. Thus, the classification of all securities issued prior to June 1, 1969 once determined under election "a" or election "b" never change.[11] All securities with a time of issuance after May 31, 1969 must be classified under the provisions of section 2011. [*.45, .46*]

.049 Election "b" allows a corporation to ignore options and warrants issued before June 1, 1969 in primary earnings per share computations unless they were considered residual securities under APB Opinion No. 9. The election was provided because the Board has traditionally not made its Opinions retroactive. Section 2011 therefore does not apply new rules to securities which were issued under a prior section and which were already outstanding when section 2011 was issued.

.050 The election applies only to primary earnings per share computations. Fully diluted earnings per share computations include all common stock equivalents and other potentially dilutive securities without regard to the election. However, supplementary pro forma earnings per share determined under APB Opinion No. 9 are not necessarily the same[12] as fully diluted earnings per share determined under section 2011. Therefore, the Board recommends that previously reported earnings per share data be restated when reported in comparative income statements including an earnings per share amount computed under

[10] Securities no longer outstanding at May 31, 1969 are classified as common stock equivalents if they were residual securities under APB Opinion No. 9 at the statement date. This applies only for income statements for periods prior to May 31, 1969 when such income statements are subsequently included in comparative income statements after that date.

[11] See Interpretations 29 and 30 for exceptions.

[12] Although pro forma earnings per share and fully diluted earnings per share could be the same, they might be different. Any differences would result principally from the anti-dilution provisions of section 2011 and from different computational methods for options and warrants.

 © 1974, American Institute of Certified Public Accountants, Inc.

the provisions of section 2011 if election "b" of section 2011.46 has been made. Restatement for all prior periods presented is accomplished by retroactively applying (1) the security classifications determined under election "b" and (2) the computational methods prescribed by section 2011. [*.45, .46*]

.051 Both primary and fully diluted earnings per share amounts for prior periods must be retroactively restated if election "a" of section 2011.46 has been made when the prior period data are reported in comparative income statements including earnings per share data computed under the provisions of section 2011.

PART II: ACCOUNTING INTERPRETATIONS OF SECTION 2011

DEFINITIONAL INTERPRETATIONS

1. Security

.052 The term *security* is used in sections 2010, 2011 and in these Interpretations in a broad context to include instruments not usually considered to be securities. Securities are usually thought of as being common stocks, preferred stocks (both nonconvertible and convertible), bonds (both ordinary and convertible), and warrants. In a broad context, the term *security* also includes all debt instruments, options to purchase stock (or other securities), stock purchase contracts, stock subscriptions, and agreements to issue stock (or other securities) at a future date. Several securities may be included in a single instrument, which may or may not be separable. [*.27, .37*]

2. Common Stock Equivalents

.053 A common stock equivalent is defined by section 2011 as: "A security which, because of its terms or the circumstances under which it was issued, is in substance equivalent to common stock." (See section 2011D.05.) A common stock equivalent is not common stock in form but rather derives a large portion of its value from its common stock characteristics or conversion privileges. Such a security typically contains provisions enabling its holder to become a common stockholder. Its value tends to change with changes in the value of the common stock to which it is related. Examples of common stock equivalents are: options

and warrants, preferred stock or debt convertible into common stock if the stock or debt yields less than 66⅔% of the bank prime interest rate at time of issuance, and agreements to issue common stock with the passage of time as the only condition to issuance. [*.25, .27, .33, .35*]

3. Other Potentially Dilutive Securities

.054 *Other potentially dilutive securities* is a term used in this Interpretation to designate a classification of securities which are similar to common stock equivalents but which for one reason or another do not meet the tests for common stock equivalents under section 2011.[13] Other potentially dilutive securities are included only in fully diluted earnings per share computations while common stock equivalents are, in effect, included in both primary and fully diluted earnings per share computations.

.055 Examples of other potentially dilutive securities are convertible senior securities (convertible preferred stock and convertible debt) and options or warrants issued prior to June 1, 1969 if election "b" of section 2011.46 is made[14] and the options or warrants were not classified as residual securities under APB Opinion No. 9. [*.41, .46*]

4. Dilution—Dilutive Security

.056 Dilution, as used in section 2011, is a reduction of the amount which would otherwise be reported as earnings per share. A dilutive security is a security which results in a decrease in the amount reported as earnings per share. As explained in Interpretations 5 and 15, there is no dilution of net loss per share when a corporation reports a net loss on its income statement. [*.14 fn. 4, .30, .40*]

.057 A dilutive security increases the number of common shares which are considered to be outstanding during

[13] The term is not used in section 2011 in this strict context. *Potentially dilutive securities,* as that term is used in section 2011, includes common stock equivalents. (For example, see section 2011.14.) Section 2011 discusses convertible senior securities which are not common stock equivalents and other contingent issuances which are not common stock equivalents. Securities which are *not* common stock equivalents but which enable their holders to obtain common stock are described in these Interpretations as "*other* potentially dilutive securities." Therefore, convertible senior securities described in section 2011 are classified as "other potentially dilutive securities" in these Interpretations.

[14] See Interpretation 46 for an explanation of why these options and warrants are not classified as common stock equivalents.

 © 1974, American Institute of Certified Public Accountants, Inc.

the period for which the earnings per share computation is being made. Thus, a dilutive security increases the denominator used in the earnings per share computation. Earnings applicable to common stock, the numerator in the computation, may also increase. But so long as the numerator increase per additional denominator share is less than earnings per outstanding share, the security will be dilutive. [*2011A.06*]

5. Anti-Dilution—Anti-Dilutive Security

.058 Anti-dilution is an increase in the amount which would otherwise be reported as earnings per share or a decrease in the amount of the net loss per share. Anti-dilution therefore has an incremental effect on earnings per share data. An anti-dilutive security is a security which would result in an increase in the amount reported as earnings per share or a decrease in the amount reported as net loss per share. [*.30, .40*]

.059 When a net income is reported, an anti-dilutive option or warrant under the treasury stock method reduces the number of common shares considered outstanding during a period. Such options or warrants, if permitted to enter the computation, would increase earnings per share by reducing the denominator used. Anti-dilutive convertible debt would increase the denominator. However, its interest adjustment would increase earnings applicable to common stock, the numerator used in the computation, by a greater amount per additional share than earnings per share computed without assuming conversion. Any numertor increase per additional denominator share which is greater than earnings per share computed without assuming conversion would have an incremental effect on earnings per share and would be anti-dilutive. Convertible preferred stock is anti-dilutive when its dividend per common share obtainable upon conversion exceeds earnings per share computed without assuming conversion.

.060 When a net loss is reported, exercise or conversion is not assumed.[15] Any computation is anti-dilutive which increases the number of shares considered outstanding during a period for which a net loss is reported. Exercise of options and warrants is not assumed since this would

[15] See Part I, paragraph .016, footnote 5.

increase the number of shares considered outstanding. Likewise, conversion would increase the number of shares considered outstanding. In addition, the if converted adjustments for convertible debt would decrease the amount of the loss. Not deducting dividends on convertible preferred stock would also decrease the amount of the loss applicable to common stock.

6. Dual Presentation

.061 The dual presentation has two groups of earnings per share data; one is primary earnings per share data and the other is fully diluted earnings per share data. Both must be presented with equal prominence on the face of the income statement. [*.16*]

.062 The dual presentation of primary and fully diluted earnings per share data should not be confused with the two earnings per share amounts which must be presented when a corporation reports extraordinary items on its income statement. Even when the dual presentation is not required, a corporation reporting extraordinary items must report (1) earnings per share for income before extraordinary items and (2) earnings per share for net income. When the dual presentation is required, a corporation reporting extraordinary items must report both amounts for primary earnings per share and both amounts for fully diluted earnings per share. [*.13*]

.063 A corporation with no extraordinary items on its income statement would report only earnings per share for net income. But this must be reported for both primary and fully diluted earnings per share by a corporation when the dual presentation is required.

7. Primary Earnings per Share

.064 Primary earnings per share is the amount of earnings attributable to each share of common stock outstanding and common stock assumed to be outstanding to reflect the dilutive effect of common stock equivalents. Primary earnings per share data include an earnings per share amount for income before extraordinary items and an earnings per share amount for net income. These data may also include an earnings per share amount for extraordinary items. [*.13, .15*]

 © 1974, American Institute of Certified Public Accountants, Inc.

.065 Primary earnings per share is used in section 2011 and in these Interpretations as a convenient means of designating the presentation of these data which must appear on the face of an income statement of a corporation when the dual presentation is required. Thus, "primary" is a communication tool used merely to identify this group of earnings per share data to be presented and is not suggested as a caption to be used on the income statement. The term "primary" is not intended in any way to attribute greater significance to this group of data than is attributed to the fully diluted data.

8. Fully Diluted Earnings per Share

.066 Fully diluted earnings per share is the amount of earnings attributable to each share of common stock outstanding and common stock assumed outstanding to reflect the dilutive effect of common stock equivalents and other potentially dilutive securities. Fully diluted earnings per share data include an earnings per share amount for income before extraordinary items and an earnings per share amount for net income. These data may include an earnings per share amount for extraordinary items. [*.13, .15*]

.067 Fully diluted earnings per share is used in section 2011 and in these Interpretations as a convenient means of designating the presentation of these data which must appear on the face of an income statement of a corporation when the dual presentation is required. Thus, "fully diluted" is a communication tool used merely to identify this group of earnings per share data to be presented and is not suggested as a caption to be used on the income statement.

APPLICABILITY OF SECTION 2011

9. Corporations and Financial Presentations Excepted *

.068

Q—Does section 2011 require all corporations to present earnings per share on all income statements?

A—All corporations which are not specifically excepted by section 2011 must present earnings per share on the face of any income statement or summary of such a statement for periods beginning after December 31, 1968.

* See section 2083, *Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*

.069 The only corporations excepted from the provisions of section 2011 are:

1. Mutual companies without common stock or common stock equivalents outstanding (for example, mutual savings banks, cooperatives, credit unions, etc.).
2. Companies registered under the Investment Company Act of 1940.
3. Corporations owned by political subdivisions or municipal, county, state, federal or foreign governments.
4. Not-for-profit corporations (for example, colleges, universities, medical or scientific research entities, trade and professional associations, religious organizations, etc. which are incorporated). [*.06*]

.070 Section 2011 applies to all financial presentations which purport to present results of operations in conformity with generally accepted accounting principles and to summaries of those presentations for all corporations except those listed above. However, the following financial presentations are also excepted from the provisions of section 2011:

1. Parent company statements accompanying consolidated financial statements.
2. Statements of wholly owned subsidiaries.
3. Special purpose statements.
[*.05, .06*]

.071 Special purpose statements (as described in AU section 621, volume 1, AICPA PROFESSIONAL STANDARDS) by definition are not prepared in accordance with generally accepted accounting principles. Special purpose statements are not, however, merely those prepared for specific purposes if they purport to present results of operations in conformity with generally accepted accounting principles. For example, SEC Form S-9 for registration of certain high-grade, nonconvertible, fixed-interest debt securities requires disclosure of ratios of earnings to fixed charges for each year in the summary (or statement) of earnings. Although the SEC does not require that earnings per share data be reported in Form S-9, this form is not a "special purpose

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

statement." Earnings per share must therefore be reported under section 2011.

10. Closely Held Corporations *

.072

Q—Does section 2011 apply to closely held corporations?

A—Yes, closely held corporations which are not wholly owned subsidiaries of other corporations must report earnings per share on their income statements in accordance with section 2011. A corporation whose stock is all owned by a single individual is not a wholly owned subsidiary [*.05, .06*]

11. Dilution Less Than 3%

.073

Q—Must a corporation with few dilutive securities outstanding make the dual presentation? May such a corporation ignore the dilutive securities and report earnings per share based on common shares outstanding?

A—The required reporting of earnings per share data depends on the materiality of the amount of dilution produced by securities which enable their holders to obtain common stock in the future. Aggregate dilution from all such securities which is less than 3% of earnings per common share outstanding need not be reported for either primary or fully diluted earnings per share, since such dilution is not considered to be material. Thus, if both the primary and fully diluted amounts are more than 97% of earnings per common share outstanding, earnings per share may be based on only common shares outstanding. [*.14 fn. 4*]

.074 The 3% provision applies to fully diluted earnings per share compared to earnings per common share outstanding, not compared to primary earnings per share. Anti-dilutive securities are not dilutive by definition and should be excluded in computing aggregate dilution. The 3% provision also applies to the reporting of any other earnings per share information, such as supplementary

* See section 2083, *Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*

data. Aggregate dilution of less than 3% generally should be reported when it is anticipated that earnings per share data for a period when the provision applies might subsequently be included in a comparative income statement in which the following period reflects dilution of 3% or more. Otherwise, dilution in the following period would appear greater than it in fact was. [*.15, .17*]

.075 The Board intended the 3% provision to provide relief from complex computations to corporations which would have insignificant dilution if all obligations to issue common stock in the future were fulfilled currently. This would be the case, for example, for a corporation which has no obligations to issue common stock except for a small amount of stock under options granted to its executives. [*.14 fn. 4*]

12. 3% Test

.076

Q—Is there a simple test which can be applied to determine if dilution would be at least 3%?

A—Yes. As a "rule of thumb," make both the primary and fully diluted computations whenever the number of additional common shares which must be assumed to be issued exceeds 3% [16] of the number of outstanding common shares. If the dilution produced by either computation is at least 3%, the dual presentation is required. [*.15*]

.077 Dilutive options and warrants are included in earnings per share computations under the treasury stock method, which produces incremental shares (as explained in Interpretation 51). The number of incremental shares the treasury stock method will produce can be approximated by applying a simple formula. Since stock options are the only obligations of many closely held corporations to issue common stock, the formula is useful when the test described above is to be applied and only options or warrants are considered. [*.36*]

[16] Actually, the number of additional shares must be at least 3/97 (or 3.09 + %) of the number of outstanding common shares. If earnings applicable to common stock includes an "if converted" adjustment, a greater number of additional shares would be required to produce dilution of at least 3%. Thus, although the number of additional shares is not the only determinant of dilution, common shares assumed outstanding must increase more than 3% to produce dilution of at least 3%.

 Copyright © 1978, American Institute of Certified Public Accountants, Inc.

.078 The following formula[17] will approximate the number of incremental shares which will result from applying the treasury stock method for options or warrants:

$$I = \frac{M - E}{M}(N)$$

Where:

- I is the number of incremental shares which would be produced by the treasury stock method.
- M is the market price (or fair value) per share of common stock.
- E is the exercise price of the option or warrant per common share obtainable upon exercise.
- N is the total number of shares obtainable on exercise.

Subject to the constraint[18] that $M > E$

.079 An example of the application of the formula follows. Assume that a corporation has granted options to its officers to purchase 10,000 shares of common stock at $6 per share and the common stock has a market price (or fair value) of $10 per share.

.080 Applying the formula for the information given, the amounts to be substituted for the letters are:

$I = \text{unknown}$

$M = \$10$

$E = \$6$

$N = 10{,}000$

Therefore:

$$I = \frac{\$10 - \$6}{\$10}(10{,}000)$$

$$I = .4(10{,}000)$$

$$I = 4{,}000$$

---

[17] The formula should not be used when section 2011.38 applies, i. e., when the number of common shares obtainable on the exercise of all options and warrants and their equivalents exceeds 20% of the number of common shares outstanding.

[18] The formula would not be used unless the market price is greater than the exercise price since the result could be anti-dilutive.

If the 4,000 incremental shares exceeds 3% of the number of outstanding common shares, actual dilution would be computed to determine if dilution is at least 3%.

13. Subchapter S Corporations

.081

Q—Does section 2011 apply to the financial statements of corporations electing under Subchapter S of Chapter 1 of the *Internal Revenue Code?*

A—Yes, such corporations must report earnings per share on the face of their income statements. Net income is computed without regard to taxes on that income which will be paid by stockholders rather than by the corporation. Undistributed earnings of the corporation taxed to the stockholders increase the stockholders' tax bases in the shares they own, but the number of shares outstanding does not increase unless the corporation issues additional shares. The amount per share of income tax the corporation would have paid in the absence of the Subchapter S election would be useful information to disclose. [*.05, .06*]

14. Unaudited Financial Statements

.082

Q—Does section 2011 apply to unaudited financial statements?

A—Yes. If a CPA is associated with an unaudited income statement which does not report earnings per share, the CPA should phrase his disclaimer of opinion on the statement in accordance with the provisions of either AU sections 516.05-.06 or 517.06 (Volume 1, AICPA PROFESSIONAL STANDARDS) as is appropriate under the circumstances of the engagement. [*.05, .06*]

EARNINGS PER SHARE PRESENTATION

15. Reporting Loss per Share

.083

Q—Must net loss per share be reported?

A—Yes, net loss per share must be reported under the same requirements that earnings per share must be reported. Net loss per share, however, is based on outstanding

 © 1974, American Institute of Certified Public Accountants, Inc.

common shares. Assuming exercise of options and warrants or conversion of convertible securities would be anti-dilutive since an increase in the number of shares assumed to be outstanding would reduce the amount of the loss per share.[19] The amount of the loss is increased by any dividends declared (or cumulative even though not declared) for the period on preferred stocks. [*.12, 2011A.05*]

16. EPS for Extraordinary Items

.084

Q—Must earnings per share be presented for extraordinary items?

A—No, although this presentation may generally be desirable. Section 2011.13 states that earnings per share data should be reported consistent with the income statement presentation required by section 2012.11. Thus, it would appear that earnings per share should be presented for (1) income before extraordinary items, (2) extraordinary items less applicable income tax, and (3) net income as required by section 2012.11 when an extraordinary item is reported on the income statement. This presentation is used in the example in section 2011C.03, Exhibit B. [*.13*] [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

.085 However, section 2011.13 requires that earnings per share data be presented for only (1) income before extraordinary items and (2) net income. Although the two requirements appear to conflict, earnings per share need not be presented for extraordinary items. A reader of the financial statements can determine earnings per share for extraordinary items by subtraction if it is not reported.

.086 Naturally, the earnings per share data will be more complete if an amount is reported for extraordinary items when such items are reported on the income statement. This presentation, although not required, may therefore be generally desirable. In some cases, reporting all three earnings per share amounts would be particularly helpful to the reader, such as in the situation described in section 2011.30, footnote 10 (where the effect on either income before extraordinary items or on net income is antidilutive but is dilutive on the other). [*.30, fn. 10*]

[19] See paragraph .016, footnote 5.

17. Simple Capital Structure

.087

Q—What is a simple capital structure for purposes of computing earnings per share?

A—A corporation has a simple capital structure for purposes of computing earnings per share if during the period it had no securities outstanding (or agreements to issue securities) that in the aggregate dilute earnings per outstanding common share. [*.14*]

18. Complex Capital Structure

.088

Q—What is a complex capital structure for purposes of computing earnings per share?

A—A corporation has a complex capital structure for purposes of computing earnings per share if it has issued, in addition to common stock, securities which have a dilutive effect on earnings per outstanding common share. Among the securities which may have a dilutive effect are convertible preferred stock, convertible debt, options, warrants, participating securities, different classes of common stock, and agreements to issue such securities or shares of common stock in the future. [*.15, .27, .41*]

.089 As explained in Interpretation 11, if the aggregate dilution for the period produced by all such securities which are dilutive does not reduce earnings per outstanding common share by at least 3%, a corporation may be considered as having a simple capital structure for purposes of computing earnings per share. It may be desirable, however, to report the actual dilution in such a case, particularly if the period being reported upon might later be included in a comparative income statement which includes one or more periods with dilution of 3% or more. [*.14, .14 fn. 4, .17*]

19. EPS for Simple and Complex Capital Structures

.090

Q—How does the reporting of earnings per share data differ for corporations with simple capital structures and corporations with complex capital structures?

 © 1974, American Institute of Certified Public Accountants, Inc.

A—A corporation with a simple capital structure is required to have a single presentation of "earnings per common share" on the face of its income statement. A corporation with a complex capital structure is required to have a dual presentation of both primary and fully diluted earnings per share on the face of its income statement. [*.14*, *.15*]

.091 Exceptions which apply to corporations with simple capital structures are explained in Interpretation 20. An exception which applies to corporations with complex capital structures is explained in Interpretation 18.

20. Dual Presentation for Corporation with Simple Capital Structure

.092

Q—Is a corporation with a simple capital structure ever required to have the dual presentation?

A—Yes, the dual presentation is required if common stock was issued during the period on exercise, conversion, etc. and primary earnings per share would have increased or decreased if the issuance had taken place at the beginning of the period. [*.41*]

.093 A corporation has a simple capital structure when it has no dilutive securities outstanding. If outstanding anti-dilutive securities are exercised or converted, however, such a corporation would be required to have the dual presentation if primary earnings per share would have been affected as described above. Thus the dual presentation may be required for a corporation with a simple capital structure to report the incremental effect of an anti-dilutive exercise or conversion. [*.14*, *.41*]

.094 Also, the dual presentation is required for all periods presented in a comparative income statement if it is required for any period. The dual presentation may therefore be required for one or more periods in a comparative income statement when the corporation had a simple capital structure. [*.17*]

21. Primary v. Fully Diluted EPS

.095

Q—How do fully diluted earnings per share differ from primary earnings per share?

A—Primary earnings per share computations include only common stock and dilutive common stock equivalents. Fully diluted earnings per share computations include common stock and dilutive common stock equivalents together with other potentially dilutive securities. Fully diluted earnings per share also include those exercises or conversions for which common stock was issued during the period whether their effect is dilutive or anti-dilutive. [*.24, .41*]

.096 Fully diluted earnings per share show the maximum potential dilution of all dilutive contractual obligations to issue common stock and their effect on current earnings per share on a prospective basis. The difference between primary and fully diluted earnings per share shows (1) the maximum extent of potential dilution of current earnings which would occur from the conversions of securities that are not common stock equivalents or the contingent issuance of common stock not included in the computation of primary earnings per share and (2) the effect of all issuances of common stock on exercises or conversions during the year as if the issuance had occurred at the beginning of the year. [*.16, .40, .41*]

22. Captions for Earnings per Share Presentations

.097

Q—What captions should be used for reporting earnings per share amounts in the dual presentation?

A—Precise designations are not prescribed by section 2011 except that the term "earnings per common share" should not be used unless a corporation has a simple capital structure or the term is appropriately qualified. The qualification is determined by whether the corporation has only common stock equivalents or also has other potentially dilutive securities. [*.16*]

.098 Listed below are five captions which might be used to designate earnings per share amounts. Following the captions is a table indicating the captions a corporation might use when it has various combinations of securities outstanding. The first two columns of the table indicate the combinations of securities a corporation might have. The numbers in the other three columns refer to the numbers listed beside the captions which might be used to

 © 1974, American Institute of Certified Public Accountants, Inc.

designate the earnings per share amounts. For example, a corporation having both dilutive common stock equivalents and other potentially dilutive securities outstanding could designate the primary amounts "Earnings per common and common equivalent share" and could designate the fully diluted amounts "Earnings per common share—assuming full dilution."

SUGGESTED EARNINGS PER SHARE CAPTIONS

1. Earnings per common share.
2. Earnings per common share—assuming no dilution.
3. Earnings per common share—assuming full dilution.
4. Earnings per common and common equivalent share. (If both dilutive and anti-dilutive common stock equivalents are present, the caption may be: Earnings per common and dilutive common equivalent share.)
5. Earnings per common share—assuming issuance of all dilutive contingent shares.

TABLE INDICATING USE OF EPS CAPTIONS

			Dual Presentation	
Common Stock Equivalents Present	*Other Potentially Dilutive Securities Present*	*Caption for Single Presentation*	*Primary Caption*	*Fully Diluted Caption*
No [a]	No [a]	1		
No [a]	Dilutive		2	3
No [a]	Anti-dilutive	1 [b]		
Dilutive	No		4	3 [c]
Dilutive	Dilutive		4	3
Dilutive	Anti-dilutive		4	5 [b, c]
Anti-dilutive	No [a]	1 [b]		
Anti-dilutive	Dilutive		2 [b]	5 [b]
Anti-dilutive	Anti-dilutive	1 [b]		

Notes:

[a] *Or dilution is less than 3% if such securities are present.*

[b] *In a note, disclose the existence of the anti-dilutive securities.*

[c] *Primary and fully diluted amounts will be the same.*

23. Captions in Comparative Statements

.099

Q—What presentation is required in a comparative income statement when a corporation has a simple capital structure in one period and a complex capital structure in another period?

A—The dual presentation is required for all periods presented if it is required for any period presented. Since the corporation had a complex capital structure in one period presented, the dual presentation is required for that period and for all other periods presented in the comparative income statement. [*.17*]

.100 In a comparative income statement the captions used should be appropriate for the most dilutive presentation. For example, if there were no common stock equivalents in one period, anti-dilutive common stock equivalents in one period, and dilutive common stock equivalents in another period in a comparative income statement, the primary amounts could have a designation such as "earnings per common and dilutive common equivalent share." Explanatory disclosure in a note may also be appropriate.

COMPUTING EARNINGS PER SHARE

24. Earnings Applicable to Common Stock

.101

Q—How is "earnings applicable to common stock" determined for earnings per share computations?

A—For a corporation with a simple capital structure, earnings applicable to common stock is net income reduced by dividends declared or paid for the period to preferred stock. Cumulative preferred dividends for the current period not paid or declared also are deducted from net income in determining earnings applicable to common stock. However, preferred dividends which are cumulative only if earned are deducted only to the extent they are earned. Interest on debt need not be adjusted in determining earnings applicable to common stock since it was deducted in arriving at net income. [*2011A.05*]

.102 For example, assume that a corporation has a net income of $6,000 and has 1,000 shares of common stock outstanding. Also outstanding are 1,000 shares of nonconvertible noncumulative preferred stock and $10,000 of 6% nonconvertible bonds. The corporation has a simple capital structure. If no dividends were paid on preferred stock, earnings applicable to common stock would be $6,000. Earnings per common share would be $6 per share ($6,000 net income divided by 1,000 common shares). The declaration of a dividend of $1 per share on preferred stock would

 © 1974, American Institute of Certified Public Accountants, Inc.

result in earnings applicable to common stock of $5,000 ($6,000 net income less $1,000 for preferred dividends) and earnings per common share of $5 per share. The same result would be obtained if the dividend were cumulative and had not been declared. The same result would also be obtained whether or not the corporation paid (or declared) a dividend on common stock. [*.14, 2011A.05*]

.103 For a corporation with a complex capital structure, net income is reduced by dividends on nonconvertible preferred stock as described above. When the if converted method is applied for outstanding convertible securities, however, dividends for convertible preferred stock are not deducted from net income but other adjustments may be necessary. Under the if converted method, convertible dividends are not deducted when conversion is assumed, and interest (less applicable income tax) is added back to net income when convertible debt is assumed to be converted. [*2011A.06*]

.104 For example, assume that a corporation has a net income of $6,000 and has 1,000 shares of common stock outstanding. Also outstanding are 1,000 shares of common stock equivalent convertible preferred stock (convertible one common share for each preferred share) and $10,000 of 6% convertible bonds (convertible three common shares for each $100 bond) which are not common stock equivalents. The corporation has a complex capital structure. Assume also that the corporation paid a $1 per share dividend on both common and preferred stock and the income tax rate is 22%. For primary earnings per share, earnings applicable to common stock is $6,000 and earnings per common and common equivalent share is $3 per share ($6,000 divided by 2,000 shares, composed of 1,000 common shares and 1,000 common equivalent shares from the assumed conversion of the convertible preferred stock). For fully diluted earnings per share, earnings applicable to common stock is $6,468 ($6,000 net income plus $600 interest less $132 additional tax payable if the interest had not reduced net income). Earnings per common share assuming full dilution is $2.81 per share [$6,468 divided by 2,300 shares; composed of 1,000 common shares, 1,000 common equivalent shares, and 300 shares from the assumed conversion of the convertible bonds). [*.15, 2011A.06*]

25. Weighted Average of Shares Outstanding

.105

Q—What is the effect on earnings per share computations of issuing common stock or other securities which may be converted or exercised to obtain common stock or of reacquiring common stock or such securities during a period?

A—Such issuances or reacquisitions of common stock or other securities during a period require that a weighted average of shares be computed for the denominator to be used in the earnings per share computations. A weighted average gives due consideration to all shares outstanding and assumed to have been outstanding during a period. Shares issued or retired during a period are weighted by the fraction of the period they were outstanding. The weighted number of shares is added to the number of shares outstanding for the entire period to obtain the weighted average number of shares outstanding during the period. [*2011A.02*]

.106 For example, assume that a corporation had 100,000 common shares outstanding on January 1 and issued 6,000 additional common shares on March 1. The weighted average would be 102,000 shares for the quarter ending March 31 or 104,000 shares for the six months ending June 30 or 105,000 shares for the year ending December 31.

COMPUTATIONAL NOTES:

100,000 + 1/3 (6,000) = *102,000*
100,000 + 4/6 (6,000) = *104,000*
100,000 + 10/12 (6,000) = *105,000*

The same answers would result if the 6,000 shares issued on March 1 were merely assumed to have been issued to reflect the dilutive effect of common stock equivalents issued on March 1. It should be noted that the number of shares in the weighted average for the quarter and for the year are different.

.107 Reacquired shares are included in the weighted average only for the time they were outstanding. For example, assume that a corporation had 100,000 shares outstanding on January 1 and reacquired 6,000 shares on March 1. The weighted average would be 98,000 shares for the quarter ending March 31 or 96,000 shares for the six

 © 1974, American Institute of Certified Public Accountants, Inc.

months ending June 30 or 95,000 shares for the year ending December 31.

COMPUTATIONAL NOTES:

$$100{,}000 - 6{,}000 = 94{,}000$$
$$94{,}000 + 2/3\ (6{,}000) = 98{,}000$$
$$94{,}000 + 2/6\ (6{,}000) = 96{,}000$$
$$94{,}000 + 2/12\ (6{,}000) = 95{,}000$$

The same answers would result if the 100,000 shares had included common stock equivalents and the corporation had reacquired 100 dilutive common stock equivalent convertible bonds (convertible 60 common shares for one bond) on March 1.

.108 More complex methods for computing a weighted average could be used if the number of shares involved changes frequently, such as computing an average weighted by days. (See Exhibit 4, paragraph .360.)

.109 The weighted average discussed in section 2011 and in these Interpretations is technically an arithmetical mean average of shares outstanding and assumed to be outstanding for earnings per share computations. The most precise average would be the sum of the shares determined on a daily basis divided by the number of days in the period. Less precise averaging methods may be used, however, as illustrated above, if they produce reasonable results. But methods which introduce artificial weighting are not acceptable for computing a weighted average of shares for earnings per share computations. For example, the "Rule of 78" method, which weights shares for the first month of the year by 12 and weights shares for the last month of the year by 1, is not an acceptable method.

.110 Retroactive recognition is given for all periods presented to any stock dividend, stock split or reverse split, including those occurring after the end of the period for which the computation is being made but before the statements are issued.

CONVERTIBLE SECURITIES

26. Classification and Assumed Conversion

.111

Q—Which convertible securities are assumed to be converted for primary earnings per share computations

and which are assumed to be converted for fully diluted earnings per share computations?

A—Convertible securities which are classified as common stock equivalents are assumed to be converted for both primary and fully diluted earnings per share computations. Convertible securities which are not common stock equivalents are classified as other potentially dilutive securities and are assumed to be converted only for fully diluted earnings per share computations. [*.15, .31*]

.112 Conversion is assumed for either computation only when the result is dilutive unless (1) the security is included in an aggregate computation which has a net dilutive effect or (2) for fully diluted earnings per share, common stock was issued during the period on an anti-dilutive conversion, that is, a conversion which would have had the effect of increasing earnings per share if it had occurred at the beginning of the period. When conversion is assumed, the if converted method is applied.[20] When conversion is not assumed because the result would be anti-dilutive, interest or dividends on the securities reduce the amount of earnings or increase the amount of loss otherwise applicable to common stock. [*.30, .38, .40, .41, 2011A.05, 2011A.06*]

.113 Most convertible securities are classified on the basis of their yield at time of issuance. (The exceptions are discussed in the following paragraphs of this Interpretation.) Under the yield test, convertible securities which yield less than 66⅔% of the bank prime interest rate at time of issuance are common stock equivalents; those yielding at least 66⅔% of the prime rate are other potentially dilutive securities. [*.33*]

.114 If a convertible security has a change scheduled in its interest or dividend rate within five years after issuance, its yield at issuance is considered to be the lowest scheduled rate within the five years. (See Interpretation 28 for the treatment of convertible securities which are not convertible until a future date.) A convertible security which would not otherwise be a common stock equivalent at time of issuance is classified as a common stock equiva-

[20] See paragraph .023 of this Interpretation and section 2011A.06 for a description of the if converted method.

 © 1974, American Institute of Certified Public Accountants, Inc.

lent if it is issued with the same terms as those of an outstanding convertible security which is a common stock equivalent. [*.28*]

.115 Convertible securities issued prior to June 1, 1969 are classified by the issuer under one of two alternative elections specified in section 2011.46. (The election made applies to all securities issued before that date, not just to convertible securities.) Under election "a," all convertible securities issued prior to June 1, 1969 are classified as either common stock equivalents or other potentially dilutive securities under the provisions of section 2011. Under election "b," all convertible securities issued prior to June 1, 1969 which were classified as residual securities under APB Opinion No. 9 are classified as common stock equivalents; those which were classified as nonresidual securities are classified as other potentially dilutive securities. [*.46*]

.116 Convertible securities which require or permit the payment of cash upon conversion are considered the equivalents of warrants and are classified as common stock equivalents. (See Interpretation 71 for the treatment of such securities.) A few convertible participating securities are common stock equivalents for which the two-class method may be applied. (See Interpretation 87 for the treatment of such securities.) The if converted method is applied when any convertible security is assumed to be converted except for unusual cases when the two-class method is applied. [*.35, .37, 2011A.06, 2011A.14*]

27. Time of Issuance

.117

Q—What is the "time of issuance" of a convertible security?

A—"Time of issuance" is *generally* the date when agreement as to terms has been reached and announced even though subject to further actions, such as directors' or stockholders' approval. In this context, time of issuance is often referred to in financial jargon as the "handshake" date. Thus, time of issuance will usually precede the actual date of issuance of a security by some period which might be as long as several months or as short as a few hours. [*.29*]

.118 "Agreement as to terms" means that all of the terms have been set, not merely that the parties have reached an agreement in principle but the number of securities to be issued or the issue price is still to be determined at a later date. Agreement as to terms is reached when the parties are obligated to complete the transaction if it is ratified by the directors and/or stockholders, that is, neither party may legally terminate the agreement except for failure to receive approval from the directors or stockholders. The fact that the agreement is subject to a "favorable" ruling from the Treasury Department or a regulatory agency does not affect time of issuance so long as all of the terms of the agreement have been set.

.119 The classification of a convertible security is determined at time of issuance and does not change when the security is actually issued except as discussed in Interpretation 29.

.120 When time of issuance occurs before a year end but the agreement has not been approved by either the directors or stockholders before the financial statements are issued, the securities are not considered outstanding in the financial statements being issued or in earnings per share computations. (The securities are similar to a contingent issuance whose conditions are not currently being met.) [*2011A.17*]

28. Classification and Computation Not Always the Same

.121

Q—Are convertible securities included in earnings per share computations at time of issuance?

A—Convertible securities are classified at time of issuance. Generally they are assumed to be converted for earnings per share computations from this date also. Although a convertible security is classified at time of issuance, in some cases it is not assumed to be converted for earnings per share computations until a later date. [*.28, 2011A.06*]

.122 If the conversion privilege is not effective during the period being reported upon, the length of time before the privilege becomes effective determines when the security is eligible for assumed conversion in earnings per share computations. Conversion is not assumed for either primary or fully diluted computations if the conversion privi-

 © 1974, American Institute of Certified Public Accountants, Inc.

lege is not effective within ten years from the end of the period being reported upon. Conversion is assumed only for fully diluted computations if the conversion privilege is effective after five years but within ten years from the end of the period being reported upon. Conversion is assumed as if the security were immediately convertible if the conversion privilege is effective within five years from the end of the period being reported upon. [*2011A.12, 2011A.13*]

.123 For example, assume that a corporation issued a debt security at the end of its 1969 reporting year that may be converted into common stock after twelve years (at the end of 1981). The security's yield at time of issuance requires that it be classified as a common stock equivalent. Conversion would not be assumed for 1969 or 1970 earnings per share computations (interest would reduce net income in 1970, however). Conversion would be assumed whenever the effect is dilutive for fully diluted computations beginning in 1971 and for both primary and fully diluted computations beginning in 1976. Thus, the security is classified at time of issuance but conversion is not assumed for earnings per share computations until later. [*.28*]

.124 Time of issuance and classification of a convertible security may precede the obligation to issue and actual issuance by as much as several months, but a convertible security is not considered outstanding in the interim until there is a valid obligation to issue the security. For example, assume that agreement as to terms for a business combination is reached and announced on December 1, 1969. Final approval by stockholders occurs on February 16, 1970 and a convertible security is to be issued March 2, 1970. Classification of the security is determined at December 1, 1969. The security would be omitted from 1969 earnings per share computations if the financial statements are issued before February 16, 1970, but the impending issuance would be disclosed.

.125 If the business combination is accounted for as a purchase, the security would be considered outstanding from the date of the acquisition in 1970 earnings per share computations if the stockholders in fact ratify the agreement. If the business combination is accounted for as a pooling of interests, prior periods' earnings per share data would be retroactively restated in comparative income

statements issued subsequently to reflect the security as outstanding for all periods presented. (See Part I, paragraphs .042-.044.) [*2011A.04*]

29. Change of Classification of Convertible Security

.126

Q—When does the classification of a convertiblé security change?

A—A convertible security's classification is generally determined only at time of issuance and does not change thereafter. However, a change of classification (usually from other potentially dilutive security status to common stock equivalent status) may be required in two situations. These are when (1) an incorrect estimate of the security's value at time of issuance was made in the absence of a market price or (2) a common stock equivalent convertible security is issued with the same terms as an already outstanding convertible security which is not a common stock equivalent. (See Interpretation 30.) [*.28, .29*]

.127 If a convertible security does not have a market price at time of issuance, an estimate must be made of the security's fair value to apply the yield test. If the estimate of the security's value is too low, a convertible security which should be classified as a common stock equivalent might not be so classified. In such a case, the security would have to be reclassified as a common stock equivalent at actual issuance. Typically, an obviously incorrect estimate would be evidenced by materially higher market transactions for the security at actual issuance shortly after the time of issuance. [*.29, .33 fn. 11*]

.128 A change of the classification of the security would not be appropriate in such a case, however, if the higher market prices resulted from an external change over which the issuer had no control. (A general increase in the market prices of other securities might indicate an external change.) A change of the classification would also not be appropriate if convertible securities were sold for cash and the gross proceeds to the issuer were substantially equal to the total amount of the original fair value estimate for the securities. In this case, the total of the net amount received by the issuer plus brokerage commissions paid is approximately equal to the original estimate of fair value of the securities.

30. Change of Classification Is Mandatory

.129

Q—Would convertible securities issued prior to June 1, 1969 and classified as other potentially dilutive securities under section 2011.46 become common stock equivalents if another convertible security is issued with the same terms after May 31, 1969 and is classified as a common stock equivalent? [*.46*]

A—Yes, a change in classification is required by the second sentence of section 2011.28 for any outstanding convertible security which is not a common stock equivalent but which has the same terms as those of another convertible security being issued which is classified as a common stock equivalent at time of issuance. Thus, an outstanding convertible security which is not a common stock equivalent would be reclassified as a common stock equivalent if another convertible security is issued with the same terms and is classified as a common stock equivalent at time of issuance. [*.28*]

.130 Although this reclassification is an exception to the general rule that securities do not change status subsequent to time of issuance, reclassification is mandatory. All of a corporation's convertible securities issued with the same terms therefore are classified the same for earnings per share computations.

.131 For example, assume that convertible securities were issued with the same terms on May 2, June 2, and July 2, 1969. Only the July 2 issue is a common stock equivalent if classification is based on yield at time of issuance because of an increase in the bank prime interest rate. Under section 2011.28, however, both the May 2 and June 2 issues become common stock equivalents also.

31. Definition of "Same Terms"

.132

Q—What are the "same terms" (as used in the second sentence of section 2011.28) for the subsequent issuance of a convertible security?

A—The "same terms" are identical terms, not merely similar terms. Thus, any change in dividend or interest rates, conversion rates, call prices or dates, preferences in liquidation, etc. is a change in terms. Market price or issue price is not considered a "term." (See Interpretation 32.) [*.28*]

32. Issue Price Is Not a "Term"

.133

Q—Do different issue prices for different issuances of convertible securities constitute a change in "terms" if all other terms for the securities are the same?

A—No, different issue prices for convertible securities with the same terms otherwise is not a change in terms. Thus, two convertible securities issued at different prices but with the same stated dividend or interest rates, conversion rates, call prices and dates, preferences in liquidation, etc. have the same terms. [*.28*]

33. Sale of Treasury Securities Is a New Issue

.134

Q—Are convertible securities sold by an issuer from securities held as treasury securities to be classified as a new issue or as part of the original issue under the provisions of the second sentence of section 2011.28?

A—When convertible securities are acquired by the issuing corporation and subsequently reissued, they constitute a new issue with the same terms as the existing outstanding convertible security. The "new" issue's status (as a common stock equivalent or not) should be determined under both the common stock equivalent test and the provisions of the second sentence of section 2011.28. If deemed a common stock equivalent, the "new" issue could also affect the status of outstanding securities with the same terms as described in the second sentence of section 2011.28. For example, if the outstanding securities are not common stock equivalents and the reissued securities are common stock equivalents under the yield test (because of a change in market prices or the prime rate), the outstanding securities also become common stock equivalents. [*.28*]

34. Determining a Convertible Security's Cash Yield

.135

Q—Upon what return is a convertible security's cash yield based?

A—Cash yield for most convertible securities is based upon the stated amount of interest or dividends the security is scheduled to pay each year.[21] However, if the dividends

---

[21] See Interpretation 26 for the amount to be used when a convertible security has a change of interest or dividends scheduled.

© 1974, American Institute of Certified Public Accountants, Inc.

on convertible preferred stock are not cumulative, yield might have to be based on some lesser amount, particularly if the stated amount appears impossible to pay. Low earnings or contractual provisions on outstanding debt, for example, might prohibit payment of the stated amount. The same would apply for preferred dividends which are cumulative only if earned. [*.33*]

35. Computing a Convertible's Cash Yield

.136

Q—How is a convertible security's cash yield at time of issuance computed?

A—Yield is a security's return expressed as a percentage of its value. For example, a $1,000 bond which is paying $45 annual interest to the holder and selling at 90 (i. e., $900) yields 5% $\left(\text{computed } \frac{\$45}{\$900} \times 100\right)$ if the time factor to maturity is ignored. Although yield is generally computed to maturity, the yield test described in section 2011 for convertible securities uses only the stated annual return expressed as a percentage of the security's market price (ignoring commissions and transfer taxes) at time of issuance. If the security does not have a market price at time of issuance, the test is based on the security's fair value. [*.33*]

36. Cash Yield of Convertible Security in a "Package"

.137

Q—How is the cash yield determined for a convertible security issued in a "package," i. e., a convertible security is one of two or more securities issued as a unit?

A—When two or more securities are issued as a unit, the unit price at time of issuance should be allocated to each security based on the relative fair values of the securities at time of issuance. For example, assume that a "package" consisting of one share of common stock, one share of convertible preferred stock, and one nonconvertible $100 bond with a detachable warrant is sold as a unit for a total price of $200. At time of issuance, fair values were $42 per share of common stock, $63 per share of convertible preferred stock, $99.75 per bond and $5.25 per warrant. The $200 unit amount would be allocated to each security as follows:

	Fair Value at Issuance	Percentage of Total	Allocated Amount of $200
Common stock	$ 42.00	20.0%	$ 40.00
Preferred stock	63.00	30.0	60.00
Bond	99.75	47.5	95.00
Warrant	5.25	2.5	5.00
Totals	$210.00	100.0%	$200.00

If the convertible preferred stock is scheduled to pay a dividend of $3.15 per share each year, it would yield 5.25%

$$\left(\text{computed } \frac{\$3.15}{\$60.00} \times 100\right)$$

[*.33, fn. 11**]

37. Property Included in Cash Yield

.138

Q—May the fair value of property to be paid as dividends or interest be included in computing cash yield since section 2011 specifically states only "cash"?

A—Yes, the fair value of property to be paid in lieu of cash may be included in computing the cash yield of a convertible security. The property so treated may include nonconvertible senior securities of the same company. But it may not include the same issue for which common stock equivalency is being determined. And it may not include securities of the issuer or its parent or subsidiary which are currently or potentially dilutive and enter into the computation of either primary or fully diluted earnings per share. [*.33*]

.139 For example, any common stock or common stock equivalent of the issuer and securities such as those described in sections 2011A.14, 2011A.15, and 2011A.20-.24 would not be considered property for this purpose. Also, "extra" dividends to be paid on convertible stock on a nonrecurring basis would not be considered in computing cash yield in conformity with the "lowest scheduled rate" provision of section 2011.33.

