(b) the subsidiary operates under conditions in which severe long-term restrictions on the transfer of funds impair control by the parent company over the subsidiary's assets and operations.

.37 A subsidiary may be excluded from consolidation if its activities are so dissimilar from those of the other companies in the group that better information for the parent company shareholders and other users of the statements would be provided by presenting separate financial statements in respect of such subsidiary with the consolidated financial statements.
.38 A company in which a group does not have control, but in which a group:

(a) owns more than half the equity capital, but less than half the voting power, or

(b) has the power to control, by statute or agreement, the financial and operating policies of the management of the company, with or without more than one half of the equity interest,

may be treated as a subsidiary and consolidated in the consolidated financial statements. In such circumstances, the reasons for consolidating the company should be disclosed.

.39 Uniform accounting policies should preferably be followed by companies in the consolidated financial statements. There should be disclosure of different accounting policies used, and of the proportion of assets and liabilities to which different accounting policies have been applied if they are included in a single balance sheet classification.

The Equity Method of Accounting for Investments

.40 Investments in associated companies as defined in paragraph .04 and in subsidiaries which are not consolidated for the reasons stated in paragraph .37 should be included in the consolidated financial statements under the equity method of accounting.

.41 As from the date that

(a) a subsidiary ceases to be consolidated for the reason stated in paragraph .36(b), or

(b) an investee ceases to fall within the definition of a subsidiary and does not become an associated company, or an investee ceases to fall within the definition of an associated company,

the investment should be stated in the consolidated balance sheet at the carrying amount under the equity method at that date. From that date, the investor should discontinue accruing its share of the subsequent profits or losses of the investee.

.42 If the carrying amount of an investment dealt with under the equity method, and of investments referred to in paragraph .41, exceeds the value of the investment and that difference is other than temporary, there should be appropriate recognition of the decline in value. Provision should be made for a decline in value of each such investment; individual investments should not be aggregated for evaluation in total.
Financial Statement Presentation

.43 The minority interest in the equity of consolidated companies should be classified in the consolidated balance sheet as a separate item and should not be shown as part of shareholders' equity. The minority interest in the profits or losses of such companies should be shown separately in the consolidated income statement.

.44 Investments accounted for under the equity method of accounting should be appropriately classified in the consolidated balance sheet and the investor's share of profits or losses should be disclosed as a separate item in the consolidated income statement. If the profits or losses for the period include unusual items, the investor's share of the unusual items should be shown separately in accordance with the accounting policies applicable to the investor.

.45 A gain or loss on a sale of shares in an investee by an investor should be recognised in the consolidated income statement. The amount recognised should be the difference at the time of sale between the proceeds of sale and the carrying amount in the consolidated financial statements of the shares sold.

Disclosure

.46 The disclosure of accounting policies—see International Accounting Standard 1, Disclosure of Accounting Policies [section 9001]—should include a description of the bases on which subsidiaries and associated companies have been dealt with.

.47 The following disclosures should be made in the consolidated financial statements:

(a) An appropriate listing and description of significant subsidiaries and associated companies and, in respect of such companies, differences in reporting dates from that of the parent company, unless disclosed in statements accompanying the consolidated financial statements.

(b) The reasons for not consolidating a subsidiary.

(c) The nature of the relationship between the parent company and a company that is not a subsidiary but is treated as a subsidiary in consolidation, as described in paragraph .38.

(d) The amounts relating to any significant unadjusted transactions occurring between the dates of investors' and investees' financial statements.

(e) An analysis of the amounts under each significant balance sheet and income statement caption if necessary to provide
a fair disclosure of the exposure to exceptional risks of operating in other countries, including the risk of foreign currency exchange rate fluctuations.

(f) The extent to which there are statutory or contractual restrictions on the distribution of the accumulated retained income of the group.

.48 When a subsidiary is excluded from consolidation in accordance with paragraph .37, separate financial statements in respect of that subsidiary should supplement the consolidated financial statements. The supplementary statements may be presented in condensed form provided they give adequate disclosure, including particulars of intra-group balances and the nature of transactions with the remainder of the group. There should be a reconciliation of the amount at which the results of operations of the excluded subsidiary are stated in the supplementary financial statements, and the amount included in the consolidated income statement in respect of that subsidiary. For the purposes of this supplementary disclosure the financial statements of two or more subsidiaries with similar operations may be combined.