38. Prime Rate Used in Yield Test

.140

Q—What bank prime interest rate should be used to determine the status of a convertible security as a com-

* Also see section 5516.

 © 1974, American Institute of Certified Public Accountants, Inc.

mon stock equivalent or not in applying the yield test when more than one rate is in effect in a country?

A—The prime interest rate in effect at the bank where the issuer borrows is used when more than one bank prime interest rate (or its equivalent in foreign[22] countries) is in effect in the U. S. If the issuer borrows from more than one bank and the different banks have different prime rates in effect, an average of the rates is used. If the issuer does not borrow from a bank where the prime interest rate is offered and more than one bank prime interest rate is in effect, an average of the rates would be used unless the issuer can show that the predominant rate is more appropriate than an average rate. [*.34*]

39. Prior Period Prime Rates

.141

Q—What source should be considered authoritative in determining the bank prime interest rate which was in effect in the U. S. during prior periods when applying election "a" of section 2011.46? [*.46*]

A—The *Federal Reserve Bulletin* may be considered an authoritative source for determining the bank prime interest rate at any time. When a "split" prime rate is in effect, the provisions of Interpretation 38 are applied. For readers' convenience, the dates of changes in the prime rate and the rates in effect from 1954 through 1970 have been extracted and appear in paragraph .357. [*.34*]

40. Original Issue Premium or Discount on Convertible Securities

.142

Q—What happens to original issue premium or discount when convertible securities are assumed to be converted and common stock is assumed to be issued for earnings per share computations?

A—Any original issue premium or discount amortized during the period (to compute the effective interest deducted from net income for a debt security) is eliminated from net income in arriving at earnings applicable to common stock. The unamortized original issue premium or

[22] See *The Banker,* February 1969, p. 117 *ff.,* for a discussion of rates in foreign countries which are the equivalents of the U. S. bank prime interest rate.

discount balance at the date of assumed conversion (the ending balance plus the amount amortized during the period) is then ignored for earnings per share computations. The if converted method only assumes conversion of the securities; it does not assume retirement. The converted securities are assumed to be held by the issuer as treasury securities during the period being reported upon and balance sheet accounts related to those securities are not affected by the assumed conversion. Note that these assumptions are made only for earnings per share computations; the issuer's balance sheet and net income for the period are not affected in any way by the assumptions made for earnings per share computations. [*.39, 2011A.06*]

41. No Anti-Dilution from Convertible Preferred Stock

.143

Q—When is convertible preferred stock antidilutive and therefore not assumed to be converted for earnings per share computations?

A—Convertible preferred stock is anti-dilutive and conversion is not assumed [23] whenever the amount of the dividend paid or declared for the current period (or accumulated if not paid) per common share obtainable upon conversion exceeds the earnings per share amount computed without assuming conversion. [*.30, .40, 2011A.05*]

.144 For example, assume that a corporation had a net income of $1,500 and had 1,000 shares of common stock outstanding. Also outstanding were 1,000 shares of preferred stock convertible on a one-for-one basis and classified as a common stock equivalent. A $1 per share dividend was paid to the convertible shareholders. Assumption of conversion would be anti-dilutive in this case since earnings per outstanding common share is $.50 per share. (Earnings per common and common equivalent share would be $.75 per share if conversion were assumed.) Conversion would not be assumed, but rather the preferred dividend would be deducted to compute earnings applicable to common stock. Earnings per share would be computed on the basis of actual common stock outstanding. The same result would be obtained if the dividend were cumulative and not paid.

[23] See Interpretation 44 for an exception when actual conversion occurs.

© 1974, American Institute of Certified Public Accountants, Inc.

42. No Anti-Dilution from Convertible Debt

.145

Q—When is convertible debt anti-dilutive and therefore not assumed to be converted for earnings per share computations?

A—Convertible debt is anti-dilutive and conversion is not assumed[24] whenever its interest (net of tax) per common share obtainable on conversion exceeds the earnings per share computed without assuming conversion. [*.30, .40, 2011A.05*]

.146 For example, assume that a corporation had a net income of $500 and had 1,000 shares of common stock outstanding. Also outstanding were 1,000 convertible bonds with a par value of $100 each paying interest at 3% per annum and convertible into one share of common stock each. Assume the bonds are classified as common stock equivalents and that the effective income tax rate is 50%. The earnings per common share outstanding (ignoring conversion of the bonds) is $.50 per share. Assuming conversion, $3,000 interest would be added back less $1,500 of additional income tax, resulting in a net increase of $1,500 and earnings applicable to common stock of $2,000. The $1.00 earnings per share for the 2,000 common and common equivalent shares would be anti-dilutive and conversion would therefore not be assumed.

43. Conversion Assumed for Primary Only

.147

Q—When a common stock equivalent convertible security is assumed to be converted for primary earnings per share computations, must it also be assumed to be converted for fully diluted earnings per share computations?

A—Generally, a common stock equivalent convertible security is assumed to be converted for both computations. However, if fully diluted earnings per share would be increased by the assumed conversion, conversion would be assumed only for the primary earnings per share computation. Such a situation could occur if two convertible securities were outstanding and the dividend on one classified as a common stock equivalent exceeds fully diluted earnings per share but not primary earnings per share. [*.15, .31, .40*]

---

[24] See Interpretation 44 for an exception when actual conversion occurs.

.148 For example, assume that a corporation had a net income of $9,500 and had 2,000 shares of common stock outstanding. Also outstanding were 1,000 shares of Class A convertible preferred stock which was a common stock equivalent and 1,500 shares of Class B convertible preferred stock which was not a common stock equivalent. The Class A paid a dividend of $2.50 per share and the Class B paid a dividend of $1 per share. Both are convertible into common on a one-for-one basis.

.149 Primary earnings per share is $2.67 per share assuming conversion of the Class A convertible preferred ($9,500 — $1,500 = $8,000 earnings applicable to common divided by 3,000 shares). Fully diluted earnings per share would be $2.11 per share if conversion were assumed for both the Class A and Class B convertible preferred ($9,500 ÷ 4,500 shares). However, fully diluted earnings per share is $2.00 per share if conversion is assumed for only the Class B ($9,500 — $2,500 = $7,000 earnings applicable to common divided by 3,500 shares). The difference between $2.11 and $2.00 is caused by the incremental effect of assuming conversion of the Class A. Since the Class A dividend per common share obtainable upon conversion exceeds fully diluted earnings per share computed without assuming conversion, conversion would be anti-dilutive. (See Interpretation 41.) Therefore, primary earnings per share is reported at $2.67 per share and fully diluted earnings per share is reported at $2.00 per share since this is the maximum dilutive amount.

.150 This example illustrates the fact that earnings per share amounts may be affected by changes either in the numerator or in the denominator used in the computation. Naturally, in some cases, both change.

44. If Converted Method at Actual Conversion

.151

Q—Is the if converted method applied differently for primary and fully diluted earnings per share computations when actual conversion occurs?

A—When a common stock equivalent convertible security is converted during a period, the if converted method

 © 1974, American Institute of Certified Public Accountants, Inc.

is applied from the beginning of the period [25] to the date of conversion for both primary and fully diluted earnings per share computations if the result is dilutive. [*.41*]

.152 If the result is anti-dilutive, however, conversion is not assumed for the primary computation. But when an actual conversion occurs during a period, conversion is assumed at the beginning [25] of the period for the fully diluted computation and the if converted method is applied, regardless of whether the result is dilutive or anti-dilutive. [*.30, .41*]

.153 Upon actual conversion, common stock issued is included in the weighted average of shares outstanding in both the primary and fully diluted computations from the date of conversion. The securities tendered by the holder for conversion are thereafter considered to be retired. [*2011A.02*]

45. Securities Convertible into Other Convertible Securities

.154

Q—How is a convertible security which is convertible into another convertible security included in earnings per share computations?

A—Such convertible securities enter earnings per share computations according to their provisions and their characteristics. [*.43*]

.155 A convertible security issued by a subsidiary which is convertible only into a parent company's convertible security is a senior security from the standpoint of the subsidiary, i. e., the yield test does not apply. For consolidated earnings per share computations, however, the subsidiary's security would be assumed to be converted into the parent's security. The parent's security would then be assumed to be converted under the if converted method (if the net result is dilutive). If the parent's convertible security is not a common stock equivalent, conversion of the parent's security would be assumed only for fully diluted computations. If it is a common stock equivalent, conversion of the parent's security would be assumed for both primary and fully diluted computations. (See Interpretation 93.)

---

[25] For convertible securities issued and converted during the period, conversion is assumed only from time of issuance rather than from the beginning of the period.

.156 Convertible securities which are convertible at the option of the holder into either another convertible security or a nonconvertible security are assumed to be converted into the security which would be more advantageous for the holder (but not if the result is anti-dilutive). If conversion is assumed into the other convertible security, that security is then assumed to be converted into common stock for earnings per share computations (but not if the net result is anti-dilutive). If conversion is assumed into the nonconvertible security, dividends which would have been applicable to the nonconvertible security, as if it had been outstanding, are deducted in determining earnings applicable to common stock. If converted adjustments may also be applicable. The classification (determined under the yield test) as a common stock equivalent or other potentially dilutive security of convertible securities which are convertible at the option of the holder as discussed in this paragraph determines whether conversion is assumed for both primary and fully diluted computations or only for fully diluted computations. [*2011A.11, 2011A.13*]

.157 In some cases, the security which would be more advantageous for assumed conversion cannot be determined. This might be the case, for example, if the nonconvertible security pays a high dividend and the second convertible security has good prospects for an increase in its market price. If the more advantageous security to the holders cannot be determined, the computation should give effect to the greater earnings per share dilution.

OPTIONS AND WARRANTS AND THEIR EQUIVALENTS

46. Classification of Options and Warrants

.158

Q—How are options, warrants and their equivalents classified for earnings per share computations?

A—Options, warrants and their equivalents are always common stock equivalents unless *all* of the following conditions are met: (1) they were issued prior to June 1, 1969 *and* (2) the issuer makes election "b" under section 2011.46 *and* (3) they were not classified as residual securities under APB Opinion No. 9. Options, warrants and other equivalents classified under this exception are not common stock equivalents but are other potentially dilutive securities and are included only in fully diluted earnings per share com-

 © 1974, American Institute of Certified Public Accountants, Inc.

putations.[26] All other options, warrants and their equivalents are included in both primary and fully diluted earnings per share computations. [*.35, .42, .46*]

47. No Anti-Dilution from Options and Warrants

.159

Q—When are options and warrants anti-dilutive under the treasury stock method?

A—Generally, options and warrants are anti-dilutive whenever their exercise price exceeds the market price of the common stock obtainable on exercise. This is because application of the treasury stock method in such a case would reduce the number of common shares included in the computation which would increase the earnings per share amount. [*.36, .36 fn. 14*]

.160 The prohibition against anti-dilution in applying the treasury stock method recognizes the economic fact that an option or warrant would not be exercised if the exercise price were above the market price because the stock could be purchased in the market for less than it could be purchased by exercising the option or warrant. However, if for some reason options or warrants are exercised when the market price is below the exercise price, the market price at the exercise date is applied in the fully diluted computation for the exercised options or warrants for the period they were outstanding. (See Interpretation 62.) However, anti-dilution is not reflected in the primary computation prior to exercise. [*.30, .40, .42*]

.161 In special cases for which other methods are applied (see sections 2011.37 and 2011.38), the factors which cause dilution or anti-dilution are, of course, different. These special cases are discussed in Interpretations 50 and 65-71. [*.37, .38*]

48. Equivalents of Options and Warrants

.162

Q—What kinds of securities are considered the equivalents of options and warrants and therefore always classified as common stock equivalents?

A—Stock purchase contracts, stock subscriptions not fully paid, deferred compensation plans providing for the

[26] These options and warrants would be common stock equivalents except for the fact that they were issued before section 2011 was released. Section 2011 provides that they be classified as common stock equivalents only if the issuer elects to so classify them.

issuance of common stock, and convertible debt and convertible preferred stock allowing or requiring the payment of cash at conversion (regardless of the yield of such convertible securities at time of issuance) are considered the equivalents of options or warrants. The treasury stock method should be applied for all of these securities unless their terms or the provisions of sections 2011.37 and 2011.38 require that another method be applied for the computation of earnings per share. [*.27, .35, .36, .37, .38*]

49. Grouping Options and Warrants

.163

Q—May anti-dilutive options and warrants be grouped with dilutive options and warrants in applying the treasury stock method?

A—No, except in the special situations discussed below. [*.30, .40*]

.164 Section 2011.35, footnote 13, allows reasonable grouping of like securities, i. e., options and warrants with the same exercise prices per common share to be issued. For example, it would be appropriate to group an option to purchase one share of common stock for $20 with a warrant to purchase two shares of common stock for $40. Assuming a market price of $15 per share for common stock, these options and warrants would not be grouped with a warrant to purchase one share of common stock for $10. [*.35 fn. 13*]

.165 If an aggregate computation is required, however, anti-dilutive and dilutive securities must be included in the same computation. Section 2011.38 provides for an aggregate computation, for example. An anti-dilutive option which must be exercised before a dilutive option may be exercised must also be included in an aggregate computation. [*.38*]

.166 For example, assume an option is exercisable at $30 to purchase one share of common stock and a second option is exercisable at $10 to purchase one share of common stock *after* the first option is exercised. The two options would be grouped and considered as a "two-step" option to buy two shares of common stock for $40. Their aggregate effect would be dilutive whenever the market price of common stock exceeds $20 per share. An aggre-

 © 1974, American Institute of Certified Public Accountants, Inc.

gate computation would not be made for a dilutive option which must be exercised before an anti-dilutive option may be exercised, because the anti-dilutive option would not be exercised in such a situation.

50. Methods Used for Options and Warrants

.167

Q—Since different methods are described for the treatment of options and warrants in section 2011, in what order should the different methods be applied?

A—In determining the effect of options and warrants and their equivalents in earnings per share computations, apply section paragraphs in the following order (to the extent that each is pertinent):

Section 2011.37
Section 2011.38
Section 2011.36 [.36]

.168 Section 2011.37 applies to options and warrants or their equivalents (1) which either allow or require the tendering of debt at exercise or (2) whose proceeds from exercise must be applied to retire debt or other securities under the terms of those securities. Section 2011.37 also applies to convertible securities which either allow or permit the payment of cash at conversion. Such convertibles are considered the equivalents of warrants. [*.35, .37*]

.169 Section 2011.38 applies only when the number of common shares obtainable upon exercise of all outstanding options and warrants and their equivalents exceed 20% of the number of common shares outstanding at the end of the period. [*.38*]

.170 Section 2011.36 (the treasury stock method) applies to all other options and warrants and their equivalents. [*.36*]

51. Treasury Stock Method Reflects Dilution of Options and Warrants

.171

Q—How does the treasury stock method reflect the dilutive effect of options and warrants?

A—The treasury stock method increases the number of shares assumed to be outstanding when the exercise price of an option or warrant is below the market price of common stock obtainable on exercise. The dilutive effect of the

treasury stock method is demonstrated in the following example. [*.36 fn. 14*]

.172 Assume that a corporation earned $125,000 during a period when it had 60,000 shares of common stock outstanding. The common stock sold at an average market price of $20 per share during the period. Also outstanding were 10,000 warrants which could be exercised to purchase one share of common stock for $15 for each warrant exercised. Earnings per common share *outstanding* would be $2.08 per share ($125,000 ÷ 60,000 shares).

.173 Applying the treasury stock method, the 10,000 warrants would be assumed to have been exercised by their holders at the beginning of the period. Upon exercise, 10,000 shares of common stock would be assumed to have been issued by the corporation to the holders. The $150,000 proceeds (10,000 warrants at an exercise price of $15 per share) would be assumed to have been used by the corporation to purchase 7,500 shares ($150,000 ÷ $20 per share average market price) of common stock in the market on the exercise date. Common stock would therefore increase 2,500 shares.[27] (10,000 shares issued less 7,500 shares purchased results in 2,500 *incremental* shares.) A total of 62,500 shares would be considered as outstanding for the entire period. The amount to be reported as primary earnings per share would be $2.00 per share ($125,000 ÷ 62,500 shares), or dilution of $.08 per share.

.174 Fully diluted earnings per share would also be $2.00 per share if the ending market price of the common stock were $20 per share or less. But an ending market price above $20 per share would cause more dilution to be reflected in fully diluted earnings per share. For example, an ending market price of $25 per share would produce 4,000 incremental common shares[28] which would result in fully diluted earnings per share of $1.95 per share. Dilution would be $.13 per share from earnings per outstanding share and $.05 per share from primary earnings per share. [*.42*]

[27] The incremental number of shares may be more simply computed

$$\frac{\$20 - \$15}{\$20} \times 10{,}000 = 2{,}500$$ using the formula given in Interpretation 12

[28] For fully diluted incremental shares, the computation would be

$$\frac{\$25 - \$15}{\$25} \times 10{,}000 = 4{,}000.$$

 © 1974, American Institute of Certified Public Accountants, Inc.

52. Market Prices Used for Treasury Stock Method

.175

Q—What market prices of common stock are used in applying the treasury stock method for options and warrants?

A—The average market price of common stock during each three-month quarter included in the period being reported upon is used to determine the number of incremental shares included in primary earnings per share computations. When a period of less than three months is being reported upon, the average market price during that period is used. [*.36, 2011C.03*]

.176 The average market price during each three-month quarter included in the period being reported upon is also used to determine the number of incremental shares included in fully diluted earnings per share computations *unless* (1) the ending market price for the quarter is higher than the average market price or (2) options or warrants were exercised during the quarter. [*.42, 2011C.03*]

.177 A higher ending market price for the quarter is used in fully diluted computations rather than the average market price. For the fully diluted year-to-date computation, the number of incremental shares produced by applying the ending market price is compared to the number of shares determined by computing a year-to-date weighted average of incremental shares included in the quarterly fully diluted computations. The number of incremental shares used in the fully diluted year-to-date computation is the greater of the number of incremental shares determined from the ending market price or from the weighted average of quarters. (See Interpretation 60 and paragraph .359 for examples.)

.178 When options or warrants are exercised, the market price on the exercise date is applied for the exercised options or warrants from the beginning of the year to the exercise date for fully diluted computations. Thus, the incremental share computations for quarters prior to the exercise date use the market price at the exercise date rather than the ending or average market price. (See Interpretations 61 and 62 for examples.)

.179 In accordance with the anti-dilution provisions of section 2011 exercise of options or warrants is not as-

sumed for any quarter when the exercise price is higher than the market price determined for the computation (as described above) except when options or warrants have in fact been exercised. However, anti-dilutive options or warrants would be included in an aggregate computation resulting in a net dilutive effect. [*.30, .38, .40, .42*]

.180 Thus, options and warrants may be included in the computations in some quarters but not in other quarters. Also, options and warrants may be included in fully diluted earnings per share computations in a quarter when the ending market price is above the exercise price but not included in primary earnings per share computations for the quarter because the average market price is below the exercise price. [*.30, .42*]

53. How Many Market Prices?

.181

Q—How many market prices should be used to determine the average market price of common stock when applying the treasury stock method?

A—As many market prices as are needed to compute a meaningful average would be used. [*.36*]

.182 Theoretically, every market transaction for a company's common stock (both the number of shares and the price per share) could be included in determining the average market price. For example, consider four transactions of: 100 shares at $10 per share, 60 shares at $11 per share, 30 shares at $12 per share, and 10 shares at $13 per share. The average of the four prices would be $11.50 (a simple average) but the average price for the 200 shares would be $10.75 per share (a weighted average).

.183 As a practical matter, however, a simple average of monthly prices is adequate so long as prices do not fluctuate significantly. If prices fluctuate greatly, weekly or daily prices probably would be used. Only if volume of common shares traded and prices at which trades occurred both fluctuated significantly would it be necessary to compute a weighted average to obtain a meaningful average market price.

54. What Market Price to Use?

.184

Q—Should the market price used in computing the average described in Interpretation 53 be the high, low, close or an average of high and low prices?

 © 1974, American Institute of Certified Public Accountants, Inc.

A—Generally, closing market prices would be adequate for use in computing the average market price. When prices fluctuate widely, however, an average of the high and low prices for the period the price represents (whether a month, week, or day) would usually produce a more representative price to be used. [*.36*]

.185 Perhaps more important than the price selected is that the particular price selected be used consistently unless it is no longer representative because of changed conditions. For example, a company using the closing price during several years of relatively stable market prices could change to an average of high and low prices if prices started fluctuating greatly and the closing market price would no longer produce a representative average market price. Likewise, a company using an average of high and low prices during several years of relatively stable volume could use an average weighted by the number of shares included in market transactions during the period if both prices and volume started fluctuating greatly and the simple average of high and low prices would no longer produce a representative average market price. Shorter periods would be more appropriate than longer periods in this case also, as noted in Interpretation 53.

.186 Changing the price, period or method used in computing the average market price would only be done when it becomes obvious that a representative average market price would not be obtained if the change were not made. In the absence of changed conditions a change would not be made.

55. Over-the-Counter and Listed Stocks Not Traded

.187

Q—What price should be used when applying the treasury stock method for an over-the-counter stock or a listed stock not traded?

A—If available, market prices at which trades occur would be used in applying the treasury stock method. For stocks traded over-the-counter, the actual trade prices may not be known. Bid and asked quotations generally are available, however, for both over-the-counter stocks and listed stocks not traded. [*.36*]

.188 The price which will be representative of the market price may have to be computed from the information

available. An average of the bid and asked quotations might produce a representative price. In some cases, an average of quotations from several dealers could be used. Generally the method selected would be used consistently in the absence of actual market prices.

.189 It should be noted that although bid quotations produce a conservative estimate of a stock's market value, asked quotations are more conservative for earnings per share computations. This is because a higher market price produces more incremental shares under the treasury stock method than does a lower price. Therefore, to obtain a conservative answer, the asked quotation would be used in applying the treasury stock method for listed common stocks not traded and for common stocks traded over the counter.

56. Fair Value Used If No Market Price

.190

Q—How should the average market price be determined, to apply the treasury stock method for options and warrants, if a company's common stock is not traded (for example, for a closely held company with only options outstanding)?

A—When a company's common stock is not traded and market prices are therefore not available, the fair value per share of its common stock is used to apply the treasury stock method for options and warrants. [*.33 fn. 11*]

.191 Estimating the fair value of a share of common stock which is seldom, if ever, traded is often difficult. Various methods of valuation may be appropriate under different circumstances. While book value or liquidation value per share may provide some indication of fair value, these amounts usually would not be used without adjustment. Estimations based on replacement value or capitalized earnings value, however, might be used in determining fair value.

.192 In some cases documents may be used as a basis for estimating the fair value of a company's common stock. Personal financial statements of stockholders prepared in accordance with *Audits of Personal Financial Statements* (An AICPA Industry Audit Guide published by the American Institute of CPAs in 1968) would present the estimated

 © 1974, American Institute of Certified Public Accountants, Inc.

value of their stock ownership in the company. Buy and sell agreements contain provisions for determining the value of a stockholder's interest in a company in the event of death or retirement or withdrawal from participation in the company's activities. Estate tax valuations established for recently deceased stockholders may provide a basis for estimating the current value of a company's stock. Merger or sales negotiations entered into by the company and valuations or appraisals obtained by a stockholder or the company for credit purposes may provide established values appropriate for use in estimating the fair value of a company's common stock. A fair value estimate of the stock might also be projected currently from the relationship at the time of issuance of the warrant or option to earnings (on a per share basis) or to the book value of the common stock.

.193 External sources may also be used to obtain a fair value estimate for a company's stock. Traded securities of other companies in the same industry, their price-earnings ratios, dividend yields, and the relationship of their market prices to book values per share may provide guidance for estimating the value of a stock which is not traded. In addition to the methods suggested above, articles in professional publications may suggest other valuation methods and provide more specific guidance for applying selected techniques (for example, see *The Journal of Accountancy,* August 1969, pages 35-47, and March 1966, pages 47-55). Revenue Ruling 59-60 also provides guidance for valuing stocks with no quoted market prices. In some instances, companies have engaged investment bankers to estimate the value of the common stock when management believed a fair value could not be obtained any other way.

.194 When a fair value estimate is used in the absence of market prices for a company's common stock, this fact and the method used to estimate the fair value would be disclosed as required by section 2011.20. The disclosure would usually be contained in a note to the earnings per share amounts presented (such as the example in section 2011C.04). [*.20*]

57. Options and Warrants Outstanding Part of a Period

.195

Q—How should dilutive options or warrants which are outstanding for only part of a period be treated for earnings per share computations?

A—Dilutive options or warrants which are issued during a period or which expire or are cancelled during a period are reflected in both primary and fully diluted earnings per share computations for the time they were outstanding during the period being reported upon. The common equivalent shares to be considered enter earnings per share computations as a weighted average as described in section 2011A.02. [*.36, .41, 2011A.02*]

.196 For example, assume that a corporation whose financial reporting year ends on December 31 issued 100,000 warrants for one share each on October 8, 1969 with an exercise price of $10. Assume also an average market price for common stock during the intervening twelve-week period of $12 per share. Applying the treasury stock method for primary earnings per share computations for the fourth quarter, the 16,667 incremental shares

$$\left(\text{computed } \frac{\$12 - \$10}{\$12} \times 100{,}000 = 16{,}667\right)$$

would be weighted 12/13, since they were outstanding for only twelve of the thirteen weeks during the quarter, and would represent 15,385 common shares (16,667 × 12/13) in the fourth quarter of 1969. In the annual earnings per share computation for 1969, these warrants would represent 3,846 common shares (15,385 ÷ 4).

.197 If the market price at December 31, 1969 for common stock exceeded the $12 average market price, the higher market price would be used in computing fully diluted earnings per share to reflect maximum potential dilution as specified in section 2011.42. For a market price of common stock on December 31 of $12.50 per share, the shares to be added for the fourth quarter fully diluted earnings per share would be computed as follows:

$$\frac{\$12.50 - \$10}{\$12.50} \times 100{,}000 = 20{,}000$$

$$12/13 \times 20{,}000 = \textit{18,462} \text{ shares.}$$

The shares to be added for 1969 annual fully diluted earnings per share in this case would be 4,615.

.198 If the warrants described in the above example expired or were cancelled on March 25, 1970 and we assume

 © 1974, American Institute of Certified Public Accountants, Inc.

an average market price for common stock during the twelve weeks then ended of $12, the same results as above would be obtained for primary earnings per share computations for the first quarter of 1970. That is, assumed exercise of the 100,000 warrants would produce 16,667 incremental shares weighted 12/13 and would represent 15,385 common shares in the first quarter of 1970. In the annual earnings per share computations for 1970, these warrants would represent 3,846 common shares.

.199 If the market price of common stock on the *last day the warrants were outstanding* (March 25, 1970) exceeded the $12 average market price for the twelve week period, the higher market price would be used in computing fully diluted earnings per share to reflect maximum dilution. For a market price of $12.50 on March 25, 1970 in this example, 18,462 shares would be added for the first quarter computations and 4,615 shares would be added for the 1970 annual computations in computing fully diluted earnings per share. [*.42*]

.200 Generally, options or warrants which expire or are cancelled will not affect earnings per share computations. The above examples are included only for those rare cases when they do. Most dilutive options and warrants will be exercised prior to expiration or cancellation. Anti-dilutive options and warrants do not enter earnings per share computations,[29] since they would not be exercised when common stock could be purchased for less in the market than through exercise. [*.30, .40*]

.201 When dilutive options or warrants expire or are cancelled during a period, it may also be desirable to furnish supplementary earnings per share data as described in section 2011.22, but previously reported earnings per share data would not be retroactively adjusted for expirations or cancellations of warrants or options. [*.22*]

58. What Is a Period?

.202

Q—What is a "period" as the term is used in section 2011?

A—A "period" is the time for which net income is reported and earnings per share are computed.

---

[29] Except in the unusual situations described in section 2011.38 and in Part I, paragraph .016, fn. 6.

.203 However, when the treasury stock method or any method[30] requiring the computation of an average market price is used and the reporting period is longer than three months, a separate computation is made for each three-month period. [*2011C.03*]

.204 If a period of less than a quarter is being reported upon, the average market price of common stock during the period encompassed by the income statement is used in applying the treasury stock methods. Other methods[30] requiring the use of average market prices also use the prices in effect during this shorter period.

59. Share Averaging

.205

Q—When the reporting period is longer than three months and the treasury stock method is applied, how is the weighted average of shares computed for the reporting period?

A—A weighted average of shares is computed based on the average market prices during each three months included in the reporting period. Thus, if the period being reported upon is six months, nine months, or one year, a weighted average[31] of shares is computed for each quarter. The weighted averages for all quarters are then added together, and the resulting total is divided by the number of quarters to determine the weighted average for the period. [*2011C.03*]

.206 Assume, for example, that a corporation had 25,000 shares of common stock outstanding during a year and also had granted options which resulted in the following incremental shares computed using the treasury stock method: 500 in the first quarter, none in the second quarter because they would have been anti-dilutive, 1,400 in the third quarter, and 1,000 in the fourth quarter. The weighted average of shares for the year could be computed either

$$25{,}500 + 25{,}000 + 26{,}400 + 26{,}000 = 102{,}900$$

$$102{,}900 \div 4 = \mathit{25{,}725}$$

or

$$\frac{500}{4} + \frac{1{,}400}{4} + \frac{1{,}000}{4} = 725$$

$$725 + 25{,}000 = \mathit{25{,}725}$$

[30] For example, see Interpretations 67, 70, 77 and 79.

[31] See Interpretation 25 and paragraph .359 for examples of computing a weighted average.

 © 1974, American Institute of Certified Public Accountants, Inc.

60. Applying Ending and Average Market Prices

.207

Q—How do the computations of primary and fully diluted earnings per share differ when the treasury stock method is applied for options and warrants and the ending market price of common stock is different from the average market price?

A—When the ending market price of common stock is higher than the average market price for the period, the ending market price is used for the fully diluted computation to reflect maximum potential dilution. The use of different market prices for primary and fully diluted earnings per share computations naturally results in different numbers of shares for the two computations. The use of a higher ending market price for fully diluted computations may also result in the assumption of exercise for fully diluted earnings per share but not for primary earnings per share. Year-to-date computations for fully diluted earnings per share may also be more complex when market prices of common stock increase and then decrease during the year, since the share computation is then made two ways and the greater number of shares is used in computing year-to-date fully diluted earnings per share. The above situations are illustrated in the following example. [*.42*]

.208 Assume stock options are outstanding to obtain 5,000 shares of common stock at an exercise price of $10 per share. Assume also the following average and ending market prices of common stock during the calendar year:

	Average Market Price	*Ending Market Price*
First quarter	$11.11	$12.00
Second quarter	9.75	11.00
Third quarter	13.89	14.00
Fourth quarter	12.50	13.00

.209 For primary earnings per share, the treasury stock method would produce the following number of *incremental* shares to reflect the dilutive effect of the options:

	Primary Incremental Shares	
	Quarterly EPS	*Year-to-Date EPS*
First quarter	500(1)	500
Second quarter	—0—	250(2)
Third quarter	1,400(3)	633(4)
Fourth quarter	1,000(5)	725(6)

COMPUTATIONAL NOTES:

(1) $\frac{\$11.11 - \$10}{\$11.11} \times 5{,}000 = 500$

(2) 500 + 0 = 500. 500 ÷ 2 = 250

(3) $\frac{\$13.89 - \$10}{\$13.89} \times 5{,}000 = 1{,}400$

(4) 500 + 0 + 1,400 = 1,900. 1,900 ÷ 3 = 633

(5) $\frac{\$12.50 - \$10}{\$12.50} \times 5{,}000 = 1{,}000$

(6) 500 + 0 + 1,400 + 1,000 = 2,900. 2,900 ÷ 4 = 725

.210 For fully diluted earnings per share, the treasury stock method would produce the following number of incremental shares to reflect the maximum dilutive effect of the options:

	Fully Diluted Incremental Shares	
	Quarterly EPS (1)	*Year-to-Date EPS*
First quarter	833	833
Second quarter	455(2)	644(3)
Third quarter	1,429	1,429(4)
Fourth quarter	1,154	1,154(5)

COMPUTATIONAL NOTES:

(1) Based on ending market price for each quarter.

(2) Note that the average market price for this quarter was anti-dilutive, so the computation is made only for fully diluted earnings per share.

(3) 833 + 455 = 1,288. 1,288 ÷ 2 = 644
Use 644 weighted average since 644 is greater than 455 incremental shares based on ending market price.

(4) 833 + 455 + 1,429 = 2,717. 2,717 ÷ 3 = 906.
Use 1,429 incremental shares based on the ending market price since 1,429 is greater than 906.

(5) 833 + 455 + 1,429 + 1,154 = 3,871. 3,871 ÷ 4 = 968.
Use 1,154 incremental shares based on the ending market price since 1,154 is greater than 968.

.211 Note that the two computations made for year-to-date fully diluted incremental shares may in some cases cause different market prices to be applied for the quarterly and year-to-date fully diluted computations. For example, assume that in the above illustration the average market price in the fourth quarter was $13 and the ending market price was $12.50. The $13 average market price would produce 1,154 incremental shares in the fourth quarter for both primary and fully diluted computations. In the annual fully diluted computation, however, the $12.50 ending market price would produce 1,000 incremental shares while the average number of shares for the four quarters would be only 968 (see computational note 5 above under fully diluted).

 © 1974, American Institute of Certified Public Accountants, Inc.

Therefore the average market price would be used for the fourth quarter fully diluted computation and the ending market price would be used for the annual fully diluted computation.

.212 A more comprehensive example of these points appears in paragraph .359.

61. *Treasury Stock Method at Exercise*

.213

Q—How is the treasury stock method applied for options and warrants which are exercised?

A—Common stock issued upon the exercise of options or warrants is included in the weighted average of outstanding shares from the exercise date. The treasury stock method is applied for exercised options or warrants from the beginning of the period to the exercise date. For primary earnings per share, the computation for the period prior to exercise is based on the average market price of common stock during the period the exercised options or warrants were outstanding (if the result is dilutive). Incremental shares are weighted for the period the options or warrants were outstanding and shares issued are weighted for the period the shares were outstanding. For fully diluted earnings per share, however, the computation for the period prior to exercise is based on the market price of common stock when the options or warrants were exercised regardless of whether the result is dilutive or anti-dilutive. Incremental shares are weighted for the period the options or warrants were outstanding and shares issued are weighted for the period the shares are outstanding. These situations are illustrated in the following example. [*.42, 2011A.02*]

.214 Assume stock options are outstanding to obtain 5,000 shares of common stock at an exercise price of $10 per share. Assume also the following average and ending market prices of common stock during the calendar year:

	Average Market Price	*Ending Market Price*
First quarter	$11.11	$12.00
Second quarter	9.75	11.00
Third quarter	13.89	14.00
Fourth quarter	12.50	13.00

Also assume that 1,000 options were exercised May 1 when the market price of common stock was $10.50 per share and

another 1,000 options were exercised September 1 when the market price of common stock was $15 per share. The average market price from April 1 to May 1 was $11.25 and from July 1 to September 1 was $13.

.215 For primary earnings per share, the treasury stock method would produce the following number of *incremental* shares to reflect the dilutive effect of the options:

	Primary Incremental Shares	
	Quarterly EPS	*Year-to-Date EPS*
First quarter	500	500
Second quarter	37(1)	269(2)
Third quarter	994(3)	510(4)
Fourth quarter	600	533(5)

COMPUTATIONAL NOTES:

(1) ⅓ of 111 incremental shares for 1,000 options exercised May 1 (using $11.25 average market price for the period the options were outstanding). Remaining options are anti-dilutive.

(2) 500 + 37 = 537. 537 ÷ 2 = 269

(3) 840 incremental shares for 3,000 options outstanding all of the quarter (exercise assumed at $13.89 average market price for the quarter) plus ⅔ of the 231 incremental shares for 1,000 options outstanding for two months of the quarter (exercise assumed at $13 average market price for the period the options were outstanding). 840 + 154 = 994

(4) 500 + 37 + 994 = 1,531. 1,531 ÷ 3 = 510

(5) 500 + 37 + 994 + 600 = 2,131. 2,131 ÷ 4 = 533

In addition, outstanding shares would increase as follows to reflect options *exercised* May 1 and September 1:

	Increase in Outstanding Shares	
	Quarterly EPS	*Year-to-Date EPS*
First quarter	—0—	—0—
Second quarter	667(1)	333(2)
Third quarter	1,333(3)	667(4)
Fourth quarter	2,000(5)	1,000(6)

COMPUTATIONAL NOTES:

(1) ⅔ of 1,000 shares issued May 1 and outstanding for two months.

(2) 0 + 667 = 667. 667 ÷ 2 = 333

(3) 1,000 shares issued May 1 plus ⅓ of 1,000 shares issued September 1.

(4) 667 + 1,333 = 2,000. 2,000 ÷ 3 = 667

(5) 1,000 shares issued May 1 plus 1,000 shares issued September 1.

(6) 0 + 667 + 1,333 + 2,000 = 4,000. 4,000 ÷ 4 = 1,000

.216 For fully diluted earnings per share, the treasury stock method would produce the following number of *incremental* shares to reflect the maximum dilutive effect of the options:

 © 1974, American Institute of Certified Public Accountants, Inc.

	Fully Diluted Incremental Shares	
	Quarterly EPS	Year-to-Date EPS
First quarter	833	833
Second quarter	380(1)	548(2)
Third quarter	1,079(3)	1,174(4)
Fourth quarter	692(5)	930(6)

COMPUTATIONAL NOTES:

(1) 364 incremental shares for 4,000 options outstanding all of the quarter (using $11 ending market price) plus ⅓ of 48 incremental shares for 1,000 options exercised May 1 (using $10.50 market price at exercise date).

(2) (667 + 48) + 380 = 1,095. 1,095 ÷ 2 = 548. For the first quarter, 667 incremental shares for 4,000 options (using $12 ending market price) plus 48 incremental shares for 1,000 options exercised May 1 (using $10.50 market price at exercise date). See note 1 for second quarter. The incremental shares for the two quarters are then weighted.

(3) 857 incremental shares for 3,000 options outstanding all of the quarter plus ⅔ (333) = 222 incremental shares for 1,000 options exercised September 1 and outstanding two months.

(4) 857 incremental shares for 3,000 options outstanding for all of the three quarters based on $14 higher ending market price applied for all of the three quarters plus 4/9 (48) = 21 for the May 1 exercise plus 8/9 (333) = 296 for the September 1 exercise.

(5) Based on $13 market price and 3,000 options.

(6) 500 + 273 + 857 + 692 = 2,322. 2,322 ÷ 4 = 581 incremental shares for 3,000 options outstanding for four quarters using market prices of $12, $11, $14 and $13 for the respective quarters for computing the weighted average of incremental shares. Since 692 incremental shares determined by applying the ending market price is greater than 581 weighted incremental shares, 692 is used. The 692 is increased by 4/12 (48) = 16 shares for the May 1 exercise plus 8/12 (333) = 222 for the September 1 exercise. 692 + 16 + 222 = 930.

In addition, outstanding shares would increase by the same number of shares as illustrated for the primary earnings per share computation for the options *exercised* on May 1 and September 1, i. e., 667 shares in the second quarter, 1,333 in the third quarter, 2,000 in the fourth quarter, 333 for the first six months, 667 for the first nine months, and 1,000 for the year.

62. Anti-Dilutive Exercise

.217

Q—Is the treasury stock method applied for options and warrants which are exercised when the market price is below the exercise price?

A—Options or warrants usually would not be exercised in such a situation. The common stock obtainable upon exercise could be purchased in the market for less than the exercise price. However, in those rare cases where such an exercise does occur, the treasury stock method is applied from the beginning of the year to the exercise date for fully diluted computations using the market price at the exercise date. The result will be anti-dilutive. [*.42*]

.218 For primary computations, the average market price from the beginning of the quarter to the exercise date is used, but only if the result is dilutive. Thus, when the average market price is less than the exercise price while the exercised options or warrants were outstanding, the exercised options or warrants are omitted from primary computations. [*.30, .36*]

.219 Common stock issued upon exercise is included in the weighted average of outstanding shares from the exercise date for both primary and fully diluted computations. Shares produced by the treasury stock method are included in the weighted average of outstanding shares for the time the exercised options or warrants were outstanding. [*2011A.02*]

.220 For example, assume stock options are outstanding to obtain 5,000 shares of common stock at an exercise price of $10 per share. Assume also the following average and ending market prices of common stock during the calendar year.

	Average Market Price	*Ending Market Price*
First quarter	$11.11	$12.00
Second quarter	9.75	11.00
Third quarter	13.89	14.00
Fourth quarter	12.50	13.00

On June 1, 1,000 options were exercised when the market price of common stock was $9.50 per share. The average market price from April 1 to June 1 was $9.65 per share.

.221 For primary earnings per share, the treasury stock method would produce the following number of *incremental* shares to reflect the dilutive effect of the options:

	Primary Incremental Shares	
	Quarterly EPS	*Year-to-Date EPS*
First quarter	500	500
Second quarter	—0—(1)	250
Third quarter	1,120(2)	540(3)
Fourth quarter	800	605(4)

COMPUTATIONAL NOTES:

(1) Average market price for both outstanding options and exercised options are anti-dilutive.

(2) 1,120 incremental shares for 4,000 options outstanding all of the quarter.

(3) 500 + 0 + 1,120 = 1,620. 1,620 ÷ 3 = 540

(4) 500 + 0 + 1,120 + 800 = 2,420. 2,420 ÷ 4 = 605

© 1974, American Institute of Certified Public Accountants, Inc.

In addition, outstanding shares would increase as follows to reflect options *exercised* June 1:

	Increase in Outstanding Shares	
	Quarterly EPS	Year-to-Date EPS
First quarter	—0—	—0—
Second quarter	333(1)	167(2)
Third quarter	1,000(3)	444(4)
Fourth quarter	1,000(5)	583(6)

COMPUTATIONAL NOTES:

(1) ⅓ of 1,000 shares issued June 1 and outstanding for one month.
(2) 0 + 333 = 333. 333 ÷ 2 = *167*
(3) 1,000 shares issued June 1.
(4) 0 + 333 + 1,000 = 1,333. 1,333 ÷ 3 = *444*
(5) 1,000 shares issued June 1.
(6) 0 + 333 + 1,000 + 1,000 = 2,333. 2,333 ÷ 4 = *583*

.222 For fully diluted earnings per share, the treasury stock method would produce the following number of *incremental* shares to reflect the maximum dilutive effect of the options:

	Fully Diluted Incremental Shares	
	Quarterly EPS	Year-to-Date EPS
First quarter	833	833
Second quarter	329(1)	472(2)
Third quarter	1,143(3)	1,114(4)
Fourth quarter	923(5)	901(6)

COMPUTATIONAL NOTES:

(1) 364 incremental shares for 4,000 options outstanding all of the quarter less ⅔ (1,000—1,053) = — 35 to reflect the anti-dilutive effect of the exercise of 1,000 options outstanding 2 months during the quarter. 364 — 35 = 329
(2) (667 − 53) + (364 − 35) = 943. 943 ÷ 2 = *472*. See note 1. For the first quarter, 667 incremental shares for 4,000 options are reduced by 53 anti-dilutive shares for 1,000 options exercised June 1. The net incremental shares for the two quarters are then weighted.
(3) 1,143 incremental shares for 4,000 options outstanding all of the quarter.
(4) 1,143 incremental shares for 4,000 options outstanding for all of the three quarters based on $14 higher ending market price applied for all of the three quarters *less* 5/9 (53) = − 29 for the June 1 anti-dilutive exercise.
(5) Based on $13 market price and 4,000 options.
(6) 667 + 364 + 1,143 + 923 = 3,097. 3,097 ÷ 4 = 774 incremental shares for 4,000 options outstanding for four quarters using market prices of $12, $11, $14 and $13 for the respective quarters for computing the weighted average of incremental shares. Since 923 incremental shares determined by applying the ending market price is greater than 774 weighted incremental shares, 923 is used. The 923 is decreased by 5/12 (— 53) = — 22 for the June 1 anti-dilutive exercise. 923 — 22 = *901*.

In addition, outstanding shares would increase by the same number of shares as illustrated for the primary earnings per share computation for the options *exercised* on June 1, i. e., 333 shares in the second quarter, 1,000 shares in the third and fourth quarters, 167 shares for the first six

months, 444 shares for the first nine months, and 583 shares for the year.

63. "Substantially All" of Three Months

.223

Q—How long is "substantially all" of a three-month period and why should exercise of options and warrants not be assumed in applying the treasury stock method "until" the market price has exceeded the exercise price for such a period?

A—"Substantially all" is not defined in section 2011. Following the recommendation [32] to not assume exercise before the three-month test is met (1) eliminates the need to make the computation until the market price has exceeded the exercise price for a significant period and (2) reduces "flip-flop" of options and warrants in and out of the computation because of the common stock's market price fluctuations above and below the exercise price. [*.36*]

.224 Presumably, eleven weeks would be substantially all of a thirteen-week quarter. Therefore, the computation would be made for any quarter after the market price has once been above the exercise price for any eleven weeks during a quarter.