.49 If a subsidiary is excluded from consolidation because of the restriction described in paragraph .36(b), the following disclosures should be made with respect to such investment:

(a) the name of the investee and the group’s share in the net assets of the investee,

(b) the carrying value of the investment in the consolidated financial statements,

(c) the dividends received by the group during the period,

(d) the profits or losses for the period, with unusual items separately stated, and

(e) the amounts of any write-downs or adjustments to consolidated net income in the current period.

Transitional Provisions

.50 On the first occasion that consolidated financial statements are presented, comparative figures should be shown in respect of the consolidated balance sheet but need not be shown in respect of the consolidated income statement if it is not practicable to do so. In all subsequent years full comparative figures should be shown—see International Accounting Standard 1, Disclosure of Accounting Policies [section 9001].

.51 On the first occasion of the application of the equity method, there should be disclosure of the investee’s income of earlier
Consolidated Financial Statements

periods which is attributable to the investor, and of any write-down of the investment at that time to recognise a decline in its value.

Effective Date

52 The provisions of this International Accounting Standard become operative for financial statements covering periods beginning on or after 1 January 1977.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 3 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Paragraph 39 of International Accounting Standard 3 states:

"Uniform accounting policies should preferably be followed by companies in the consolidated financial statements. There should be disclosure of different accounting policies used, and of the proportion of assets and liabilities to which different accounting policies have been applied if they are included in a single balance sheet classification."

Generally accepted accounting principles in the U. S. do not require disclosure "of the proportion of assets and liabilities to which different accounting policies have been applied if they are included in a single balance sheet classification."

The next page is 11,107.
Depreciation Accounting

Issue date, unless otherwise indicated:
October, 1976

INTRODUCTION

.01 This Statement deals with depreciation accounting and applies to all depreciable assets except:

(a) forests and similar regenerative natural resources
(b) expenditures on the exploration for and extraction of minerals, oil, natural gas and similar non-regenerative resources
(c) expenditures on research and development
(d) goodwill.

Definitions

.02 In this Statement the following terms are used with the meanings specified.

Depreciation is the allocation of the depreciable amount of an asset over its estimated useful life. Depreciation for the accounting period is charged to income either directly or indirectly.

Depreciable assets are assets which
(a) are expected to be used during more than one accounting period, and
(b) have a limited useful life, and
(c) are held by an enterprise for use in the production or supply of goods and services, for rental to others, or for administrative purposes.

Useful life is either (a) the period over which a depreciable asset is expected to be used by the enterprise; or (b) the number of production or similar units expected to be obtained from the asset by the enterprise.

Depreciable amount of a depreciable asset is its historical cost or other amount substituted for historical cost \(^1\) in the financial statements, less the estimated residual value.

\(^1\) This Statement does not deal with the differences which arise when revaluations are substituted for historical cost.
EXPLANATION

.03 Depreciable assets comprise a significant portion of the assets of many enterprises. Depreciation can therefore have a significant effect in determining and presenting the financial position and results of operations of those enterprises.

.04 The view is sometimes expressed that if the value of an asset has increased over the amount at which it is carried in the financial statements, it is unnecessary to provide for depreciation. It is considered, however, that depreciation should be charged in each accounting period on the basis of the depreciable amount irrespective of an increase in the value of the asset.

Useful Life

.05 Estimation of the useful life of a depreciable asset or a group of similar depreciable assets is a matter of judgment ordinarily based on experience with similar types of assets. For an asset using new technology or used in the production of a new product or in the provision of a new service with which there is little experience, estimation of the useful life is more difficult but is nevertheless required.

.06 The useful life of a depreciable asset for an enterprise may be shorter than its physical life. In addition to physical wear and tear, which depends on operational factors such as the number of shifts for which the asset is to be used and the repair and maintenance programme of the enterprise, other factors need to be taken into consideration. These include obsolescence arising from technological changes or improvements in production, obsolescence arising from a change in the market demand for the product or service output of the asset, and legal limits such as the expiry dates of related leases.

Residual Value

.07 The residual value of an asset is often insignificant and can be ignored in the calculation of the depreciable amount. If the residual value is likely to be significant, it is estimated at the date of acquisition, or the date of any subsequent revaluation of the asset, on the basis of the realisable value prevailing at that date for similar assets which have reached the end of their useful lives and have operated under conditions similar to those in which the asset will be used. The gross residual value in all cases is reduced by the expected costs of disposal at the end of the useful life of the asset.
Depreciation Methods

.08 Depreciable amounts are allocated to each accounting period during the useful life of the asset by a variety of systematic methods. Whichever method of depreciation is selected its consistent use is necessary, irrespective of the level of profitability of the enterprise and of taxation considerations, in order to provide comparability of the results of operations of the enterprise from period to period.

Land and Buildings

.09 Land normally has an indefinite useful life and is not usually regarded as a depreciable asset. However, land which does have a limited useful life for the enterprise is treated as a depreciable asset.

.10 Buildings are depreciable assets because they fall within the definition in paragraph .02.

.11 Some enterprises have not treated buildings as depreciable assets for the reason that the aggregate value of the building and the land on which it stands does not decline. As land and buildings are separate assets, recognition for accounting purposes of any increased value of the land is a different issue from the determination of the depreciable amount of the buildings.

Disclosure

.12 The selection of an allocation method and the estimation of the useful life of a depreciable asset are matters of judgment. The disclosure of the methods adopted and of the estimated useful lives or depreciation rates used provides users of financial statements with information which allows them to review the policies selected by management and enables comparisons to be made with other enterprises. For similar reasons, it is necessary to disclose the depreciable amount allocated in a period and the accumulated depreciation at the end of that period.

INTERNATIONAL ACCOUNTING STANDARD 4

DEPRECIATION ACCOUNTING

International Accounting Standard 4 comprises paragraphs .13—.19 of this Statement. The Standard should be read in the context of paragraphs .01—.12 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.13 The depreciable amount of a depreciable asset should be allocated on a systematic basis to each accounting period during the useful life of the asset.
.14 The depreciation method selected should be applied consistently from period to period unless altered circumstances justify a change. In an accounting period in which the method is changed, the effect should be quantified and disclosed and the reason for the change should be stated.

.15 The useful life of a depreciable asset should be estimated after considering the following factors:

(a) expected physical wear and tear
(b) obsolescence
(c) legal or other limits on the use of the asset.

.16 The useful lives of major depreciable assets or classes of depreciable assets should be reviewed periodically and depreciation rates adjusted for the current and future periods if expectations are significantly different from the previous estimates. The effect of the change should be disclosed in the accounting period in which the change takes place.

.17 The valuation bases used for determining the amounts at which depreciable assets are stated should be included with the disclosure of other accounting policies—see International Accounting Standard 1, Disclosure of Accounting Policies [section 9001].

.18 The following should be disclosed for each major class of depreciable asset:

(a) the depreciation methods used
(b) the useful lives or the depreciation rates used
(c) total depreciation allocated for the period
(d) the gross amount of depreciable assets and the related accumulated depreciation.

Effective Date
.19 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1977.

COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 4 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES
Paragraph 18 of International Standard 4 requires the disclosure, for each major class of depreciable asset, of certain information including "the useful lives or the depreciation rates used," "total depreciation allocated for the period," and "accumulated depreciation."
Generally accepted accounting principles in the U. S. do not require such information to be disclosed for each major class of depreciable assets. APB Opinion No. 12 [section 2043] requires disclosure of "depreciation expense for the period," but not by asset class. That Opinion also requires disclosure of "accumulated depreciation, either by major classes, of depreciable assets or in total." Disclosure of "the rates used in computing" depreciation is required by Regulation S-X but not by generally accepted accounting principles.
INTRODUCTION

.01 This Statement deals with information to be disclosed in financial statements which include a balance sheet, an income statement, notes, and other statements and explanatory material which are identified as part of the financial statements.

.02 Financial statements are required, among other purposes, for making evaluations and financial decisions. Users cannot make reliable judgments unless the financial statements are clear and understandable. The information needed for this purpose will often extend beyond the minimum necessary to meet the requirements of local law or regulatory authorities.

.03 Certain minimum disclosures are set out in this Standard. These disclosures may be amplified by detailed disclosure requirements included in other International Accounting Standards which deal with specific accounting subjects.

.04 This Standard does not propose a particular format for the presentation of financial statements. The layout and groupings used in the Standard are based on the significant items affecting the financial statements of most industrial and commercial enterprises. A different layout and grouping may be appropriate for enterprises such as financial and insurance companies.