.225 Note that this is a one-time test. Exercise need not be assumed for the computations *until* the test has been met, not *unless* the test is met in a particular quarter. Thus, once the test is met, the average market price would be computed thereafter unless the market prices are clearly anti-dilutive.

.226 The test applies for both primary and fully diluted computations. But after the test has once been met, an ending market price which is above the exercise price is used for the fully diluted computation even though the average market price is below the exercise price. [*.42*]

.227 This recommendation also applies to earnings per share computations for income statements prepared for periods which are less than a quarter. When applied to shorter periods, however, virtually all market prices in the

[32] The Board recommended that exercise of options and warrants not be assumed for earnings per share data *until* the market price has been above the exercise price for *substantially all* of the three months ending with the month for which the computation is being made.

 © 1974, American Institute of Certified Public Accountants, Inc.

shorter period should be above the exercise price or exercise need not be assumed. For a one-month statement, for example, the market prices during that month and for most of the two preceding months should be above the exercise price. [*.36*]

64. Total of Quarters May Not Equal Annual EPS

.228

Q—Are previously reported earnings per share data ever retroactively adjusted or restated for changes in the incremental number of shares computed using the treasury stock method?

A—No, retroactive adjustment or restatement of previously reported earnings per share data are not made when the incremental number of shares determined by applying the treasury stock method changes. The Board realized that the total of four quarter's earnings per share might not equal the earnings per share for the year when market prices change and the treasury stock method is applied. [*.36, .41*]

.229 Computations for each quarter or other period are independent. Earnings per share data would not either be restated retroactively nor adjusted currently to obtain quarterly (or other period) amounts to equal the amount computed for the year or year to date.

65. Unusual Warrants and Their Equivalents

.230

Q—To what kinds of securities does section 2011.37 apply?

A—Section 2011.37 must be applied for earnings per share computations for the following kinds of securities, all of which are classified as common stock equivalents:

1. Warrants which *require* the tendering of debt or other securities of the issuer or its parent or its subsidiary in full or partial payment of the exercise price.

2. Warrants which *permit* as an alternative the tendering of debt or other securities of the issuer or its parent or its subsidiary in full or partial payment of the exercise price.

3. Warrants whose proceeds from exercise must be applied toward the retirement of debt or other securities of the issuer. Such debt or other securities would have

been issued with the warrants and the requirement to apply any proceeds toward retirement would usually be written into an indenture, making the requirement a contractual obligation.

4. Convertible securities which *require* the payment of cash upon conversion (regardless of their yield at time of issuance).

5. Convertible securities which *permit* the payment of cash as an alternative upon conversion, for example, to obtain a greater number of common shares than could be obtained from straight conversion (regardless of their yield at time of issuance). [*.37*]

66. Securities Subject to Section 2011.37 Tests

.231

Q—Are all of the securities listed in the preceding Interpretation subject to the two tests described in section 2011.37?

A—The two tests described in section 2011.37 are tests to determine whether certain warrants are dilutive or anti-dilutive. The "a" test is the usual test to determine if a warrant is dilutive. The "b" test is applied when securities can be tendered in lieu of cash to exercise a warrant. The computations to be made when either or both tests are met are described in Interpretations 67-70. [*.37*]

.232 The "a" test (the market price of the related common stock must exceed the exercise price of the warrant or the convertible security considered the equivalent of a warrant) applies to warrants (1) which require the tendering of debt, (2) which permit the tendering of debt, and (3) whose proceeds must be used to retire debt.

.233 The "b" test (the security to be tendered is selling at enough discount to establish an effective exercise price below the market price of the common stock obtainable) applies only to the debt or other securities which must or may be tendered toward the exercise price of the warrant (the debt listed in 1 and 2 in Interpretation 65). The "b" test gives recognition to the possibility that a warrant holder could purchase debt in the market at a discount and exercise a warrant by tendering the debt at its face amount, thereby effecting the purchase of the common stock for less than its market price.

 © 1974, American Institute of Certified Public Accountants, Inc.

.234 These tests are demonstrated in the following example. Assume that a warrant may be exercised to purchase two shares of common stock by tendering either $100 cash or a $100 face value debenture when market prices are $48 per common share, $94 per debenture, and $6 per warrant. The "a" test is not met (2 × $48 = $96 market price of common does not exceed the exercise price of $100 cash). The "b" test is met. (The $94 market price of the debenture is below the $96 market price for two shares of common. This may also be computed

$$\frac{\text{\$94 market price of debenture}}{\text{\$100 tender value of debenture}} \times \text{\$50 exercise price per}$$

share = $47 effective exercise price per share.) Note that the market price of the warrant is not considered in either test.

.235 The "a" and "b" tests apply to securities on an individual basis. However, when section 2011.38 applies (see Interpretations 72-74), the securities subject to these tests are included in the aggregate computation required by that paragraph whether their individual effect is dilutive or anti-dilutive. [*.35, .38*]

67. Market Prices Used in Section 2011.37 Tests

.236

Q—What market prices are used for the two tests described in section 2011.37?

A—The market prices used for these two tests and for the computations when the tests are met correspond to the market prices used for the treasury stock method (see Interpretations 52-56). Therefore, the computations are made for each quarter and the shares for the quarters are averaged for annual primary computations. [*.37*]

.237 The market price of common stock for both tests is the average market price during each three-month quarter included in the period being reported upon. The ending market price of common stock is used, however, for fully diluted earnings per share if the ending price is *higher* than the average price. [*.42, 2011C.03*]

.238 For the "b" test, the average market price of the debt or other security during each three-month quarter included in the period being reported upon is used. The

ending market price of the debt or other security is used, however, for fully diluted earnings per share if the ending price is *lower* than the average price. [*.37*]

.239 Usually, only one test will be met. In some cases, however, both tests will be met. Also, different tests may be met for primary and fully diluted computations. The computations to be made in these situations are explained in Interpretations 68 and 69. When neither test is met, these securities are not included in earnings per share computations unless section 2011.38 applies. [*.35, .38*]

68. Computations for Warrants Requiring the Tendering of Debt

.240

Q—What computations are made under the "a" and "b" tests specified in section 2011.37 for warrants which require that debt or other securities be tendered upon exercise?

A—If either the "a" or "b" test described in Interpretations 66 and 67 is met when debt or other securities *must* be tendered toward the exercise price, exercise of the warrants is assumed. The debt or other security is tendered at the amount it must be tendered (usually face amount). Interest, net of tax, on the debt is added back to net income in determining earnings applicable to common stock. Common stock is assumed to be issued on the exercise date. The treasury stock method is applied for any cash proceeds when cash is also to be tendered with the debt. The fact that both tests may sometimes be met does not affect the computations. [*.37*]

69. Computations for Warrants Allowing the Tendering of Debt

.241

Q—What computations are made under the "a" and "b" tests specified in section 2011.37 for warrants which permit the tendering of debt or other securities upon exercise?

A—The computations depend upon the test met. If both tests are met, the computations depend upon the alternatives available since some warrants and their equivalents provide two or more exercise or conversion alternatives to the holder. For example, a warrant may be exercisable by paying $60 cash to obtain one share of common stock

 © 1974, American Institute of Certified Public Accountants, Inc.

or by tendering $100 face value debt to obtain two shares of common stock. In such a case, debt *may* be tendered but is not required to be tendered. [.37]

.242 When only the "a" test is met (because the debt or other security is selling for more than the amount for which it may be tendered), the treasury stock method is applied since the debt or other security would not be tendered toward exercise of the warrant or its equivalent.

.243 When only the "b" test is met (the debt or other security which may be tendered is selling at enough discount to create an effective exercise price below the market price of the common stock), the procedures described in Interpretation 68 (for when debt or other securities *must* be tendered) are applied.

.244 If *both* the "a" and "b" tests described above are met when debt or other securities *may* be tendered toward the exercise price or if two or more exercise or conversion alternatives meet one test (whether or not both tests are met), the computation should be based upon the alternative which meets the test and is more (or most) advantageous to the holder of the warrant or its equivalent. [*2011A.13*]

.245 The "a" and "b" tests are applied for each quarter using the market prices specified in Interpretation 67. When either test is met, the computations are made for that quarter. Different tests may apply for different quarters in the period. The shares determined for each quarter are averaged for year-to-date primary computations. In fully diluted year-to-date computations, the greater of the average number of shares included in the fully diluted quarterly computations or the number of shares determined by applying ending market prices is used. [*2011C.03*]

70. Computations for Warrants Whose Proceeds Are Applied To Retire Debt

.246

Q—How are warrants whose proceeds must be used to retire debt or other securities included in earnings per share computations?

A—When debt or other securities of the issuer require that the proceeds from the exercise of warrants or their

equivalents be applied toward retirement of those securities, exercise of the warrants is assumed at the beginning of the period (or time of issuance, if later). The proceeds from exercise are assumed to have been used to purchase the securities to be retired at the date of assumed exercise. [*.37*]

.247 These computations are made on a quarterly basis. The shares determined for each quarter are averaged for annual earnings per share computations. The purchase price to be used is the average market price during each three-month quarter for the securities assumed to have been purchased. To reflect maximum potential dilution, the purchase price for the computation of fully diluted earnings per share is the market price of the securities to be retired at the end of the period if this price is *higher* than the average market price. [*.42, 2011C.03*]

.248 Exercise of the warrants is not assumed for either primary or fully diluted earnings per share unless the market price of the related common stock exceeds the exercise price of the warrants.[33] When exercise is assumed and the proceeds from exercise are used to purchase securities to be retired, interest (net of tax) on any debt retired must be added back to net income in determining earnings applicable to common stock. Any excess amount from the assumed exercise of the warrants above the amount needed for the purchase of securities is used to purchase common stock under the treasury stock method. [*.30, .37, .40*]

71. Treasury Stock Method for Convertibles

.249

Q—How are convertible securities which require or permit the payment of cash at conversion included in earnings per share computations?

A—Convertible securities which require or permit the payment of cash at conversion are considered the equivalents of warrants and are therefore always [34] common stock equivalents. [*.37*]

.250 Convertible securities requiring the payment of cash are assumed to be converted at the beginning of the

[33] Exercise may be assumed, however, if section 2011.38 applies. See Interpretations 72-74.

[34] Unless issued before June 1, 1969 and classified under election "b" of section 2011.46.

 © 1974, American Institute of Certified Public Accountants, Inc.

period (or time of issuance, if later) and the if converted method is applied. Proceeds from conversion are used to purchase common stock under the treasury stock method. Thus, the incremental number of shares assumed to be outstanding is the difference between the number of shares issued upon assumed conversion and the number of shares assumed purchased under the treasury stock method. If the net result of the aggregate computation of applying both the if converted method and the treasury stock method is dilutive, these computations are included in both primary and fully diluted earnings per share. The computations are not included, however, if the net result is anti-dilutive.[35] [*.30, .40*]

• **.251** Some convertible securities permit the payment of cash at conversion to obtain a more favorable conversion rate. The procedures described in the preceding paragraph are applied for such securities except that no proceeds are assumed to be received upon conversion whenever the amount of cash to be paid exceeds the market value of the additional shares obtainable. The treasury stock method therefore cannot be applied when this condition exists and only the if converted method is applied (if the result is dilutive).[35] [*.37, 2011A.13*]

.252 When several conversion alternatives exist (for example, permitting the payment of different amounts of cash for different conversion rates), the computation should give effect to the alternative which is most advantageous to the holder of the convertible security. [*2011A.13*]

72. Anti-Dilutive Options and Warrants Included

.253

Q—When section 2011.38 applies (the number of common shares obtainable upon exercise of all options and warrants exceeds 20% of the number of common shares outstanding at the end of the period), are anti-dilutive options and warrants assumed to be exercised as well as dilutive options and warrants?

A—Yes, when section 2011.38 applies, all options and warrants and their equivalents are assumed to be exercised (or converted) whether they are dilutive or anti-

[35] Conversion may be assumed even if the result is anti-dilutive when section 2011.38 applies. See Interpretations 72-74 and sections 2011.35 and 2011.38.

dilutive. Under this exception to the general rule that computations should not give effect to anti-dilution, all of the computations specified in sections 2011.36, 2011.37 and 2011.38 are made and aggregated. If the net result is dilutive, all are included. If the net result is anti-dilutive, all are excluded. [*.35, .36, .37, .38*]

73. No Order for Exercise

.254

Q—When section 2011.38 applies and several issues of options and warrants with different exercise prices are outstanding, which options and warrants should be assumed to be exercised to obtain common stock under the treasury stock method, i. e., may anti-dilutive options and warrants be used in applying the treasury stock method or is the treasury stock method applicable only for dilutive options and warrants?

A—All options and warrants are assumed to be exercised when section 2011.38 applies without regard to whether the proceeds will be applied to purchase common stock under the treasury stock method or will be applied to the retirement of debt. Specific options or warrants are not to be allocated for the treasury stock method, but rather all options and warrants are assumed to be exercised and the number of common shares assumed to be repurchased under the treasury stock method may not exceed 20% of the number of common shares outstanding at the end of the period. [*.38*]

74. Explanation of 20% Provision

.255

Q—How is the 20% provision described in section 2011.38 applied?

A—20% is used in two ways in section 2011.38. First, a 20% *test* is applied[36] to outstanding common shares. If the 20% test is met, an aggregate computation is required and all options and warrants and their equivalents are assumed to be exercised. Then a 20% *limitation* is applied to the number of common shares purchased under the treasury stock method. [*.38*]

[36] A corporation which has made election "b" of section 2011.46 would apply this test for both primary and fully diluted earnings per share computations, since the number of shares obtainable from options and warrants may differ for the two computations as described in Interpretation 81.

 © 1974, American Institute of Certified Public Accountants, Inc.

.256 Even though the 20% test is met, the number of shares purchased under the treasury stock method may be below the 20% limitation if the market price is high relative to the exercise price. For example, if 1,000,000 common shares and warrants to obtain 500,000 shares were outstanding, the 20% test would be met and the 20% limitation for the treasury stock method would be 200,000 shares. At an exercise price of $10 and a market price of $50, however, only 100,000 shares could be purchased under the treasury stock method.

.257 Note that the 20% limitation applies only to shares assumed *purchased* under the treasury stock method. It does not apply to the number of incremental shares which results from the computation. In the above example, 400,000 incremental shares resulted from the assumed issuance of 500,000 shares upon exercise and the assumed purchase of 100,000 shares under the treasury stock method.

.258 In addition, some warrants and their equivalents for which the treasury stock method may not be applicable result in the assumed issuance of common stock. They are therefore included in applying the 20% test and are included in the aggregate computation if the test is met. For example, warrants whose proceeds must be used to retire debt are included in applying the 20% test and in the aggregate computation if the test is met. Only the proceeds in excess of the amount required for debt retirement would be eligible for the treasury stock method, however. Warrants assumed to be exercised by tendering debt or other securities would also be included in applying the 20% test and in the aggregate computation if the test is met. But only if both cash and debt or other securities were assumed tendered would there be any proceeds eligible for the treasury stock method. Convertible securities which require or permit the payment of cash at conversion are considered the equivalent of warrants. Such convertible securities would be included in applying the 20% test and in the aggregate computation if the test is met. [*.35, .37, .38*]

.259 Most convertible securities, however, (those which do *not* require or permit the payment of cash at conversion) are *not* included in applying the 20% test. Nor are other securities which are not options or warrants or

their equivalents included in the 20% test. For example, the usual participating securities, two-class common stocks and common stock issuable when specified conditions are met are not included in the 20% test. [*.27, .33*]

.260 Securities which are not included in the 20% test are not included in the aggregate computation [37] described in section 2011.38. Thus, even if the net result of the aggregate computation is anti-dilutive and therefore not included in the earnings per share computation, other securities not included in the aggregate computation would be included in the earnings per share computations if they are dilutive. [*.15, .38*]

75. Original Issue Premium or Discount

.261

Q—What treatment is accorded to any original issue premium or discount when debt is assumed acquired under the provisions of sections 2011.37 and 2011.38?

A—Original issue premium or discount is treated as specified in Interpretation 40, i. e., applicable premium or discount amortized during the period is eliminated from net income. Unamortized premium or discount is not included in earnings applicable to common stock and does not affect earnings per share. [*2011A.06*]

76. Redemption Premium or Discount

.262

Q—What treatment is accorded to any redemption premium or discount when debt is assumed acquired under the provisions of sections 2011.37 and 2011.38?

A—Redemption premium or discount, i. e., the difference between the purchase price and the "book" carrying amount of debt, is ignored for earnings per share computations. [*2011A.06*]

.263 Redemption premium or discount could occur only when the proceeds from the assumed exercise of options and warrants are applied to purchase debt at the market price under the provisions of either section 2011.37 or 2011.38. Redemption premium or discount is not included

[37] However, convertible debt assumed to be retired with proceeds from exercise in excess of the amount required for applying the treasury stock method would be included in the aggregate computation and its interest would be eliminated as described in section 2011A.06.

 © 1974, American Institute of Certified Public Accountants, Inc.

in earnings applicable to common stock and does not affect earnings per share.

.264 Common shares are, of course, assumed to be issued for all options and warrants assumed to be exercised. [*.36, .42*]

77. Debt Purchased Under Section 2011.38

.265

Q—What debt may the issuer assume is purchased when the provisions of section 2011.38 apply?

A—The issuer may select any debt which is eligible to be retired for assumed purchase when the provisions of section 2011.38 apply. This includes convertible debt (both common stock equivalents and other potentially dilutive securities) except that convertible debt may not be assumed purchased if the purchase would be anti-dilutive (that is, result in less dilution). Debt is eligible to be retired when it either may be "called" or is trading and could be purchased in the market. [*.30, .38, .40*]

.266 The same debt is assumed purchased for both primary and fully diluted earnings per share computations. Different amounts of debt may be assumed purchased, however, since different market prices may have to be used for the primary and fully diluted computations for the treasury stock method. The average market price of the debt during each quarter for which the computations are made is used for both the primary and fully diluted computations under section 2011.38. [*.38*]

78. Compensating Balances Excluded

.267

Q—When section 2011.38 applies and a loan is assumed to be paid, what treatment is accorded to any compensating balance maintained for the loan?

A—A compensating balance maintained for a loan assumed to be paid is excluded from consideration in applying section 2011.38. Although a compensating balance increases the effective interest rate on a loan to the borrower, only the actual interest paid or accrued (less applicable income tax) is adjusted against net income for earnings per share computations. [*.38*]

79. Investments Under Section 2011.38

.268

Q—What securities are eligible for assumed purchase as investments when the provisions of section 2011.38 apply?

A—Only U. S. government securities and commercial paper are eligible for assumed purchase as investments when the provisions of section 2011.38 apply. Tax-exempt securities of state and local governments are not eligible. The same securities are assumed purchased as investments for both primary and fully diluted earnings per share computations. Different amounts may have to be assumed invested for primary and fully diluted computations, however. [*.38*]

.269 U. S. government securities, in the context of section 2011.38, are securities issued by the federal government, not merely securities guaranteed by the federal government. Typically the securities to be considered would be short-term securities, such as Treasury bills.

80. Debt Eligible Only While Outstanding

.270

Q—When section 2011.38 applies and debt assumed purchased was actually outstanding only part of the period, may the assumed purchase apply for the entire period?

A—No, debt issued or retired during the period may be assumed purchased at its average market price under section 2011.38 only for the time the debt was actually outstanding. Since all computations under this paragraph are made on a quarterly basis, the issue or retirement typically affects only one quarter. An investment in U. S. government securities or commercial paper must be assumed for the time when debt was not outstanding and therefore could not be purchased. Any difference in interest (net of tax) between the debt and the investment naturally is reflected in earnings applicable to common stock. [*.38*]

81. Computations May Differ for Primary and Fully Diluted when Section 2011.38 Applies

.271

Q—Will section 2011.38 always apply for both primary and fully diluted computations if it applies to either?

 © 1974, American Institute of Certified Public Accountants, Inc.

A—No, in some cases section 2011.38 may apply for fully diluted computations but not for primary computations. This could occur when an issuer has made election "b" under section 2011.46 and the common shares obtainable upon exercise of options and warrants issued before June 1, 1969 exceed 20% of the common shares outstanding. Section 2011.38 applies in such a case for fully diluted but not for primary computations because the options and warrants issued before June 1, 1969 are included only in fully diluted computations. [*.38, .46*]

.272 Even if the common shares obtainable upon exercise of options and warrants issued before June 1, 1969 do not exceed 20% of the outstanding common shares when election "b" is in effect, the subsequent issuance of additional options or warrants could cause section 2011.38 to apply for fully diluted but not for primary computations. In such a case, section 2011.38 would be applied only for fully diluted computations because options and warrants issued before June 1, 1969 would not be included in primary computations. [*.38, .46*]

.273 The computation of primary and fully diluted earnings per share would also differ if section 2011.38 applied for both computations, but the net result in primary is anti-dilutive and is dilutive in fully diluted. This could occur when the ending market price is above the exercise price but the average market price is below the exercise price. In such a case, the computations would be included only for determining fully diluted earnings per share. [*.30, .36, .38, .42*]

82. Deferred Compensation Stock Option

.274

Q—What treatment for earnings per share computations should be accorded to an employee deferred compensation plan with the compensation to be paid in stock?

A—Stock to be issued to an employee under a deferred compensation plan is considered a stock option. The time of issuance is the agreement date (or "date of grant"). The fact that the employee may not receive (or be able to sell) the stock until more than five or ten years from the statement date does not affect the computation. Accordingly, all shares to be issued are considered outstanding and

the treasury stock method is applied to determine the incremental number of shares to be included in the earnings per share computations. The exercise amount of the option is the sum of the amount the employee must pay, the unamortized deferred compensation, and any tax benefit credited to capital surplus.[38] The exercise amount is divided by the market price [39] per share of the common stock to determine the number of shares assumed to be purchased. [*.29, .35, .36, 2011A.12, 2011A.13*]

.275 For primary earnings per share computations, the average unamortized deferred compensation for the period and the average market price of the issuer's common stock are used. For fully diluted earnings per share computations, the unamortized deferred compensation at the end of the period and, if higher than the average market price, the ending market price of the issuer's common stock are used.

.276 For example, assume that on January 2, 1973 [40] a corporation grants options to its president for the purchase of 6,000 shares of its common stock at $2 per share, with options for 1,000 shares exercisable each July 1 and January 1 for three years as partial compensation for services during the preceding six months. The shares issued cannot be sold within three years of the issue date. At time of the grant of the options (January 2, 1973 [41]), the 6,000 shares have a market price of $10 per share. Also assume

---

[38] The tax benefit credited to capital surplus is the "windfall" tax credit resulting from an increase in the market price of the stock between the date the plan is entered into and the date the compensation charge is deductible for tax purposes. Since the compensation is charged on the financial statements against the period benefited, the tax related to the charge results in a timing difference for interperiod tax allocation. If the market price of the stock increases, the additional reduction in taxes (i. e., a "windfall" gain) should be credited to capital surplus and considered part of the proceeds from the stock compensation plan which would be used to purchase stock under the treasury stock method.

[39] The unadjusted quoted market price of a share of stock of the same class that trades freely in an established market should be used. If a quoted market price is not available, the best estimate of what the market price would be (not reduced for any restrictions imposed) should be used.

[40] Grants or awards made prior to January 1, 1973 are subject to section 4061 rather than section 4062. Accordingly, fair value per share rather than market price is used if a restriction on the sale of the stock makes it worth less than the market price of freely trading stock.

[41] If the corporation has made election "b" under section 2011.46 as to grants or awards made prior to June 1, 1969, only the fully diluted computations would apply, since "time of issuance" of these options is the date of grant.

 © 1974, American Institute of Certified Public Accountants, Inc.

that the market price per share increases steadily during the three years at the rate of $1 per quarter and the tax rate is 50%. The total compensation to be charged to expense over the three-year period is $48,000 ($10 market price reduced by the $2 option price results in $8 per share compensation multiplied by 6,000 shares).

.277 At March 31, 1973, the unamortized deferred compensation is $44,000 ($48,000 — $4,000) and the windfall tax benefit is $3,000 ($1.00 × 6,000 = $6,000 increase in market multiplied by .50 tax rate). The total exercise price is $12,000 (6,000 × $2). For primary computations, averages of $46,000 unamortized deferred compensation and $1,500 windfall tax benefit plus the $12,000 total exercise price produce $59,500 "proceeds" for the total exercise amount. Dividing by the average market price of $10.50 ($10 + $11 = $21 divided by 2) results in 5,667 shares assumed repurchased under the treasury stock method. Therefore, 333 incremental shares (6,000 — 5,667) are assumed to be outstanding for the first quarter in the primary computation. For fully diluted computations, 636 incremental shares are computed:

$44,000 + $3,000 + $12,000 = $59,000
$59,000 ÷ $11 = 5,364
6,000 — 5,364 = *636*

.278 At June 30, 1973, the second quarter primary computation would include 913 incremental shares and fully diluted would include 1,167 incremental shares computed:

$42,000 + $4,500 + $12,000 = $58,500
$58,500 ÷ $11.50 = 5,087
6,000 — 5,087 = *913*
$40,000 + $6,000 + $12,000 = $58,000
$58,000 ÷ $12 = 4,833
6,000 — 4,833 = *1,167*

.279 On July 1, 1973, 1,000 shares would be issued to the president and are outstanding shares thereafter.[42]

[42] The amount of the tax benefit for each share issued will be the lesser of the difference between the $2 exercise price and (1) the market price of the unrestricted stock when the restricted stock is issued or (2) the market price when restrictions lift. Changes in the windfall tax gain after the stock is issued are ignored in this computation since the compensation paid in stock is considered finalized upon issuance in this example.

At September 30, 1973, the treasury stock method would produce 660 incremental shares for the third quarter primary and 885 incremental shares for fully diluted computed:

$$\$38{,}000 + \$6{,}250 + \$10{,}000 = \$54{,}250$$
$$\$54{,}250 \div \$12.50 = 4{,}340$$
$$5{,}000 - 4{,}340 = \mathit{660}$$

$$\$36{,}000 + \$7{,}500 + \$10{,}000 = \$53{,}500$$
$$\$53{,}500 \div \$13 = 4{,}115$$
$$5{,}000 - 4{,}115 = \mathit{885}$$

.280 At December 31, 1973, the treasury stock method would produce 1,093 incremental shares for the fourth quarter primary and 1,286 incremental shares for fully diluted computed:

$$\$34{,}000 + \$8{,}750 + \$10{,}000 = \$52{,}750$$
$$\$52{,}750 \div \$13.50 = 3{,}907$$
$$5{,}000 - 3{,}907 = \mathit{1{,}093}$$

$$\$32{,}000 + \$10{,}000 + \$10{,}000 = \$52{,}000$$
$$\$52{,}000 \div \$14 = 3{,}714$$
$$5{,}000 - 3{,}714 = \mathit{1{,}286}$$

.281 The deferred compensation payable in stock would produce the following shares of common stock to be included in the corporation's 1973 annual earnings per share computations:

	Primary Computations	*Fully Diluted Computations*
Incremental shares from application of the treasury stock method:		
First quarter	333	1,167(1)
Second quarter	913	1,167
Third quarter	660	1,286(2)
Fourth quarter	1,093	1,286
Totals	2,999	4,906
Shares for weighted average (divide totals by 4)	750	1,227
Shares issued (1,000 ÷ 2)	500	500
Total shares	1,250	1,727

© 1974, American Institute of Certified Public Accountants, Inc.

COMPUTATIONAL NOTES:

(1) 636 incremental shares computed for first quarter fully diluted not used in annual computation. 1,167 incremental shares based on $12 market price at July 1 "exercise date" when the stock was issued.

(2) 885 incremental shares computed for third quarter fully diluted not used in annual computation. 1,286 incremental shares based on $14 ending market price for the fourth quarter.

.282 If the market price of the stock should subsequently fall below the market price at the date of grant, the application of the treasury stock method would be antidilutive. In such a case, the treasury stock method would not be applied and any unissued shares would not be considered outstanding for earnings per share computations. [*.30, .40*]

.283 The procedures described above are also used for deferred compensation plans to be paid in stock which do not require the employee to make a payment to obtain the stock. In such plans, the option price is zero. The period for measuring compensation under such plans is generally the period over which the restrictions lift. Although the plans are different, the procedures described in this Interpretation are applied with the zero option price offset by an increase in the unamortized deferred compensation. Also, these procedures would be applied for earnings per share computations whether or not the plan has been recorded by the company prior to the issuance of the stock. [*.35, .36, .39*]

.284 Whether or not these procedures apply to "phantom" or "shadow" stock deferred compensation plans depends upon the nature of the plan. These plans may require the employer corporation to (1) either issue stock or pay cash for the stock's value to the employee at a future date or (2) pay the employee in cash at a future date for any increase in the stock's value. Most "phantom" stock plans are based on the employer corporation's stock but some of these plans are based on the stock of an unrelated corporation selected by the employee. Additionally, these plans may either be "funded" or "unfunded." Funding may be accomplished by periodically setting aside any cash to be paid out under the plan or by purchasing stock (which may subsequently be issued or sold to fulfill the plan) or, in the

case of plans based on the employer corporation's stock, by reserving unissued or treasury shares.

.285 Phantom stock deferred compensation plans based on the employer corporation's stock (or the stock of a parent or subsidiary corporation) are included in earnings per share computations under the procedures described above in this Interpretation. However, plans requiring the employer to pay cash rather than stock to the employee are an exception if stock will not be sold to provide the cash. Such plans affect earnings per share only through any compensation charged against net income, since the stock value determines the compensation amount and stock is not issued.

.286 Phantom stock plans based on the stock of an unrelated corporation likewise affect earnings per share only through any compensation charged against net income, since the employer corporation's stock is in no way involved in the plan.

[As amended, for all stock option, purchase, award, and bonus rights granted after December 31, 1972 by APB Opinion No. 25.] (See section 4062.)

83. Stock Subscriptions Are Warrants

.287

Q—How are stock subscriptions included in earnings per share computations?

A—Fully paid stock subscriptions are considered outstanding stock whether or not the shares have actually been issued. Partially paid stock subscriptions are considered the equivalents of warrants and are therefore always[43]

[43] Unless subscribed before June 1, 1969 and election "b" under section 2011.46 is made.

 © 1974, American Institute of Certified Public Accountants, Inc.

common stock equivalents. The unpaid balance is assumed to be proceeds used to purchase stock under the treasury stock method. [*.35*]

.288 The number of shares included in earnings per share computations for partially paid stock subscriptions is the difference between the number of shares subscribed and the number of shares assumed to be purchased under the treasury stock method.

.289 The procedures described above are used for subscriptions to purchase convertible securities as well as for subscriptions to purchase common stock. Any incremental convertible securities resulting are then assumed to be converted into common stock if the result is dilutive (see Interpretation 84).

84. Options or Warrants to Purchase Convertible Securities

.290

Q—What treatment is accorded options or warrants to purchase convertible securities?

A—Options or warrants to purchase convertible securities are assumed to be exercised to purchase the *convertible* security whenever the market price of both the convertible security and the common stock obtainable upon conversion are above the exercise price of the warrant. However, exercise is not assumed unless conversion of the *outstanding* convertible securities is also assumed. The treasury stock method is applied to determine the incremental number of convertible securities which are assumed to be issued and immediately converted into common stock. The if converted adjustments which would be applicable to the incremental convertible securities are ignored since the adjustments would be self-cancelling, i. e., any interest or dividends imputed to the incremental convertible securities would be cancelled in applying the if converted method. [*.30, .40, .36, 2011A.06*]

.291 For example, assume that a corporation issued 10,000 warrants exercisable to obtain its $100 par value 5% convertible debt. Each warrant may be exercised at $90 to obtain one convertible bond. Each bond is convertible into two shares of common stock. The market prices of the securities are $46 per common share and $95 per convertible

bond. The warrants are dilutive (2 × $46 = $92 which is greater than the $90 exercise price).

.292 Assumption of exercise would produce $900,000 proceeds, which would be used to purchase 9,474 convertible bonds, resulting in 526 incremental bonds. Conversion would be assumed and 1,052 shares of common (2 × 526 = 1,052) would be assumed issued to replace the 526 convertible bonds. [*.36*]

.293 If the market price of common were $45 per share or less, exercise would not be assumed (for example, at $42 per share, 2 × $42 = $84 which is less than $90).

.294 The classification of the convertible security as a common stock equivalent or other potentially dilutive security determines whether the incremental number of common shares enters primary and fully diluted or enters only fully diluted earnings per share computations. [*.33*]

TWO-CLASS COMMON STOCK AND PARTICIPATING SECURITIES

85. EPS Treatment of Two-Class and Participating Securities

.295

Q—How are two-class common stocks and participating securities treated for earnings per share computations?

A—Two-class common is a term applied when a corporation has issued more than one class of common stock (for example, Class A and Class B). A participating security is a security eligible to participate in dividends with common stock; often a fixed amount is guaranteed to the participating security, then common is paid a dividend at the same rate, and the security participates with common on a reduced ratio thereafter. Classes of common stock other than "ordinary" common stock and the participating securities may be convertible into "ordinary" common stock or may be nonconvertible and may or may not be senior to common stock.

.296 For example, some stocks may be designated as common stock (e. g., Class B Common), but their terms and conditions are equivalent to preferred stock (by limiting their voting rights or the amount of dividends they may receive and by giving them preferences in liquidation). If

 © 1974, American Institute of Certified Public Accountants, Inc.

dividends are guaranteed in some way but limited in participation to a maximum amount for a particular class of common stock, that common stock is considered the equivalent of a senior security to the extent it is to share in earnings.

.297 If dividend participation for a particular class of common stock is not limited but the participation is at a rate different from the "ordinary" common stock (for example, participating equally to some amount per share and partially participating thereafter), the two-class method is used. The two-class method is also used for participating preferred stock which is not limited as to participation in dividends with common stock. The two-class method is modified, however, when it is applied for a convertible security. (See Interpretation 87.) To be applied for a convertible security, the two-class method must result in greater dilution than would result from application of the if converted method. [*2011A.09, 2011A.10*]

.298 A determination of the status of a two-class common stock or other participating security as a common stock equivalent or as an other potentially dilutive security is based on an analysis of all the characteristics of the security, including the ability to share in the earnings potential of the issuing corporation on substantially the same basis as the common stock. Dividend participation *per se* does not make such a security a common stock equivalent. [*2011A.15*]

.299 The two-class method of computation for nonconvertible securities is discussed in Interpretation 86. The two-class method of computation for convertible securities is discussed in Interpretation 87.

86. Two-Class Method for Nonconvertible Securities

.300

Q—How is the two-class method applied for nonconvertible securities?

A—The two-class method for nonconvertible securities is an earnings allocation formula which determines earnings per share for each class of common stock and participating security according to dividends paid and participation rights in undistributed earnings. [*2011A.10*]

.301 Under the two-class method, net income is first reduced by the amount of dividends actually paid for the period to each class of stock and by the contractual amount of any dividends (or interest on participating income bonds) which must be paid (for example, unpaid cumulative dividends or dividends declared during the period and paid during the following period). The remaining unencumbered undistributed earnings is secondly allocated to common stock and participating securities to the extent each security may share in earnings. The total earnings allocated to each security is determined by adding together the amount allocated for dividends and the amount allocated for a participation feature.

.302 This amount is divided by the number of outstanding shares of the security to which the earnings are allocated to determine the earnings per share for the security. For this computation, outstanding common stock (the "ordinary" class of common stock) includes the usual common stock equivalent securities assumed to be converted or exercised for primary computations and includes these securities and all other potentially dilutive securities assumed to be converted or exercised for fully diluted computations. Although reporting earnings per share for each class of security may be desirable, earnings per share must be reported for the "ordinary" class of common stock.

.303 The application of the two-class method for a nonconvertible security is illustrated in the following example. Assume that a corporation had 5,000 shares of $100 par value nonconvertible preferred stock and 10,000 shares of $50 par value common stock outstanding during 1969 and had a net income of $65,000. The preferred stock is entitled to a noncumulative annual dividend of $5 per share before any dividend is paid on common. After common has been paid a dividend of $2 per share, the preferred stock then participates in any additional dividends on a 40:60 *per share* ratio with common. That is, after preferred and common have been paid dividends of $5 and $2 per share respectively, preferred participates in any additional dividends at a rate of two-thirds of the additional amount paid to common on a per share basis. Also assume that for 1969 preferred shareholders have been paid $27,000 (or $5.40 per

 © 1974, American Institute of Certified Public Accountants, Inc.

share) and common shareholders have been paid $26,000 (or $2.60 per share). Earnings per share for 1969 would be computed as follows under the two-class method for non-convertible securities:

Net income		$65,000
Less dividends paid:		
Preferred	$27,000	
Common	26,000	53,000
Undistributed 1969 earnings		$12,000

Allocation of undistributed earnings:

To preferred:

$$\frac{.4(5{,}000)}{.4(5{,}000) + .6(10{,}000)} \times \$12{,}000 = \$3{,}000$$

$$\$3{,}000 \div 5{,}000 \text{ shares} = \$.60 \text{ per share.}$$

To common:

$$\frac{.6(10{,}000)}{.4(5{,}000 + .6(10{,}000)} \times \$12{,}000 = \$9{,}000$$

$$\$9{,}000 \div 10{,}000 \text{ shares} = \$.90 \text{ per share.}$$

Earnings per share amounts:

	Preferred Stock	*Common Stock*
Distributed earnings	$5.40	$2.60
Undistributed earnings	.60	.90
Totals	$6.00	$3.50

87. Two-Class Method for Convertible Securities

.304

Q—How is the two-class method applied for convertible securities?

A—Most convertible two-class common stocks and other convertible participating securities are assumed to be converted and the if converted method is applied for earnings per share computations. The two-class method is rarely appropriate for such convertible securities and may be applied only when it results in greater dilution than

would result from the if converted method. [*2011A.06, 2011A.09*]

.305 When the two-class method is used for a convertible two-class common or other convertible participating security, net income is first allocated under the procedure described in Interpretation 86 for dividends for the current period which were paid or declared or are cumulative if not paid or declared. Conversion of the convertible two-class common and participating securities is then assumed, but adjustments to net income usually made for the if converted method are *not* made. Unencumbered undistributed earnings is divided by the total of all common shares outstanding and assumed outstanding from conversions and exercise. The resulting amount per share is added to the amount of the dividends per share allocated to each class of security to determine the earnings per share for each class of security. Although reporting earnings per share for each class of security may be desirable, earnings per share must be reported for the "ordinary" class of common stock. [*2011A.10*]

.306 The application of the two-class method for a convertible security is illustrated in the following example. Assume that a corporation had 10,000 shares of Class A common stock (the "ordinary" common) and 5,000 shares of Class B common stock outstanding during 1969 and had a net income of $65,000. Each share of Class B is convertible into two shares of Class A. The Class B is entitled to a noncumulative annual dividend of $5 per share. After Class A has been paid a dividend of $2 per share, Class B then participates in any additional dividends on a 40:60 *per share* ratio with Class A. For 1969 the Class A shareholders have been paid $26,000 (or $2.60 per share) and the Class B shareholders have been paid $27,000 (or $5.40 per share). Earnings per share for 1969 would be computed as follows:

Under the if converted method:

$$\frac{\$65{,}000}{20{,}000 \text{ shares*}} = \$3.25 \text{ per share}$$

* Conversion of Class B is assumed.

 © 1974, American Institute of Certified Public Accountants, Inc.

Under the two-class method for convertible securities:

Net income		$65,000
Less dividends paid:		
Class A common	$26,000	
Class B common	27,000	53,000
Undistributed 1969 earnings		$12,000

Allocation of undistributed earnings:

$$\frac{\$12{,}000}{20{,}000 \text{ shares}} = \$.60 \text{ per Class A share.}$$

$$2(.60) = \$1.20 \text{ per Class B share.}$$

Earnings per share amounts:

	Class A	*Class B*
Distributed earnings	$2.60	$5.40
Undistributed earnings	.60	1.20
Totals	$3.20	$6.60

.307 The two-class method may be used in this case since it results in greater dilution than the if converted method.

SECURITIES ISSUABLE UPON SATISFACTION OF SPECIFIED CONDITIONS

88. Contingent Shares

.308

Q—How is common stock contingently issuable or subject to recall classified and treated in earnings per share computations?

A—Common stock contingently issuable or subject to contingent recall is always[44] classified as a common stock equivalent unless it will be issued upon the mere passage of time and is therefore considered to be outstanding for both

[44] Unless their time of issuance (see Interpretation 89) is prior to June 1, 1969 *and* the issuer makes election "b" of section 2011.46 *and* they were not considered residual securities under APB Opinion No. 9. Contingent shares meeting these three conditions are other potentially dilutive securities.

primary and fully diluted computations. Whether (1) the stock will be issued in the future upon the satisfaction of specified conditions, (2) the stock has been placed in escrow and part must be returned if specified conditions are not met, or (3) the stock has been issued but the holder must return part if specified conditions are not met does not affect the classification of contingent shares. [*.27, 2011A.16*]

.309 When certain conditions are not met, however, contingent shares are omitted from primary or from primary and fully diluted earnings per share computations. Typical examples of the conditions to be met for contingent shares are (1) the passage of time along with other conditions, (2) the maintenance of some level of earnings, (3) the attainment of some level of earnings, and (4) changes in market prices which modify the number of shares to be issued.

.310 Contingent shares are included in both primary and fully diluted computations when the conditions for their issuance are currently being met. If additional shares would be contingently issuable if a higher earnings level were being attained currently, the additional shares are included only in fully diluted computations (giving effect to the higher earnings level) but only if dilution results. Contingent shares based on (1) the attainment of increased earnings levels above the present earnings level or (2) the maintenance of increased earnings above the present level of earnings over a period of years are included only in fully diluted computations (giving effect to the higher earnings level) but only if dilution results. [*2011A.17*]

.311 When contingent shares have been included in an earnings per share computation, they continue to be included in the computations in following periods until the expiration of the term of the agreement providing for the contingent issuance of additional shares. However, contingent shares are excluded from the computations whenever their effect would be anti-dilutive. [*.30, .40*]

.312 Prior period primary and fully diluted earnings per share should be retroactively restated whenever the number of shares issued or contingently issuable changes from the number of shares originally included in the com-

 © 1974, American Institute of Certified Public Accountants, Inc.

putation. However, prior period earnings per share data are not retroactively restated for shares actually issued when the condition was the attainment of specified increased earnings levels and the shares were not previously considered outstanding. [*2011A.17-.19*]

89. Time of Issuance for Contingent Issuances

.313

Q—What is the time of issuance of a contingently issuable security?

A—The time of issuance of a contingently issuable security is the date when agreement to terms has been reached and announced even though subject to further actions, such as directors' or stockholders' approval. But, contingently issuable common stock is considered outstanding for earnings per share computations only when the terms become binding. (See Interpretations 27 and 28.) [*.29*]

90. Market Price Conditions

.314

Q—How do market price conditions affect the number of contingent shares included in earnings per share computations?

A—The number of contingently issuable shares may depend on market prices for an issuer's common stock. Generally, these market price conditions for contingent shares may be classified as (1) maximum future market price guarantees, (2) market prices for base number of shares to be determined, and (3) minimum future market price guarantees. Additionally, some agreements based on market prices for an issuer's common stock specify that no less than some minimum number of shares and/or no more than some maximum number of shares will be issued regardless of market prices. [*2011A.18, 2011A.19*]

.315 Conditions which guarantee a maximum future price provide ''upside'' assurance. That is, the issuer guarantees that the market price per share will increase to some stated amount within some time period. To the extent that the market price does not increase as guaranteed, the issuer agrees to issue additional shares or pay cash to make up the difference. Such a guarantee may extend to shares already issued as well as shares to be issued.

.316 Conditions for market prices to determine the base number of shares to be issued may relate to periodic prices (such as the end of each year), an average of prices over some period, or some final price (such as at the end of five years). The conditions may also specify maximum or minimum market price guarantees.

.317 Conditions which guarantee a minimum future price provide "downside" protection. That is, the issuer guarantees that the market price per share will not decrease below some stated amount within some time period. To the extent that the market price goes below that amount, the issuer agrees to issue additional shares or pay cash to make up the difference. Such a guarantee may extend to shares already issued as well as to shares to be issued.

.318 When the number of contingently issuable shares depends on the future market price of an issuer's common stock, earnings per share computations reflect the number of shares which would be issuable based on the market price at the close of the period being reported upon. If a minimum and/or maximum number of shares is also specified, the number of shares determined from the market price at the close of the period would, if necessary, be adjusted to not less than the minimum nor more than the maximum number of shares so specified.

.319 When additional shares are to be issued for an "upside" or a "downside" guarantee and the market price at the close of the period is less than the guaranteed price, earnings per share computations should give effect to the additional shares which would be issued.