.05 In this Standard the definitions of parent company, subsidiary company and associated company are the same as those used in International Accounting Standard 3, Consolidated Financial Statements [section 9003].

INTERNATIONAL ACCOUNTING STANDARD 5

INFORMATION TO BE DISCLOSED IN FINANCIAL STATEMENTS

International Accounting Standard 5 comprises paragraphs .06—.19 of this Statement. The Standard should be read in the context of paragraphs .01—.05 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].
General Disclosures

.06 All material information should be disclosed that is necessary to make the financial statements clear and understandable.

.07 The name of the enterprise, the country of incorporation, the balance sheet date, and the period covered by the financial statements should be stated. A brief description of the nature of the activities of the enterprise, the legal form of the enterprise, and the currency in terms of which the financial statements are expressed should be given if they are not otherwise apparent.

.08 The amounts and classifications of items should be supplemented if necessary by additional information to make their meanings clear. Significant items should not be included with, or offset against, other items, without separate identification.

.09 Financial statements should show corresponding figures for the preceding period.

Specific Disclosures—Balance Sheet

General

.10 The following disclosures should be made:

(a) Restrictions on the title to assets
(b) Security given in respect of liabilities
(c) The methods of providing for pension and retirement plans
(d) Contingent assets and contingent liabilities, quantified if possible
(e) Amounts committed for future capital expenditure.

Long-Term Assets

.11 Property, plant and equipment—The following items should be disclosed:

(a) Land and buildings
(b) Plant and equipment
(c) Other categories of assets, suitably identified
(d) Accumulated depreciation.

Separate disclosure should be made of leaseholds and of assets being acquired on instalment purchase plans.

.12 Other long-term assets—The following items should be disclosed separately, including, if applicable, the method and period of depreciation and any unusual write-offs during the period:

(a) Long-term investments
   Investments in subsidiaries
Information to Be Disclosed in
Financial Statements

Investments in associated companies
Other investments, stating the market value of listed investments, if different from the carrying amount in the financial statements

(b) Long-term receivables
   Accounts and notes receivable—trade
   Receivables from directors
   Intercompany receivables
   Associated company receivables
   Other

(c) Goodwill

(d) Patents, trademarks, and similar assets

(e) Expenditures carried forward, for example, preliminary expenses, reorganisation expenses, and deferred taxes.

Current Assets
.13 The following items should be disclosed separately:

(a) Cash
   Cash includes cash on hand and current and other accounts with banks. Cash which is not immediately available for use, for example, balances frozen in foreign banks by exchange restrictions, should be disclosed.

(b) Marketable securities, other than long-term investments
   The market value should be disclosed if different from the carrying amount in the financial statements.

(c) Receivables
   Accounts and notes receivable—trade
   Receivables from directors
   Intercompany receivables
   Associated company receivables
   Other receivables and prepaid expenses

(d) Inventories

Long-Term Liabilities
.14 The following items should be disclosed separately, excluding the portion repayable within one year:

Footnote:

The term "intercompany" used in this Statement refers to the presentation in the financial statements of balances or transactions between:
(a) A parent company and its subsidiaries
(b) A subsidiary and its parent company or other subsidiaries in the group.

AC § 9005.14
AICPA Professional Standards
(a) Secured loans
(b) Unsecured loans
(c) Intercompany loans
(d) Loans from associated companies.

A summary of the interest rates, repayment terms, covenants, subordinations, conversion features and amounts of unamortised premium or discount should be shown.

Current Liabilities
.15 The following items should be disclosed separately:
(a) Bank loans and overdrafts
(b) Current portions of long-term liabilities
(c) Payables
   Accounts and notes payable—trade
   Payables to directors
   Intercompany payables
   Associated company payables
   Taxes on income
   Dividends payable
   Other payables and accrued expenses

Other Liabilities and Provisions
.16 The significant items included in other liabilities and in provisions and accruals should be separately disclosed. Examples of such items are deferred taxes, deferred income and provisions for pensions.

Shareholders’ Interests
.17 The following disclosures should be made separately:
(a) Share capital
   For each class of share capital:
   The number or amount of shares authorised, issued and outstanding ²
   The par or legal value per share
   The capital not yet paid in
   The movement in share capital accounts during the period
   The rights, preferences, and restrictions with respect to the distribution of dividends and to the repayment of capital
   Cumulative preferred dividends in arrears

²Shares outstanding refers to shares other than those held as “treasury stock.” Treasury stock are a company's shares which have been acquired by the issuing company or a consolidated subsidiary company and are legally available for reissue or resale. This practice is not permitted in some countries.
Reacquired shares
Shares reserved for future issuance under options and sales contracts, including the terms and amounts.

(b) Other equity, indicating the movement for the period and any restrictions on distribution
   Capital paid in excess of par value (share premium)
   Revaluation surplus
   Reserves
   Retained earnings.

Specific Disclosures—Income Statement
.18 The following information should be disclosed:
   (a) Sales or other operating revenues
   (b) Depreciation
   (c) Interest income
   (d) Income from investments
   (e) Interest expense
   (f) Taxes on income
   (g) Unusual charges
   (h) Unusual credits
   (i) Significant intercompany transactions
   (j) Net income.

Effective Date
.19 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1977.
Accounting Responses to Changing Prices

EXPLANATION

.01 This Statement deals with accounting responses to changing prices.

Changes in the Relationships Between Prices and in the General Level of Prices

.02 Prices do not remain constant. They change over time as the result of various economic and social forces. A change in the general level of prices, as measured by a general price index, reflects changes in the general purchasing power of money. Individual prices may change significantly, independently of each other, and even during times of relative stability in the general level of prices.

.03 Most financial statements are prepared without regard either for changes in the general level of prices, or for changes in specific prices except to the extent that they are reflected in the amounts realised by sale of goods or in the net realisable value of inventories which have fallen below historical cost. The need to remedy the shortcomings of the traditional accounting approach has focused attention on (a) specific price changes and (b) changes in the general level of prices.

Specific Price Changes

.04 The specific prices of goods or other assets held by an enterprise may change while such assets are held. The expression "specific prices" includes buying prices and selling prices. These prices may change whether or not there is a significant change in the general level of prices.

.05 The questions posed by changes in specific prices include:

(a) should assets held at the balance sheet date be presented at historical cost or at a current value, and how should the changes in prices be reflected in the financial statements?
(b) for assets sold or consumed during the accounting period, how should changes in prices of those assets while they were held be dealt with in the financial statements?

.06 There are enterprises which prepare financial statements that recognise both increases and decreases in the replacement prices of assets while they are held. That practice involves the presentation of assets in the balance sheet at their current replacement prices, the recognition in owners’ equity of the effects of changes in those prices, and the recognition in the income statement of current replacement prices of assets sold or used. That practice and others, including some that involve recognition of increases and decreases in selling prices of assets during the period they are held, have been advocated for adoption in place of the historical cost system.

.07 Some proposals recommend the presentation of selected financial statement items based on current prices. This may be done through the adjustment of these items within the financial statements, by the presentation of supplementary information, or by disclosure in the notes to the financial statements.

Changes in the General Level of Prices

.08 Financial statements are traditionally stated in units of money. During inflation or deflation, the value of a unit of money changes—its general purchasing power decreases (inflation) or increases (deflation). The instability of conventional units of money in terms of general purchasing power has led to questions as to whether financial statements should continue to be prepared without regard for changes in the general purchasing power of money.

.09 Proposals have been made for enterprises which issue historical cost financial statements to prepare and present supplementary financial statements in which all items are stated in terms of the general purchasing power of the unit of money at a given date. Some enterprises have adopted these proposals.

.10 Other proposals recommend that the enterprise disclose the effect of changes in the general purchasing power of money on the shareholders’ net equity interest only. This disclosure is usually made as supplementary information or by way of note.

Responding to the Problem of Changing Prices

.11 Financial information intended as a response to the problem of changing prices could be prepared in a number of different ways.

.12 Financial information could be prepared in units of money using current values in place of historical costs. This financial
information would recognise changes in specific prices of assets while they are held but would not recognise inflation or deflation as such.

.13 Financial information could be prepared on the basis of historical costs but with amounts stated in terms of general purchasing power. This financial information would recognise inflation or deflation but would not recognise changes in specific prices of assets while they are held.

.14 Financial information could be prepared by combining features of each of the responses described in paragraphs .12 to .13. This financial information would recognise both changes in specific prices and the influence of inflation or deflation.