.320 The number of contingently issuable shares may differ for primary and fully diluted computations based upon earnings levels. But market price conditions do not cause different numbers of contingently issuable shares to be included in primary and fully diluted computations. Specifically, more shares are not included in fully diluted than in primary computations because of market price guarantees. A market price guarantee has the same effect on both computations. [*2011A.17, 2011A.18, 2011A.19*]

.321 Prior period earnings per share would be retroactively restated if the number of shares issued or contin-

 © 1974, American Institute of Certified Public Accountants, Inc.

gently issuable subsequently changes because of market price changes.

91. Earnings Conditions

.322

Q—How does an earnings condition affect the number of contingent shares included in earnings per share computations?

A—Earnings conditions for the contingent issuance of common stock vary. Some earnings conditions determine the *total* number of shares to be issued, for example, one share for each $100 earned (1) each year for five years or (2) based on a formula, such as ten times the average annual earnings for five years. [*2011A.17, 2011A.19*]

.323 Other earnings conditions determine the *additional* number of shares to be issued. Typically, additional shares are to be issued based on either (1) the *maintenance* of (a) the present level of earnings or (b) a higher level of earnings or (2) the *attainment* of (a) a higher level of earnings or (b) successively higher levels of earnings.

.324 Earnings conditions may specify a minimum and/or a maximum number of shares to be issued regardless of earnings. Shares may be issued each year or only at the end of several years. Earnings conditions may apply to each year individually or may apply to all years on some cumulative or average basis. Various combinations of the earnings conditions described above may be contained in an agreement.

.325 Some maximum number of shares may be issued initially (or placed in escrow) with the stipulation that unearned shares are to be returned to the issuer. Such plans specifying that shares are returnable are treated the same as contingently issuable shares for earnings per share computations. [*2011A.16*]

.326 Because of the diversity of earnings conditions, stating general guidelines which will apply to all agreements is difficult. The number of shares included in earnings per share computations for an earnings agreement should conform to the provisions of sections 2011A.17 and 2011A.19 and to the guidelines given below.

.327 If shares would at some time be issuable based on the present level of earnings, the shares issuable based on that level of earnings projected to the end of the agreement are considered outstanding for both primary and fully diluted computations. If shares previously considered outstanding become unissuable (for example, because of a decline in earnings), previously reported earnings per share data would be retroactively restated when the term of the condition expires and it is determined that the shares will not be issued. [*2011A.17, 2011A.19*]

.328 If additional shares would at some time be issuable if a level of earnings higher than the present level were attained, the additional shares issuable based on the higher level (or levels) projected to the end of the agreement are considered outstanding only for the fully diluted computation, giving effect to the higher earnings level. If different levels of earnings are specified, the level which results in the greatest dilution is used. If additional shares previously considered outstanding become unissuable (for example, because the higher earnings level is not maintained), previously reported earnings per share data would be retroactively restated when it is determined that the shares will not be issued. If in giving effect to the higher earnings level dilution does not result, the additional shares are not included in the computation. When such additional shares were not included in prior earnings per share computations but are subsequently issued (for example, because the higher earnings level was actually attained), previously reported earnings per share data are *not* retroactively restated.

.329 When an earnings condition specifies a minimum and/or a maximum number of shares to be issued, no less than the minimum nor no more than the maximum number specified would be included in the earnings per share computations. If shares are issued each year and a total minimum and/or maximum number is specified, the minimum and/or maximum would be reduced by the number of shares issued.

92. Convertible Securities Contingently Issuable

.330

Q—How are contingently issuable convertible securities treated for earnings per share computations?

 © 1974, American Institute of Certified Public Accountants, Inc.

A—Contingently issuable convertible securities are included in earnings per share computations under the guidelines described for convertible securities and the guidelines described for contingently issuable common stock. That is, additional convertible securities are assumed to be issued in conformity with the conditions specified for their issuance. (See Interpretations 88-91 for an explanation of how conditions affect the number of securities considered outstanding.) [*.33, 2011A.06, 2011A.16-.19*]

.331 Time of issuance of the contingently issuable convertible securities is the date when agreement as to terms has been reached and announced. The classification of the contingently issuable convertible security as a common stock equivalent or other potentially dilutive security is determined at time of issuance based on its yield at that time[45] and does not change when the security is actually issued. A change in the bank prime interest rate or the market price of the security between the time of issuance and actual issuance of a contingently issuable convertible security has no effect on its classification.[46] [*.29*]

.332 Those contingently issuable convertible securities classified as common stock equivalents are included in both primary and fully diluted computations. However, such common stock equivalents based on the attainment or maintenance of earnings above the present level are included only in fully diluted computations. Contingently issuable convertible securities classified as other potentially dilutive securities are included only in fully diluted computations. [*.33, 2011A.17*]

.333 When contingently issuable convertible securities are to be included in earnings per share computations, conversion of the additional securities is assumed. However, conversion is not assumed for the additional securities unless conversion is also assumed for their counterpart outstanding convertible securities. Interest or dividends are not imputed for the additional contingently issuable convertible securities since any imputed amount would be

---

[45] Unless it has the same terms as the terms of an outstanding convertible security which is a common stock equivalent. A convertible security contingently issuable at May 31, 1969 would be classified under either election "a" or election "b" of section 2011.46.

[46] Except in the situations described in Interpretations 29 and 30.

reversed by the if converted adjustments for assumed conversion. [*2011A.06*]

PARENT AND CONSOLIDATED FINANCIAL STATEMENTS

93. Securities Issued by Subsidiaries

.334

Q—How do convertible securities and options and warrants issued by a subsidiary affect parent and/or consolidated earnings per share?

A—The effect of options and warrants and convertible securities issued by a subsidiary upon consolidated earnings per share (or parent company earnings per share when parent company statements are prepared as the primary financial statements using the equity method) depends upon whether the securities issued by the subsidiary to the public enable their holders to obtain common stock of the subsidiary company or common stock of the parent company. [*2011A.20*]

.335 Securities issued by a subsidiary which enable their holders to obtain the subsidiary's common stock are included in computing the subsidiary's earnings per share data. These earnings per share data are then included in the parent or consolidated earnings per share computations based on the consolidated group's holdings of the subsidiary's securities. [*2011A.21-.22*]

.336 Options and warrants issued by a subsidiary which enable their holders to purchase parent company common stock are common stock equivalents[47] for parent or consolidated earnings per share computations. Securities of a subsidiary convertible into parent company common stock are classified as common stock equivalents or other potentially dilutive securities for parent or consolidated earnings per share computations under the yield test.[48] [*2011A.23-.24*]

.337 The following example illustrates the earnings per share computations for a subsidiary's securities which enable their holders to obtain the subsidiary's common stock. Assume that a parent corporation had a net income

---

[47] Unless issued prior to June 1, 1969 and the parent company makes election "b" specified by section 2011.46.

[48] See Interpretation 45 for a description of the treatment of a subsidiary security convertible into a parent company's convertible security.

 © 1974, American Institute of Certified Public Accountants, Inc.

of $10,000 from operations (excluding any dividends paid by the subsidiary), had 10,000 shares of common stock outstanding and had not issued any other securities. The parent corporation owned 900 of the common shares of a domestic subsidiary corporation and also owned 40 warrants and 100 shares of convertible preferred stock issued by the subsidiary. The subsidiary corporation had a net income of $3,600 and had outstanding 1,000 shares of common stock, 200 warrants exercisable to purchase 200 shares of its common at $10 per share (assume $20 average and ending market price for common), and 200 shares of preferred stock convertible into two of its common shares for each preferred share. The convertible preferred paid a dividend of $1.50 per share and is not a common stock equivalent. Assume that no intercompany eliminations or adjustments are necessary except for dividends. (Income taxes have been ignored in the following computations for simplicity.) [*2011A.21-.22*]

Earnings per share for the subsidiary

Primary earnings per share $3.00

Computed:

$$\frac{\$3{,}600^{a} - \$300^{b}}{1{,}000^{c} + 100^{d}}$$

[a] Subsidiary's net income.

[b] Dividends paid by subsidiary on convertible preferred stock.

[c] Shares of subsidiary's common stock outstanding.

[d] Incremental shares of subsidiary's common stock assumed outstanding applying the treasury stock method for warrants (computed $\frac{\$20-\$10}{\$20} \times 200$).

Fully diluted earnings per share $2.40

Computed:

$$\frac{\$3{,}600^{e}}{1{,}000 + 100 + 400^{f}}$$

[e] Subsidiary's earnings applicable to common stock applying the if converted method for convertible preferred stock.

[f] Shares of subsidiary's common stock assumed outstanding from conversion of convertible preferred stock.

Parent or consolidated earnings per share

Primary earnings per share $1.29

Computed:

$$\frac{\$10{,}000^{a} + \$150^{b} + \$2{,}700^{c} + \$60^{d}}{10{,}000^{e}}$$

[a] Parent's net income.

[b] Dividends received by parent on subsidiary's convertible preferred stock.

[c] Parent's proportionate interest in subsidiary's earnings attributable to common stock, computed: $\frac{900}{1{,}000}$ (1,000 shares × $3 per share).

[d] Parent's proportionate interest in subsidiary's earnings attributable to warrants, computed: $\frac{40}{200}$ (100 incremental shares × $3 per share).

[e] Shares of parent's common stock outstanding.

Fully diluted earnings per share $1.27

Computed:

$$\frac{\$10{,}000 + \$2{,}160^{f} + \$48^{g} + \$480^{h}}{10{,}000}$$

[f] Parent's proportionate interest in subsidiary's earnings attributable to common stock, computed: $\frac{900}{1{,}000}$ (1,000 shares × $2.40 per share).

[g] Parent's proportionate interest in subsidiary's earnings attributable to warrants, computed: $\frac{40}{200}$ (100 incremental shares × $2.40 per share).

[h] Parent's proportionate interest in subsidiary's earnings attributable to convertible preferred stock, computed: $\frac{100}{200}$ (400 shares from conversion × $2.40 per share).

[*2011A.21*]

.338 The above computations apply only to earnings per share data. Parent or consolidated net income is determined in the usual manner as follows:

Parent net income from operations......				$10,000
Subsidiary net income			$3,600	
Less minority interest:				
	Preferred	$150 [i]		
	Common	330 [j]	480	3,120
Parent or consolidated net income				$13,120

 © 1974, American Institute of Certified Public Accountants, Inc.

Computed:

[i] 50% (200 preferred shares × $1.50 dividend per share).

[j] 10% ($3,600 net income—$300 preferred dividends).

Note that parent or consolidated net income is not the basis for parent or consolidated earnings per share computations.

.339 These computations would be different if the subsidiary's securities could be exercised or converted only to obtain the parent company's common stock. For example, assume the same facts as were given in the preceding illustration except (1) the warrants and convertible securities are all owned by outsiders, (2) the subsidiary's warrants are exercisable only to obtain parent company common stock, and (3) the subsidiary's preferred stock is convertible only into parent company common stock.

Earnings per share for the subsidiary

Primary earnings per share $3.30

Computed:

$$\frac{\$3{,}600 - \$300}{1{,}000}$$

Fully diluted earnings per share $3.30

Computed:

$$\frac{\$3{,}600 - \$300}{1{,}000}$$

Parent or consolidated earnings per share

Primary earnings per share $1.28

Computed:

$$\frac{\$10{,}000^{a} + \$2{,}970^{b}}{10{,}000^{c} + 100^{d}}$$

[a] Parent's net income.

[b] Parent's proportionate interest in subsidiary's earnings attributable to common stock, computed: $\frac{900}{1{,}000}$ (1,000 shares × $3.30 per share).

[c] Shares of parent's common stock outstanding.

[d] Incremental shares of parent's common stock assumed outstanding applying the treasury stock method for warrants issued by subsidiary exercisable to obtain parent's common stock (computed $\frac{\$20-\$10}{\$20} \times 200$).

Fully diluted earnings per share $1.26

Computed:

$$\frac{\$10{,}000 + \$2{,}970 + \$300^{e}}{10{,}000 + 100 + 400^{f}}$$

[e] Dividends paid by subsidiary on convertible preferred stock which would not have been received by outsiders if the subsidiary's preferred stock had been converted into parent's common stock at the beginning of the period.

[f] Shares of parent's common stock assumed outstanding from conversion of subsidiary's preferred stock convertible into parent's common stock.

[*2011A.23-.24*]

.340 Parent or consolidated net income would be determined as follows:

Parent net income from operations			$10,000
Subsidiary net income		$3,600	
Less: Dividends on preferred stock	$300		
Minority common interest (10%)	330	630	2,970
Parent or consolidated net income			$12,970

Note that parent or consolidated net income is not the basis for parent or consolidated earnings per share computations. [*.39*]

EFFECTS OF SCHEDULED CHANGES

94. Changing Exercise Prices and Conversion Rates

.341

Q—How do changes which may occur in exercise prices or conversion rates affect earnings per share computations?

A—Except as discussed in the next paragraph, if an exercise price or conversion rate is in effect during a period, that exercise price or conversion rate is used for primary computations. When no exercise price or conversion rate is in effect during a period, the earliest effective exercise price or conversion rate during the following five years

 © 1974, American Institute of Certified Public Accountants, Inc.

is used for primary computations. The most advantageous exercise price or conversion rate available to the holder within ten years is always used for fully diluted computations. Previously reported earnings per share data are not restated for subsequent changes in the conversion rate or exercise price. [*2011A.12, 2011A.13*]

.342 If a convertible security having an increasing conversion rate is issued in exchange for another class of security of the issuing company and is at some time convertible back into as many of the same or a similar security as was exchanged, the conversion rate used in the computation does not result in a reduction of the number of common shares (or common stock equivalents) existing before the exchange.

.343 For example, assume that a corporation issued 100,000 shares of convertible preferred to officers and principal stockholders in exchange for 300,000 shares of common stock and each preferred share is convertible back into one common share the first year, two common shares the second year, three common shares the third year, and four common shares the fourth year and thereafter. The convertible preferred would be included as 300,000 common equivalent shares for primary earnings per share computations and 400,000 common equivalent shares for fully diluted earnings per share computations for the first three years and 400,000 common equivalent shares thereafter for both computations.

ELECTION TO CLASSIFY OUTSTANDING SECURITIES

95. Factors in Section 2011.46 Election

.344

Q—What factors would be considered in classifying securities issued prior to June 1, 1969 under the elections provided in section 2011.46?

A—The following factors might be considered for elections "a" and "b" provided in section 2011.46:

1. The section 2011 recommends restatement of prior periods' earnings per share data if election "b" is made

and such data are included in financial statements issued after May 31, 1969, e. g., included in a comparative income statement. Restatement is not required under election "b." Although retroactive restatement is recommended, restatement may not greatly change previously reported earnings per share data. Such data therefore could be included in a comparative income statement without restatement and without a significant loss of comparability.

If election "a" is made, however, all prior periods' earnings per share data must be retroactively recomputed and restated under the provisions of section 2011 when prior periods' data are subsequently presented.

2. Section 2011 includes all options and warrants as common stock equivalents and establishes a test at issuance for convertible securities to determine their classification as common stock equivalents or not. APB Opinion No. 9 excluded the effect of options and warrants from the first EPS amount (unless they were classified as residual securities) and allowed a convertible security to move from senior security to residual status and vice versa based on the value of its conversion rights and common stock characteristics. [*.46*]

.345 Therefore, election "b" would generally exclude options and warrants issued before May 31, 1969 from primary earnings per share computations. Election "a," on the other hand, would cause convertible securities classified as residual under APB Opinion No. 9 at May 31, 1969 which would not be common stock equivalents at issuance under section 2011 to be reclassified as other potentially dilutive securities. If a corporation had options and warrants and convertible securities as described above, the effects of both types of securities would probably be considered in determining the election to be made.

96. Effect of New Issue of Common Stock Equivalents

.346

Q—When securities are classified under election "b" of section 2011.46, can the classifications of those securities change in the future?

A—Generally, the classification of a security does not change after either election is made. However, convertible securities issued before June 1, 1969 would change from

 © 1974, American Institute of Certified Public Accountants, Inc.

other potentially dilutive security status to common stock equivalent status if another convertible security is issued with the same terms which is a common stock equivalent as specified by the second sentence of section 2011.28. (See Interpretation 30.) [*.28, .46*]

97. No Change for Options and Warrants

.347

Q—Would outstanding options or warrants issued prior to June 1, 1969 classified as non-residual securities under election "b" of section 2011.46 become common stock equivalents under the second sentence of section 2011.28 if another option or warrant were issued with the same terms after May 31, 1969?

A—No, such a change of classification applies only to convertible securities. Although this creates a difference of treatment between convertible securities and options and warrants, the Board was explicit in naming only convertible securities. [*.28*]

.348 Because warrants are often traded, identification of a warrant being exercised as having been issued "before" or "after" may be impossible. When an exercised warrant cannot definitely be identified as having been issued after May 31, 1969, exercise is assumed on a FIFO basis. That is, the first warrants issued are assumed to be the first exercised when specific identification is impossible. The same treatment applies for options, except options usually are not transferable and the specific option being exercised can usually be identified.

98. Prior Period Restatement Recommended

.349

Q—Must earnings per share reported under the provisions of APB Opinion No. 9 be restated under the provisions of section 2011?

A—When election "b" of section 2011.46 is made, section 2011 recommends that earnings per share amounts previously reported under APB Opinion No. 9 be restated so the previously outstanding securities conform to the classifications determined under election "b" when such amounts are reported in comparative income statements and election "b" applies to at least one period in the statement. To the extent that the Opinions differ, following this recom-

mendation will have the effect of retroactively restating previously reported earnings per share amounts. [*.45*]

.350 If election "a" of section 2011.46 is made, section 2011 must be applied for all periods presented. [*.46*]

.351 If election "b" of section 2011.46 is made, some companies might prefer not to restate previously reported earnings per share amounts and such restatement is not required by section 2011. There may be cases, however, where the corporation or its auditor may believe that disclosure of the restated earnings per share data is particularly appropriate.

99. Is Prior Period Restatement Permitted?

.352

Q—May prior period earnings per share amounts be retroactively restated other than when restatement is required, for example, for changes in the number of shares computed under the treasury stock method or when a convertible security being issued is determined to be a common stock equivalent and causes outstanding convertible securities with the same terms which were not common stock equivalents at issuance to also become common stock equivalents?

A—No, previously reported earnings per share amounts generally are retroactively restated only when restatement is required (see Part I, paragraphs .039-.041). Earnings per share data are not restated because of changes in the number of shares computed under the treasury stock method. Nor should primary earnings per share data be restated when a convertible security's classification changes because of the subsequent issuance of another convertible security with the same terms. [*.28, .36*]

DISCLOSURE

100. Required Disclosure

.353

Q—What information related to earnings per share is required to be disclosed in addition to earnings per share data?

A—Section 2011 requires disclosure of the following information:

1. Restatement for a prior period adjustment.

 © 1974, American Institute of Certified Public Accountants, Inc.

2. Dividend preferences.
3. Liquidation preferences.
4. Participation rights.
5. Call prices and dates.
6. Conversion rates and dates.
7. Exercise prices and dates.
8. Sinking fund requirements.
9. Unusual voting rights.
10. Bases upon which primary and fully diluted earnings per share were calculated. (The computations would not, however, appear upon the face of the income statement.)
11. Issues which are common stock equivalents.
12. Issues which are potentially dilutive securities.
13. Assumptions and adjustments made for earnings per share data.
14. Shares issued upon conversion, exercise, and conditions met for contingent issuances.
15. Recapitalization occurring during the period or before the statements are issued.
16. Stock dividends, stock splits or reverse splits occurring after the close of the period before the statements are issued.
17. Claims of senior securities entering earnings per share computations.
18. Dividends declared by the constituents in a pooling.
19. Basis of presentation of dividends in a pooling on other than a historical basis.
20. Per share and aggregate amount of cumulative preferred dividends in arrears.

[*.18, .19, .20, .21, .23, 2011A.03, 2011A.05, 2011A.05 fn. 2, 2011A.25*]

101. Supplementary Data

.354

Q—When must supplementary earnings per share data be furnished?

A—Supplementary earnings per share data must be furnished for the latest period when common stock is issued on conversion during the period or after the close of the

period before the report is issued if primary earnings per share would have increased or decreased at least 3% if the issuance had occurred at the beginning of the period. It may also be desirable to furnish supplementary earnings per share data for each period presented giving the cumulative retroactive effect of all such issuances, but primary earnings per share as reported in those periods should not be retroactively adjusted. [*.22, .14 fn.* 4]

.355 Supplementary earnings per share data generally would also be furnished whenever common stock or common stock equivalents have been sold for cash and the proceeds have been or are to be used to retire preferred stock or debt. The supplementary data would be furnished even though the sale occurred shortly after the close of the period but before completion of the financial report. [*.23*]

.356 When the issuance of a convertible security classified as a common stock equivalent causes outstanding convertible securities with the same terms classified as other potentially dilutive securities to be reclassified as common stock equivalents, supplementary earnings per share data may be useful to explain the change in classification. The supplementary data would show what previously reported primary earnings per share would have been if the convertible securities had been classified as common stock equivalents since issuance and thus reconstruct the primary earnings trend. Previously reported primary earnings per share would not be retroactively restated for prior periods in a comparative income statement because of such a change in classification. [*.22, .28*]

	June 9	8.50	5.67
1970	February 25	8.50(3)	5.67
	March 25-26	8.00(4)	5.33

Notes:

(1) 5.75% predominant rate with 5.50% in effect at some banks.

(2) 6.25% predominant rate with 6% in effect at some banks.

(3) 8.50% predominant rate. Starting on February 25, 1970, however, and on several days thereafter, several small banks reduced their prime rates to 8%. At least one bank announced a 7½% prime rate. (See Interpretation 38.)

(4) Many major banks reduced their prime rates to 8% on March 25 and others followed on March 26. The 8% rate was the predominant rate in effect the date this table was prepared (May 6, 1970).

.358

EXHIBIT 2

EXAMPLES OF COMPUTING AVERAGE MARKET PRICES

An average market price may be computed various ways in applying the treasury stock method for options and warrants. (See Interpretations 53 and 54.) In first applying the treasury stock method, the computation depends upon the stability of the market price of the common stock.

In the following example, an average market price has been computed eight different ways for one quarter. First, the computation is based upon weekly prices. The weekly prices are then averaged to determine a monthly average, which is then averaged to determine a quarterly average. (Although not illustrated, a quarterly average could also be computed by adding weekly prices and dividing by 13, thereby eliminating the computation of a monthly average.) In the second example, the computation is based upon monthly prices.

The "High-Low" computation is based upon an average of the high and low prices for the week or month. In the weighted averages, the market prices are weighted by the number of shares involved in the transactions.

Assume the following market transactions for a corporation's common stock during a three-month period:

	Week	High	Low	Close	Shares Traded
Month 1	1	21	19	20	300
	2	24	20	23	700
	3	24	22	22	500
	4	23	21	21	500
Month 2	5	26	22	23	1,000
	6	27	23	26	1,200
	7	29	27	28	1,500
	8	31	29	31	2,000
Month 3	9	28	26	26	2,500
	10	26	22	23	1,500
	11	24	22	22	1,000
	12	22	20	21	800
	13	20	20	20	500

Quarterly total	72.00	72.00	14,000	345,250	344,700
Divided by	3	3		14,000	14,000
Quarterly average ..	24.00	24.00		24.66	24.62

Assuming an exercise price of $20 for options or warrants to purchase 10,000 shares, the above average market prices would produce the following incremental shares:

	Simple Averages		*Weighted Averages*	
	High-Low	*Close*	*High-Low*	*Close*
Weekly prices	1,607	1,536	1,853	1,790
Monthly prices	1,667	1,667	1,890	1,877

Note: Computed

$$10{,}000 - \left(\frac{\$20 \times 10{,}000}{\text{average price}}\right) = \text{incremental shares}$$

EXHIBIT 3

APPLICATION OF THE TREASURY STOCK METHOD FOR OPTIONS AND WARRANTS

.359 Assume 100,000 common shares are outstanding and 10,000 warrants are outstanding which are exercisable at $20 per share to obtain 10,000 common shares. Assume also the following market prices for common stock during a three-year period:

Market Prices Per Share of Common Stock

	Year 1		*Year 2*		*Year 3*	
Quarter	*Average*	*Ending*	*Average*	*Ending*	*Average*	*Ending*
1..........	$18*	$22	$24	$25	$20	$18
2..........	20*	21	22	21	18	22
3..........	22	19	20	19	24	21
4..........	24	23	18	17	22	25

* Assume market prices had been more than $20 for substantially all of a previous quarter.

Computation of Number of Incremental Shares by Quarters

Primary Earnings Per Share(1)

Quarter	*Year 1*	*Year 2*	*Year 3*
1..................	—0—	1,667	—0—
2..................	—0—	909	—0—
3..................	909	—0—	1,667
4..................	1,667	—0—	909

Fully Diluted Earnings Per Share

Quarter	*Year 1*	*Year 2*	*Year 3*
1..................	909(2)	2,000(2)	—0—
2..................	476(2)	909(1)	909(2)
3..................	909(1)	—0—	1,667(1)
4..................	1,667(1)	—0—	2,000(2)

(1) Based on average market price

(2) Based on ending market price

Note: Computed $\left(\frac{\text{Market Price—Exercise Price}}{\text{Market Price}}\right) \times 10{,}000 =$ Incremental Shares

Number of Incremental Shares Included in Year-to-Date Weighted Average

Primary Earnings Per Share(1)

	Year 1	Year 2	Year 3
First quarter	—0—	1,667	—0—
Six months	—0—	1,288	—0—
Nine months	303	859	556
Year	644	644	644

Fully Diluted Earnings Per Share

	Year 1	Year 2	Year 3
First quarter	909(1)	2,000(1)	—0—(1)
Six months	693(1)	1,455(1)	909(2)
Nine months	765(1)	970(1)	859(1)
Year	1,304(2)	727(1)	2,000(2)

(1) Computed by adding incremental shares of each quarter included and dividing by number of quarters included in the year-to-date.
(2) Incremental shares for all quarters included based on ending market price.

EXHIBIT 4
DAYS BETWEEN TWO DATES

.360 The table on page 12,869 is useful in computing a weighted average of shares outstanding when the number of shares outstanding changes frequently during the year. The table includes numbered days for two years; one day must be added after February 28 during leap year. Corporations reporting on a calendar year basis should use the first 366 numbers; all other corporations should use both tables.

Since the number of days between two dates is determined by subtraction, the number used for the last day of the year is the first day of the following year. That is, a corporation reporting on a calendar year having a stock transaction on June 20 should weight the shares outstanding before the transaction by 170 (determined $171 - 1 = 170$) and the shares outstanding after the transaction by 195 (determined $366 - 171 = 195$). The 170 days before plus the 195 days after then equal 365 days. For leap year, corresponding computations would be $172 - 1 = 171$ and $367 - 172 = 195$, so $171 + 195 = 366$.

An example of how to use the table follows. Assume a corporation reports on a fiscal year ending June 30. At July 1, 1969 the corporation had 100,000 shares of common stock outstanding. On August 25, 1969 the corporation distributed a 5% stock dividend to its shareholders. On September 18, 1969 the corporation purchased 525 shares of its stock. On April 8, 1970 the corporation issued 10,000 shares of its stock for cash. On May 21, 1970 the corporation split its stock 2-for-1.

The days to be used for weighting are:

Transaction Day	Number for Transaction Day	Number for Beginning Day	Days for Weighting
September 18, 1969	261	182	79
April 8, 1970	463	261	202
End of year	547	463	84
Total days			365

The August 25, 1969 stock dividend and the May 21, 1970 stock split are reflected retroactively in the weighted average of shares outstanding as computed below:

Date	Shares		Stock Dividend[49]	Stock Split[49]	Days Outstanding	Weighted Shares
7/ 1/69	outstanding	100,000	× 1.05 = 105,000	× 2 = 210,000 ×	79	= 16,590,000
9/18/69	purchase	(525)		× 2 = (1,050)		
				208,950 ×	202	= 42,207,900
4/ 8/70	issue	10,000		× 2 = 20,000		
				228,950 ×	84	= 19,231,800
Totals					365	78,029,700

Weighted average number of shares outstanding:

$$\frac{78{,}029{,}700}{365} = 213{,}780$$

[49] Note that stock dividends and stock splits are retroactive adjustments rather than transactions to be weighted by the number of days a stock dividend or split was outstanding.

102. Two-Class Method for Warrants Issued by REITs

.361 *Question*—The capitalization of a real estate investment trust (REIT) includes shares of beneficial interest (common stock) and an equal number of warrants. This REIT is not subject to federal income tax with respect to the income it distributes to its shareholders because it distributes at least 90 percent of its annual taxable income (as defined by the *Internal Revenue Code*) and elects not to be taxed on the income distributed. How should this entity treat warrants in computing earnings per share under section 2011?

.362 *Interpretation*—The "two-class" method of computing primary earnings per share should be used by any REIT which elects under the *Internal Revenue Code* not to be subject to tax on income distributed and which pays dividends equal to 90 percent or more of its taxable income. Under this method, dividends are deducted from net income and the remaining amount (the undistributed earnings) is allocated to the total of common shares and common share equivalents with use of warrant proceeds applied as described in paragraph .36 or .38. Per share distributions to common shareholders (total dividends divided by the weighted average of common shares outstanding) are added to this per share amount to determine primary earnings per share.

.363 For example, the REIT described in the question above should compute primary earnings per share under the "two-class" method in conjunction with section 2011.38. Assume that this REIT has a net income of $1,000,000 and distributes $900,000 in dividends on 1,000,000 common shares outstanding. Warrants exercisable at $5 per share for 1,000,000 common shares are also outstanding. Assuming a market price of $23 per share for common and a 3 percent interest rate for debt and/or investments in commercial paper or U.S. government securities, primary earnings per share would be determined applying the two-class method and paragraph .38 as follows:

© 1974, American Institute of Certified Public Accountants, Inc.

Net income		$1,000,000
Less dividends		900,000
Undistributed earnings		$ 100,000
Proceeds from the exercise of warrants: 1,000,000 × $5	$5,000,000	
Purchase of treasury stock under paragraph .38-a 200,000 shares × $23	4,600,000	
Balance to retire debt under paragraph .38-b	400,000	
Interest rate on debt retired	.03	
Interest adjustment		12,000
Adjusted undistributed earnings		$ 112,000
Common shares outstanding		1,000,000
Common shares assumed issued for warrants	1,000,000	
Less treasury stock purchased	200,000	
Incremental shares for warrants		800,000
Common and common equivalent shares		1,800,000
Primary earnings per share:		
Distributed earnings ($900,000 ÷ 1,000,000)		$ .90
Undistributed earnings ($112,000 ÷ 1,800,000)		.06
Total earnings per common and common equivalent share		$ .96

.364 If the per share amount computed above had exceeded earnings per outstanding common share of $1.00 (computed: $1,000,000 ÷ 1,000,000 shares), the result would be anti-dilutive and primary earnings per share would be reported as $1.00 in accordance with paragraph .30.

.365 The two-class method should not be used by a REIT in computing fully diluted earnings per share in order to reflect maximum potential dilution. Therefore, fully diluted earnings per share computed for the above example would be $.56 (computed: $1,012,000 ÷ 1,800,000 shares) applying only paragraph .38.

.366 Although dividends declared after the close of the taxable year may be included in meeting the 90 percent

requirement for federal income tax purposes, only dividends paid or declared during the period for which the computation is being made should be considered in applying the two-class method. However, a dividend declaration (or official company policy in lieu of actual declaration) before the close of the period stated as a percentage of taxable earnings (the amount to be determined after the close of the period) will be considered as being declared during the period if the dividend is paid by the date the financial statements are issued.

AC Section U2012

Reporting The Results of Operations: Accounting Interpretation of Section 2012

1. Illustration of the Application of Section 2012

.001 *Question*—As stated in section 2012.19, judgment is required to segregate in the income statement the effects of events or transactions that are extraordinary items. What factors must be considered in determining whether the effects of a particular event or transaction are extraordinary items or should otherwise be set forth in the income statement, and how are these factors applied in practice?

.002 *Interpretation*—The first question which generally should be considered in determining the appropriate classification of profit or loss items which appear to be unusual, infrequently occurring or extraordinary is:

> Does the event or transaction involve the sale, abandonment or other manner of disposal of a segment of a business as defined in section 2012.13?

.003 *Discussion*—As explained in section 2012.08, results of discontinued operations of a segment of a business and any gain or loss from disposal of the segment should be reported separately in the income statement, but should not be designated as extraordinary items. The term "segment of a business" is defined in section 2012.13 as a component of an entity whose activities represent a separate major line of business or class of customer. Section 2012 further provides guidelines for the determination of a segment of a business and distinguishes between the disposal of a segment and the disposal of assets incident to the evolution of an entity's business. The following are illustrative of disposals which should be classified as disposals of a segment of a business:

(1) A sale by a diversified company of a major division which represents the company's only activities in the electronics industry. The assets and results of

operations of the division are clearly segregated for internal financial reporting purposes from the other assets and results of operations of the company.

(2) A sale by a meat packing company of a 25% interest in a professional football team which has been accounted for under the equity method. All other activities of the company are in the meat packing business.

(3) A sale by a communications company of all its radio stations which represent 30% of gross revenues. The company's remaining activities are three television stations and a publishing company. The assets and results of operations of the radio stations are clearly distinguishable physically, operationally and for financial reporting purposes.

(4) A food distributor disposes of one of its two divisions. One division sells food wholesale primarily to supermarket chains and the other division sells food through its chain of fast food restaurants, some of which are franchised and some of which are company-owned. Both divisions are in the business of distribution of food. However, the nature of selling food through fast food outlets is vastly different than that of wholesaling food to supermarket chains. Thus by having two major classes of customers, the company has two segments of its business.

.004 Certain disposals would not constitute disposals of a segment of a business because they do not meet the criteria specified in section 2012. For example, the following disposals should not be classified as disposals of a segment of a business:

(5) The sale of a major foreign subsidiary engaged in silver mining by a mining company which represents all of the company's activities in that particular country. Even though the subsidiary being sold may account for a significant percentage of gross revenue of the consolidated group and all of its revenues in the particular country, the fact that the company continues to engage in silver mining activities in other countries would indicate that there was a sale of a part of a line of business.

 © 1974, American Institute of Certified Public Accountants, Inc.

(6) The sale by a petrochemical company of a 25% interest in a petrochemical plant which is accounted for as an investment in a corporate joint venture under the equity method. Since the remaining activities of the company are in the same line of business as the 25% interest which has been sold, there has not been a sale of a major line of business but rather a sale of part of a line of business.

(7) A manufacturer of children's wear discontinues all of its operations in Italy which were composed of designing and selling children's wear for the Italian market. In the context of determining a segment of a business by class of customer, the nationality of customers or slight variations in product lines in order to appeal to particular groups are not determining factors.

(8) A diversified company sells a subsidiary which manufactures furniture. The company has retained its other furniture manufacturing subsidiary. The disposal of the subsidiary, therefore, is not a disposal of a segment of the business but rather a disposal of part of a line of business. As discussed in section 2012.13, such disposals are incident to the evolution of the entity's business.

(9) The sale of all the assets (including the plant) related to the manufacture of men's woolen suits by an apparel manufacturer in order to concentrate activities in the manufacture of men's suits from synthetic products. This would represent a disposal of a product line as distinguished from the disposal of a major line of business.

.005 If it has been determined that the particular event or transaction is not a disposal of a segment of a business, then the criteria for extraordinary items classification should be considered. That is:

Does the event or transaction meet both criteria of *unusual nature* and *infrequency of occurrence?*

.006 *Discussion*—Section 2012.19-.22 discusses the criteria of unusual nature and infrequency of occurrence of events or transactions taking into account the environment

in which the entity operates. Paragraph .23 specifies certain gains or losses which should not be reported as extraordinary unless they are the direct result of a major casualty, an expropriation, or a prohibition under a newly enacted law or regulation that clearly meets both criteria for extraordinary classification. Events or transactions which would meet both criteria in the circumstances described are:

(10) A large portion of a tobacco manufacturer's crops are destroyed by a hail storm. Severe damage from hail storms in the locality where the manufacturer grows tobacco is rare.

(11) A steel fabricating company sells the only land it owns. The land was acquired ten years ago for future expansion, but shortly thereafter the company abandoned all plans for expansion and held the land for appreciation.

(12) A company sells a block of common stock of a publicly traded company. The block of shares, which represents less than 10% of the publicly-held company, is the only security investment the company has ever owned.

(13) An earthquake destroys one of the oil refineries owned by a large multi-national oil company.

.007 The following are illustrative of events or transactions which do not meet both criteria in the circumstances described and thus should not be reported as extraordinary items:

(14) A citrus grower's Florida crop is damaged by frost. Frost damage is normally experienced every three or four years. The criterion of infrequency of occurrence taking into account the environment in which the company operates would not be met since the history of losses caused by frost damage provides evidence that such damage may reasonably be expected to recur in the foreseeable future.

(15) A company which operates a chain of warehouses sells the excess land surrounding one of its warehouses. When the company buys property to establish a new warehouse, it usually buys more land than it expects to use for the warehouse with the expectation

 © 1974, American Institute of Certified Public Accountants, Inc.

that the land will appreciate in value. In the past five years, there have been two instances in which the company sold such excess land. The criterion of infrequency of occurrence has not been met since past experience indicates that such sales may reasonably be expected to recur in the foreseeable future.

(16) A large diversified company sells a block of shares from its portfolio of securities which it has acquired for investment purposes. This is the first sale from its portfolio of securities. Since the company owns several securities for investment purposes, it should be concluded that sales of such securities are related to its ordinary and typical activities in the environment in which it operates and thus the criterion of unusual nature would not be met.

(17) A textile manufacturer with only one plant moves to another location. It has not relocated a plant in twenty years and has no plans to do so in the foreseeable future. Notwithstanding the infrequency of occurrence of the event as it relates to this particular company, moving from one location to another is an occurrence which is a consequence of customary and continuing business activities, some of which are finding more favorable labor markets, more modern facilities, and proximity to customers or suppliers. Therefore, the criterion of unusual nature has not been met and the moving expenses (and related gains and losses) should not be reported as an extraordinary item. Another example of an event which is a consequence of customary and typical business activities (namely financing) is an unsuccessful public registration, the cost of which should not be reported as an extraordinary item. (For additional examples, see section 2012.23.)

.008 Disposals of part of a line of business, such as examples 5-9 of this Interpretation, should not be classified as extraordinary items. As discussed in section 2012.13, such disposals are incident to the evolution of the entity's business and therefore the criterion of unusual nature would not be met.

.009 *Question*—Section 2012.27 states that events and transactions that were reported as extraordinary items in

statements of income for fiscal years ending before October 1, 1973 should not be restated except that a statement of income including operations of discontinued segments of a business that meet the paragraph .13 criteria may be reclassified in comparative statements to conform with the provisions of paragraphs .08 and .09 of section 2012. If a gain or loss on such a disposal in a prior year had been classified as an extraordinary item but was not computed in the *manner* specified in section 2012.15-.17, may the prior year income statements be reclassified and the gain or loss adjusted to comply with the provisions of section 2012?

.010 *Interpretation*—Section 2012 specifically uses the term "reclassified" in paragraph .27 and makes direct reference to paragraphs .08 and .09 which describe the manner of reporting disposals of a segment of a business as defined in paragraph .13. While such reclassification is optional under section 2012, there should not be a redetermination (restatement) of net income using the measurement principles specified in paragraphs .15-.17. Since Opinions of the Board are not intended to be retroactive unless otherwise stated, the method of computing of the gain or loss on disposals of a segment should not be retroactively applied if it results in a change in net income of a prior year.

.011 *Question*—Events or transactions which are not disposals of a segment of a business and are not extraordinary items may nevertheless be required to be reported as a separate component of income from continuing operations under the provisions of section 2012.26. If a company sells a portion of a line of business which does not meet the definition of a segment of a business as defined in section 2012.13, should the gain or loss be calculated using the measurement principles for determination of gain or loss on disposal of a segment of a business as prescribed in section 2012.15-.17 and how should the financial effects of such sale be reported?

.012 *Interpretation*—The gain or loss on a sale of a portion of a line of business which is not a segment of a business as defined in paragraph .13 should be calculated using the same measurement principles as if it were a segment of a business (section 2012.15-.17). Under the provisions of section 2012.26, the amount of such gain or loss

 © 1974, American Institute of Certified Public Accountants, Inc.

should be reported as a separate component of income from continuing operations. However, the gain or loss should not be reported on the face of the income statement net of income taxes or in any manner inconsistent with the provisions of paragraphs .08 and .11 of section 2012 which may imply that it is a disposal of a segment of the business. In addition, the earnings per share effect should not be disclosed on the face of the income statement. Revenues and related costs and expenses of the portion of the line of business prior to the measurement date should not be segregated on the face of the income statement but may be disclosed in the notes to the financial statements and such disclosure is encouraged. In addition, the notes to the financial statements should disclose, if known, those items specified in section 2012.18.

.013 The foregoing examples are illustrative. It should be recognized that all attendant circumstances, which can vary from those above, need to be considered in making the judgments required by section 2012.

AC Section U2021

Reporting Changes in Financial Position: Accounting Interpretations of Section 2021

1. Number of Funds Statements Required

.001 *Question*—Section 2021.07 states that when a balance sheet and an income statement are issued, a "Statement of Changes in Financial Position" (funds statement) should be presented for each period for which an income statement is presented. If comparative income statements for the past five years and only a balance sheet for the end of the five-year period are presented, how many statements of changes in financial position must be presented?

.002 *Interpretation* — Normally, five statements of changes in financial position would be required by section 2021.07—one for each year for which an income statement is presented. However, the detail of net changes in each element of working capital is required to be presented only for the current year (see section 2021.12).

.003 It should also be noted that section 2021 is effective for fiscal periods ending after September 30, 1971. Therefore, a statement of changes in financial position is not required for any period covered by an income statement ending before that date, although their presentation for earlier years is encouraged.

.004 For example, assume the financial statements described in the question included a balance sheet dated December 31, 1972 and income statements for the calendar years ending December 31, 1972, 1971, 1970, 1969, and 1968. Statements of changes in financial position are required only for the calendar years ended December 31, 1972 and December 31, 1971.

[Issue Date: February, 1972.]

2. Funds Statement for Mutuals and Co-ops

.005 *Question*—Section 2021.07 requires all "profit-oriented business entities" to present a statement of changes in financial position when financial statements purporting to present both financial position and results of operations

are issued. Are mutual companies and co-operative organizations considered "profit-oriented business entities" for this purpose?

.006 *Interpretation*—Yes, for purposes of reporting under section 2021 mutual companies and co-operative organizations are considered to be "profit oriented." These entities should therefore include a statement of changes in financial position when issuing both a balance sheet and an income statement.

[Issue Date: February, 1972.]

3. Funds Statements for Mutual Funds and Real Estate Companies

.007 *Question*—Investment companies carrying their investments at "value" (e. g., mutual funds, many "closed-end" companies, "variable annuity accounts" of life insurance companies and common trust funds) generally include a "statement of changes in net assets" and real estate investment companies may include a "statement of funds generated and disbursed" among their financial statements. The format of these statements may differ somewhat from that described in section 2021.10 for a statement of changes in financial position, but they present the information required by the section. Does such a variation in format comply with the requirements of the section?

.008 *Interpretation*—A format that varies from that described in section 2021.10 is acceptable in the case of these statements which have been devised as the most appropriate for reporting information which is peculiar in these industries, so long as the statements contain the information required by the section. The section recognizes the need for flexibility in form (paragraph .09) so long as the required information is disclosed in the most useful portrayal of the financing and investing activities and the changes in financial position of the reporting entity (paragraph .11).

.009 It is expected that Audit Guides issued by the AICPA in the future will illustrate the type of statement of changes in financial position that may be appropriate for a particular industry. Companies should, naturally, follow the recommendations of these Guides.

AC Section U4062

Accounting for Stock Issued to Employees: Accounting Interpretations of Section 4062

1. Stock Plans Established by a Principal Stockholder

.001 *Question*—Accounting for compensatory and noncompensatory stock option, purchase and award plans adopted by a corporation is discussed in sections 4062 and 4061. Should a corporation account for plans or transactions ("plans"), if they have characteristics otherwise similar to compensatory plans adopted by corporations, that are established or financed by a principal stockholder (i. e., one who either owns 10% or more of the corporation's common stock or has the ability, directly or indirectly, to control or influence significantly the corporation)?

.002 *Interpretation*—It is difficult to evaluate a principal stockholder's intent when he establishes or finances a plan with characteristics otherwise similar to compensatory plans generally adopted by corporations. A principal stockholder may be satisfying his generous nature, settling a moral obligation, or attempting to increase or maintain the value of his own investment. If a principal stockholder's intention is to enhance or maintain the value of his investment by entering into such an arrangement, the corporation is implicitly benefiting from the plan by retention of, and possibly improved performance by, the employee. In this case, the benefits to a principal stockholder and to the corporation are generally impossible to separate. Similarly, it is virtually impossible to separate a principal stockholder's personal satisfaction from the benefit to the corporation. Section 1025.14, *Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises,* states that "Financial accounting emphasizes the economic substance of events even though the legal form may differ from the economic substance and suggest different treatment."