.15 There is not yet an international consensus on a single method to reflect the impact of changing prices on financial statements. Many proposals have been issued throughout the world and financial statements are being prepared on the bases suggested in some of these proposals. The development and application of the proposed methods will lead to a considerable improvement in the information provided by financial statements.

.16 At this time harmonisation of the accounting methods on this subject can best be aided by increased disclosure and description of the accounting treatments adopted. It should be expected that a further International Accounting Standard will be issued on the subject of reflecting the impact of changing prices in the financial statements.

INTERNATIONAL ACCOUNTING STANDARD 6

ACCOUNTING RESPONSES TO CHANGING PRICES

International Accounting Standard 6 comprises paragraphs .17—.18 of this Statement. The Standard should be read in the context of paragraphs .01—.16 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.17 In complying with International Accounting Standard 1, Disclosure of Accounting Policies [section 9001], enterprises should present in their financial statements information that describes the procedures adopted to reflect the impact on the financial statements of specific price changes, changes in the general level of prices, or of both. If no such procedures have been adopted that fact should be disclosed.

¹The proposals that have been issued in IASC Member countries as at 30 November 1976 are briefly described in a Discussion Paper entitled "Treatment of Changing Prices in Financial Statements: A Summary of Proposals" issued 1 March 1977. The Discussion Paper is available from the IASC Member accountancy bodies.
.18 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1978.
Statement of Changes in
Financial Position

Issue date unless otherwise indicated:
October, 1977

INTRODUCTION
.01 This Statement deals with the presentation of a statement which summarises for the period the resources made available to finance the activities of an enterprise and the uses to which such resources have been put. The title “Statement of Changes in Financial Position” is descriptive of a statement with that objective.¹

EXPLANATION
.02 A statement of changes in financial position is often presented with the balance sheet and the income statement as an integral part of the financial statements. The inclusion of such a statement is useful to improve the understanding of the operations and activities of an enterprise for the reporting period.

.03 The statement of changes in financial position is prepared from financial data generally identifiable in the income statement, balance sheet and related notes. However, the statement of changes in financial position presents information which may not be readily available in a usable form in the other two statements. Sufficient information is generally given to enable the reconciliation of the amounts in the statement of changes in financial position to the related amounts in the other statements.

.04 For purposes of this Statement, the term “funds” generally refers to cash, to cash and cash equivalents, or to working capital. In a statement of changes in financial position the particular use of the term is made clear.

Funds Provided From or Used in Operations
.05 Funds provided from or used in the operations of an enterprise are normally shown separately in the statement of changes in financial position. This information indicates the extent to which an enterprise has generated funds from or used funds in its operations.

¹The title “Statement of Changes in Financial Position” is used throughout this Statement; in some countries “Statement of Source and Application of Funds”, or a similar title, is used.
.06 Items which do not relate to the ordinary activities of an enterprise are often presented in the income statement separately from income from the ordinary activities. This practice improves the usefulness of the financial statements. For similar reasons such items are presented separately in the statement of changes in financial position either individually or as a single amount. For the purpose of this Statement these items are referred to as "unusual items".

.07 Different forms of presentation can be used to present the amount of funds provided from or used in the operations of an enterprise. A method commonly used is to show the net income (or loss) and to make adjustments for those revenues or expenses that do not involve a movement of funds in the current period (for example, depreciation). An alternative method is to begin with revenues that provided funds during the period and deduct the costs and expenses that involve a movement of funds. The resulting amount is described as funds from operations.

.08 When unusual items are presented separately in a statement of changes in financial position, they also are adjusted to the extent that they do not involve a movement of funds in the current period.

Other Sources and Uses of Funds

.09 Other sources and uses of funds are stated separately from the funds provided from or used in the operations. These include, for example:

(a) proceeds from the sale of long-term assets
(b) outlays for the purchase of long-term assets
(c) dividends in cash or other assets
(d) issue of long-term debt
(e) redemption and repayment of long-term debt
(f) issue of shares for cash or other assets
(g) redemption or repurchase of shares for cash or other assets.

.10 Some financing transactions of an enterprise involve the exchange of one form of security for another. When such exchanges are equivalent to the issue of one security and the redemption of the other, these transactions are part of the financing and investing activities of an enterprise and are disclosed in the statement of changes in financial position. An example of such a transaction is the conversion of long-term debt to common or ordinary shares.