.003 The economic substance of this type of plan is substantially the same for the corporation and the employee, whether the plan is adopted by the corporation or a principal stockholder. Consequently, the corporation should account for this type of plan when one is established or financed by a principal stockholder unless (1) the relationship between the stockholder and the corporation's employee is one which would normally result in generosity (i. e., an immediate family relationship), (2) the stockholder has an obligation to the employee which is completely unrelated to the latter's employment (e. g., the stockholder transfers shares to the employee because of personal business relationships in the past, unrelated to the present employment situation), or (3) the corporation clearly does not benefit from the transaction (e. g., the stockholder transfers shares to a minor employee with whom he has had a close relationship over a number of years).

.004 This type of plan should be treated as a contribution to capital by the principal stockholder with the offsetting charge accounted for in the same manner as compensatory plans adopted by corporations.

.005 Compensation cost should be recognized as an expense of one or more periods in accordance with the provisions of section 4062.12-.15.

.006 The corporation should account for tax benefits, if any, from this type of plan in accordance with the provisions of section 4062.16-.18. If the corporation receives no tax benefit from this type of plan, but would have received such benefit had the plan been adopted by the corporation, the absence of such tax benefit is one of the variables in estimating the plan's cost to the corporation (see section 1091.89.).

AC Section U4063

Accounting For The Cost of Pension Plans: Accounting Interpretations of Section 4063

A DISCUSSION OF THE BACKGROUND AND REQUIREMENTS OF SECTION 4063

By Julius W. Phoenix, Jr., and William D. Bosse

PART I

1. Introduction

.001 Section 4063, issued in November 1966, is both long and comprehensive. It includes 15 separate sections, an appendix briefly describing actuarial techniques, and a glossary devoted principally to the actuarial terms used throughout section 4063. The scope of section 4063 results from the need to consider many interrelated factors affecting estimation of pension cost for accounting purposes. The complexities of estimating pension cost arise primarily from the many uncertainties inherent in the long periods separating the time of estimation from the time of payment of benefits to employees. Underlying the estimates are annuity and compound-interest computations. Mathematical probability factors are used to deal with such uncertainties as employee death or termination and changes in compensation.

.002 The major difficulties in estimating pension cost are in selecting the pertinent data relating to employees as a group, designing the actuarial computation and formulating assumptions regarding such matters as earnings of pension-fund assets. The process usually requires the technical skill, experience and judgment of an actuary. Although significant reliance may be placed on the work of an actuary, the accountant should become familiar with the actuarial concepts and methods so that he can understand the data prepared by the actuary and reach his own conclusions as to whether the provision for pension cost complies with section 4063 (see paragraphs .007-.008 for some key definitions).

.003 All complexities and difficulties notwithstanding, the basic accounting for pension plans recommended in section 4063 is relatively easy to understand.

.004 To begin negatively, provisions for pension cost should not be based on contributions to the pension fund, nor should they be limited to the amounts for which the company has a legal liability. They should not fluctuate widely as a result of pension-fund investment gains and losses or from other causes unrelated to the employee group.

.005 Turning to the positive, the provision for pension cost should be based on an actuarial cost method that gives effect, in a consistent manner, to employee group data, pension benefits, pension-fund earnings, investment gains or losses, and other assumptions regarding future events. The actuarial cost method selected should result in a systematic and rational allocation of the total cost of pensions among the employees' years of active service. If the actuarial cost method selected includes past service cost as an integral part of normal cost, the provision for pension cost should be normal cost adjusted for the effect on pension-fund earnings of differences between amounts accrued and amounts funded. If the actuarial cost method deals with past service cost separately from normal cost, the provision for pension cost should include normal cost, an amount for past service cost, and an adjustment for the effect on pension-fund earnings of differences between amounts accrued and amounts funded.

.006 As can be seen later, the most controversial issue in developing section 4063 had to do with the amount to be included for past service cost.

2. Some Key Definitions

.007 For convenience, some terms are delineated here. ''Normal cost'' is the portion of the annual pension cost that, under the actuarial cost method in use, is related to years after the date of an actuarial valuation of the plan. ''Past service cost" refers to the portion of the total pension cost that, under the actuarial cost method in use, is identified with periods prior to the adoption of the plan. Similarly, ''prior service cost'' refers to the portion of the

 © 1974, American Institute of Certified Public Accountants, Inc.

total pension cost that, under the actuarial cost method in use, is identified with all periods prior to the date of an actuarial valuation of the plan. Therefore, "prior service cost" includes, as of the date of its determination, the past service cost, the normal cost for years prior to that date, and increases in pension cost arising when the plan may have been amended to change the benefits or the group of employees covered. Since "prior service cost" is based on present value on the date of determination, it reflects the effect of other factors to that date, such as assumed earnings or interest equivalents, pension benefits paid to date, and gains or losses under the experience to date. Essentially, it is determined at any time in the same way that a past service cost would be determined if the plan were then being put into effect for the first time.

.008 Section 4063 at times makes reference to a specific part of prior service cost, the most usual being "the amounts of any increases or decreases in prior service cost arising on an amendment to the plan." Since such an amount is dealt with like a past service cost, unless otherwise indicated by the context, the term "past service cost" is used in this article to refer to both past service cost arising on the adoption of the plan and the amounts of any increases or decreases in prior service cost arising on amendments of the plan.

3. Previous Pronouncements

.009 Before discussing section 4063 further, it might be well to review briefly the previous official pronouncements of the American Institute of Certified Public Accountants on the subject of pension plans.

.010 The first pronouncement was made in Accounting Research Bulletin No. 36 issued by the committee on accounting procedure in November 1948. It was entitled "Pension Plans—Accounting for Annuity Costs Based on Past Services." Although this Bulletin dealt with only one small segment of the pension accounting problem, it did focus on the most troublesome area, both conceptually and practically, that accountants have had to face in dealing with this complex accounting subject.

.011 ARB No. 36 was included without substantive change as Chapter 13a, "Pension Plans—Annuity Costs Based on Past Service," of ARB No. 43, Restatement and Revision of Accounting Research Bulletins.[1] In ARB No. 43, Chapter 13a, the committee on accounting procedure expressed its belief that "even though the calculation is based on past service, costs of annuities based on such service are incurred in contemplation of present and future services, not necessarily of the individual affected but of the organization as a whole, and therefore should be charged to the present and future periods benefited. This belief is based on the assumption that although the benefits to a company flowing from pension plans are intangible, they are nevertheless real. The element of past service is one of the important considerations in establishing pension plans, and annuity cost measured by such past service contribute to the benefits gained by the adoption of the plan. It is usually expected that such benefits will include better employee morale, the removal of superannuated employees from the payroll, and the attraction and retention of more desirable personnel, all of which should result in improved operations."

.012 The position of the committee on accounting procedure was reaffirmed by a later generation of that committee in Accounting Research Bulletin No. 47, issued in September 1956.[2] Bulletin No. 47, however, was more specific about how past service cost should be treated and also introduced the factor of vested benefits. The committee expressed its preferences that "costs based on current and future services should be systematically accrued during the expected period of active service of the covered employees," and that "costs based on past services should be charged off over some reasonable period, provided the allocation is made on a systematic and rational basis and does not cause distortion of the operating results in any one year." The committee recognized, however, that its preferences were not universally accepted and went on to say that "as a minimum, the accounts and financial statements should reflect accruals which equal the present worth, actuarially calculated, of pension commitments to em-

[1] Editor's Note: Footnote reference eliminated.
[2] Editor's Note: Footnote reference eliminated.

 © 1974, American Institute of Certified Public Accountants, Inc.

ployees to the extent that pension rights have vested in the employees, reduced, in the case of the balance sheet, by any accumulated trusteed funds or annuity contracts purchased." The committee did not explain what it meant by the term "vested" and did not make any recommendation concerning appropriate actuarial cost methods or recognition of actuarial gains and losses. This void is filled by section 4063.

4. Development of Section 4063

.013 When the accounting variations found in practice made it evident that Accounting Research Bulletin No. 47 was not an adequate guide for accounting for the cost of pension plans, the Accounting Principles Board decided that the subject needed further study and authorized an accounting research study to be made. This study was undertaken by Ernest L. Hicks, who performed an outstanding job in putting together the many accounting complexities surrounding pension plans.

.014 The study was completed and published in 1965. A subcommittee[3] of the Accounting Principles Board began its analysis of the subject when preliminary drafts of the research study became available. Early in 1966, after the initial volume of comments on the study subsided, the subcommittee presented to the full Board a discussion outline of suggestions, problem areas and possible opinion content.

.015 During its meetings through June of that year, the Board devoted much time to discussion of the subject. A regular attendant at Board and subcommittee meetings was Frederick P. Sloat, a member of the American Academy of Actuaries, whose assistance and advice were invaluable. Along the way, the subcommittee initiated a series of meetings with representatives of the actuarial societies, the bar association, utility associations and the Financial Executives Institute.

.016 It is important to emphasize the diligence with which the Board sought the views of responsible members of the business community before reaching the point of

---

[3] John W. Queenan, chairman, Marshall S. Armstrong, LeRoy Layton, and Oral L. Luper.

taking any final votes on the contents of section 4063. It is equally important to emphasize the degree of interest and the spirit of co-operation with which the business community responded to the request of the subcommittee. This dispelled any doubt concerning the business community's genuine interest in what the Accounting Principles Board is doing. It does have views that should be considered by the profession and it does want to help.

.017 The exposure draft was issued in July 1966. The comments received as a result of the exposure were gratifying. Replies were received from over 300 of those on the exposure list, including many of the top executives of leading corporations around the country. All comments were read, analyzed and catalogued. After consideration of these comments and a further meeting of the Board, the exposure draft was converted into the final section 4063 in November 1966.

.018 From the authors' observations, the Board appreciates the efforts expended by companies in commenting on its proposed opinions, especially where the comments are supported by reasons and analysis.

.019 It may be helpful to an understanding of section 4063 to discuss its major objective and what is likely to be its principal accomplishment—the elimination of inappropriate fluctuations.

5. Major Objective of Section 4063

.020 Pension cost is an important cost of doing business. Except in rare cases, when a company commits itself to pay pensions to its employees upon their retirement, the cost of those pensions may be expected to continue as long as the company has employees. Furthermore, and this is important, pension cost year by year should not be greatly out of line with the size or compensation of the employee group. For example, it does not appear reasonable for a company with a stable or growing employee group to have pension cost of $50,000 one year, $100,000 the next and $10,000 the next. Although not usually so extreme, fluctuations of this sort did occur in many cases found in practice.

.021 These fluctuations were due largely to the effect given to three things: (1) actuarial gains and losses,

 © 1974, American Institute of Certified Public Accountants, Inc.

(2) the funding of pension plans and (3) legal safeguards typically written into the plans. The primary accomplishment of the pension section probably will be to eliminate the fluctuations due to these factors.

.022 A brief comment about each: **First, actuarial gains and losses.** In recent years, some companies made substantial reductions in their annual provision for pension cost when investment gains were realized by the pension fund, when the estimated future earnings rate of the fund was increased or when accumulated appreciation in pension-fund investments was recognized in the actuarial valuation.

.023 These occurrences represent some examples of what are described in section 4063 as actuarial gains. To eliminate the fluctuations in pension cost caused by these gains, the Board concluded that actuarial gains— and, in like manner, actuarial losses—"should be given effect in the provision for pension cost in a consistent manner that reflects the long-range nature of pension cost." The recommended way for accomplishing this is, with certain exceptions, to "spread" or "average" these actuarial gains and losses over a period of years.

.024 **Second, funding.** Some companies based their provision for pension cost on the amount funded—that is, the amount paid to the pension fund. The amounts funded frequently varied widely from year to year because of working capital availability, tax considerations and other factors. Section 4063 make it clear that, under accrual accounting, amounts funded are not determinative of pension costs.

.025 Accrual accounting is based on the assignment of costs among years on the basis of the economic benefits derived from the incurrence of the cost. Funding arrangements may not, and often do not, follow the pattern of economic benefits. Funding is a matter of financial management and may be discretionary; it is not a matter of accounting principle, however.

.026 **Third, legal safeguards.** Somewhat related to funding is the influence of legal safeguards that limit the company's liability for the payment of pensions to the

amount in the pension fund. As a matter of business prudence, most companies include a clause in their pension plan to the effect that the company may, in its discretion, discontinue the plan or discontinue contributions. In these cases, the employees have no rights to any benefits beyond those than can be paid from the assets in the pension fund. Relying on these clauses, some companies took the position that they had no liability for pensions and therefore did not need to record pension cost beyond the amounts contributed to the pension fund. The Board concluded that clauses such as these could not, as a practical matter, be brought into play by a business that expected to continue to operate in today's economy. In short, these clauses should have little effect on the incurrence of pension cost. Except in rare instances, therefore, they should be ignored in determining the amount of pension cost to be provided.

.027 While many other matters are covered in section 4063, the conclusions about actuarial gains and losses, funding and legal safeguards will probably have the most widespread effect on accounting for the cost of pension plans.

.028 These conclusions are essential to eliminating the wide fluctuations in pension cost that were largely responsible for section 4063 being written in the first place.

6. Interest Equivalents

.029 Before proceeding to a discussion of the basic section 4063 recommendations, a peripheral issue should be clarified.

.030 In many places, section 4063 refers to "amounts equivalent to interest" or "interest equivalents." As used in section 4063 and in the actuarial profession, "interest" is a simple way of referring to the earnings, assumed or actual, of a pension fund. The need to take interest equivalents into account in computing the pension-cost provision arises when the actual pension fund differs from a theoretical fund and when the amounts funded differ from the amounts which have been recorded for accounting purposes.

.031 Under the present-worth basis used for pension-cost accounting, it is assumed that amounts equivalent to

 © 1974, American Institute of Certified Public Accountants, Inc.

prior service cost and normal cost will be contributed to a fund and that the fund will produce earnings (interest) at an assumed rate. If contributions for these amounts are not made, they will not be available to produce earnings, and it becomes necessary to make an additional provision equivalent to what the earnings would have been if the contributions had been made. This assumption is extended to past service cost even though it is known at the outset that the amounts will not be funded until sometime in the future, or not at all.

.032 For this reason, section 4063 calls for the pension-cost provision to include an amount equivalent to interest on unfunded prior service cost. Such interest may be included as a separate component of the provision or it may be included in the amortization of the past service cost (subject to the 10 per cent maximum). Whenever past service cost is being amortized and the prior year pension-cost provisions have not been funded, an amount equivalent to interest on the unfunded provisions should be added to the provision for the year in addition to any amount included in the amortization. Conversely, when the amounts funded exceed the prior year pension-cost provisions, a reduction of the provision for the year is needed to reflect the interest equivalents on the excess amounts funded.

7. What Constitutes Pension Cost?

.033 The preceding discussion is about the recommendations designed to eliminate fluctuations and about the need for interest equivalents. Agreement concerning these matters was reached by the Board with relative ease. Also, there was never any disagreement that pension cost should be accounted for on the accrual basis, and that the entire cost applicable to an accounting period should be provided. There was disagreement about what constitutes the entire cost applicable to an accounting period. The different views are explained in section 4063. For purposes of this article, suffice it to say that one view was that pension cost should "take into account all estimated prospective benefit payments under a plan with respect to the *existing employee group*" whereas the principal other view was "that pension cost is related to the pension benefits to

be paid to the *continuing employee group as a whole*" (emphasis added).

.034 Under either view, annual pension cost would include normal cost. The difference between the two views essentially revolved around what to do about past service cost.

.035 The Board agreed, as had the predecessor committee on accounting procedure, that past service cost relates to periods subsequent to the adoption or amendment of a plan and should not be charged against retained earnings as something applicable to the past. Some members of the Board believed this cost should be specifically recognized in annual provisions over a period of years, although there were some differences in views concerning the period to use. Other members of the Board believed it unnecessary to make specific provisions for past service cost if all benefit payments could be met on a continuing basis by annual provisions representing normal cost plus an amount equivalent to interest on unfunded prior service cost.

.036 There was merit in both positions. Although the Board stated a preference for past service cost being amortized, it concluded that it should not at this time rule out either approach as an acceptable measure of cost. Accordingly, in the interest of attaining the substantial improvement in accounting for the cost of pension plans that would result from the other conclusions of section 4063, the Board framed section 4063 in terms of a minimum method based on the normal-cost-plus-interest concept and a maximum method based upon the amortization-of-past-service-cost concept. One result of this conclusion is that any period may be selected for the amortization of past service cost, as long as the total annual provision falls between the minimum and maximum.

.037 Many would term the minimum-maximum approach to be a flaw in section 4063, and it is fair to say that few, if any, of those working with section 4063 felt that it was a completely satisfying answer. If the minimum-maximum approach is a flaw, however, the authors believe that the flaw is more apparent than real because, as section 4063 is written, it allows a company to fit its accounting

 © 1974, American Institute of Certified Public Accountants, Inc.

for the cost of its pension plan to the facts and circumstances in its particular case and to record the pension cost most realistic for it.

8. Minimum—Maximum

.038 Before discussing the mechanics of the minimum-maximum methods, three general observations should be made.

.039 First, the difference between the two methods is essentially in the extent to which past service cost is included in the pension-cost provision. Under the defined minimum, only interest on unfunded prior service cost (plus any indicated provision for vested benefits) is included. Under the defined maximum, 10 per cent of the past service cost is included. Normal cost is the same under both.

.040 In two frequently used actuarial cost methods, the ''individual level premium" and ''aggregate'' methods, past service cost is not measured separately. That is, past service cost is included in normal cost. Because there is no amount of separately computed past service cost, the defined minimum and maximum are the same under these methods.

.041 On the other hand, in other frequently used actuarial cost methods, such as the ''unit-credit'' (''accrued benefit"), ''entry age normal," and ''attained age normal" methods, past service cost is measured separately. It is only when methods such as these are used that there is a difference between the defined minimum and maximum. Furthermore, if the past service cost has been fully amortized, there is no difference between the defined minimum and maximum.

.042 The second general observation is that section 4063 contemplates that the defined minimum, the defined maximum and the provision for the year will all be computed using the actuarial cost method selected. For example, if the pension-cost provision is based on the unit credit method, the defined maximum should also be based on that method and not on the entry age normal method, which usually would give a greater maximum amount.

.043 The third general observation has to do with an apparent misconception about the defined minimum and maximum.

.044 There has been some comment to the effect that any pension-cost provision is acceptable under section 4063 so long as it falls between the minimum and the maximum each year. This may be described as a bouncing-ball effect—that is, the pension-cost provision can bounce up and down between the two limits. This view of section 4063 is a mistaken one.

.045 Section 4063 contemplates that in all cases the provision for pension cost will be based on an acceptable actuarial cost method, with all variable factors consistently applied. Furthermore, the treatment of actuarial gains and losses, the actuarial assumptions and the like, should conform with the recommendations of section 4063, and should be applied consistently from year to year.

.046 As to past service cost, if the vested-benefit provision is not required, section 4063 contemplates that the company will select interest-only or some amortization plan not exceeding 10 per cent and apply whatever it selects consistently. If this is done, pension-cost provisions will not bounce around from year to year, unless caused by such factors as size, composition or compensation of the employee group. If the vested-benefit provision is required, it could cause some variations from year to year. However, as will be seen from the example given later, the effect is not likely to be material.

9. Computing the Defined Maximum

.047 In many cases, the maximum defined in section 4063 is the same as the maximum allowed for federal income tax purposes. Generally speaking, the Internal Revenue Service will allow a deduction for the normal cost of a qualified plan plus not more than 10 per cent of the past service cost. This is also the general maximum limitation included in section 4063. Differences between the maximum tax deduction and the maximum pension-cost provision can arise, however, as a result of unrealized appreciation or depreciation, or as a result of the application of the actuarial cost method. Probably the outstanding

 © 1974, American Institute of Certified Public Accountants, Inc.

example of the latter is where the unit credit actuarial cost method is used for tax purposes. When this method is used, actuarial gains usually reduce the pension-cost deduction in the year they occur or in the following year. In these cases, it may be necessary to make accounting adjustments to effect a spreading or averaging of the gains.

.048 It is important to note that the 10 per cent limitation applies separately to past service cost at the adoption of a plan and to changes in prior service cost that result from amendments of the plan. For example, disregarding interest equivalents, if a company adopts a pension plan with past service cost of $100,000, the maximum accounting provision would be normal cost plus $10,000 (10 per cent of $100,000) of past service cost. If the company later amends the plan to increase benefits and the cost of the increased benefits related to service prior to the amendment is an additional $50,000, the maximum would be normal cost plus $15,000 (10 per cent of the total of $150,000) until such time as the original past service cost has been fully amortized; after that time the maximum becomes normal cost plus $5,000 (10 per cent of the $50,000 increase). This can be significant when there is a series of increases in benefits over a period of time.

.049 As previously indicated, whenever the funding differs from the cost provision, the cost provision must be increased or decreased by interest equivalents on the difference between the amount provided and the amount funded. An illustration may be helpful. When a company adopts a pension plan, it may fund immediately all of the past service cost. It might do this, for example, in order to gain the advantage of the tax-free income from the investment of the funds by the pension trust. Because the pension-cost provision with respect to the past service cost is limited to 10 per cent, there will be a deferral on the balance sheet for the other 90 per cent. Again taking past service cost of $100,000, $10,000 would be included in the pension-cost provision for the year and the other $90,000 would appear as a deferred charge. In this situation, the accrual for the following year would be reduced by the earnings of the $90,000. If the assumed interest rate was 4 per cent, the cost provision for the succeeding year would

be reduced by $3,600. Because of these reductions, the amortization period will be somewhat longer than ten years.

.050 Conversely, if the company decides to make the maximum pension-cost provisions but does not immediately make contributions to the fund or makes contributions in smaller amounts than provided, there will be an accrued pension cost on the balance sheet. The pension-cost provision for subsequent years should include an amount equivalent to interest on whatever amount is shown as an accrual on the balance sheet.

.051 Accounting for pension cost under the defined-maximum method is illustrated by Exhibit A, paragraph .059. The plan used in Exhibit A has the same past service cost, normal cost and benefits as the plan in Exhibit B, paragraph .060, to illustrate the defined-minimum method. The sameness can be seen in the initial data given under "Prior Service Cost," which is identical in the two exhibits. The pension fund, balance sheet and provision for pension cost are, of course, different. This would be expected to be so in practice. Taken together, the two exhibits illustrate how the defined maximum and minimum might differ for the same plan. Although an attempt was made to make the exhibits realistic, certain liberties were necessary to illustrate different factors in applying the two methods.

.052 Exhibit A would serve to illustrate other amortization methods by substituting the method to be used for the 10 per cent maximum.

10. Computing the Defined Minimum

.053 Under the defined-minimum method, the annual provision for pension cost is the total of normal cost, an amount equivalent to interest on any unfunded prior service cost, and, under certain conditions, a provision for vested benefits. The provision for vested benefits embraces an objective that differs from those generally found in present practice. It warrants some elaboration.

.054 First, it is essential to get a clear understanding of what is meant by "vested benefits." Vested benefits are defined in section 4063 as "benefits that are not contingent on the employee's continuing in the service of the em-

 © 1974, American Institute of Certified Public Accountants, Inc.

ployer." This is consistent with the assumption of a continuing pension plan for a company with indefinite life. The amount in the pension fund, therefore, has no effect in determining the total amount of vested benefits as contemplated under section 4063. The definition also excludes any escalation in the amount of benefits through plan-termination and similar provisions. Accordingly, "vested benefits" includes benefits that, as of the date of determination, are expected to become payable (a) to employees then retired, (b) to former employees then terminated and (c) to active employees to the extent that the benefits, or any portions thereof, are not contingent on continued employee service. The value of vested benefits is computed on a present-value basis, giving effect to the usual probability assumptions concerning mortality and retirement (and sometimes also to other assumptions), but not to turnover or future changes in levels of compensation.

.055 The Board concluded that pension-cost provisions should look forward in an orderly way to the creation of a pension fund or balance-sheet accrual at least equivalent to the actuarially computed value of vested benefits. That is, the employer ultimately should maintain a fund or accrual at least sufficient to allow the payment of all benefits to all its employees who have fulfilled all the service and age requirements to be entitled to such benefits—whether or not the employees stay with the company.

.056 When provisions equivalent to the total of normal cost and the interest equivalents are made, the amount of pension cost that will be accumulated (whether funded or not) will vary widely depending on, among other things, the actuarial cost method selected and the relative ages of the employees of the company. The amount of vested benefits will vary widely, depending on the vesting terms of the plan. Some plans do not include any vesting prior to the employee's retirement. Other plans call for vesting immediately upon entry into the plan. Between these extremes there are many variations. Frequently a plan will call for vesting of a portion of the benefits when the employee has reached the age of 40 years and has ten years of service. Depending on the combination of these various factors existing in any particular case, the pension cost pro-

vided on the basis of normal cost and interest may exceed the actuarially computed value of vested benefits at any and all times. In other situations, it may fall short of the actuarially computed value of vested benefits for a period of time, or forever.

.057 In many cases, the pension fund and balance-sheet accrual may temporarily fall below the actuarially computed value of vested benefits but yet be based on an accounting method that will eventually satisfy this test. For example, when a plan is amended in a way that benefits are increased, the actuarially computed value of vested benefits may increase substantially and may exceed the pension fund and balance-sheet accrual. It may be, however—and this is not unusual—that continued cost provisions on the basis of normal cost and interest equivalents will in time again bring the pension fund and balance-sheet accrual to the point that they exceed the actuarially computed value of vested benefits at the higher level.

.058 In recognition of this, the Board initially concluded that pension-cost provisions based on normal cost and interest equivalents would be acceptable if they would result over a reasonable period of time in a pension fund and balance-sheet accrual that would exceed the actuarially computed value of vested benefits. The Board adopted 20 years as a reasonable period for reaching this objective.

EXHIBIT A
Illustration of Defined-Maximum Method

	Year 1	2	3	4	5	
Prior Service Cost (Same as Exhibit B):						
Beginning	$80,000	$ 90,000	$100,000	$110,000	$164,000	A
Increase at amendment of plan				40,000		B
"Interest" growth	3,200	3,600	4,000	6,000	6,560	4% of A + B
Normal cost	8,000	8,000	8,000	11,500	11,500	C
(Less) benefits paid	(1,200)	(1,600)	(2,000)	(3,500)	(4,000)	D
Ending	$90,000	$100,000	$110,000	$164,000	$178,060	
Pension Fund:						
Beginning	$ —0—	$ 14,800	$ 25,792	$ 36,824	$ 74,797	E
Earnings	—0—	592	1,032	1,473	2,992	4% of E
Contribution	16,000	12,000	12,000	40,000	25,000	F
(Less) benefits paid	(1,200)	(1,600)	(2,000)	(3,500)	(4,000)	D
Ending	$14,800	$ 25,792	$ 36,824	$ 74,797	$ 98,789	
Balance Sheet:						
Beginning	$ —0—	$ —0—	$ 4,000	$ 8,160	$ (8,014)	G
Provision for pension cost	16,000	16,000	16,160	23,826	23,179	H
(Less) contribution	(16,000)	(12,000)	(12,000)	(40,000)	(25,000)	F
Ending	$ —0—	$ 4,000	$ 8,160	$ (8,014)	$ (9,835)	
Pension-Cost Provision for the Year:						
Normal cost	$ 8,000	$ 8,000	$ 8,000	$ 11,500	$ 11,500	C
10% of past service cost	8,000	8,000	8,000	8,000	8,000	10% of A, Yr. 1
10% of prior service cost on amendment of plan				4,000	4,000	10% of B, Yr. 4
"Interest" on difference between accruals and funding	—0—	—0—	160	326	(321)	4% of G
Provision for the year	$16,000	$ 16,000	$ 16,160	$ 23,826	$ 23,179	H

Plan was adopted at beginning of year 1, amended to increase benefits at beginning of year 4.

Pension-cost provisions, benefit payments, and contributions are assumed to be made at the end of the year in computing "interest."

The assumed "interest" rate is 4% and there are no variations from this or any other actuarial assumptions.

.060

Pension-Cost Provision for Year:						
Normal cost	$ 8,000	$ 8,000	$ 8,000	$ 11,500	$ 11,500	C
"Interest" on unfunded prior service cost	3,200	3,200	3,200	4,792	4,775	I
Additional provision for vested benefits	—0—	200	428	469	1,306	R
Total provision	$11,200	$ 11,400	$ 11,628	$ 16,761	$ 17,581	S

Plan was adopted at beginning of year 1, amended to increase benefits at beginning of year 4.
Pension-cost provisions, benefit payments, and contributions are assumed to be made at the end of the year in computing "interest."
The assumed "interest" rate is 4% and there are no variations from this or any other actuarial assumptions.

.061 The exposure draft of section 4063 was written along these lines, and would have made necessary a 20-year projection of vested benefits. During the exposure period, a number of comments were received from actuaries and

others to the effect that a 20-year projection would be impracticable because of the need for additional assumptions as to the future and because of the added expense of making the projection. While this view was not held by all actuaries, the practicalities of the matter could be served without destroying the accounting objective. This was done by establishing a current test that would not require projections for future periods of time.

.062 In general, the provision for vested benefits is designed to assure that any excess of the actuarially computed value of vested benefits over the pension fund and balance-sheet accrual will decrease by at least 5 per cent each year before taking into account any net increase during the year in the excess of vested benefits. Five per cent a year was selected because in the long run it produces substantially the same result as the original 20-year projection. A simple rule calling for a 5 per cent annual reduction would be unrealistic because it could require the provision to include all additional amounts becoming vested as a result of an amendment of the plan or of an abnormally large group of employees who attain higher vesting levels in any particular year. To avoid this undesirable result, the formula had to be more complex.

.063 There are two circumstances when a company need not be concerned with vested benefits in providing for pension cost. One is where the actuarial cost method does not develop a separate amount for past service cost. The other is where the provision comprises normal cost and amortization of past service cost over 40 or fewer years. In other words, consideration of any provision for vested benefits is necessary only in connection with actuarial cost methods that develop a separate amount for past service cost and then only in connection with a method that extends the amortization of that past service cost beyond 40 years. If past service cost is included in normal cost or is being amortized, the accumulated total pension cost provisions necessarily will equal or exceed the actuarially computed value of vested benefits at or before the time the past service cost is fully amortized. In the two circumstances described in this paragraph, the only concern about vested benefits is for disclosure if their actuarially computed value

 © 1974, American Institute of Certified Public Accountants, Inc.

exceeds the pension fund and balance-sheet accrual at the end of the year.

.064 Even if the circumstances just described do not exist, a provision for vested benefits may not be needed. Such a provision is not required under section 4063 unless the actuarially computed value of vested benefits exceeds the pension fund and balance-sheet accrual at both the beginning and the end of the year. In other words, if such an excess does not exist at either the beginning or the end of the year, no provision for vested benefits is required. Also, if the excess at the end of the year is at least 5 per cent less than the excess at the beginning of the year, no provision for vested benefits is required.

.065 On the other hand, if an excess exists at the beginning and at the end of the year and the ending excess is not at least 5 per cent less than that existing at the beginning of the year, a provision for vested benefits is required.

.066 The provision for vested benefits is the least of the following: (a) 5 per cent of the beginning excess, (b) the amount needed to reduce the beginning by 5 per cent or (c) an amount that would make the total pension-cost provision equal to that which would result if 40-year amortization of past service cost were used.

.067 Accounting for pension cost under the defined-minimum method is illustrated by Exhibit B. As indicated earlier, the basic plan data under "Prior Service Cost" is identical with that in Exhibit A illustrating the defined-maximum method. It might be helpful to point out that the contributions shown in Exhibit B represent normal cost and the interest equivalents for each year plus any additional provision for vested benefits accrued at the end of the preceding year. In practice it is likely that the additional provision for vested benefits would be contributed, if at all, at the same time as the normal cost and interest equivalents for the year. Exhibit B was prepared as it is, however, so that the interest equivalent on the balance-sheet accrual could be illustrated.

.068 As can be seen from Exhibit B, the value of the pension fund is an essential factor in the computations. Section 4063 does not specify how the fund should be valued.

The authors believe that the fund should be valued by the actuary in a manner consistent with the treatment given to investment gains and losses and unrealized appreciation and depreciation in computing the other elements of pension cost.

.069 For purposes of determining the excess of vested benefits, however, they believe that the pension fund may be valued at market even though the full amount of appreciation or depreciation has not been recognized in the pension-cost provisions. If so valued, methods should be employed to minimize the effects of short-term market fluctuations. Whatever valuation method is adopted should be followed consistently.

.070 In concluding the discussion about the defined-minimum method, another general observation might be helpful. It is doubtful that the provision for vested benefits will be material to most companies using the defined-minimum method. Where it is not material and continuing provisions of normal cost and interest equivalents are expected to meet the vested-benefits objective within 20 years, the authors believe it would be appropriate to omit the additional provision for vested benefits. Since that objective will be met without such additional provision, it seems reasonable not to vary the basic normal-cost-plus-interest pattern.

.071 Where the ultimate goal of the vested-benefits test will not be met without additional provisions for vested benefits, however, such provisions should be made even though they are not material in any given year. Here the cumulative effect of the additional provisions for the vested benefits becomes an important consideration.

.072 In view of the earlier discussions of differences between amounts accrued and amounts funded, and other matters that may result in the recognition of pension cost for accounting purposes in periods other than those in which it is recognized for tax purposes, it may be desirable, in concluding this article, to point out that section 4063 calls for appropriate consideration to be given to the allocation of income taxes among accounting periods.

PART II

11. Actuarial Cost Methods

.073 An actuarial cost method is an interest and annuity type of cost allocation that gives effect to probabilities affecting the amount and incidence of future pension benefits. Although the various methods were developed by actuaries primarily as funding techniques, most of them are also appropriate for accounting purposes. Section 4063 deals with the acceptability of these methods for accounting purposes.

.074 Five often-used actuarial cost methods are specifically deemed acceptable for purposes of providing for pension cost in financial statements, when these methods are applied in conformity with the other conclusions of section 4063. These five acceptable methods are listed in Exhibit C, paragraph .081. Other methods may also be acceptable if they are "rational and systematic" and result in a "reasonable measure of pension cost from year to year." "Pay-as-you-go" (which is not an actuarial cost method) and "terminal funding" are rejected because they do not recognize pension cost prior to retirement of employees.

.075 Several basic conditions apply to the use of any method. The method should be applied consistently from year to year, the amount recognized for past and prior service cost should be reasonably stable from year to year, and the actuarial assumptions should be reasonable for all factors that have a significant effect on the long-range estimates of pension cost. (Section 4063 does not specify all of the actuarial assumptions that may be necessary in pension-cost calculations. In fact, only the more commonly used assumptions are mentioned. The selection of assumptions should be related to the facts and circumstances of each pension plan and employee group.)

.076 There are two major aspects of actuarial cost methods that should be kept in mind. First, some methods deal with past and prior service cost as a separate item; other methods include any such cost in normal cost. Second, some methods (accrued benefit cost methods) assign cost based on specific benefits deemed to be earned ("earned,"

that is in the limited sense that the employee service on which such benefits are based has been rendered) by each employee; other methods (projected benefit cost methods) assign cost based on an allocated part of all projected future benefits for each employee or group of employees. These distinctions are shown in Exhibit C.

.077 Other differences between the methods generally relate to the treatment of prospective changes in compensation, the recognition of gains and losses, and the allocation of the cost on an individual or group basis. Further discussion of the various characteristics of the different methods is beyond the scope of this article. Each of the methods is discussed in section 4063A.

.078 As an aside, it might be well to point out that in determining the actuarially computed value of vested benefits (paragraphs .089-.098) for purposes of the defined-minimum method or for purposes of disclosure, section 4063 contemplates that the accrued-benefit-cost-method approach will be used. This method, in its usual form, results in the determination of accumulated values based on service actually rendered and, if applicable, present compensation levels. When a projected benefit cost method (which takes into account estimated future service and future compensation) is used for accounting purposes, it may be necessary to compute separately or to approximate the actuarially computed value of vested benefits.

12. Actuarial Valuations

.079 Actuarial valuations are made as of a specific date. They may be used, however, for projections of results either forward or backward from that date. Consequently, the amount of pension cost for several periods may be estimated from a single actuarial valuation, sometimes in conjunction with the preceding valuation. Where shifts in employee age and service distributions and group size are not significant from year to year, it is possible for a single valuation to provide the foundation for pension-cost estimates for several years.

.080 An actuarial valuation will rarely be made as of the balance sheet date. Consequently, a computation of the actuarially computed value of vested benefits as of that

 © 1974, American Institute of Certified Public Accountants, Inc.

date usually will not be available. Also, the value of the pension fund may be reported only as of the valuation date. Since a computation of the excess of the actuarially computed value of vested benefits over the total of the pension fund and net balance sheet accruals may be needed under section 4063 as of the end of the year (and sometimes also as of the beginning of the year), a practical problem is created when any of these amounts is not available as of that date. There are several possible solutions to this problem. The authors agree with the solutions indicated by Ernest L. Hicks in footnote 2 to Schedule 2 in his JOURNAL article. (*The Journal of Accountancy,* September, 1967, pp. 70-73.)

.081

EXHIBIT C

Acceptable Actuarial Cost Methods

	Past Service Cost	
	Separate Amount	*Included in Normal Cost*
Accrued Benefit Cost Method—Unit credit	X	
Projected Benefit Cost Methods:		
Entry age normal	X	
Individual level premium		X
Aggregate		X
Attained age normal	X	

. . . the appropriate as-of dates for the [actuarially computed value of vested benefits, pension fund, and net balance sheet accruals] will depend on the circumstances. Consistency is a primary consideration. Under one approach, the [actuarially computed value of vested benefits] would be as of the valuation date, and the amounts [of the pension fund and net balance sheet accruals] would be as of the end of the employer's fiscal year. If the amount of the pension fund is regularly reported only as of the valuation date, it should be satisfactory for the [actuarially computed value of vested benefits and pension fund] to be as of that date; the [net balance sheet accruals] might then include the amount funded or accrued for the fiscal year, reduced by any portion funded before the valuation date. Under still another approach, all three amounts would be as of the valuation date. Only in very rare circumstances (such as when a material, extraordinary change in the level of vesting is known to have

taken place after the valuation date) would a valuation made within the employer's fiscal year be updated.

.082 The same basic actuarial cost method may be used for both funding and cost-provision purposes even when the funding and cost provisions differ. A single actuarial valuation could serve both purposes by applying auxiliary adjustments when necessary to comply with section 4063.

13. Actuarial Gains and Losses

.083 Actuarial gains and losses arise from changes in the assumptions concerning future events used in pension-cost estimates and from differences between the estimates based on the assumptions and the actual results. Important among such assumptions are those relating to:

1. The fund earnings (interest), including both realized and unrealized investment gains and losses
2. The turnover of the work force
3. The mortality of active and retired employees
4. Compensation levels, retirement ages and other factors concerning employees.

.084 As indicated in the previous article, the treatment to be accorded actuarial gains and losses under section 4063 is likely to cause one of the most significant changes from past practice. The elimination of significant year-to-year pension-cost fluctuations resulting from actuarial gains and losses is a major objective of section 4063.

.085 Actuarial gains and losses should be dealt with "in a manner that reflects the long-range nature of pension cost." Annual determinations of pension cost are necessarily estimates. Actuarial gains and losses are, at best, an indication of the short-term accuracy of the estimates and may themselves be estimates. There is no assurance that changes in assumptions or trends based on current experience will be valid for very long. Under section 4063, therefore, actuarial gains and losses are treated as if they were an integral part of the overall assumptions concerning the future.

© 1974, American Institute of Certified Public Accountants, Inc.

.086 Consistent with the view that pension costs are long-range costs, section 4063 holds that actuarial gains and losses should be spread in a consistent manner over a reasonable period of years or determined on some average basis, either through the routine application of the actuarial method or by separate adjustments.

.087 The spreading or averaging of actuarial gains and losses is accomplished by the normal application of some actuarial cost methods and, as a consequence, likely would be automatically recognized in accordance with section 4063. This is the result when the application of a method measures normal cost by allocating to the current and future years the difference between (1) the present value of all benefits expected to become payable to current and former employees and (2) the value of the assets of the plan. Since these two values would normally comprehend any actuarial gains or losses, the actuarial gains and losses are thereby effectively spread. The pattern of spreading is complex, recognizing such factors as remaining service lives, compensation, and the various actuarial assumptions. Any of the projected benefit cost methods may be applied in this manner, although some may be applied differently.

.088 Net cumulative *gains* may also be spread by applying them to reduce the unamortized past or prior service cost *before* computing amortization or interest equivalents. Under section 4063 it is not acceptable to recognize actuarial gains in a manner that shortens the amortization period. Therefore, if past or prior service cost is being amortized, the reduced amount of unamortized past or prior service cost should be accounted for over the remaining amortization period. Since section 4063 calls for spreading over at least ten years, it would appear that this method should not be used if the remaining amortization period is less than ten years. It should be noted that section 4063 does not say that net cumulative *losses* may be added to past or prior service cost. If past or prior service cost is being amortized, however, and the remaining amortization period is between 10 and 20 years, there should be no objection to doing so.

14. What Should Be Included in the Actuarially Computed Value of Vested Benefits

Comments by Frederick P. Sloat, a member of the American Academy of Actuaries

.089 If a retirement benefit would stay with an employee if he were to terminate service on the valuation date, it is one that is ''not contingent on his continuing in the service of the employer"; therefore, it is a ''vested benefit'' and its entire value should be included in the actuarially computed value of vested benefits. If the benefit would be forfeited upon such termination of service, none of its value is included.

.090 As an illustration of some of the situations that are frequently encountered, assume that the actuarial assumptions are such that—for 100 employees in a given group who have already met the age and service requirements for vesting and, thus, have vested benefits—the following is expected to happen:

Number who will stay in service and retire at normal retirement	50
Number who will stay in service and retire at early retirement	24
Number who will terminate service at the current or a future date and later receive retirement income	12
Number who will die while in service	10
Number who will terminate service at the current or a future date, but die before receiving any retirement income	4
	100

.091 The value of the retirement benefits for the group will reflect each situation and the probability of occurrence and will be determined on the accrued benefit (unit credit) cost method. Thus, it will include the value of normal retirement benefits for the 50% who will retire at normal retirement, the value of early retirement benefits for the 24% who will retire at early retirement and the value of deferred benefits to be vested in terminating employees for the 12% who will terminate service and later receive retire-

 © 1974, American Institute of Certified Public Accountants, Inc.

ment income. It will, in effect, include nothing for the 10% expected to die in service or the 4% expected to terminate service and die without receiving benefits.

.092 A plan may provide a special benefit, greater than the actuarial equivalent of the normal retirement benefit, for an employee who terminates service after having met the service required by the plan for such special benefit. In the actuarial assumptions above, say that 30 of the 74 who will reach normal or early retirement will, at some earlier date, be eligible to receive this special benefit if they terminate service, that 9 of them now have the necessary service and that only 3 out of the 9 will be expected to so terminate. In such event, the value of the special benefit will be included only for this 3 per cent.

.093 If partial vesting were to apply in event of current termination, say 60 per cent of the total benefit, only that per cent of the total array of values is included, the other 40 per cent being omitted in the same way as for employees who would not be subject to current vesting.

.094 If vesting can be forfeited by the employee's election of a refund of his own contribution, the probability of such election should be taken into account.

.095 Even though a plan provides retirement benefits on a final average salary formula, the benefit for an employee terminating service would be based on current earnings. This is like partial vesting and only the value of benefits based on current earnings would be included.

.096 For plans that do not provide specific amounts of benefits for each year of service, the benefit that would apply in event of current termination of service would be included and valued on the accrued benefit cost method.

.097 A plan may include death, disability or other benefits in addition to retirement benefits; if such a benefit would no longer apply if the employee were to terminate service, its value would not be included with the value of vested benefits. If it would apply after vesting, however, the full value of such benefits would be included for those employees currently eligible for vesting.

.098 Where the accrued benefit cost method is already being used, such as under regular group annuity funding, the value of vested benefits will usually be the value of all benefits (or the fractional portions of the benefits, in the case of partial vesting) for service to date for employees who have met the vesting requirements. Where any other actuarial cost method is being used, a corresponding accrued benefit cost method value is needed for all vested benefits.

15. Separate Adjustments for Actuarial Gains and Losses

.099 If actuarial gains and losses are spread or averaged as a separate component of the annual pension-cost provision, they are considered to be adjustments of the normal cost computed under the actuarial method in use. Spreading may be by simple straight-line allocation of each year's net gain or loss over a period of 10 to 20 years, or more complex methods may be used. A historical moving average may be used, or future expectations may be considered in conjunction with past and current experience in developing an average. The objective of avoiding significant year-to-year fluctuations should be a central consideration in selecting or evaluating any method of spreading or averaging.

.100 Exhibit D, paragraph .102, illustrates the application of a ten-year straight-line spreading technique and a five-year moving-average technique to given data. In practice it may not be necessary to record the adjustments annually. For example, if it were concluded that a difference of about $5,000 between the actual and the spread or averaged gains and losses would not be material, deferrals would be needed in the Exhibit D illustrations only in years seven and nine, and the amounts deferred could be absorbed in a few years.

.101 A combination of techniques may be appropriate. For example, the spreading approach might be applied to items not expected to recur frequently, such as a change in the interest assumption, while averaging might be applied to such recurring items as mortality and turnover adjustments. Consistency of application from year to year is important.

.102

EXHIBIT D

ACCOUNTING FOR THE COST OF PENSION PLANS

Application of Spreading and Averaging Techniques to Actuarial Gains and Losses

Spreading Technique—10-Year Straight-line Basis:

	Gain (Loss)		
Year	*Actual*	*Applied to Reduce Provision*	*Deferred to Future Years*
1	$ 5,000	$ 500	$ 4,500
2	2,000	700	5,800
3	6,000	1,300	10,500
4	(1,000)	1,200	8,300
5	7,000	1,900	13,400
6	3,000	2,200	14,200
7	(8,000)	1,400	4,800
8	1,000	1,500	4,300
9	10,000	2,500	11,800
10	1,000	2,600	10,200

Averaging Technique—5-Year Moving-Average:

	Gain (Loss)			
Year	*Actual*	*5-Year Total*	*Applied to Reduce Provision*	*Deferred to Future Years*
–4	$ 1,000	See Note		
–3	4,000			
–2	(2,000)			
–1	3,000			
1	5,000	$11,000	$2,200	$ 2,800
2	2,000	12,000	2,400	2,400
3	6,000	14,000	2,800	5,600
4	(1,000)	15,000	3,000	1,600
5	7,000	19,000	3,800	4,800
6	3,000	17,000	3,400	4,400
7	(8,000)	7,000	1,400	(5,000)
8	1,000	2,000	400	(4,400)
9	10,000	13,000	2,600	3,000
10	1,000	7,000	1,400	2,600

Note: Before year 1, the gains and losses were recognized in the year of determination; they are used here, however, to develop a starting point in the averaging computation.

16. Unrealized Appreciation and Depreciation

.103 The effect of unrealized gains and losses in the pension fund frequently has been omitted from estimates of annual pension cost. In some cases, turnover of fund assets has caused the spread between cost and market value to be reasonably narrow, with little unrealized appreciation

of depreciation. In other cases, however, the amounts have been significant.

.104 Under section 4063, unrealized appreciation or depreciation of pension-fund assets (other than debt securities expected to be held to maturity and redeemed at face value) is considered to be an element affecting fund earnings and, like other actuarial gains and losses, should be recognized in estimating pension cost. The objective to be met is a "rational and systematic basis that avoids giving undue weight to short-term market fluctuations." Unrealized appreciation or depreciation may be recognized by the spreading or averaging techniques described for other actuarial gains and losses or by other appropriate techniques. For example, unrealized appreciation and depreciation may be dealt with indirectly by adjusting the assumed rate of interest. Or, the value placed on fund assets for actuarial valuation purposes may be regularly adjusted to reflect an assumed long-term growth rate.

.105 Whether unrealized appreciation and depreciation are included with other actuarial gains or losses, or dealt with as a separate item, the method of determining the amount to be recognized is an important consideration. When unrealized appreciation or depreciation is spread or averaged in an appropriate manner, the total market value of the pension-fund assets may be used. In such circumstances, however, it would be desirable to have a continuing buffer guarding against a decline in market value of such magnitude as to cause the cumulative pension-cost reductions for appreciation to exceed the gain reasonably expected to be realized in the long run.

.106 When the amount of appreciation to be recognized annually as a reduction of pension cost is based on an assumed long-term growth rate, a buffer can be provided by limiting the total of cost and recognized appreciation to a specified portion of the fund's market value.

.107 Because current fluctuations in market value may be abrupt and frequent, section 4063 implies that appreciation need not be recognized if the carrying value of the fund is 75% or more of its market value; however, the 75% referred to in section 4063 is not intended to be a fixed rule.

 © 1974, American Institute of Certified Public Accountants, Inc.

.108 Here, again, consistency from year to year is important.

17. Other Gain and Loss Considerations

.109 Under section 4063 certain actuarial gains and losses should be recognized in the year they occur. A characteristic of these gains and losses is that they "arise from a single occurrence not directly related to the operation of the pension plan and not in the ordinary course of the employer's business." The examples of these gains and losses given in section 4063 are those resulting from plant closings and business purchase acquisitions. A plant closing might give rise to an immediately recognizable gain to the extent of previous accruals made unnecessary by the elimination from the plan of people formerly employed at the closed plant.

.110 Employees coming into a plan by reason of an acquisition may make necessary immediate recognition of the additional cost. When purchase accounting is followed for the acquisition, any additional pension-cost accrual needed should be treated as an adjustment of the purchase price. On the other hand, when pooling-of-interests accounting is followed for an acquisition, the companies are assumed to be continuing their prior existence; therefore, any additional pension cost related to prior years' services should be treated like an increment of prior service cost arising on the amendment of a plan.

.111 Gains and losses that are immediately recognizable, it should be noted, do not arise from transactions relating to assets of the pension fund. As mentioned previously, these gains and losses are considered to be inherent in the long-range estimates of pension cost.

.112 In variable annuity and similar plans, the pension benefit formula gives effect to changes in the market value of a specified portfolio of equity investments in the fund. Consequently, the pension benefits themselves change with changes in such market values. Section 4063 recognized this type of plan by stating that pension-fund investment gains and losses should not have an effect in computing pension cost if they will be applied in determining pension benefits.

18. Changes in Accounting Method

.113 The section discussion of changes in accounting method refers only to changes from one acceptable method to another. The Board concluded that any adjustments arising from such a change should be recognized in the current and future years and should not be given retroactive effect.[4] A change in accounting method includes any change in the actuarial cost method, in the method or period for dealing with past and prior service cost, or in the method or period for dealing with actuarial gains and losses or unrealized appreciation and depreciation. A change in assumptions is considered to reflect a new circumstance and hence is not a change in method; however, the accounting for changes in circumstance should, like changes in method, be given effect in the current and future years (except, of course, actuarial gains and losses resulting from changes in circumstances of the type previously discussed as being properly recognized in the year they occur). Both method and circumstance changes are subject to the disclosure recommendations of section 4063.

.114 The transitional procedure for change from a method previously considered acceptable under Accounting Research Bulletin No. 47 but no longer acceptable under section 4063 conforms with the general procedure set forth in section 4063 for a change from one acceptable method to another. The consequences of any such change are therefore also related by section 4063 to current and future cost estimates and should not be applied retroactively.

.115 Because of the complexities of determining initial past and prior service cost for employers who previously followed methods, such as pay-as-you-go and terminal funding, that do not comply with section 4063 and because of the need to deal with any inadequacies of cost previously recognized under these or other methods, the transitional procedure includes a "fresh start" approach. Any prior service cost not covered by the pension fund or balance sheet accruals at the date section 4063 is effective (or such earlier date as it is first applied) may be treated as though created by a plan amendment on that date. This approach

---

[4] It should be noted that this conclusion of the Board appears to be controlling for purposes of applying section 1051, *Accounting Changes.* [As amended effective for fiscal periods beginning after July 31, 1971, by APB Opinion No. 20.]

 © 1974, American Institute of Certified Public Accountants, Inc.

may be used by any company, including those who can identify the various amounts of initial past and prior service cost. The 40-year amortization in the defined-minimum method may also be considered to begin at the effective date of section 4063.

.116 Any unamortized prior service cost as of the effective date of section 4063 should be computed under the actuarial cost method to be used for accounting purposes in the future.

19. Treatment of Overfunding

.117 Any overfunding existing at the effective date of section 4063 is to be treated as an actuarial gain in the same manner as any overfunding arising later. There is a distinction between (a) overfunding and (b) funding in excess of the amounts that would have been required under a method complying with section 4063. Overfunding refers only to a fund (together with unfunded accruals, less prepayments and deferred charges) that is in excess of all prior service cost assigned under the actuarial cost method to be used in the future. If a condition of overfunding exists, the amount of such overfunding is to be considered as an actuarial gain and spread to the future. As to (b), section 4063 rejects the reversal of pension cost recognized in prior years, even though recognized in amounts greater than necessary under section 4063.

20. Balance Sheet Presentation

.118 The amount to be included in the balance sheet as an accrued liability or a prepaid expense is usually the difference between the cost provisions and the amounts paid. Unamortized prior service cost should appear in the balance sheet only if it is a legal liability.

.119 A simultaneous asset and liability position should appear in the balance sheet whenever pension-plan arrangements impose a specific legal obligation that exceeds the total of the amounts paid or accrued. For example, if a company is liable for vested benefits, without limitation to amounts funded, accounting recognition of the unfunded, unaccrued portion of this obligation as a liability on the balance sheet is necessary; to the extent not appropriately

included in cost provisions, the cost of such benefits should appear as a deferred charge to operations of future periods.

.120 A practical way to account for such situations is to determine, at the end of each year, the amount of the legal liability not yet covered by the pension fund and balance sheet accruals. A liability and deferred charge equal to this amount would then be recorded (or the corresponding amounts as of the end of the preceding year adjusted for the net change) and classified with any other pension-cost accruals and deferred charges appearing in the balance sheet.

21. Disclosure

.121 The Board concluded that the effect of the typical pension plan is of such magnitude as to be a material consideration in evaluating financial position and results of operations and should therefore be disclosed. There may be cases, however, where the effect of the pension plan is not such as to require disclosure—for example, plans covering only a relatively small portion of the employees.

.122 Disclosure of the amount of unamortized past or prior service cost, as is often found in present practice, is not necessary under section 4063.[5] There are several reasons for the Board's conclusion. As discussed earlier, past and prior service cost is not derived in all actuarial methods. Also, some methods assign a greater past or prior service cost than would be assigned under the unit credit method for benefits based on age, compensation, salary and other conditions existing at the end of the year. As a result, the amount of past or prior service cost could vary considerably—or be non-existent—without any differences in either facts or assumptions, depending entirely on the actuarial cost method used. For these reasons, disclosure of unamortized past or prior service cost may be misleading to some and may not be useful for meaningful analysis by others.

.123 In lieu of disclosure of unamortized past or prior service cost, the Board recommended the disclosure of the

[5] However, at the time of the authors' last contact with the staff of the Securities and Exchange Commission, the Commission had not changed its requirements for the disclosure of unfunded or otherwise unprovided for past or prior service cost.

 © 1974, American Institute of Certified Public Accountants, Inc.

excess of the actuarially computed value of vested benefits over the total of the pension fund and any balance sheet accruals, less any pension prepayments or deferred charges. The disclosure of such excess of vested benefits is meaningful because it should be comparable among companies, except for real distinctions between plan arrangements and employee groups, and because it relates directly to the minimum objective section 4063 sets forth for all plans. This disclosure may be necessary even though the defined-minimum method is not being followed; in fact, it could conceivably be necessary when the defined-maximum method is used—for example, upon adoption or amendment of a plan, a large portion of the past and prior service cost could represent vested benefits if the plan calls for early vesting. When the company has several plans, the disclosures may be presented in summary form.

22. Regulated Industries

.124 Section 4063 does not refer specifically to regulated industries. The absence of any such reference makes section 4063 applicable to companies in regulated industries within the framework of the principles set forth in section 6011.

23. Employees Included

.125 Section 4063 calls for inclusion in the pension-cost computations of data for all employees who may reasonably be expected to receive benefits under a pension plan. This should be done without regard to technical "eligibility." Extreme situations found in practice illustrate the need for this conclusion of the Board. In some plans, employees are not "eligible" for coverage or, for other reasons, data for them are not included in the cost calculations until they reach age 35 or 40, or until they have 10 or 15 years of service. In some plans, "eligibility" may not occur until the time of actual retirement. Pension-cost provisions that exclude data for employees who may reasonably be expected to receive benefits could be substantially smaller than the appropriate provision for the year.

.126 However, the combination of low unit cost for the younger employees and the high turnover often experienced frequently results in relatively small amounts of

pension cost for the employees excluded from the cost calculations. The cost applicable to excluded employees also tends to be offset by the higher cost provided for employees included. The net effect of exclusion is unlikely to be material in plans where the period of exclusion is only two or three years. Where the exclusion is based on a longer period of service, or is based on an age factor, the possibility of material effect is increased. When the effect is not material, employees may be omitted from the cost computations during their early years of service. Although materiality is always pertinent in applying Board Opinions, the Board covered the point explicitly in this case.

.127 In this connection, it should be remembered that materiality should be judged in relation to results of operations and financial position rather than in relation to the pension-cost provision itself.

24. Several Plans

.128 Many companies have more than one pension plan. Sometimes each plan covers a different group of employees, but often two or more plans cover a portion or all of the same employee group. Generally, each plan should be considered a separate accountable undertaking and should not be combined for purposes of determining compliance with section 4063. However, two or more plans covering substantial portions of the same employee group may be combined for that purpose if "the assets in any of the plans ultimately can be used in paying present or future benefits of another plan or plans." For example, upon a major revision of the pension structure, a new plan may be established to provide benefits for service after its effective date, with the old plan continuing to provide benefits for service previously rendered. In this situation, if any assets ultimately remaining in the old plan could be used to provide benefits under the new plan, the two could be treated as one in applying section 4063.

.129 A different accounting method may be used for each plan so long as each method conforms with section 4063.

 © 1974, American Institute of Certified Public Accountants, Inc.

25. Multiemployer Plans

.130 Often multiemployer plans combine a cents-per-hour or similar defined contribution with stated benefits. The movement of employees among employers and the differing employee age and service distributions that exist among employers make it difficult, if not impossible, to correlate the defined contribution with the cost of the stated benefits related to employees' services for any individual employer. Any future adjustment of the defined contributions would be negotiated with all employers—not separately with an individual employer based only on his experience. Hence, the defined contribution ordinarily would be the best available measure of pension cost.

26. Insured Plans

.131 Insured plans generally use one of three contract forms: (1) individual policies (cost usually determined under the individual level premium method), (2) group deferred annuity contracts (cost usually determined under the unit credit method, but generally without a turnover factor) and (3) group deposit administration contracts (similar to a trust-fund arrangement—cost may be determined by any of several actuarial cost methods). The following discussion is directed to those insured plans that use only individual policies or group deferred annuity contracts as the basis for determining pension cost and for funding the plan. Employers having such plans for small employee groups are unlikely to have ready access to actuarial advice. Group deposit administration contracts are not discussed because they should be accounted for in the same manner as noninsured plans.

.132 Most of the factors of pension-cost estimation are present in plans using individual policies and group deferred annuity contracts. Some of the factors may not be apparent because they are included in the determination of the premium structure or are dealt with subsequently as "dividends" or "termination credits."

.133 Individual policies usually include past or prior service cost in normal cost whereas group deferred annuity contracts usually deal with it as a separate factor which may be paid in varying amounts at the employer's discre-

tion. In the latter case, separate adjustments may be needed to comply with section 4063.

.134 Because policy dividends generally arise from "averaged" gains of the insurance company, these dividends may be applied to reduce the provision for pension cost in the year received or credited if they do not vary significantly from year to year. If they do, a further averaging or spreading should be applied for accounting purposes.

.135 Problems in accounting for many insured plans arise in respect to termination credits and the period before coverage. Termination credits arise when, as is typical, a turnover assumption is not used. In these cases, some of the cash values built up or the premiums paid for employees who leave before their benefits have vested will be returned in the future as termination credits. The period before coverage is often set to exclude employees during the high turnover period that immediately follows employment; if so, future termination credits will tend to be minimized. When termination credits occur, they should be spread or averaged if necessary to avoid significant year-to-year fluctuations in pension-cost provisions.

.136 The most difficult problem in accounting for the cost of insured plans arises in cases where the financial statements would be materially affected by the omission of pension cost applicable to employees during the early years of their employment. In these cases, it will be necessary to estimate an additional pension-cost provision for the omitted employees. A reasonable estimate for accounting purposes often may be made without an actuarial valuation and without using an actuarial cost method.

.137 Before setting out to estimate what the additional pension-cost provision would be for omitted employees, it would usually be desirable to take a look at the broad picture of the plan, including the employee group and the premiums paid, to see whether the *entire* pension cost is material to the company's operations and financial position. There are cases where the provision for pension cost could be doubled or tripled without its having any material effect on the financial statements.

 © 1974, American Institute of Certified Public Accountants, Inc.

.138 Although the authors are unable to cite any statistics, their discussions with members of the actuarial and accounting professions, as well as their own experience, have led them to believe that the omission of pension cost for employees during the early years of employment is not likely to have a material effect on the financial statements in many cases, particularly for smaller companies.

.139 A simple test of materiality could be made by estimating the additional pension-cost provision for omitted employees to be that proportion of the premiums due for the year which the number (or compensation) of omitted employees bears to the corresponding amount for included employees. The resulting estimated amount (which usually would be larger than a refined estimate) could be compared with income before taxes and other pertinent factors to determine materiality. A variation of this approach could be to base this estimate on only the proportion of omitted employees expected to remain with the company until they become insured.

.140 If preliminary tests indicate that the effect of omitting employees is material, or leave the matter in doubt, more refined techniques should be applied. Should this be necessary, the following techniques are possible ways to deal with the problem.

.141 For each employee not yet covered, the estimated premiums to be paid after coverage could be totaled and then accrued by allocation over his remaining service life. The estimated premiums might be obtained from the insurance agent or based on the premiums being paid for the youngest covered employee. Premiums paid after coverage could be charged against the accrual. If the employee subsequently terminates, any amount accrued in excess of premiums paid would be treated as an additional termination credit. In time, this form of accounting would include all covered employees in the cumulative accruals. This approach could be modified by excluding employees with less than two or three years of service if the effect, giving due regard to turnover, were not material. Interest equivalents on the accruals should be added if the effect would be material.

.142 Another approach would be to estimate what the premium would be if the employees were covered immediately after employment. This amount could be accrued during the years prior to coverage, and the amount thus accumulated could be spread to the years after coverage as a credit against premiums charged to expense. Again, interest equivalents on the accruals should be added if the effect would be material.

.143 The effect of turnover, in rather simple form, could be applied by a variation of the approaches just discussed. Assume, for example, that the computations are to exclude data for employees who do not have one full year of service, and that the plan coverage begins after five years of service. Further assume that, say, 25 per cent of employees with one year's service are expected to continue in service and become covered. In the four years before coverage, the additional cost for employees after one year of service could be based on 25 per cent of the total amount computed for the year the employees attained one full year of service. If the company had ten employees attaining one year's service in the current year and the estimated annual premium for each was $200, the additional cost would be $500 (10 × $200 × 25%). This amount would be accrued each year before coverage even though one or more of the employees terminated. In the first year of coverage and thereafter, the accruals during the preceding four years could be spread over the average remaining service lives of any of the ten employees who are still active, or the accruals could be spread as actuarial gains.

.144 The procedures suggested do not include all of the factors that could be applied in computing the pension cost applicable to employees in years before coverage. Adjustments for such actuarial factors as past service cost and interest or annuity computations could be introduced. These would increase the complexity of the computations and likely would require the services of an actuary.

.145 The additional cost provision for vested benefits, or disclosure of vested benefits, would not normally be a problem with individual policy plans. It is not likely that benefits vest before the benefits are covered by premium

 © 1974, American Institute of Certified Public Accountants, Inc.

payments. This factor should be reviewed, however, for possible applicability to these plans.

27. Conclusion

.146 In conclusion, the authors would like to express a thought that may seem inconsistent with much of what has been said in this and the preceding article. Many of the rules and formula-type parts of section 4063 represent virgin territory in accounting for the cost of pension plans. Nevertheless, the accounting followed by most companies heretofore probably will conform with section 4063 in all material respects. There will be many cases, of course, where important changes will have to be made. By and large, these will be cases where the CPA has already been concerned about the pension cost but has not taken a strong stand because of what he has found to be generally accepted in practice. Section 4063 should change that.

.147 The authors hope that section 4063 will not be viewed as a rule-bookish structure that encloses the accountant in a maze of formulas limiting the exercise of judgment to interpretation, but rather that it will prove to be a working tool that will result in a substantial step forward in accounting for the cost of pension plans.

ACTUARIAL CONSIDERATIONS INVOLVED IN PENSION COST UNDER SECTION 4063

By Frederick P. Sloat

28. Questions and Answers

.148 Section 4063 requires wider understanding of the actuarial, as well as of the accounting, procedures applicable in accounting for the cost of pension plans. The accountant's efforts in determining a proper charge for annual pension expense and the actuary's role in this undertaking must, of course, be closely co-ordinated.

.149 From the actuarial view, section 4063 has stimulated many questions whose answers will more clearly delineate the actuarial responsibility in accounting for pensions. A representative selection of questions and answers follows.

.150 *Why does section 4063.07 state that "generally pension cost should be determined from a study by an actuary"?*

.151 The computations for a pension plan to take into account the financial effects of expected future occurrences are performed by actuarial techniques and require actuarial judgment. The determination of pension cost has always been considered a function of the actuary.

.152 *Has section 4063 altered any concepts held by pension technicians?*

.153 Many of us who have been involved with pensions have become so used to considering the cost of a pension plan to be whatever an employer has funded that we are surprised to find that this may not be the only way to measure its cost. The amounts paid toward funding are governed by tax considerations and also by a company's cash position. The former must bear some overall relationship to pension costs, but not necessarily on a year-by-year correlation. As to the latter, cash considerations need not relate to a year's pension costs.

.154 *What is the basis of the terminology used for pension cost matters?*

 © 1974, American Institute of Certified Public Accountants, Inc.

.155 Pension plan development has evolved without a precise terminology so that the same words have come to mean different things, and many concepts have a variety of names. Regardless of the terms used, it would be very desirable if each term meant only one thing and if each concept had only one name. For any particular undertaking, a glossary may be needed. The Committee on Pension and Profit-Sharing Terminology [1] of the American Risk & Insurance Association is working to develop a more precise terminology; the American Institute of CPAs' research study, the foundation for section 4063, incorporated many of the committee's terms, including those that had already been promulgated and those that were being developed. Older terms were also used in the study, recognizing the needs of the accounting profession and others to relate the study to familiar terms. Section 4063 continued this approach, and section 4063 and its glossary are consistent with proposals of the Committee on Pension and Profit-Sharing Terminology.

.156 *Section 4063 is obviously intended to apply to any arrangement whereby a company undertakes to provide its employees with retirement benefits. Section 4063 specifies that deferred compensation contracts and profit-sharing plans must be treated as pension plans in certain situations. How do you decide whether these arrangements are equivalent to a pension plan?*

.157 Section 4063 would apply to deferred compensation contracts if such contracts, taken together, are equivalent to a pension plan. This will not apply in many instances where deferred compensation contracts exist, but auditors may need to investigate this type carefully. As to the deferred profit-sharing plan, section 4063 would apply to the extent that such an arrangement is, in substance, a pension plan or part of one. An example might be a profit-sharing plan providing minimum pension benefits. If an arrangement is deemed to be in the nature of a pension plan, the actuarial considerations relating to pensions are applicable.

.158 *How about a pension plan where the cost is incurred in a foreign country?*

---

[1] Mr. Sloat is a member of this committee.

.159 Section 4063 says it would apply if the cost is included in financial statements prepared in conformity with generally accepted accounting principles in the United States. The cost of a plan for a wholly owned foreign subsidiary of a United States company, when included in a consolidated income statement, would be an example. Section 4063 refers, however, to plans that are reasonably similar to those contemplated by it. Thus, there may be bona fide conditions that make an exception necessary; for example, where plans may be affected by foreign laws quite unlike those of this country.

.160 *Section 4063 refers to various methods of determining pension cost. Why is there more than one method?*

.161 Pension benefits are spread over many years and depend on many factors. A man works for a number of years and the amount of his pension, the payment of it and the period over which it will be paid depend upon future events. If the problem were simply to provide for a fixed payment over a fixed number of years at a fixed rate of investment return, the cost would be definitely determinable, and the only problem would be its allocation to each year he worked. But, under a pension plan, none of these factors are fixed, and problems arise because of the plan's long-term nature and because educated guesses have to be made to measure the probable effect of the contingencies. If an employee works for a company from 1930 to 1970 and retires, his pension payments begin in 1970 and will continue for approximately 15 years. The purpose of an actuarial valuation is to provide for pension payments in advance of retirement. More than one logical method exists for doing this over the 1930-70 period.

.162 *If the employer doesn't get around to setting up a plan until 1960 and then amends it in 1969, why should the cost relate to the years of employment and not to 1970, for an employee who retires in that year, or over the years after 1970 when the pension is being paid out?*

.163 Pension costs are deemed to be associated to a large extent with the plan itself rather than with specific employees. The actuarial computations take into consideration employees who are already at or near retirement as part of the past or prior service costs to be amortized.

 © 1974, American Institute of Certified Public Accountants, Inc.

.164 *How about the actuarial cost methods that are mentioned neither in the body of section 4063 nor in section 4063A?*

.165 There are some methods that are disguised forms of terminal funding, such as meeting pension costs only when employees have reached the earliest age at which they can retire—say, 55. If the valuation includes all employees, other than those with relatively short service and those who are at the young ages where only short-service employees would be found, the actuarial cost method would undoubtedly be an adaptation of one or more of those methods contemplated in section 4063.

.166 *How would the auditor know which method was being used?*

.167 He should ask the actuary whether the method being used is one of those described in section 4063A or is identifiable as an adaptation or variation of one of such methods.

.168 *Since the actuarial cost method is just a beginning, aren't there many variations, depending upon the combination of actuarial assumptions?*

.169 Yes. Unreasonable assumptions can destroy the appropriateness of any method. There is usually, however, quite a wide range in which the assumptions can reasonably be located. A familiar and easy illustration is the interest rate. Currently, a rate of 2 per cent or of 10 per cent, taking two extremes, would obviously be illogical. But, given a particular situation, it is difficult to say that any rate within a range of from 3½ per cent to 5 per cent would be unacceptable.

.170 *As section 4063 carefully distinguishes between funding and accounting, will the actuarial basis be the same for each? If not, the auditor will want to know why one basis is used for funding and another for accrual of cost.*

.171 Many companies have become accustomed to the flexibility available in determining the annual payments for funding and for tax purposes. In light of the year-to-year consistency requirement in accounting under section 4063, these companies may well have to use a different approach.

A company may also want to take a cautious tack and set a method and use assumptions that will produce lower accrual costs because of a feeling that it will have to stick with whatever it starts with when bad years occur. It is important for such companies to be informed by their accountants as to what would be involved in making future changes in the actuarial bases of determining accruals.

.172 *Section 4063 refers to averaging gains and losses. How is an averaging method applied?*

.173 You would need the experience of prior years as a guide. If there have been successive gains, let's say, by the fund earning an average of one-half per cent over the assumed rate, the average amount would be anticipated next year and the cost accrual reduced accordingly.

.174 *If the gain in a particular year isn't the same as the average being used, how do you treat the difference?*

.175 Over some period, the differences will have to be taken into account, to the extent that the average and the actual gains or losses do not offset each other.

.176 *Doesn't this have the same effect as using different actuarial assumptions?*

.177 Yes, but with averaging they are not projected into the future, and the expected averaging is readily modified from year to year as experience unfolds. Incidentally, averaging can be the most useful where an employer has been following the immediate recognition basis and can no longer do this under section 4063. If the employer starts to spread his gains over the approved 10- to 20-year period, only a small part of one year's gains can be used the first year. The next year there will be another segment of the first-year gains plus the first segment of the second-year gains—resulting in a pyramiding effect. Averaging will obviate this effect or at least diminish it.

.178 *Section 4063.36 provides that if employees are omitted from the calculations because of age or length of service, or for other reasons, they should be included in the pension cost, unless the effect of omitting them is not material. Can the actuary satisfactorily estimate the effect of this situation without making an actual calculation?*

 © 1974, American Institute of Certified Public Accountants, Inc.

.179 Generally, the actuarial assumptions include the expected rates of service termination. If done precisely, the rates would vary with length of service as well as with age, with very high rates in the first year or two of employment. If employees with only one or two years of service are included, use of realistic termination rates would very likely show their cost to be negligible.

.180 *What about plans that have an age eligibility clause, such as 25 or 30?*

.181 Here, the difference might be more significant, just as it could be with a relatively long service requirement. In some instances, the actuary might feel that he has sufficient knowledge of the trends to estimate the probable maximum effect of omitting the employees. Often, however, he would need the valuation data for omitted employees to gauge the effect, particularly with a high age limit, such as 30 or over.

.182 *What basis should be used for valuing the pension fund to determine the amount of excess vested benefits over the fund?*

.183 Since this was left unspecified in section 4063, it is in order to use current market values or some other basis giving a proper current measure of the assets on hand. The effect of following the chosen method in subsequent years should be given consideration.

.184 *The disclosure provision (section 4063.46) requires a company to show the excess of the value of vested benefits over amounts funded or accrued. Why does section 4063.17 take vesting into account only when calculating accruals under the minimum method?*

.185 If past service cost is being amortized, the value of all vested benefits will be recognized at some point along the amortization schedule. But if it is not being amortized, the actuarial value of vested benefits might never be fully recognized or, if the amortization period is too long, recognition could be prolonged. Since vesting recognition can be accomplished by amortizing past or prior service cost, it was a logical step to limit the vesting increment to that which would be available in the event of amortization over the longest period that would not be considered as unduly

prolonging the recognition of vested benefits, set by section 4063 as 40 years. This has the effect of saying that, if past service is being amortized over a period of no longer than 40 years, the minimum test will automatically be met.

.186 *A company is not using minimum accrual and believes that available assets exceed the value of vested benefits so that disclosure of any excess is not needed. Can the actuary estimate whether there is any excess of value of vested benefits over assets without making some detailed calculations?*

.187 In many cases he can. It is not possible to set up rules or guides, but an actuary will often be able to do so in particular situations. It is much like a doctor making a medical diagnosis. He notes various symptoms and has acquired a certain intuition from years of observation and a well-developed sixth sense. Where the actuary is able to state that, in his professional judgment, the assets equal or exceed the value of vested benefits, it can be accepted. The probable error in such a test should be well within the range of materiality.

.188 *Does the actuarial value of vested benefits call for any amounts that are not already incorporated in the actuarial valuation of a plan?*

.189 No. Such amounts, however, would not usually be identified separately and therefore will need to be isolated for purposes of section 4063. It is this difficult separation that causes the problems in reprograming valuation computations.

.190 *A plan may include death, disability or other benefits in addition to retirement benefits. Are these included in the value of vested benefits?*

.191 If such a benefit no longer applied if the employee were to terminate service, its value need not be included with the value of vested benefits. If the benefit continued to apply after termination of service, it would be included. Note that the value of vested benefits does not just mean the value of the benefits for those employees who will terminate service and take their vested benefits with them. Rather, it is the full value of providing such of the benefits, regardless of when they will become payable (but with actuarial account taken of the probability of pay-

 © 1974, American Institute of Certified Public Accountants, Inc.

ment in various situations), which benefits could become payable even if termination of the employee's service occurred on the valuation date. [ED. NOTE: This is described in more detail by Mr. Sloat in paragraphs .089-.098.

.192 *For minimum accrual of vested benefits, it is necessary to know their value at the beginning and at the end of the year. What if the company doesn't have this figure at the beginning of the year, as may be the case in this first year of applying section 4063?*

.193 The figure would normally not be available at the first of the year and it would be costly to obtain during the first year of section 4063's application. There seem to be several possible alternatives. One is to add 5 per cent of the year-end excess value of the vested benefits; this would always be equal to or *greater* than the precise amount required. Another alternative is to use a 40-year amortization amount; this can never be *less* than the amount required. Whether use of the correctly calculated amount in the next year requires any footnote reference indicating a change in accounting method is the auditor's responsibility. In most cases, the footnote could probably be omitted because the effect of the change is immaterial. But, again, that is the auditor's final determination in each case.

.194 *Take the case of a company with a small number of employees and whose pension plan utilizes individual life policies. Will this employer have to hire an actuary to comply with section 4063?*

.195 No. Section 4063.41 is intended to recognize this situation. The amount of the premiums less dividends under the policies is a satisfactory basis of pension cost. Gains arise in the form of dividends on the policies, and these are usually determined by insurance companies to maintain a reasonable level trend year by year. Since the dividends are based on the experience of large blocks of policies, they are not affected by fluctuations that tend to occur in a small group. Thus, section 4063.41 says: Premiums less dividends comply with the purposes of section 4063.

.196 *What happens when employees terminate their service and the surrender values of their policies are returned to the company?*

.197 That is a different matter. Surrender values fluctuate with the experience under the plan and can be substantial in some years, sometimes enough to pay all the premiums for a year or more. This is the kind of situation that requires spreading. A 10- to 20-year range is indicated by section 4063.

.198 *What is the situation with respect to employees who are not yet eligible for the plan, say, where eligibility is something like two years of service and age 30?*

.199 Here, again, it's a question of doing without an actuary. The company or the auditor can probably make a pretty fair estimate of what the maximum cost could be for those employees by taking the premium for the youngest employee at age 30 and using it for the ineligible employees. If this calculation produces a total amount that is not considered material, that is an adequate test because it's bound to be on the high side. If it is material, a closer estimate is needed; here the insurance broker selling the policies might be able to help.

.200 *What about a group annuity contract a small client might have?*

.201 The dividends might fluctuate more, but section 4063 notes that, even here, the insurance company procedure usually furnishes acceptable results.

.202 *Where a company has a separate fund used to build up sums to provide additional retirement income other than that available from the group annuity contract or the individual policies, how is it handled?*

.203 The special provisions of section 4063.41 apply only where individual policies or group annuity contracts are used exclusively. When you have a plan with a separate fund, then you are in the same position as with a trust or deposit administration plan. The individual policy or the group annuity contract is just part of the total operation of the plan. This plan would probably need an actuary —but may already have some actuarial help, perhaps from the insurance company to determine the amounts for the separate fund.

AC Section U4064

Deferred Compensation Contracts: Accounting Interpretations

1. Accounting for Key-Man Life Insurance

.001 *Question*—Is the "ratable charge" method of accounting for the cost of nonterm life insurance policies on corporate officers an acceptable accounting method?

.002 *Answer*—No, the ratable charge method is not acceptable for use by a corporation to account for the cost of officers' life insurance policies. Under this method, the net cost of the policy (total premiums to be paid minus total cash surrender value for a paid-up policy) is amortized over the life of the policy by the straight-line method, producing a "level" annual charge. The method assumes that a critical unknown—the length of time an officer will remain in the corporation's employment—can be predicted with much greater certainty than is usually justifiable. If the policy should be discontinued prior to the payment of all scheduled premiums (for example, because of termination of the officer's employment or a change in management's policies), the ratable charge method would result in a "writeoff" of a large unamortized deferred charge.

.003 The generally accepted method of accounting for nonterm insurance on the life of a corporate officer is to charge the increase in the cash surrender value of the policy to an asset account and to charge the remaining balance of the annual premium to expense. Advocates of the ratable charge method cite the large charges to expense under the generally accepted method in the early years of a policy as being too conservative and inconsistent with the "matching" and "going concern" concepts in accounting.

.004 Admittedly the generally accepted method is conservative, but it reflects the economic realities of the transaction. And "matching" should not be confused with "leveling." Finally, the going concern concept recognizes that businesses continue in existence, but the fact that a business continues is not an argument for deferring costs unless a future period will in fact be benefited.

AC Section U4091

Accounting for Income Taxes: Accounting Interpretations of Section 4091

1. Accounting for Income Tax Surcharge Rate Changes

[.001—.005] (Deleted)

INTRODUCTION

2. Historical Development

.006 The issuance of section 4091, *Income Taxes,* represents the culmination of many years of study and consideration. Section 4091 is the most complete and authoritative statement ever issued on the subject. In many respects, it is a codification of practices followed by many companies in the past, although these practices were not necessarily expressed in official pronouncements.

.007 The principal problems in accounting for income taxes arise from transactions that affect the determination of net income for financial accounting purposes in one reporting period and the computation of taxable income in a different reporting period. The practice of interperiod allocation of income taxes has evolved for more than twenty-five years, particularly since the enactment of the United States Internal Revenue Code of 1954 which permitted the use of accelerated depreciation methods for tax purposes. As would be expected when an accounting procedure develops over a long period of time, various approaches to allocation have been followed by different companies. The objective of section 4091 is to provide guidelines to cover the recognition and presentation of income taxes in financial statements.

.008 After several years of research by Professor Homer A. Black, with the assistance of the Accounting Research Division of the American Institute of Certified Public Accountants, Accounting Research Study No. 9, *Interperiod Allocation of Corporate Income Taxes,* was published in May 1966. Concurrent with publication of the

Study, a subcommittee of the Accounting Principles Board began consideration of the subject. The subcommittee presented a point outline of the substantive issues involved for consideration by the Board before drafting section 4091. Numerous discussions were held within the Board, with extensive consideration by the subcommittee between Board meetings.

.009 In the summer of 1967, the subcommittee held informal meetings with more than twenty industry associations, user groups, and government agencies.

.010 Subsequently, a public exposure draft of section 4091 was distributed to members of the AICPA, listed companies, and others. Approximately 1,000 letters of comment were received and considered by the Board. A substantial number of the letters objected to a proposed requirement that realized investment credits be deferred and amortized over the life of the related property. As a result and in order to permit further study, particularly of transition problems, the Board deleted that section from the proposed section. Accordingly, section 4094, dealing with the *"Investment Credit"*, continues in effect.

.011 Section 4091 was issued in December 1967, effective for fiscal periods beginning after December 31, 1967. The conclusions significantly modify the views previously expressed by the predecessor Committee on Accounting Procedure and by the Board and vary in some important respects from the recommendations of Accounting Research Study No. 9.

3. Subjects Included in Section 4091

.012 Section 4091 reaffirms the general concept that "income taxes are an expense of business enterprises earning income subject to tax." By definition, income taxes include taxes based on income determined under provisions of the United States Internal Revenue Code and foreign, state and other taxes (including franchise taxes) based on income.[1]

.013 The major subjects covered by section 4091 are (1) interperiod allocation of income tax expense because of

[1] In some situations (such as for the State of California), application of section 4091 requires the current accrual of certain taxes measured by income in the years the income is earned, even though the taxes constitute a fee for the privilege of doing business in a succeeding period and are payable in that period.

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

timing differences, (2) accounting for operating loss carry-backs and carryforwards, and (3) financial statement presentation of income taxes, including allocation within a period (intraperiod allocation).

.014 The Board also reaffirmed its conclusion, expressed in section 4092, that deferred taxes should not be accounted for on a discounted basis pending further study of the broader aspects of discounting as it is related to financial accounting in general.

.015 Section 4091, as in the case of all other Opinions of the Board, is not intended to apply to immaterial items.

4. Exclusions from the Section

.016 As mentioned previously, accounting for investment credits continues to be governed by section 4094. However, in applying section 4091, consideration should be given to the effect of investment credits in certain situations not covered in those sections, as discussed in this article.

.017 Section 4091 applies to all other aspects of accounting for income taxes and to all industry situations except as specifically indicated.

.018 Section 4091 does not apply to regulated industries in those circumstances where the standards described in section 6011 are met. Section 6011 states that there may be differences in the application of generally accepted accounting principles to regulated industries because of the effect of the rate-making process and that different treatments, therefore, may be necessary in order to achieve an appropriate matching of expenses and revenues.

.019 The Board deferred consideration of the special problems of allocation among components of a business enterprise pending resolution of the broader problems of recognition and allocation of all revenues and expenses in these situations. (As amended, effective after December 31, 1973, by APB Opinion No. 28, *Interim Financial Reporting*.)

.020 In section 4095, *Accounting for Income Taxes—Special Areas,* the Board has examined the characteristics of the tax consequences of transactions in four special areas

and sets forth its conclusions on appropriate accounting treatments. The four special areas are: (1) undistributed earnings of subsidiaries, (2) "general reserves" of stock savings and loan associations, (3) amounts designated as "policyholders' surplus" by stock life insurance companies, and (4) income from investments in corporate joint ventures accounted for by the equity method in accordance with section 5131, *The Equity Method of Accounting for Investments in Common Stock.* [As amended by APB Opinion No. 23, December, 1971.]

.021 One specialized industry situation having tax consequences somewhat similar to those for timing differences has been excluded pending further study. This situation has certain unique aspects which create problems in the measurement and recognition of its tax consequences. The exclusion is deposits in statutory reserve funds by United States steamship companies. Section 4091 is, however, applicable to this industry in all other respects including timing differences. [As amended by APB Opinion No. 23, December, 1971. As modified, effective for financial statements issued on or after December 1, 1975, by FASB Statement No. 9.]

INTERPERIOD TAX ALLOCATION

5. Objective

.022 Section 4091 adopted the comprehensive allocation concept which requires interperiod allocation of income taxes in the case of all material timing differences, both recurring and nonrecurring. The objective of interperiod allocation of income taxes is to match the income tax expense reported in an income statement for a specific period with the revenues and other expenses reported for that period. Stated another way, reported income tax expense should represent the tax effects or tax consequences of the revenues and expenses included in income before income taxes (which is referred to in section 4091 as "pretax accounting income").

.023 The Board rejected the partial allocation viewpoint which generally would require interperiod allocation only for nonrecurring differences. Under prior pronouncements of the Committee on Accounting Procedure, inter-

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

period allocation was required for nonrecurring differences and for some but not all recurring differences.[2] Practice had been mixed with regard to types of recurring differences where allocation was not specifically required under prior pronouncements.

[2] ARB No. 43, Chapter 10, Section B, *Taxes: Income Taxes,* paragraph 1, stated that "The section does not apply where there is a presumption that particular differences between the tax return and the income statement will recur regularly over a comparatively long period of time."

6. Alternative Methods Considered by the APB

.024 Section 4091 adopted the deferred method of applying tax allocation and rejected the alternatives—the liability and the net of tax methods.[3] The three methods are discussed in detail in Accounting Research Study No. 9 and are summarized in section 4091. Each of the three methods was considered by the Accounting Principles Board in its deliberations.

.025 Generally, the same amount of net income would be reported under each of the three tax allocation methods if tax rates never changed or no new taxes were imposed. The effect on net income of changes in tax rates or the imposition of new taxes, however, will vary depending upon which of the three methods is used. Also, the net of tax method may yield different net income amounts when depreciation or amortization expense is capitalized or included in inventories and treated as a cost of future periods. Financial statement presentation varies depending upon the method used.

.026 The deferred method of allocation ". . . is a procedure whereby the tax effects of current timing differences are deferred currently and allocated to income tax expense of future periods when the timing differences reverse. The deferred method emphasizes the tax effects of timing differences on income of the period in which the differences originate. The deferred taxes are determined on the basis of the tax rates in effect at the time the timing differences originate [4] and are not adjusted for subsequent changes in tax rates or to reflect the imposition of new taxes." The tax effects of transactions which reduce taxes

---

[3] Prior pronouncements permitted the use of any of the three methods—deferred, liability or net of tax. For example, see ARB No. 43, Chapter 9, Section C, *Depreciation: Emergency Facilities—Depreciation, Amortization and Income Taxes* (paragraphs 11-13); ARB No. 44 (Revised), *Declining-balance Depreciation* (paragraphs 4, 5, 7 and 10); ARB No. 51, *Consolidated Financial Statements* (paragraph 17); APB Opinion No. 5, *Reporting of Leases in Financial Statements of Lessee* (paragraph 21), and APB Opinion No. 6, *Status of Accounting Research Bulletins* (paragraph 23).

[4] The Revenue and Expenditure Control Act of 1968, which became law on June 28, 1968, imposes a 10% income tax surcharge retroactive to January 1, 1968 for corporations. The surcharge should be considered for financial accounting purposes under section 4091 as a change in tax rates effective as of that date even though it may be only a temporary change. Accordingly, the tax effects of timing differences originating in a taxable period subject to the surcharge should be computed as if the law had actually been in effect on January 1, 1968. (Also see section U 4091.001.)

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

currently payable (or create a refund of taxes because of a loss carryback) are treated as deferred tax credits; the tax effects of transactions which increase taxes currently payable (or reduce the amount of a refund of taxes because of a loss carryback) are treated as deferred tax charges. Such deferred credits and charges are amortized to income tax expense in future years as the original timing differences reverse and enter into the determination of pretax accounting income.

.027 Advocates of the liability method consider income tax expense for a period to represent the taxes paid or to be paid on the components of pretax accounting income. Differences between tax expense for accounting purposes and taxes currently payable, which result from timing differences, are viewed as either liabilities for taxes payable in the future, or assets for prepaid taxes. Under the liability method, taxes are computed at the rates in effect or expected to be in effect when the components of pretax accounting income are reported in an income tax return. Adjustments of the liability or prepaid accounts are made whenever tax rates change or new taxes are imposed.

.028 The advocates of the net of tax method consider that tax allocation (determined by either the deferred or liability methods) should give explicit recognition to the fact that taxability and tax deductibility are factors in the valuation of assets and liabilities and the related revenues and expenses. Under the net of tax method, deferred tax accounts are not presented separately in the balance sheet, but instead are shown as reductions of the related assets and liabilities. Also, some advocates of the net of tax method would follow a similar procedure in the income statement and show the income statement effects of tax allocation as adjustments to the related revenue and expense accounts.

.029 Under either the deferred or the liability methods, it is possible to determine from the financial statements the effects of tax allocation; this is not possible under the net of tax method without extensive additional disclosures.

.030 The deferred method is considered to be preferable to the liability method because, although deferred

tax charges and deferred tax credits are similar in some respects to receivables and payables, they do not represent receivables and payables in the usual sense. Also, the deferred method has the practical advantage that it neither requires assumptions as to future tax rates or the imposition of new taxes, nor does it require adjustments of balance sheet deferred tax accounts when tax rates change or new taxes are imposed.

.031 In substance, the deferred method, being income statement oriented, measures the tax cost or tax benefit of a timing difference on the basis of the tax rates in effect at the time the difference originates. The liability method, being balance sheet oriented, relates the cost or benefit to the amount actually payable or expected to be payable. For example, assume that a company owns one building and adopts accelerated depreciation for tax purposes and straight-line depreciation for accounting purposes. Under the deferred method, the tax effects would be equal to the reduction or increase in income taxes payable attributable to the difference between depreciation claimed for tax purposes and the amount recognized for accounting purposes. Under the liability method, the tax effects would be based on the taxes expected to be payable over the period in which the property will be held. Conceivably, such tax effects could be computed at "capital gains" rates if there was an intention to dispose of the property at a later date and it was apparent that a capital gain would result.

.032 Deferred taxes relating to an originating timing difference are computed, under the deferred method, as the difference in income taxes payable that would result from (a) including the effect of the timing difference in the calculation of income taxes payable and (b) excluding the effect of the timing difference from such calculation.

.033 The deferred method may be applied to each individual transaction or similar transactions may be grouped. When similar transactions are grouped, either (1) originating differences and reversing differences may each be considered separately, or (2) the originating and reversing differences may be combined.

.034 Differences between pretax accounting income and taxable income may be either "timing differences"

 © 1974, American Institute of Certified Public Accountants, Inc.

which require interperiod tax allocation or "permanent differences" which do not require interperiod tax allocation. The distinction between timing differences and permanent differences can best be explained by considering the technical definitions included in section 4091 together with specific examples.

7. Timing Differences

.035 Timing differences are defined as—

> "Differences between the periods in which transactions affect taxable income and the periods in which they enter into the determination of pretax accounting income. Timing differences originate in one period and reverse or 'turn around' in one or more subsequent periods. Some timing differences reduce income taxes that would otherwise be payable currently; others increase income taxes that would otherwise be payable currently."

.036 When timing differences occur, the income tax currently payable as shown on the income tax return for a period may not be the appropriate amount of income tax expense to match with the pretax accounting income for the period. In order to obtain proper matching, it is usually necessary to report as income tax expense an amount that is more or less than income taxes currently payable. In substance, section 4091 requires the recognition of the tax effects as income tax expense in the same periods as the related transactions are recognized in the determination of net income for financial accounting purposes. The cumulative effects of timing differences at any date appear in the balance sheet as deferred taxes—either deferred charges or deferred credits.

.037 Transactions which give rise to timing differences are classified into four categories—(1) revenues or gains taxed *after* accrual for accounting purposes, (2) expenses or losses deducted for tax purposes *after* accrual for accounting purposes, (3) revenues or gains taxed *before* accrual for accounting purposes, and (4) expenses or losses deducted for tax purposes *before* accrual for accounting purposes.

.038 For example, the gross profit on installment sales is customarily recognized for accounting purposes at the

time of sale. However, under certain circumstances, it is possible to defer the inclusion of gross profit in taxable income until subsequent periods when the receivables arising from the installment sales are collected. Thus, in the period of sale, an originating timing difference occurs because gross profit is included in accounting income, but not in taxable income. In subsequent periods, a reverse timing difference occurs when the installment accounts receivable are collected and gross profit is recognized in the tax returns but not in the accounts.

.039 A simplified illustration of an originating timing difference is presented below. The illustration assumes that a company has sold merchandise on the installment basis for the first time and recognizes the gross profit thereon for accounting purposes at the time of sale but elects the installment method for tax purposes.

Year 1

Pretax accounting income	$1,000,000
Gross margin on uncollected installment sales at end of year	200,000
Taxable income	$ 800,000
Taxes estimated to be payable (assuming a 48% rate less surtax exemption)	$ 377,500
Charge equivalent to reduction in income taxes arising from installment method of reporting for tax purposes (excess of 48% of $1,000,000, less $6,500, over $377,500; or 48% of $200,000)	96,000
Income tax expenses as shown in income statement	$ 473,500

.040 A deferred tax is amortized when the reverse timing difference takes place. Thus, in the case of installment sales, as the installment receivables are collected, and the gross profit is recognized for tax purposes, income tax expense is reduced by the amortization of the deferred tax credits previously recorded.

.041 Continuing the preceding illustration, the amortization of deferred taxes related to the reverse timing difference appears as follows:

 © 1974, American Institute of Certified Public Accountants, Inc.

Year 2

Pretax accounting income	$1,000,000
Gross margin on prior year's sales collected during the current year	200,000
Taxable income	$1,200,000
Taxes estimated to be payable (assuming a 48% rate less surtax exemption plus 10% surcharge)	$ 626,450
Amortization of deferred taxes set up in prior year (credit)	(96,000)
Income tax expenses as shown in income statement	$ 530,450

.042 These illustrations show the effect of a timing difference arising from the use of the installment method for tax purposes and the effect of a change in the tax rate.

.043 In a typical case where installment sales occur each year, there would be both originating differences and reversing differences each year. Accordingly, the increase or decrease in the deferred tax credit balance would be the combination of the tax effects from originating differences and the tax effects of reversing differences. Thus, income tax expense appearing in the financial statements might be higher or lower than taxes currently payable.

.044 It should be noted that at least two periods are affected by each initial timing difference—the period in which the difference originates and a subsequent period (or periods) when the initial difference reverses.

.045 Another example of a relatively simple kind of recurring timing difference is a provision for product warranty expenses which originates in one period and reverses in one or more future periods. The provision is recorded for accounting purposes during the period when the warrantied products are sold. However, an income tax deduction is not allowed until the period when expenditures under the warranty are made. For the period when the timing difference originates, warranty expense for accounting purposes exceeds warranty expense for tax purposes; and, consequently, taxable income is greater than pretax accounting income and income taxes payable are greater than

income tax expense for accounting purposes. In effect, a portion of the income taxes is prepaid. During a subsequent period a reverse timing difference occurs when expenditures under the warranty are made. In the period of reversal, warranty expense for tax purposes exceeds warranty expense for accounting purposes; consequently, taxable income and income taxes are reduced.

.046 In the not uncommon situation where the warranty period runs for more than one year, the reverse timing differences occur in part during each year of the warranty period. Under these circumstances, the total of the reverse timing differences for several periods will be equal to the original timing difference occurring during the period when the warrantied products were sold. In many cases it will be impracticable to relate recurring originating timing differences to the reverse timing differences because of the number of transactions involved. This problem becomes particularly important when the tax rates applied to originating differences change from period to period. In these cases an arbitrary assumption as to reversal may be necessary. Application of either first-in, first-out, or averaging techniques would be appropriate in these situations.

.047 A more complex example of timing difference occurs when an accelerated method of depreciation is used for tax purposes, while the straight-line method is used for accounting purposes. In such cases, the depreciation accounting following the purchase of a unit of depreciable property results in originating timing differences each period for a number of periods during which tax depreciation exceeds accounting depreciation. In later periods reverse timing differences occur as accounting depreciation exceeds tax depreciation. The reversal period is, of course, known. Even for this type of timing difference, however, an arbitrary flow assumption—either first-in, first-out or averaging—may be necessary in order to relate specific reverse timing differences to specific originating timing differences. The problems of specific identification of reverse timing differences with originating timing differences become further complicated if not impossible, if a composite rate of depreciation is used for a group of assets, the individual units of which have different life cycles.

 © 1974, American Institute of Certified Public Accountants, Inc.

8. Permanent Differences

.048 Permanent differences are defined as—

> "Differences between taxable income and pretax accounting income arising from transactions that, under applicable tax laws and regulations, will not be offset by corresponding differences or 'turn around' in other periods."

.049 Timing differences involve both an originating difference and, subsequently, a reverse difference. Differences between accounting and taxable income, however, are permanent if an originating difference is *never* followed by a reverse difference. Interperiod tax allocation should not be applied to permanent differences because the amount of income tax payable is the proper income tax expense to match with the revenues and other expenses reported for the period in which the differences occur.

.050 Permanent differences may arise under the tax law because specified revenues are exempt from taxation or specified expenses are not deductible. Examples of exempt revenues are life insurance proceeds and interest on municipal obligations. Examples of non-deductible expenses are premiums paid on officers' life insurance and fines. Amortization of goodwill recorded for accounting purposes gives rise to a permanent difference if it is not deductible for tax purposes.

.051 Permanent differences also arise if items enter into the determination of taxable income but are never recognized in determining accounting income. Examples are the excess of statutory depletion over cost depletion and the special deduction for certain dividends received which are recognized for tax purposes but not for accounting purposes.

.052 A permanent difference also results if different bases of carrying property for accounting purposes and for tax purposes produce amounts for depreciation or amortization different for tax purposes than for accounting purposes. Also, gains or losses for tax purposes upon dispositions of such property may differ from those recognized for accounting purposes. Different bases for property frequently result from write-downs of assets in a reorganization. Different bases may also occur from business combinations accounted for as purchases and treated as

tax-free exchanges or from business combinations accounted for as poolings of interests and treated as taxable exchanges. Similarly, in the case of a donation of property, accounting expense could be recorded on the basis of the net carrying amount of the property whereas the tax deduction would be for the fair value on the date of gift.

[.053] [Superseded, effective for fiscal periods beginning after December 31, 1972, by APB Opinion No. 25.] (See section 4062.)

[.054] [Superseded, effective for fiscal periods beginning after December 31, 1972, by APB Opinion No. 25.] (See section 4062.)

.055 In summary, tax benefits or tax costs related to transactions affecting income for a period should be reflected in the income statement for that period. If there are no timing differences affecting income for a period, the income statement will show only the taxes estimated to be payable for the period as income tax expense; any tax benefits or tax costs related to permanent differences occurring in the period pertain to that period.

9. Computation of Deferred Taxes

.056 Section 4091 requires that "The tax effect of a timing difference should be measured by the differential between income taxes computed with and without inclusion of the transaction creating the difference between taxable income and pretax accounting income." In computing such differentials, "taxable income" is defined as "the excess of revenues over deductions or the excess of deductions over revenues to be reported for income tax purposes for a period" except that "deductions" do not include loss carrybacks or loss carryforwards. Accordingly, in theory, a separate computation is required for each originating timing difference in order to determine what the tax would have been both with and without including the timing difference. In practice, the same result will often be obtained if the current tax rate is simply applied to the amount of the timing difference. In some cases, however, the same result will not be obtained by use of the "short-cut" approach. Differences may result from the effect of the investment credit or a foreign tax credit, the existence of an operating

 © 1974, American Institute of Certified Public Accountants, Inc.

loss for the period, or the fact that an operating loss would be incurred if a timing difference is excluded.

.057 Two alternative approaches to the computation of the tax effects of timing differences are set forth in section 4091.36, which states:

> "In computing the tax effects referred to in paragraph .35 timing differences may be considered individually or similar timing differences may be grouped. The net change in deferred taxes for a period for a group of similar timing differences may be determined on the basis of either (a) a combination of amounts representing the tax effects arising from timing differences originating in the period at the current tax rates and reversals of tax effects arising from timing differences originating in prior periods at the applicable tax rates reflected in the accounts as of the beginning of the period; or (b) if the applicable deferred taxes have been provided in accordance with this section on the cumulative timing differences as of the beginning of the period, the amount representing the tax effects at the current tax rates of the net change during the period in the cumulative timing differences."

.058 Similar timing differences refer to individual timing differences which arise from the same kinds of transactions. For example, all differences between accounting depreciation and tax depreciation may be grouped together as similar differences even though they may relate to many individual assets acquired during various years. Also, differences between accounting and taxable income arising from deferral for tax purposes of gross margin on installment sales may be grouped together as similar differences even though they may represent many individual sales occurring over a number of different periods. However, depreciation timing differences should not be combined with gross margin timing differences.

.059 For convenience, the method of computation set forth in (a) in the preceding quotation is referred to as the "gross change method," because, for each group of similar timing differences, separate computations are made for the tax effects of originating differences based on current tax rates and for the tax effects of reversing differences at the applicable tax rates reflected in the accounts at the beginning of the period. The method of computation described under (b) is referred to as the "net change method," because a single computation is made at the current tax rates for the net cumulative effect of both originating and reversing differences occurring during a period relating to a particular group of similar timing differences.

.060 For each kind of "similar" differences, a company may choose to compute deferred taxes either on individual transactions or for groups of transactions and in the latter case by either the gross change or net change methods. Once chosen, the same method should be consistently employed for the specific kind of similar differences. If the method of computation is changed, a consistency exception will be required in the auditor's report where the effect is material.

.061 Under all three methods of computation (individual transaction, gross change, or net change) the tax effect is based on a differential calculation.[6] Under either

[6] The calculation should take into consideration all taxes based on income—United States, foreign, state and local. As a practical matter, where companies are subject to a number of jurisdictions which have income

 © 1974, American Institute of Certified Public Accountants, Inc.

the individual transaction or the gross change methods the reversal of tax effects of timing differences originating prior to the effective date of section 4091 may be recognized only if the applicable deferred taxes had been provided for in accordance with section 4091 either in the prior periods, or retroactively as of the effective date of section 4091. The net change method may be employed only if the deferred taxes applicable to the net cumulative differences of prior periods were provided in those periods or retroactively as of the effective date of section 4091.

.062 The provisions discussed in the preceding paragraphs were included in section 4091 so that a company that was not applying interperiod tax allocation for any particular kind of timing difference prior to the effective date of section 4091 could not use the tax effects of the reversal of that difference to offset deferred taxes required to be recognized for current originating timing differences.

.063 For example, assume that certain expenditures are capitalized when incurred and amortized in subsequent periods for accounting purposes, but are deducted when incurred for tax purposes, and that no provision has been made in the past for the applicable deferred taxes. After the effective date of section 4091, deferred tax credits (equivalent to the tax benefits received) must be provided by a charge against income with respect to any expenditures which are capitalized for accounting purposes but are claimed as tax deductions in the period of expenditure. However, as these costs which were capitalized prior to the effective date of section 4091 are amortized during periods *after* the effective date, the tax effects of such reverse timing differences may not be considered as a reduction of the provision for deferred taxes required for differences originating *after* the effective date. [As modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2.] (See section 4211.)

.064 Illustrations of the procedures followed in computing deferred taxes comparing the gross change method with the net change method are presented in Exhibits I and Ia. They are not intended as typical illustrations but

---

taxes, the rates to be used in the calculation are often determined by increasing the United States income tax rate by a percent equivalent to the effect of the taxes imposed by the other jurisdictions.

rather to illustrate some of the complications that may be encountered in practice. The illustrations also demonstrate that the current provision for deferred taxes is not necessarily the amount obtained by applying the current statutory tax rate to the amounts of the timing differences.

10. Amortization of Deferred Taxes

.065 The amortization of deferred taxes upon reversal of nonrecurring timing differences usually presents no special problems. If the entire reverse timing difference occurs during one period subsequent to the period of origination, the entire deferred tax set up at the time of origination is amortized to income tax expense during the period of reversal. If the timing difference reverses over two or more periods, the deferred tax recognized at the time of origination is amortized in each of the subsequent periods of reversal in proportion to the amount of the reverse timing difference in each period relative to the total original timing difference.

.066 Sometimes when the gross change method of computing deferred taxes is employed for recurring timing differences, it may be possible to associate specific reverse timing differences with specific originating timing difference. Under such circumstances, the amortization of deferred taxes is similar to that previously described for nonrecurring timing differences. There are instances of recurring timing differences, however, in which it is not possible to associate a specific reverse difference with a specific originating difference. Often in such circumstances the total deferred tax account applicable to the particular type of, or group of similar, timing differences has been accumulated over a number of years at varying rates. It is appropriate in such circumstances to amortize a portion of the aggregate deferred tax balance at the beginning of the period by use of either the first-in, first-out flow assumption or the average rate assumption.

.067 Under the first-in, first-out assumption, the earliest additions to the deferred tax account are amortized first. Application of the first-in, first-out assumption requires a record of amounts of deferred taxes by year of addition. Under the average rate assumption, the amount of deferred tax amortized is determined by applying the

 Copyright © 1975, American Institute of Certified Public Accountants, Inc.

ratio of aggregate deferred taxes to aggregate timing differences at the beginning of the period, to the amount of the reverse timing difference during the period. The practice adopted for amortization of deferred taxes, where specific identification is not possible, should be consistently followed; otherwise, if the effect is material a consistency exception will be required in the auditor's report.

.068 Amortization procedures are different when the net change method of computing deferred taxes is employed. Under the net change method no amortization of deferred taxes is recorded for periods in which the aggregate timing differences increase. In each period in which the aggregate timing differences decrease, deferred taxes are amortized. Such amortization is computed as the difference between income tax on taxable income and income tax on taxable income less the reduction in aggregate timing differences. The amortization of deferred taxes, however, cannot exceed the amounts previously provided. In a period when reversal of all timing differences of a particular type occurs, the entire related deferred tax account should be amortized regardless of the amount determined under the differential computation. For example, a company that has been using the installment method of accounting for gross margin on installment sales for tax purposes may decide to abandon the installment method by selling all installment receivables. The entire amount of deferred tax credits relative to installment sales which was carried over from the preceding period should then be amortized.

.069 EXHIBIT I

COMPUTATION OF DEFERRED TAXES UNDER ALTERNATIVE APPROACHES FOR TWO KINDS OF TIMING DIFFERENCES

Assumptions

1. All prior deferred taxes are at an average rate of 48%
2. Current period tax rate is 48% less surtax exemption of $6 and plus 10% surcharge
3. Current period investment credit is $0

	Gross Change Method	*Net Change Method*
	(thousands of dollars)	
Computation of taxable income		
Pretax accounting income	$500	$500
Timing differences from use of accelerated depreciation for tax purposes and straightline depreciation for accounting purposes:		
Originating—tax depreciation in excess of accounting depreciation	(500)	
Reversing—accounting depreciation in excess of tax depreciation	100	
Net change		(400)
Timing differences from use of installment method for tax purposes and accrual method for accounting purposes:		
Originating—gross margin on current period sales uncollected at end of period	(300)	
Reversing—gross margin on prior period sales collected during current period	400	
Net change		100
Taxable income	$200	$200
Computation of tax estimated to be currently payable		
48% rate	$ 96	$ 96
Surtax exemption	(6)	(6)
10% surcharge	9	9
	$ 99	$ 99

© 1974, American Institute of Certified Public Accountants, Inc.

	Gross Change Method	Net Change Method
	(thousands of dollars)	
Computation of deferred tax on depreciation timing difference		
Taxable income	$200	$200
Originating or net change in depreciation timing differences	500	400
Adjusted taxable income—"without" timing differences	$700	$600
Tax on adjusted taxable income	$363 (a)	$310 (a)
Tax currently payable	99	99
Differential equivalent to tax effects of timing differences to be added to deferred tax credit	$264	$211
Computation of deferred tax on deferred gross margin timing differences		
Taxable income	$200	$200
Originating or net change in gross margin timing differences	300	(100)
Adjusted taxable income—"without" timing differences	$500	$100
Tax on adjusted taxable income	$257 (a)	$ 46 (a)
Tax currently payable	99	99
Differential equivalent to tax effects of timing differences to be added to (or deducted from) deferred tax credit	$158	$(53)
Summary of changes in deferred tax credit balance		
Additions to deferred credits arising from originating differences:		
Depreciation	$264	
Deferred gross margin	158	
Arising from increase in cumulative depreciation differences		$211
Amortization of deferred credits arising from reversing differences:		
Depreciation—(48% of $100)	(48)	
Deferred gross margin—(48% of $400)	(192)	
Net amortization arising from reduction in cumulative deferred gross margin		(53)
Net Increase	$182 (b)	$158 (b)

Notes:

(a) 48% of adjusted taxable income ("without" timing difference), less surtax exemption of $6 and plus 10% surcharge.

(b) The difference between the net increase in the deferred tax credit balance of $182 under the gross change method and $158 under the net change method, or $24 (in effect 4.8% of $500, the aggregate amount of reversing timing differences) represents the effect of using (1) under the gross change method the current tax rate for originating differences and the effective prior period rates for reversing differences and (2) under the net change method the current tax rate for the cumulative net effect of both originating and reversing differences.

.070

EXHIBIT Ia

COMPUTATION OF DEFERRED TAXES UNDER ALTERNATIVE APPROACHES FOR TWO KINDS OF TIMING DIFFERENCES

Assumptions

Same as Exhibit I, except current period investment credit is $50.

	Gross Change Method	*Net Change Method*
	(thousands of dollars)	
Computation of taxable income		
Same as Exhibit I		
Computation of tax estimated to be currently payable		
48% rate	$ 96	$ 96
Surtax exemption	(6)	(6)
10% surcharge	9	9
Allowable investment credit	(50)	(50)
	$ 49	$ 49
Computation of deferred tax on depreciation timing difference		
Taxable income	200	$200
Originating or net change in depreciation timing differences	500	400
Adjusted taxable income—"without" timing differences	$700	$600
Tax on adjusted taxable income	$313 (a)	$260 (a)
Tax currently payable	49	49
Differential equivalent to tax effects of timing differences to be added to deferred tax credit	$264	$211

 © 1974, American Institute of Certified Public Accountants, Inc.

	Gross Change Method	Net Change Method
	(thousands of dollars)	
Computation of deferred tax on deferred gross margin timing differences		
Taxable income	$200	$200
Originating or net change in gross margin timing differences	300	(100)
Adjusted taxable income—"without" timing differences	$500	$100
Tax on adjusted taxable income	$207 (a)	$ 10 (b)
Tax currently payable	49	49
Differential equivalent to tax effects of timing differences to be added to (or deducted from) deferred tax credit	158	$(39)
Summary of changes in deferred tax credit balance		
Additions to deferred credits arising from originating differences:		
Depreciation	$264	
Deferred gross margin	158	
Arising from increase in cumulative depreciation differences		$211
Amortization of deferred credits arising from reversing differences:		
Depreciation—(48% of $100)	(48)	
Deferred gross margin—(48% of $400)	(192)	
Net amortization arising from reduction in cumulative deferred gross margin		(39)
Net increase	$182	$172 (c)

Notes:

(a) 48% of adjusted taxable income ("without" timing difference), less surtax exemption of $6, plus 10% surcharge and less allowable investment credit of $50.

(b) 48% of adjusted taxable income ("without" timing difference), less surtax exemption of $6, plus 10% surcharge and less maximum investment credit of $36 ($25 plus 50% of the difference between $46 and $25).

(c) The difference between the net increase in the deferred tax credit balance under the net change method of $158 in Exhibit I and $172 in Exhibit Ia, or $14, arises from the influence of the investment credit. It should be noted that under the gross change method the full investment credit of $50 is utilized in all of the computations "with and without inclusion of the transaction creating the difference between taxable income and pretax accounting income." Under the net change method the utilization of the investment credit is limited to $36 in the computation of the tax effects of deferred gross margin timing differences whereas $50 is utilized in the computation of depreciation timing differences. (See section on "Investment Credit Carrybacks and Carryforwards.")

OPERATING LOSSES

.071 Tax benefits are usually available when operating losses are incurred. Such benefits are obtained either (a) from refunds of taxes paid in prior profitable years—by carryback of losses, or (b) as reductions of taxes otherwise payable in future profitable years—by carryforward of losses.[7] The basic accounting concept of matching revenues and expenses suggests that it is appropriate to record the tax benefit from an operating loss in the income statement of the loss year.

11. Loss Carrybacks

.072 Refunds of taxes paid in prior years arising from carrybacks of operating losses should be recognized during the loss year. This is required to achieve proper matching inasmuch as current realization of the refund is assured. The refunds should be reflected in the balance sheet as current assets.

.073 An illustration of the presentation of an operating loss carryback, assuming that pretax accounting income and taxable income are identical, follows.

Loss before refundable income taxes	$1,000,000
Refund of prior years' income taxes arising from carryback of operating loss	485,000
Net loss	$ 515,000

(Note: The refund should be computed at the amount actually refundable regardless of current tax rates.)

.074 A loss carryback may occur at a time when net deferred tax credits exist. Under these circumstances "appropriate adjustments of existing net deferred tax credits may also be necessary in the loss period." The tax effects of the loss carryback included in the income statement should be based on income (loss) reported for accounting purposes rather than for tax purposes, the objective being to reflect in income the carryback refund which would exist if there were no timing differences. The difference between this amount and the amount currently refundable should be added to or deducted from the appropriate balance sheet deferred tax account. This is accomplished by recomput-

[7] This section is also applicable to other unused deductions and credits that may be carried backward or forward in determining taxable income (for example, capital losses, contribution carryovers and foreign tax credits).

 © 1974, American Institute of Certified Public Accountants, Inc.

ing the net deferred tax amounts for the carryback periods and the current period on a cumulative basis. Such computation is illustrated in Exhibit II.

.075 **EXHIBIT II**

APPLICATION OF LOSS CARRYBACK AGAINST EXISTING DEFERRED TAX CREDITS

	Income (Loss) Before Income Taxes		*Income Tax Expense (Credit)*			
Year	*Accounting*	*Taxable*	*Current*	*Deferred*	*Total*	*Cumulative Net Deferred Tax Credits*
1	$ 15,000	$ 5,000	$ 2,500	$ 5,000	$ 7,500	$ 5,000
2	15,000	5,000	2,500	5,000	7,500	10,000
3	15,000	5,000	2,500	5,000	7,500	15,000
4	15,000	5,000	2,500	5,000	7,500	20,000
5	(35,000)	(45,000)	(7,500) (A)	(10,000) (B)	(17,500)	10,000 (C)
6	5,000	15,000	—0— (A)	2,500 (D)	2,500	12,500

Assumptions:

1. 50% tax rate for all years.
2. Surtax exemptions and investment credits ignored.

Notes:

(A) Taxes paid in years 2, 3 and 4 aggregating $7,500 become refundable as a result of the carryback of the loss from year 5. No tax is payable in year 6 because of the loss carryforward from year 5.

(B) For years 2 through 5 cumulative accounting income is $10,000, which at a 50% rate requires a deferred tax credit of $5,000. Accordingly a reduction in deferred tax credits of $10,000 is required. In effect, a loss carryforward has been recognized to that extent. (See section on "Recognition of Carryforwards as Offset to Deferred Tax Credits.")

(C) The cumulative deferred tax credit at end of year 5 consists of $5,000 from year 1 plus $5,000 for years 2 through 5.

(D) Represents the tax benefit ($2,500) of the loss carryforward to year 6 previously recognized in year 5.

---

12. Loss Carryforwards—Conflict of Concepts

.076 The procedures applied to loss carryforwards differ from those applied to loss carrybacks. The existence of a carryforward means that a company has incurred operating losses which exhausted benefits available from carrybacks and which can be realized only as a carryforward. Usually a company in a carryforward position is experiencing financial difficulties so serious that doubt exists as to future realization of the carryforward. In such cases a company may not have shown profits in any recent year—or in its entire history. The recording of the tax benefit of a loss carryforward during the loss year under such circumstances would be contrary to the accounting concept that revenues or gains should not be recognized if realization is doubtful.

.077 Section 4091 takes the position, relative to loss carryforwards, that the realization concept should take precedence over the matching concept. Therefore, loss carryforward benefits usually should be recognized only when realized through subsequent profitable operations. However, section 4091 also states that the future tax benefit of a loss carryforward should be recorded as an asset during the loss year in those cases where realization is *assured beyond any reasonable doubt.*

.078 In the usual case of a loss carryforward—where realization is *not* assured beyond any reasonable doubt—tax benefits can be recognized *only* during subsequent years *as they are realized.* Thus, even though in a period subsequent to the loss year the future realization of a carryforward becomes assured beyond any reasonable doubt, it is not permissible under section 4091 to recognize the future tax benefit until it is actually realized.

.079 When a loss carryforward is realized and recognized subsequent to the loss period, income statement presentation is a problem. Under the matching concept, the benefit applies to the loss period and not to the period of realization; this suggests retroactive adjustment of the loss period. However the criteria set forth in section 2014, *Prior Period Adjustments,* greatly restrict prior period adjustments. Therefore, it is not appropriate to adjust the loss period retroactively. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

.080 In order to keep within the criteria of section 2012, it is necessary to include the tax benefit from a loss carryforward in the income statement of the year of realization. However, because it seemed illogical to consider such a credit to be a part of ordinary income, the Board decided that such tax benefits should be presented as extraordinary credits in the year of realization. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

.081 A loss carryforward benefit recognized in the year realized could be presented as shown in Exhibit III.

.082

EXHIBIT III

RECOGNITION OF LOSS CARRYFORWARD BENEFIT IN YEAR REALIZED

Income before income taxes and extraordinary items		$1,000,000
Income tax expense:		
Currently payable	$200,000	
Tax effect of loss carryforward	300,000	500,000
Income before extraordinary items		$ 500,000
Extraordinary items:		
Reduction of income taxes arising from carry-forward of prior years' operating losses	$300,000	
Loss on major devaluation of foreign currency (less applicable income tax of $100,000)	(100,000)	200,000
Net income		$ 700,000

Assumptions:

1. 50% tax rate for all years.
2. Surtax exemptions and investment credits ignored.

13. Assurance Beyond Any Reasonable Doubt

.083 Section 4091 provides that the future tax benefit of a loss carryforward should be recognized as an asset during the loss period if realization is "assured beyond any reasonable doubt." Consequently, the meaning of the phrase "assured beyond any reasonable doubt" is quite important. It was the Board's intention that recognition of future tax benefits of carryforwards should be restricted to unusual cases.

.084 Section 4091 cites, by way of example, circumstances under which carryforwards may be recognized during the loss year as follows:

> "Realization of the tax benefit of a loss carryforward would appear to be assured beyond any reasonable doubt when both of the following conditions exist: (a) the loss results from an identifiable, isolated and nonrecurring cause and the company either has been continuously profitable over a long period or has suffered occasional losses which were more than offset by taxable income in subsequent years, and (b) future taxable income is virtually certain to be large enough

> to offset the loss carryforward and will occur soon enough to provide realization during the carryforward period."

.085 The use of the words "identifiable, isolated, and nonrecurring" in the above quotation was intended to rule out recognition of loss carryforwards resulting from generally unsuccessful business operations of an entity. Thus, operating losses resulting because of depressed economic conditions or because of changes in consumer preferences or in technology do not give rise to a situation where a future tax benefit may be recognized. Loss carryforwards resulting from the introduction of products or services which have not achieved sufficient acceptance to produce profits do not qualify for recognition prior to realization. Such non-recognition of loss carryforwards applies both to companies in existence for many years that have moved into a new area of business and to newly-formed companies in the developmental stage.

.086 Examples of the kinds of situations giving rise to loss carryforwards that may qualify for recognition during the loss period are:

(1) Losses resulting from the expropriation of a foreign subsidiary, or from the abandonment of one of several operations where the continuing operations are and have been profitable and are virtually certain to be profitable enough to offset the loss carryforwards, and

(2) Losses of one or more subsidiaries of a profitable parent company where the carryforward will be made available as an offset against other taxable income by filing a consolidated income tax return, or by claiming a bad debt deduction, or by some other means. On the other hand, it would not be appropriate to record a loss carryforward of a subsidiary company even though the parent and other subsidiaries are profitable if there are no specific plans to obtain the tax benefit from the loss.

.087 In those rare cases where operating loss carryforwards are expected to be realized beyond any reasonable doubt as offsets against future taxable income, the potential tax benefits should be reflected in the balance sheet as

 © 1974, American Institute of Certified Public Accountants, Inc.

assets, and should be classified as current or noncurrent depending on the extent to which realization is expected to occur within the current operating cycle.

14. Recognition of Carryforwards as Offsets to Deferred Tax Credits

.088 It may happen that an operating loss carryforward arises at a time when net deferred tax credits exist because of prior timing differences. Even though the realization of an operating loss carryforward is not assured beyond any reasonable doubt, it may be necessary if net deferred tax credits exist to recognize a portion or all of the loss carryforward as an offset to such net deferred tax credits. Section 4091 provides that, in such situations:

> "net tax credits should be eliminated to the extent of the lower of (a) the tax effect of the loss carryforward, or (b) the amortization of the net deferred tax credits that would otherwise have occurred during the carryforward period. If the loss carryforward is realized in whole or in part in periods subsequent to the loss period, the amounts eliminated from the deferred tax credit accounts should be reinstated (at the then current tax rates) on a cumulative basis as, and to the extent that, the tax benefit of the loss carryforward is realized."

.089 The limiting factor in the amount of loss carryforward that may be recognized by way of offset against net deferred tax credits is indicated in clause (b) of the preceding quotation.

.090 The justification for recognizing loss carryforwards as an offset to deferred tax credits is that it would be unrealistic to require recognition of deferred tax credits while at the same time denying recognition of deferred tax charges, in the form of a loss carryforward. This follows because both the deferred credits and the deferred charges will reverse during the same future accounting periods. However, net deferred credits which will not be amortized until after the expiration of the loss carryforward period cannot be offset by loss carryforwards.

.091 If both current and non-current net deferred tax credits exist when the future benefit of a loss carryforward

is recognized as an offset, such benefit should be allocated between current and non-current deferred tax credits on a proportional basis.

.092 As the loss carryforward benefit is realized, the net deferred credits eliminated to give recognition to the carryforward, as well as credits related to originating timing differences of the loss year, should be reinstated at the then current rates (i. e., at the rates at which the loss carryforward is realized) before recognition is given to the realization of any remaining loss carryforwards. At the same time amortization of such deferred credits that would otherwise have occurred should also be recognized.

.093 The interaction of net deferred tax credits and loss carryforwards is illustrated in Exhibit IV.

EXHIBIT IV

EXAMPLE OF LOSS CARRYFORWARD RECOGNIZED AS OFFSET TO NET DEFERRED TAX CREDITS

(All amounts in thousands of dollars)

	Income before income taxes		Depreciation		Income tax expense (1)			Cumulative net deferred tax credits
Year	*Accounting*	*Taxable*	*Accounting*	*Tax*	*Current (2)*	*Deferred (F)*	*Total*	
1	$ 15,000	$ 5,000	$ 10,000	$ 20,000	$ 2,500	$ 5,000	$ 7,500	$ 5,000
2	15,000	5,000	10,000	20,000	2,500	5,000	7,500	10,000
3	15,000	5,000	10,000	20,000	2,500	5,000	7,500	15,000
4	15,000	5,000	10,000	20,000	2,500	5,000	7,500	20,000
5	(54,000) (3)	(64,000) (3)	10,000	20,000	(7,500) (A)	(15,000) (B) (2,000) (C)	(24,500)	3,000
6	2,000	6,000	10,000	6,000	—	(2,000) 3,000	1,000 (D)	4,000
7	2,000	6,000	10,000	6,000	—	(2,000) 3,000	1,000 (D)	5,000
8	2,000	6,000	10,000	6,000	—	(2,000) 3,000	1,000 (D)	6,000
9	2,000	6,000	10,000	6,000	—	(2,000) 3,000	1,000 (D)	7,000
10	5,000	9,000	10,000	6,000	—	(2,000) 4,500	2,500 (D)	9,500
11	10,000	16,000	10,000	4,000	8,000	(1,900) (E)	6,100	7,000
12	10,000	16,000	10,000	4,000	8,000	(1,900) (E)	6,100	5,700
13	10,000	16,000	10,000	4,000	8,000	(1,900) (E)	6,100	3,800
14	10,000	16,000	10,000	4,000	8,000	(1,900) (E)	6,100	1,900
15	10,000	16,000	10,000	4,000	8,000	(1,900) (E)	6,100	—
	$ 69,000	$ 69,000	$150,000	$150,000	$ 42,500	$ —	$ 42,500	$ —

ADDITIONAL ASSUMPTIONS:

(1) 50% tax rate for all years and surtax exemptions and investment credits ignored.

(2) Equal to amount payable (or refundable) each year.

(3) Loss carryforward of $9,000 on accounting and $49,000 on tax basis is not assured beyond any reasonable doubt.

Notes:

(A) Refund of taxes paid in years 2-4 available because of loss carryback.

(B) Adjustment of deferred credit from timing difference recognized in years 2-4 (carryback period) in accordance with section 4091.43. No deferred credit is required for year 5 since tax refund computed with timing difference is same as refund computed without timing difference.

(C) The tax benefit of the loss carryforward that may be recognized is the lower of (1) the tax effect of carryforward for accounting purposes of $4,500 (computed as 50% of $9,000); or (2) the amortization of remaining deferred tax credits that would otherwise occur during the carryforward period of $2,000 (computed as $20,000—timing difference reversing in years 6-10—divided by $50,000—aggregate timing difference at end of year 5—or 40% applied to $5,000 deferred credit from year 1). The $2,000 limitation prevails.

(D) During each of the years 6 through 10, amortization of deferred tax credits on a cumulative basis of $2,000 is recognized on the basis of 50% of $4,000 reverse timing differences. In each of these years, deferred credits are restored to the extent of realization of the loss carryforward equal to tax that would otherwise be currently payable in year 6 through 9 of $3,000 each year, and in year 10 of $4,500. Full benefit of carryforward is added to deferred credits because aggregate net deferred credits never exceed amounts that would have been recorded if there had been no operating loss.

(E) The accumulated deferred tax at the end of year 10 is $9,500 which must be amortized equally during each of the years 11 through 15 since timing differences reverse in equal annual amounts of $6,000 during those years.

(F) The average rate assumption has been used in the amortization of deferred tax credits upon reversal of the depreciation timing differences. A first-in, first-out assumption could have been applied. (See section on "Amortization of Deferred Taxes.")

15. Deferred Tax Charges Existing When Loss Carryforward Arises

.095 A company may incur operating losses sufficient to put it in a loss carryforward position at the same time that unamortized net deferred tax charges exist. To the extent the deferred charges arose in the three preceding profitable years, they would normally be eliminated through carryback of losses. However, balances prior to that period may still remain. If the realization of the tax benefit of the carryforward is not assured beyond any reasonable doubt, the question arises as to the propriety of continuing to carry the remaining deferred tax charges. In these situations unamortized net deferred tax charges represent the tax effects of additional expenses not recognized for tax purposes but recognized for accounting purposes. Therefore, if it is not appropriate to recognize the effect of the tax loss carryforward in the year of loss, it may not be appropriate to recognize or to continue to carry as deferred charges the tax effects of the additional expenses recognized for accounting purposes. Accordingly, in the situations cited

 © 1974, American Institute of Certified Public Accountants, Inc.

the net deferred tax charges should be evaluated as to realizability in the same manner as are other assets.

.096 In other situations companies may incur losses which, because of the nature of the timing differences, are larger for accounting purposes than the amounts carried forward for tax purposes and there is no assurance of future realization of the carryforward benefit. No recognition is given to the tax effects (deferred tax charges) of the timing differences (additional accounting loss carryforwards) inasmuch as the tax effects would be zero under the "with" and "without" computations. Therefore, when these timing differences reverse, the tax benefits realized will not be offset by amortization of deferred charges which would otherwise have been provided. Accordingly, in these situations the tax benefits realized from these timing differences (additional accounting loss carryforwards) should be included in the income statement as extraordinary credits (see Exhibit V) in the same manner as benefits obtained upon future realization of tax loss carryforwards (see Exhibit III).

.097

EXHIBIT V

RECOGNITION OF ADDITIONAL ACCOUNTING LOSS CARRYFORWARD BENEFIT IN YEAR REALIZED

Income before income taxes and extraordinary items		$1,000,000
Income tax expense:		
Currently payable	$200,000	
Tax effect of losses (or expenses) deducted from income for accounting purposes in prior loss periods, but for tax purposes in current period	300,000	500,000
Income before extraordinary items		$ 500,000
Extraordinary items:		
Reduction of income taxes arising from deduction of prior years' accounting losses (or expenses)	$300,000	
Loss on major devaluation of foreign currency (less applicable income tax of $100,000)	(100,000)	200,000
Net Income		$ 700,000

Assumptions:

1. 50% tax rate for all years.
2. Surtax exemptions and investment credits ignored.

16. Loss Carryforward Arising Prior to Quasi-Reorganization

.098 A company which goes through a quasi-reorganization (including for this purpose the application of a deficit in retained earnings to contributed capital) is likely to be in a loss carryforward position. The proper accounting for the future tax benefit of such loss carryforwards poses a question because the losses occurred prior to quasi-reorganization, but the tax benefit from the carryforward is available as an offset against taxable income after quasi-reorganization. Normally, it would be inappropriate to recognize the potential future tax benefits from the carryforward at the date of the quasi-reorganization because realization would not be assured beyond any reasonable doubt. Also, the deficit from operations prior to the quasi-reorganization is written off to contributed capital; in effect a new enterprise is said to have been established.

.099 When a tax benefit is realized from such loss carryforwards, section 4091 provides that such benefits should be added to contributed capital because the benefits are attributable to the loss periods prior to the quasi-reorganization. Thus, the benefits are treated as a part of the capital of the new enterprise.

.100 In some instances, losses may also occur subsequent to the quasi-reorganization and the question may arise as to whether realization of the loss carryforwards applies to losses incurred prior or subsequent to quasi-reorganization. Under the tax law the earliest loss carryforward must be utilized first. For accounting purposes the tax benefits from loss carryforwards should be allocated between losses before and after the quasi-reorganization in the same manner that they are available under the tax laws.

.101 The above requirements apply to the tax effects of loss carryforwards realized after the effective date of section 4091 even though the related quasi-reorganization occurred prior to the effective date.

.102 The concepts described in the preceding paragraphs relative to quasi-reorganizations apply equally to reorganizations under the bankruptcy laws where a deficit is written off to capital.

 © 1974, American Institute of Certified Public Accountants, Inc.

17. Purchased Loss Carryforwards

.103 Occasionally when a corporation acquires another business in a transaction accounted for as a purchase, one of the assets acquired is the future tax benefit of a loss carryforward. Such future tax benefit should be recorded as an asset at the date of purchase only if its realization is assured beyond any reasonable doubt. In the normal case, however, where such assurance does not exist, the tax benefits of such a loss carryforward ". . . should be recognized only when the tax benefits are actually realized and should be recorded as retroactive adjustments of the purchase transactions . . .".

.104 This is based on the concept that accounting for the acquisition of a business as a purchase requires the allocation of the purchase price to the assets acquired. When a loss carryforward exists it may be considered as an important part of the assets acquired. It is likely that in arriving at the purchase price the parties assigned some value to the loss carryforward. Therefore, when the purchase price is being allocated, the future tax benefit of the carryforward should, in theory, be recorded as a receivable. However, inasmuch as it may not be recorded as a receivable unless its recovery is assured beyond any reasonable doubt, the effect of not recognizing it at the date of the purchase may be to increase the goodwill or reduce the "negative goodwill" that would otherwise be recognized.

.105 Therefore, if and when a tax benefit is realized from the purchased loss carryforward, a retroactive adjustment of the purchase transaction is required. This would normally be accomplished by an adjustment of goodwill or "negative goodwill." In some cases adjustment of tangible assets and depreciation may also be required. Such accounting treatment should be applied to tax benefits realized after the effective date of section 4091 even though the related purchase occurred before the effective date.

18. Investment Credit: Carrybacks and Carryforwards

.106 Section 4094.21 states: "The amount of a carryback of unused investment credit may be set up as an asset (a claim for refund of income taxes) and be added to the allowable investment credit in accounting for the effect of the credit in the year in which the property is placed

in service. A carryforward of unused investment credit should ordinarily be reflected only in the year in which the amount becomes 'allowable', in which case the unused amount would not appear as an asset." Section 4094 remains in effect without modification by APB Opinion No. 11.

.107 APB Opinion No. 2 required that the "deferral" method should be followed in accounting for investment credits; APB Opinion No. 4 stated that the "flow-through" method was also acceptable. This method is now predominant in practice. Under the "deferral" method investment credits actually realized, including those realized through carryback or carryforward, are deferred and amortized over the productive life of the acquired property.

.108 Under the "flow-through" method investment credits generally are treated as reductions of income tax expense of the year in which the credits are actually realized. Practice does not treat the realization of investment credit carryforwards as extraordinary items in the year of realization, as is required for operating loss carryforwards under section 4091.

.109 As discussed in the section on "Computation of Deferred Taxes," the effect of the investment credit must also be recognized in computing deferred taxes for timing differences originating in the current period. This occurs because deferred taxes are computed as the differential in taxes (giving effect to investment credits) arising from including and excluding the timing difference.

.110 If tax allocation results in net deferred credits the differential calculations will recognize as income for financial accounting purposes, through a reduction in the deferred tax provisions, that portion of available investment credits that would have been allowable had taxes payable been based on pretax accounting income. In effect investment credit carryforwards are being recognized as offsets against net deferred tax credits in a manner similar to that followed for operating loss carryforwards. The carryforwards utilized should be limited to the lower of (a) the amount of the carryforward benefit or (b) the amortization of the net deferred credits that would otherwise have occurred during the carryforward period. The total amount of investment credits that may be reflected in these

 © 1974, American Institute of Certified Public Accountants, Inc.

computations is limited to the amount actually available (either currently or as a carryforward).

.111 As the investment credit carryforward benefits are realized, reductions of net deferred credits resulting from application of unused investment credits should be reinstated at the then current rates (i. e., at the rates at which the investment credit carryforwards are realized) before recognition is given to the realization of any remaining investment credits. At the same time amortization of such deferred credits that would otherwise have occurred should also be recognized.

.112 If allocation results in a net deferred charge an opposite effect should be obtained—a portion of the investment credit actually realized will be deducted from the deferred charge and omitted from income of the current period for financial accounting purposes.

.113

EXHIBIT VI

EXAMPLE OF EFFECT OF INVESTMENT CREDIT WHEN TAXABLE INCOME IS ZERO (thousands of dollars)

Assumed Facts		
Pretax accounting income		$500
Additional depreciation for tax purposes		500
Taxable income		$ -0-
Available investment credits		$100
Tax rate		52.8% (less surtax exemption)
Deferred tax computation		
Tax on taxable income		$ -0-
Tax on taxable income without timing difference:		
52.8% of $500 less surtax exemption		$257
Less investment credits (maximum—$25 plus 50% of tax in excess of $25 or $141) limited to $100		100
		$157
Differential equal to deferred tax credit		$157
Financial statement presentation		
Income before income taxes		$500
Income tax expense:		
Currently payable	$ -0-	
Deferred	157	157
Net income		$343

(Note: If more than one kind of timing difference is involved and the available investment credits are less than the maximum based on pretax accounting income, then the available credits should be applied in proportion to the amounts of the respective timing differences.)

.114

EXHIBIT VII

ILLUSTRATION OF DEFERRED TAX COMPUTATION WHEN INVESTMENT CREDIT CARRYFORWARD EXISTS
(thousands of dollars)

Assumptions:		
Pretax accounting income		$1,000
Excess depreciation (assuming no cumulative timing differences from prior years exist)		500
Taxable income		$ 500
Available investment credits		$ 400
Deferred taxes:		
Taxable income with timing difference		$ 500
Tax thereon:		
52.8% less surtax exemption		$ 257
Investment credits ($25 plus 50% of tax in excess of $25)		141
Tax payable		$ 116
Taxable income without timing difference		$1,000
Tax thereon:		
52.8% less surtax exemption		$ 521
Investment credits ($25 plus 50% of tax in excess of $25)		$ 273
Tax		$ 248
Differential equal to deferred tax credits		$ 132
Investment credits:		
Available		$ 400
Realized		141
Carryforward		$ 259
Investment credit benefit received in computation of deferred taxes:		
Deferred taxes without considering investment credits ($521 less $257)	$264	
Deferred taxes as computed above	132	$ 132
Investment credit carryforward to future years		$ 127
Summary:		
Income before income taxes		$1,000
Income tax expense:		
Currently payable (after giving effect to investment credits realized of $141)	$116	
Deferred taxes	132	248
Net income		$ 752

FINANCIAL STATEMENT PRESENTATION

19. Allocation Within a Period

.115 Section 4091 requires income tax expense for any period to be allocated among income before extraordinary items, extraordinary items, adjustments of prior periods (or of the opening balance of retained earnings), and direct entries to other stockholders' equity accounts. The amount of income tax expense for the period allocated to income before extraordinary items is computed as the amount of income tax expense (after giving effect to related investment credits) that would have been determined by excluding from pretax accounting income all transactions that are not included in the determination of income before extraordinary items. The difference between income tax expense allocated to income before extraordinary items and the total income tax expense for the period (after giving effect to investment credits) is then allocated among the extraordinary items (and to adjustments of prior periods and direct entries to stockholders' equity accounts).

.116 If exclusion of extraordinary losses from a net loss for a period results in income before extraordinary items, an appropriate provision should be made for the income tax expense that would have been applicable to such income. This imputed tax provision should then be reversed by application against the extraordinary loss.

.117 If exclusion of extraordinary items from pretax accounting income results in a loss before extraordinary items, a credit tax provision should be allocated to such loss. The credit would be equivalent to the tax that would be refundable from an operating loss carryback equal to the loss before extraordinary items. The sum of such credit tax provision and total income tax expense for the period should then be allocated among the items excluded from pretax accounting income in the determination of the loss before extraordinary items. Often the income tax expense allocated to the extraordinary items will differ from the tax that normally would be associated with such items, as illustrated in the example on next page.

.118 If there is more than one item of revenue and expense included in extraordinary items, adjustments of

prior periods and direct entries to stockholders' equity accounts, it is necessary to allocate the total income tax effects applicable to them among the individual items. The tax effect applicable to each individual item should be determined as the differential in income taxes resulting from including and excluding the specific item and should be determined in the same manner as for a timing difference. The amount of income tax expense allocated to all excluded items should then be allocated to the individual items on the basis of the proportion that the tax effect of each item bears to the aggregate tax effects.

Loss before income taxes and extraordinary capital gain	$ (200,000)
Income tax credit (assuming a 50% rate)	100,000
Loss before extraordinary credit	$ (100,000)
Extraordinary long-term capital gain of $600,000, less applicable income tax of $250,000 [8]	350,000
Net income	$ 250,000

.119 In certain unusual cases, an item recognized in the determination of taxable income may not enter into the reporting of results of operations but, instead, for accounting purposes represents a capital transaction which is reflected by a direct entry in a stockholders' equity account. In such cases, the tax effect of such an item should be related to the transaction affecting the stockholders' equity account and not considered to be an increase or decrease of income tax expense for the period. An example of such a direct entry to stockholders' equity accounts arises in connection with that portion of a loan loss reserve of a bank which is recorded in the accounts and is deducted for tax purposes but is in excess of allowances required for accounting purposes and is, therefore, treated as appropriated surplus.

.120 When a transaction is includable in the determination of taxable income for a period but is treated as a

[8] The amount of $250,000 represents the sum of 25% of $600,000, or $150,000 (the alternative tax), plus $100,000, the tax credit attributable to the carryback of the loss from operations under the "with" and "without" computations. This $100,000 tax credit is, in effect, lost inasmuch as the alternative tax computation available because of the long-term capital gain does not provide for any recognition of the loss from operations.

 © 1974, American Institute of Certified Public Accountants, Inc.

prior period adjustment for accounting purposes, the tax effects should be allocated to such prior periods. When a change in accounting method is made by retroactive restatement of prior years' operations, the applicable income tax expense should be determined on the basis of the applicable rates for those prior periods.

20. Income Statement Presentation

.121 All taxes based on income, including foreign, state and local, should be reflected in income tax expense in the income statement.

.122 The components of income tax expense for the period should be disclosed separately. This disclosure of components may be done either on the income statement or in a note. The components of income tax expense that must be disclosed separately for the period, allocated among income before extraordinary items, extraordinary items, adjustments of prior periods (or of the opening balance of retained earnings) and direct entries to other stockholders' equity accounts, are as follows:

(a) Taxes estimated to be payable,

(b) Tax effects of timing differences,

(c) Tax effects of investment credits (whether on the deferral method or the flow-through method) and

(d) Tax effects of operating losses.

.123 An example of income statement presentation of income tax expense follows:

	1968	*1967*
Income before income taxes	$800,000	$700,000
United States, foreign and state income taxes (Note A)	300,000	350,000
Net income	$500,000	$350,000

Note A—Income tax expense differs from amounts currently payable because certain revenues and expenses are reported in the income statement in periods which differ from those in which they are subject to taxation. The principal differences in timing between the income statement and taxable income involve (a) depreciation expenses recorded under the straightline method in the income statement and by accelerated methods for tax purposes and (b) provision for product warranties recorded in the income statement as warrantied products are sold but deducted for tax purposes when services under the warranties are performed. The differences between income tax expense and taxes currently payable are reflected in deferred tax accounts in the balance sheet. Income tax expense consists of the following:

	1968	1967
Currently payable before giving effect to investment credits	$550	$350
Investment credits realized	(175)	(50)
Deferred—net	(75)	50
	$300	$350

21. Balance Sheet Presentation

.124 The Opinions of the Board require that income tax accounts be presented in the balance sheet so as to provide separate classification of the following elements:

(a) Taxes estimated to be currently payable,

(b) Net amount of current deferred charges and current deferred credits relating to timing differences,

(c) Net amount of noncurrent deferred charges and noncurrent deferred credits relating to timing differences,

(d) Refundable taxes arising from carrybacks of operating losses, investment credits and similar items,

(e) Future tax benefits of carryforwards of operating losses and similar items (in those unusual cases where they have been recognized because realization is assured beyond any reasonable doubt) and

(f) Deferred investment credits (applicable when the deferral method of accounting for investment credits is employed).

.125 The distinction between current and noncurrent deferred taxes due to timing differences is based on the classification of the asset or liability related to each specific timing difference. For example, deferred taxes arising from timing differences in depreciation expense are classified with noncurrent liabilities because the related depreciable assets are noncurrent. On the other hand, if installment receivables are included in current assets, the deferred tax credits arising from the use of installment method for tax purposes are classified with current liabilities.

.126 The Board considered the possibility of presenting current deferred tax charges separately from current deferred tax credits, with similar separation of noncurrent

 © 1974, American Institute of Certified Public Accountants, Inc.

deferred tax charges from noncurent deferred tax credits. However, the Board concluded that allowing the netting of deferred charges and credits achieved a simpler presentation while allowing the reader of the financial statement to determine the effect on the balance sheet of interperiod tax allocation. It was considered necessary, however, to separate the net current deferred taxes from the net noncurrent deferred taxes in order to conform with accepted principles for determining working capital.

22. General Disclosures

.127 In addition to the presentation of components of income tax presented in the income statement and in the balance sheet, section 4091 requires the following general disclosures:

> "(a) Amounts of any operating loss carryforwards not recognized in the loss period, together with expiration dates (indicating separately amounts which, upon recognition, would be credited to deferred tax accounts);
>
> (b) Significant amounts of any other unused deductions or credits, together with expiration dates; and
>
> (c) Reasons for significant variations in the customary relationships between income tax expense and pretax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business.
>
> The Board recommends that the nature of significant differences between pretax accounting income and taxable income be disclosed."

In addition, section 4094 requires disclosure of the method adopted (deferral or flow-through) in accounting for investment credits and the amounts of unused carryforwards, together with expiration dates. These requirements are consistent with the disclosure requirements cited above in section 4091.

23. Transitional Problems

.128 Section 4091 was effective for fiscal periods that began after December 31, 1967. Retroactive application was not mandatory but was encouraged. The obvious advantage of applying section 4091 retroactively was to

achieve complete comparability among all reported periods—both then and in the future.

.129 If a company did not elect to apply section 4091 retroactively, it was nevertheless necessary to make changes in presentation of deferred taxes that related to periods prior to the effective date. For example, a company that was, prior to the effective date, presenting deferred tax accounts as direct reductions of related assets and liabilities—"net of tax" presentation—was required to change the presentation of balance sheets at the end of fiscal periods beginning after December 31, 1967. This was required even though the amounts of deferred taxes carried over from prior years had not been recomputed to conform to the provisions of section 4091.

.130 The net of tax presentation is also prohibited in income statements for periods subject to section 4091. When comparative income statements are presented which include years beginning both before and after the effective date of section 4091, it is not required that "net of tax presentation" be eliminated from the former income statements but it would certainly be highly desirable even though the amounts of deferred taxes are not recomputed.

.131 Deferred tax accounts relating to timing differences may be computed either on the basis of individual transactions or, with respect to similar timing differences, under the "gross change" or "net change" methods. Irrespective of which basis or method is elected, no recognition (beyond systematic amortization of previously recorded deferred taxes) can be given in the computation of the current deferred tax provision to the reversal of tax effects arising from timing differences originating prior to the effective date of section 4091 unless the applicable deferred taxes have been provided for in accordance with section 4091, either during the periods in which the timing differences originated or, retroactively, as of the effective date of section 4091. The method or methods adopted should be consistently applied. If the methods are changed, disclosure of a change in accounting is necessary in accordance with section 1051, *Accounting Changes*. [As amended, effective for fiscal years beginning after July 31, 1971, by APB Opinion No. 20.]

© 1974, American Institute of Certified Public Accountants, Inc.

.132 There are cases in which a company, prior to the effective date of section 4091, did not apply interperiod tax allocation procedures for significant timing differences in accordance with section 4091, but was required to do so subsequent to the effective date. It should be noted that under such circumstances if the provisions of section 4091 were not applied retroactively, there may be a significant lack of comparability among income statements for a number of years. This will occur because it will be necessary to recognize deferred taxes for timing differences that originate subsequent to the effective date of section 4091, whereas it will not be permissible to reflect in the provision for deferred taxes the tax effects of similar timing differences that reverse during the same period. The effect of this procedure will be to place the accounts of the company on a full allocation basis gradually over a period of time. The period of time required for full allocation to be achieved and the significance of the lack of comparability will depend on the "rollover period" of the timing differences involved, and their materiality.

.133 An example of a possible extreme lack of comparability could occur in the case where a company has not been providing deferred taxes relating to provisions for product warranty costs where the warranty period is relatively short, say two or three years. In such a case, during the first few years following the effective date of section 4091, the provision (credit) for deferred taxes in the income statement will vary widely (decreasing in amount) even though there is no change in tax rates or in the ending amount of the warranty reserve. Such lack of comparability, assuming it is significant, requires explanation in a note to the financial statements. It is obvious that under these circumstances retroactive application would be highly desirable.

.134 Some companies adopted tax allocation procedures for depreciation timing differences at the effective date of section 4074 on a prospective basis and did not retroactively provide deferred taxes for accumulated timing differences at that date. Such companies should consider the advisability of providing such deferred taxes retroactively on the basis provided in section 4091.

.135 If a company decides to give retroactive effect to section 4091, the computations of deferred taxes relating to timing differences for prior periods should be based on the provisions of section 4091 and should be applied to all material items of those prior periods. It is unacceptable to compute such deferred taxes under the "liability" approach, which has been rejected in section 4091, even though the liability approach would have been acceptable if it had been followed in prior years. On the other hand, where deferred taxes have been provided in prior years under the liability method, recomputation under the deferred method should be required only when the differences are material.

.136 The Board recognized that it was not practicable to discuss in section 4091 all of the problems that could arise in the application of the principles stated in section 4091. Likewise it was not practicable in this article to indicate or suggest solutions to some existing problems or to anticipate solutions to new problems. Further experience in the implementation of section 4091 will undoubtedly lead to new or different treatments.

[Issue Date: 1969.]

24. Franchise Taxes Based on Income

.137 *Question*—The Ohio corporation franchise/income tax law enacted December 20, 1971 imposes a tax based on the value of a corporation's issued and outstanding shares of capital stock. The value of the issued and outstanding stock is deemed to be (a) the stockholders' equity in the corporation (subject to certain adjustments) as of the beginning of the corporation's annual accounting period that includes the first day of January of the tax year or (b) the corporation's net income (subject to certain adjustments) for the year, or portion of the year, preceding the commencement of its annual accounting period that includes the first day of January. The amount of the tax payable is the greater of the applicable tax rate applied to stockholders' equity or net income, but no less than $50, and is first due on January 1, 1972. To what period does the tax charge belong?

 © 1974, American Institute of Certified Public Accountants, Inc.

.138 *Interpretation*—A franchise tax unrelated to income is a privilege tax which should be charged as an expense of the year to which the privilege relates. A franchise tax which, in effect, is based solely on income is considered to be an income tax under section 4091. The tax should be accrued in the year the income to which it relates is earned, even though the tax constitutes a fee for the privilege of doing business in a succeeding period and is payable in that period.

.139 The Ohio corporation franchise/income tax is considered to be composed of two elements for accounting purposes, a franchise tax and an income tax. To the extent the tax is based on stockholders' equity, it is a franchise tax which should be accrued in the year to which the privilege relates. If there is additional tax due, based on income, that excess is considered to be an income tax which should be accrued in the year the income was earned.

.140 In many instances corporations will have issued prior to the enactment of the Ohio law their financial statements for years ending in 1971. In such cases the additional tax expense for years ending in 1971 should be treated as a prior period adjustment when the corporation next issues its financial statements.

AC Section U4094

Accounting For The Investment Credit: Accounting Interpretations of Section 4094

1. Tax Credit Disclosure

.001 *Question*—What disclosure is required in relation to accounting for the investment tax credit?

.002 *Interpretation*—Section 4094.18 specifies that full disclosure of the method followed and amounts involved, when material, in accounting for the investment credit is essential. For this purpose, materiality should be measured in relation to the income tax provision, net income, and the trend of earnings. Generally, all amounts of investment credit should be revealed unless they are clearly insignificant. (Modified by Interpretation No. 2 below.)

[Issue Date: February, 1972.]

2. Tax Credit Disclosure (Modification)

.003 Accounting Interpretation No. 1, issued in February 1972, stated, "full disclosure of the method followed and amounts involved, when material, in accounting for the investment credit is essential. For this purpose, materiality should be measured in relation to the income tax provision, net income, and the trend of earnings. Generally, all amounts of investment credit should be revealed unless they are clearly insignificant." That Interpretation is reaffirmed, except for the foregoing references to materiality as it relates to disclosure of the *method.*

.004 The 1971 Act and the Treasury releases require a taxpayer to disclose in financial reports the method of accounting used for the investment credit but no materiality guideline is given. Accordingly, until such time as a guideline may be issued, the *method* of accounting for the investment credit should be disclosed in all financial reports for taxable years ending after December 9, 1971 even though the *amount* is not material and is not disclosed and dis-

closure would not otherwise be required. If more than one *method* is used (for example, the deferral method for "old" credits and the flow-through method for "new" credits), all *methods* should be disclosed. The amounts may be omitted only if they are clearly insignificant.

[Issue Date: April, 1972]

3. Acceptable Methods of Accounting for Investment Credits Under 1971 Act

.005 *Question*—What methods may be used to account for investment credits allowable under the Revenue Act of 1971?

.006 *Interpretation*—In a news release dated January 10, 1972, the Treasury Department interpreted the Act to mean that the flow-through and the deferral methods are the only acceptable methods to account for investment credits allowable under the 1971 Act for taxable years ending after December 9, 1971.

.007 Under the flow-through method, the credit is reflected as a reduction of tax expense in the year it is recognized in the financial statements.

.008 Under the deferral method, the credit is reflected as a reduction of tax expense ratably over the period during which the asset is depreciated and follows the depreciation method used for financial reporting purposes. The amortization period may be the specific life of each asset or the composite life of all depreciable assets. However, amortization over the period the asset must be held to avoid recapture of the credit rather than life of the asset is not acceptable because it is not based on depreciable life.

.009 A financing institution may include the investment credit as part of the proceeds from leased property accounted for by the financing method and include it in determining the yield from the "loan" which is reflected in income over the term of the lease. However, the financing institution may account for the investment credit on property purchased for its own use by either the flow-through or the deferral method.

.010 The investment credit may be passed through to a lessee for leased property. The lessee should account for

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

the credit by whichever method is used for purchased property. If the deferral method is used and the leased property is not capitalized, the term of the lease, generally including renewal options which are reasonably expected to be exercised, is the period over which the credit should be amortized.

[Issue Date: April, 1972]

4. Change in Method of Accounting for Investment Credit

.011 *Question*—The Revenue Act of 1971 provides that a taxpayer need not use a particular method of accounting for the investment credit in financial reports subject to the jurisdiction of, or made to, any federal agency. However, once a method is adopted, a taxpayer may not under the Act change to another method unless the Secretary of the Treasury or his delegate consents. (Therefore, a taxpayer has a one-time "free choice" to select a method different from the one used in the past to account for the investment credit under the 1971 Act but must continue to use the method selected.) The Treasury Department issued news releases on December 21, 1971 and January 10, 1972 specifying December 10, 1971 as the effective date for the accounting requirements for the credit under the Act in financial reports issued by taxpayers and describing methods of accounting for it. How do the 1971 Act and the Treasury Department releases affect the application of section 1051, Accounting Changes, by taxpayers who change their method of accounting for the investment credit in financial reports issued to shareholders?

.012 *Interpretation*—This Accounting Interpretation sets forth our understanding of how section 1051 [1] should be applied under the Act and the Treasury releases in accounting and reporting for the investment credit in general purpose financial statements issued by companies subject to the jurisdiction of, or making reports to, federal agencies. These would include, for example, annual reports to shareholders and other investors under the jurisdiction of the SEC, ICC, CAB, SBA, etc. The conclusions of this Interpretation should be applied to all financial statements prepared in accordance with generally accepted accounting

[1] Section 1051 is effective for fiscal years beginning after July 31, 1971, but earlier application is encouraged.

principles even though they are issued by companies whose financial reports are not under the jurisdiction of, or who do not report to, a federal agency. (It is our understanding that a tax return is not deemed a financial report to come under the provisions of the 1971 Act discussed in this Interpretation.) If anything in this Interpretation should conflict with any requirement issued by the Treasury, the requirement of the Treasury prevails for those financial statements.

"Old" Investment Credits

.013 Section 1051.16 specifies that the previously adopted method of accounting for a tax credit which is being discontinued or terminated should not be changed. Therefore, the method of accounting used for investment credits previously reported in financial statements covering taxable years ending before December 10, 1971 should be continued for those credits in financial statements issued after December 9, 1971. Thus, an investment credit received in 1968 and accounted for by the deferral method should under section 1051 continue to be amortized on the same basis as before even though the taxpayer elects to use the flow-through method under the one-time "free choice" to account for 1971 Act investment credits. Likewise, a 1968 investment credit which was accounted for by the flow-through method should not be reinstated, either by retroactive restatement or by a "catch-up" accounting change adjustment, even though the taxpayer elects the deferral method under the one-time "free choice" to account for 1971 Act investment credits.

.014 Under section 1051.16, the "old" investment credit in the above examples is considered terminated as of December 9, 1971 in view of the Treasury Department releases. The adoption of a different method to account for 1971 Act investment credits under the one-time "free choice" is, therefore, considered similar to the adoption of a different method of amortization for newly acquired assets as provided by section 1051.24.

"New" Credits Arising Before Cutoff Date

.015 An investment credit arising under the Revenue Act of 1971 but allowable in a taxable year ending before

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

December 10, 1971 (for example, from property purchased in September 1971 by a taxpayer with a November 30 taxable year) may be accounted for either by the method used in prior years to account for the investment credit or by the method the taxpayer will use under the one-time "free choice." In these circumstances, those taxpayers who use the "old" method may exercise their one-time "free choice" in the following year. Those taxpayers who change to a different method for the 1971 Act credit should continue that method in accounting for investment credits allowable in following taxable years ending after December 9, 1971.

Carrybacks and Carryforwards

.016 In practice, the investment credit is recognized in financial statements[2] by including it in the "with and without" computation of the tax effect of a timing difference which is specified by section 4091.35. This practice continues to be appropriate in taxable years ending after December 9, 1971 although the credit is a carryback or a carryforward for income tax purposes. Thus, when different methods are used to account for the credit in different years and carrybacks or carryforwards are involved, the method applicable to a particular credit is the method used for the year in which the credit is recognized in the financial statements.

.017 Therefore, an investment credit arising from an investment made during a taxable year ending after December 9, 1971 but carried back to produce a refund from a taxable year ending prior to December 10, 1971 should be accounted for by the method selected under the one-time "free choice." An investment credit arising under prior Revenue Acts which has not been previously accounted for and which is allowable in a taxable year ending after December 9, 1971 (for example, from property purchased in 1968 for which all or part of the credit was carried forward to calendar 1971) should be accounted for by the method selected under the one-time "free choice."

.018 The Treasury Department releases do not apply to investment credits which have been reported in annual income statements covering taxable years ending before December 10, 1971 even though the credits may be carried

[2] See sections U4091.106-.114, "Investment Credit Carrybacks and Carryforwards" and sections 4091.44-.47 for rationale.

forward to reduce tax liability in years ending after December 9, 1971. Therefore, those investment credit carryforwards realized after that date should be accounted for in the normal manner by crediting the assets set up to recognize the investment credit carryforward or by restoring the deferred tax credit when the carryforward credit is realized.

.019 An investment credit recognized in a carryforward year rather than in the year it arises should be included in the determination of income before extraordinary items in the carryforward year.

Consistency Exception in Auditor's Report

.020 A change in the method of accounting for the investment credit (either by selection of a different method under the one-time "free choice" or later by permission of the Secretary of the Treasury or his delegate) would call for a consistency exception in an independent auditor's report if it has a material effect on the financial statements in the current year (see Accounting Interpretation No. 2 on tax credit disclosure). The effect of the change under the one-time "free choice" should be disclosed in the manner specified by section 1051.24. The effect of a Treasury-approved change should be disclosed in the manner specified by section 1051.21.

[Issue Date: April, 1972]

5. Investment Credit Is Prior Period Adjustment

.021 *Question*—The Revenue Act of 1971 allows an investment credit retroactively to some taxpayers whose fiscal years closed prior to enactment of the Act on December 10, 1971. To what accounting period does this credit belong?

.022 *Interpretation*—An investment credit arising under the Revenue Act of 1971 and allowable in a taxable year ending before December 10, 1971 is considered to be an event of a fiscal year ending before December 10, 1971. If the financial statements have not yet been issued, they should be adjusted to reflect the credit as a type 1 subsequent event (see AU section 560, Volume 1, AICPA PROFESSIONAL STANDARDS).

 Copyright © 1977, American Institute of Certified Public Accountants, Inc.

If the financial statements have already been issued, the credit should be treated as a prior period adjustment as described by section 2010.17 (see also section 2011.18).

.023 The credit may be accounted for by the method used in prior years to account for the investment credit or by a different method. If a different method is used, that method should be used thereafter to account for investment credits allowable in following taxable years ending after December 9, 1971. (See Accounting Interpretation No. 4 on change in method of accounting for the investment credit.)

[Issue Date: April, 1972]

6. Investment Credit in Consolidation

.024 *Question*—The Revenue Act of 1971 specifies that a taxpayer shall not be required to use a particular method of accounting for the investment credit in reports subject to the jurisdiction of a federal agency. However, a taxpayer must continue to use the method adopted in all such reports subsequently issued unless consent to change is granted by the Secretary of the Treasury or his delegate. May different methods of accounting for the investment credit be adopted by the various legal entities that file separate income tax returns but are included in consolidated financial statements?

.025 *Interpretation*—No, a single method of accounting for the investment credit should be adopted under the one-time "free choice" by a parent company and its subsidiaries in consolidated financial statements (including subsidiaries carried on the equity method) and other financial reports subject to the jurisdiction of, or made to, a federal agency.

[Issue Date: April, 1972]

AC Section U4095

Accounting for Income Taxes— Special Areas: Accounting Interpretations of Section 4095

1. Disclosure of Untaxed Undistributed Earnings of Subsidiary

.001 *Question*—Section 4095.14b requires disclosure of the cumulative amount of undistributed earnings of a subsidiary on which the parent company has not accrued income taxes. Is the amount to be disclosed the total amount of undistributed earnings on which income taxes have not been accrued or may an amount that will not be taxed, with appropriate tax planning under existing statutes, be excluded?

.002 *Interpretation*—The amount to be disclosed under section 4095.14b is the cumulative undistributed earnings which under existing law would be subject to income taxes if distributed currently but for which the parent company has not accrued income taxes. If under existing law, however, a short-term postponement of the distribution would permit the earnings to be distributed tax free to the parent, those earnings need not be included in the amount disclosed. Thus, for example, the amount disclosed would include that portion of the undistributed earnings of a DISC subsidiary on which tax has not been accrued, the undistributed earnings of a foreign subsidiary on which tax has not been accrued and the tax would not be offset by an available foreign tax credit, and the undistributed earnings of a less than 80 percent owned domestic subsidiary.

.003 The amount disclosed would not include the undistributed earnings of an 80 percent or more owned domestic subsidiary that is included in a consolidated income tax return, or where the parent has elected a single surtax

exemption for all members of an affiliated group which file separate tax returns, since a dividend paid from those earnings would be eligible for the 100 percent dividends received deduction. Likewise, the undistributed earnings of a subsidiary that is expected to be remitted to the parent company in a tax free liquidation would not be included in the amount disclosed.

.004 The undistributed earnings of an 80 percent or more owned domestic subsidiary that files a separate tax return with multiple surtax exemptions for the affiliated group should not be included in the amount disclosed in most situations. Under present law, dividends paid out of earnings accumulated after 1974 will be eligible for the 100 percent dividends received deduction. Income taxes should, however, be accrued for any pre-1975 multiple surtax year accumulated earnings which are *not* considered to be invested for an indefinite period of time when the tax planning alternatives of filing a consolidated return or a tax free liquidation are not practical. In the unusual situations when pre-1975 accumulated undistributed earnings are considered invested for an indefinite period of time and the consolidated return and tax free liquidation alternatives are not practical, such pre-1975 accumulated undistributed earnings should be included in the amount to be disclosed.

.005 Care should be exercised in drafting the footnote required by section 4095.14b so that readers may be fully apprised of tax implications of unremitted earnings of subsidiaries. The following is illustrative: "It is the policy of the Company to accrue appropriate U. S. and foreign income taxes on earnings of subsidiary companies which are intended to be remitted to the parent company in the near future. Unremitted earnings of subsidiaries which have been, or are intended to be, permanently reinvested [disclosure of purpose], exclusive of those amounts which if remitted in the near future would result in little or no such tax by operation of relevant statutes currently in effect, aggregated $.......... at December 31, 1972."

AC Section U4111

Interest on Receivables and Payables: Accounting Interpretations of Section 4111

1. Advance Not Requiring Imputation

.001 *Question*—Section 4111 requires interest to be imputed for some rights to receive or obligations to pay money on fixed or determinable dates. In certain transactions, pipeline companies make advances to encourage exploration. These advances are satisfied by delivery of future production, but there is also a definite obligation to repay if the future production is insufficient to discharge the obligation by a definite date. Does section 4111 apply to such advances?

.002 *Interpretation*—No, paragraph .03b states that the section is not intended to apply to "amounts which do not require repayment in the future, but rather will be applied to the purchase price of the property, goods, or service involved (e.g., deposits or progress payments on construction contracts, advance payments for acquisition of resources and raw materials, advances to encourage exploration in the extractive industries)." The advance described in the question above is covered by the exclusion in paragraph .03b even though there may be an obligation to repay should the future production prove insufficient to discharge the obligation.

AC Section U5131

The Equity Method of Accounting for Investments in Common Stock: Accounting Interpretations of Section 5131

1. Intercompany Profit Eliminations Under Equity Method

.001 *Question*—In applying the equity method of accounting, intercompany profits or losses on assets still remaining with an investor or investee should be eliminated, giving effect to any income taxes on the intercompany transactions. (See section 5131.19a and sections 2051.07 and 2051.16.) Should all of the intercompany profit or loss be eliminated or only that portion related to the investor's common stock interest in the investee?

.002 *Interpretation*—Section 5131.19 normally requires an investor's net income and stockholder's equity to be the same from application of the equity method as would result from consolidation. Because the equity method is a "one-line" consolidation, however, the details reported in the investor's financial statements under the equity method will not be the same as would be reported in consolidated financial statements (see section 5131.19c). All intercompany transactions are eliminated in consolidation, but under the equity method intercompany profits or losses are normally eliminated only on assets still remaining on the books of an investor or an investee.

.003 Section 2051.13 provides for complete elimination of intercompany profits or losses in consolidation. It also states that the elimination of intercompany profit or loss may be allocated proportionately between the majority and minority interests. Whether all or a proportionate part of the intercompany profit or loss should be eliminated under the equity method depends largely upon the relationship between the investor and investee.

.004 When an investor controls an investee through majority voting interest and enters into a transaction with an investee which is not on an "arm's length" basis, none of the intercompany profit or loss from the transaction

should be recognized in income by the investor until it has been realized through transactions with third parties. The same treatment also applies for an investee established with the cooperation of an investor (including an investee established for the financing and operation or leasing of property sold to the investee by the investor) when control is exercised through guarantees of indebtedness, extension of credit and other special arrangements by the investor for the benefit of the investee, or because of ownership by the investor of warrants, convertible securities, etc. issued by the investee.

.005 In other cases, it would be appropriate for the investor to eliminate intercompany profit in relation to the investor's common stock interest in the investee. In these cases, the percentage of intercompany profit to be eliminated would be the same regardless of whether the transaction is "downstream" (i. e., a sale by the investor to the investee) or "upstream" (i. e., a sale by the investee to the investor). The following examples illustrate how these eliminations might be made. The examples assume an investor owns 30 percent of the common stock of an investee, the investment is accounted for under the equity method, and the income tax rate to both the investor and the investee is 40 percent.

.006 Assume an investor sells inventory items to the investee ("downstream"). At the investee's balance sheet date, the investee holds inventory for which the investor has recorded a gross profit of $100,000. The investor's net income would be reduced $18,000 to reflect a $30,000 reduction in gross profit and a $12,000 reduction in income tax expense. The elimination of intercompany profit might be reflected in the investor's balance sheet in various ways; for example, the investor might present $12,000 as a deferred tax charge (this is a "timing" difference under section 4091) and $30,000 as a deferred income credit. The income statement and balance sheet presentations will depend upon what is the most meaningful in the circumstances.

.007 Assume an investee sells inventory items to the investor ("upstream"). At the investor's balance sheet date, the investor holds inventory for which the investee has recorded a gross profit of $100,000. In computing the

 © 1974, American Institute of Certified Public Accountants, Inc.

investor's equity "pickup," $60,000 ($100,000 less 40% of income tax) would be deducted from the investee's net income and $18,000 (the investor's share of the intercompany gross profit after income tax) would thereby be eliminated from the investor's equity income. Usually, the investor's investment account would also reflect the $18,000 intercompany profit elimination, but the elimination might also be reflected in various other ways; for example, the investor's inventory might be reduced $18,000.

[Issue Date: December, 1971.]

2. Investments in Partnerships and Ventures

.008 *Question*—Do the provisions of section 5131 apply to investments in partnerships and unincorporated joint ventures?

.009 *Interpretation*—Section 5131 applies only to investments in common stock of corporations and does not cover investments in partnerships and unincorporated joint ventures (also called undivided interests in ventures). Many of the provisions of section 5131 would be appropriate in accounting for investments in these unincorporated entities, however, as discussed below.

.010 Partnership profits and losses accrued by investor-partners are generally reflected in their financial statements as described in sections 5131.19c and 5131.19d. Likewise, most of the other provisions of section 5131.19 would be appropriate in accounting for a partnership interest, such as the elimination of intercompany profits and losses (see section 5131.19a).

.011 Income taxes should be provided on the profits accrued by investor-partners regardless of the tax basis employed in the partnership return. The tax liabilities applicable to partnership interests relate directly to the partners, and the accounting for income taxes generally contemplated by section 4091 is appropriate. [As amended by APB Opinion No. 23, December, 1971.]

.012 Generally, the above discussion of partnerships would also apply to unincorporated joint ventures, particularly the elimination of intercompany profits and the accounting for income taxes. However, because the investor-venturer owns an undivided interest in each asset

and is proportionately liable for its share of each liability, the provisions of section 5131.19c may not apply in some industries. For example, where it is the established industry practice (such as in some oil and gas venture accounting), the investor-venturer may account in its financial statements for its *pro rata* share of the assets, liabilities, revenues, and expenses of the venture.

[Issue Date: December, 1971.]

3. Early Disclosure of Material Equity Adjustment

.013 *Question*—Section 5131 requires the equity method of accounting to be applied for a qualifying investment in common stock for fiscal periods beginning after December 31, 1971. The Board encouraged earlier adoption of section 5131. If a company owns an investment in 1971 for which it does not adopt the equity method until 1972 when the retroactive application will materially change the originally reported 1971 net income, should the amount of the change be disclosed in the 1971 financial statements when they are first issued?

.014 *Interpretation*—Yes, as a minimum the company should disclose in its 1971 financial statements the effect later retroactive application of the equity method will have on 1971 net income. In fact, the company should consider adopting the equity method in 1971 even though not required to do so.

.015 The Board issued section 5131 in March 1971 and provided a relatively long interval before its effective date because of the time required for companies to accumulate information, arrange for audits of investee companies, etc. Extenuating circumstances may therefore exist for not applying the equity method in 1971. However, any material effect of subsequent retroactive application should be disclosed in the 1971 financial statements.

[Issue Date: February, 1972.]

AC Section U5141

Accounting for Intangible Assets: Accounting Interpretations of Section 5141

1. Intangible Assets

.001 *Question*—Section 5141 requires that intangible assets acquired after October 31, 1970 be amortized over a period not exceeding 40 years. Does this section encourage the capitalization of identifiable internally developed intangible assets which have been generally charged to expense in the past?

.002 *Interpretation*—Section 5141 does not change present accounting practice for intangible assets in any way except to require that intangible assets acquired after October 31, 1970 be amortized. Paragraph .06 notes that the costs of some identifiable intangible assets are now capitalized as deferred assets by some companies while other companies record the costs as expenses when incurred. This paragraph also specifies that the question of whether the costs of identifiable internally developed intangible assets are to be capitalized or charged to expense is not covered by the section. Therefore, the section does not encourage capitalizing the costs of a large initial advertising campaign for a new product or capitalizing the costs of training new employees.

[Issue Date: April, 1971.]

2. Goodwill in a Step Acquisition

.003 *Question*—Goodwill and other intangible assets acquired before November 1, 1970 (the effective date of section 5141) are not required to be amortized until their term of existence becomes limited (see Chapter 5 of ARB No. 43). Section 5141 requires all intangible assets acquired after October 31, 1970 to be amortized. When a company purchases two or more blocks of voting common stock of another company at various dates before and after November 1, 1970 and eventually obtains control or the ability to exercise significant influence over operating and financial

policies of the other company, how should the investor company subsequently account for any "goodwill" related to the investment?

.004 *Interpretation*—When a company in a series of purchases on a step-by-step basis acquires either a subsidiary which is consolidated or an investment which is accounted for under the equity method, the company should identify the cost of each investment, the fair value of the underlying assets acquired and the goodwill for each step purchase. This process would then identify the goodwill associated with each step purchase made before November 1, 1970 or after October 31, 1970 for each investment.[1]

.005 Goodwill associated with each step purchase acquired prior to November 1, 1970 should be accounted for in accordance with Chapter 5 of ARB No. 43 as amended by section 2010. Although amortization is not required in the absence of evidence that the goodwill has a limited term of existence, section 5141.35 encourages prospective amortization of such goodwill. Retroactive amortization is prohibited by section 5141.34.

.006 Goodwill associated with each step purchase acquired after October 31, 1970 should be amortized in accordance with section 5141. The period of amortization may not exceed forty years as specified by section 5141.29.

[Issue Date: March, 1973.]

→ *The next page is 13,901.* ←

[1] The accounting for a step acquisition of a subsidiary which is consolidated is described by section 2051.09 (see also sections 1091.87, 1091.93, and 1091.94). As specified by sections 5131.19b and 5131.19n, similar procedures apply for a step acquisition of an investment carried under the equity method.

AC Section U5362

Early Extinguishment of Debt: Accounting Interpretations of Section 5362

1. Debt Tendered to Exercise Warrants

.001 *Question*—Section 5362 stipulates that gain or loss should be recognized currently in income when any form of debt security is reacquired by the issuer before its scheduled maturity except through conversion by the holder. Does section 5362 apply to debt tendered to exercise warrants which were originally issued with that debt but which were detachable?

.002 *Interpretation*—Section 5362 does not apply to debt tendered to exercise detachable warrants which were originally issued with that debt if the debt is permitted to be tendered towards the exercise price of the warrants under the terms of the securities at issuance. The tendering of the debt in such a case would be a conversion "pursuant to the existing conversion privileges of the holder" (see section 5362.02).

.003 Section 5362 does not apply to a conversion of debt nor does the section specify the accounting for conversion of debt. In practice, however, the carrying amount of the debt, including any unamortized premium or discount, is credited to the capital accounts upon conversion to reflect the stock issued and no gain or loss is recognized.

APPENDIX C

Schedule of Changes in Accounting Pronouncements

The following schedule lists the changes that have been made in Accounting Research Bulletins 43 through 51, the Opinions and Statements of the Accounting Principles Board, and pronouncements of the Financial Accounting Standards Board.

ARB	Chap.	Par.		Date of Change
43	1B		Amended by APB 6, Par. 12, 13	12/31/65
43	2A	3	Amended by APB 20	7/31/71
43	2B		Superseded by APB 9	12/31/66
43	3A	6	Amended by APB 21, Par. 16	10/ 1/71
43	3A	8	Amended by FASB Stmt. 6	12/31/75
43	3A	10	Amended by APB 6, Par. 14	12/31/65
43	3B		Superseded by APB 10, Par. 7	12/31/66
43	4	14	Amended by APB 20	7/31/71
43	5	5	Amended by APB 9	12/31/66
43	5	6	Amended by APB 9	12/31/66
43	5	7	Amended by APB 6, Par. 15	12/31/65
43	5	8	Amended by APB 9	12/31/66
43	5	9	Amended by APB 9	12/31/66
43	5	10	Superseded by APB 16	10/31/70
43	5		Superseded by APB 17	10/31/70
43	6		Superseded by FASB 5	7/ 1/75
43	7B	6	Amended by APB 6, Par. 16	12/31/65
43	7C		Superseded by ARB 48	1/57
43	8		Superseded by APB 9	12/31/66
43	9B		Superseded by APB 6, Par. 17	12/31/65
43	9C		Amended by APB 6, Par. 23	12/31/65
43	9C	11-13	Amended by APB 11	12/31/67
43	10A	19	Amended by APB 9	12/31/66
43	10A	19	Amended by FASB Stmt. 16	10/15/77
43	10B		Amended by APB 6, Par. 23	12/31/65
43	10B	15, 17	Amended by APB 9	12/31/66
43	10B		Superseded by APB 11	12/31/67
43	11B	8	Amended by APB 11	12/31/67
43	11B	9	Amended by APB 9	12/31/66
43	11B	9	Amended by APB 30	9/30/73
43	11B	9	Amended by FASB Stmt. 16	10/15/77
43	12	5	Amended by FASB Stmt. 8	1/ 1/76
43	12	7	Superseded by FASB Stmt. 8	1/ 1/76
43	12	10-22	Superseded by FASB Stmt. 8	1/ 1/76
43	12	12	Amended by APB 6, Par. 18	12/31/65
43	12	18	Amended by APB 6, Par. 18	12/31/65
43	12	21	Amended by APB 9	12/31/66
43	12	21	Amended by APB 30	9/30/73

ARB	Chap.	Par.		Date of Change
43	13A		Superseded by APB 8	12/31/66
43	13B		Amended by APB 25	12/31/72
43	14		Superseded by APB 5	9/64
43	15	4	Amended by APB 21	10/1/71
43	15	7	Amended by APB 9	12/31/66
43	15	11	Amended by APB 11	12/31/67
43	15	12	Amended by APB 6, Par. 19	12/31/65
43	15	17	Amended by APB 9	12/31/66
43	15		Superseded by APB 26	1/ 1/73
44			Superseded by ARB 44 (Revised)	7/58
44 (Rev.)			Amended by APB 6, Par. 23	12/31/65
44 (Rev.)		3	Amended by APB 20	7/31/71
44 (Rev.)		9	Amended by APB 6, Par. 20	12/31/65
44 (Rev.)		4, 5, 7, 10	Amended by APB 11	12/31/67
Letter, Dated April 15, 1959			Superseded by APB 11	12/31/67
47			Superseded by APB 8	12/31/66
48		5	Amended by APB 6, Par. 22	12/31/65
48		6	Amended by APB 6, Par. 22	12/31/65
48		12	Amended by APB 10, Par. 5	12/31/66
48			Superseded by APB 16	10/31/70
49			Superseded by APB 9	12/31/66
50			Superseded by FASB 5	7/ 1/75
51		7, 8	Superseded by APB 16	10/31/70
51		16	Superseded by APB 23	12/31/71
51		17	Amended by APB 11	12/31/67
51		19	Amended by APB 10, Par. 2-4	12/31/66
51		20	Amended by APB 10, Par. 2-4	12/31/66
51		19-21	Amended by APB 18	12/31/71
APB Opinions				
1		1, 5, 6	Amended by APB 11	12/31/67
2			Amended by APB 4	3/64
3			Superseded by APB 19	9/30/71
5		14	Amended by APB 31	12/31/73
5		16-18	Superseded by APB 31	12/31/73
5		20	Amended by APB 31	12/31/73
5		21	Amended by APB 11	12/31/67
5		23	Amended by APB 31	12/31/73
5			Superseded by FASB Stmt. 13	1/ 1/77
6		12c	Superseded by APB 16	10/31/70
6		15	Superseded by APB 17	10/31/70
6		18	Superseded by FASB Stmt. 8	1/ 1/76
6		19	Superseded by APB 26	1/ 1/73