.11 To achieve the objective of the statement of changes in financial position, it may be necessary to disclose separately the
investment and financing aspects of each type of transaction. For example, the proceeds on disposal of long-term assets are presented separately from the outlay for acquisition of long-term assets and, when an asset is acquired through the issue of long-term debt or equity, the issue of debt or equity and the acquisition of the asset are separately disclosed.

Consolidated Statement of Changes in Financial Position

.12 If a consolidated balance sheet and a consolidated income statement are presented, a statement of changes in financial position may be presented only on a consolidated basis. Under some circumstances it may also be appropriate to present a statement of changes in financial position with respect to the financial statements of the parent company.

Investments Accounted for Using the Equity Method

.13 In the statement of changes in financial position there are two methods of dealing with income from an investee company accounted for using the equity method of accounting.

.14 The amounts included in funds provided from or used in the operations as a result of such an investment may be restricted to the dividends received or currently receivable. This method is based on the view that the unremitted earnings of such an investee company do not represent current resources available to the investor. Under this method the adjustments described in paragraph .07 include the portion of the income from the investee company that does not involve a movement of funds.

.15 Alternatively, the investor's entire share of investee earnings can be included in funds provided from or used in operations and no adjustment is required in determining funds provided from or used in the operations. Under this method, the unremitted portion of the income from the investee company is shown separately as a use of funds.

Acquisition or Disposal of Subsidiaries

.16 The acquisition or disposal of subsidiaries may be presented in the statement of changes in financial position as a single amount. Alternatively, the amounts of the individual assets and liabilities acquired or disposed of may be included with the separate sources and uses of funds of each asset and liability dealt with in the statement.

.17 Under both methods of presenting the acquisition or disposal of subsidiaries the following supplementary information is presented

---

8 Not applicable to business combinations described as mergers or poolings of interest.
either in the statement of changes in financial position or by way of note:

(a) the total purchase or disposal price of the subsidiary,
(b) the portion of the purchase or disposal price discharged by cash and cash equivalents,
(c) the amount of cash and other working capital items in the subsidiary acquired or disposed of,
(d) the amounts of the other assets and liabilities in the subsidiary acquired or disposed of, summarised by each major category.

Presentation

.18 Several forms of presentation are used for the statement of changes in financial position. For example, the statement may show the sources of funds as equal to the uses of funds. Another form of presentation is to show a difference between the sources and the uses of funds which represents the net increase or decrease either in cash and cash equivalents or in working capital. No particular form of presentation is preferable for all enterprises, but the enterprise selects the form of presentation considered most informative in the circumstances.

.19 When a net change in working capital is presented as a single amount in the statement of changes in financial position, additional disclosure regarding changes in individual working capital items is often presented.

INTERNATIONAL ACCOUNTING STANDARD 7

STATEMENT OF CHANGES IN FINANCIAL POSITION

International Accounting Standard 7 comprises paragraphs .20—.23 of this Statement. The Standard should be read in the context of paragraphs .01—.19 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.20 A statement of changes in financial position should be included as an integral part of the financial statements. The statement of changes in financial position should be presented for each period for which the income statement is presented.

.21 Funds provided from or used in the operations of an enterprise should be presented in the statement of changes in financial position separately from other sources or uses of funds. Unusual items which are not part of the ordinary activities of the enterprise should be separately disclosed in the statement.
.22 Each enterprise or group of enterprises should adopt the form of presentation for the statement of changes in financial position which is most informative in the circumstances.

Effective Date
.23 This International Accounting Standard becomes operative for financial statements covering reporting periods beginning on or after 1 January 1979.

\[ \text{The next page is 11,151.} \]
Unusual and Prior Period Items
and Changes in Accounting Policies

INTRODUCTION
.01 International Accounting Standard 5 [section 9005], Information to be Disclosed in Financial Statements, requires certain specific information to be disclosed in the income statement, including the identification of an amount described as net income \(^1\) for the period. This Statement deals with the treatment in the income statement \(^2\) of unusual items, prior period items, and changes in accounting policies and estimates.

.02 This Statement does not deal with the treatment of revaluations in excess of historical cost or depreciated historical cost, nor does it deal with the treatment of the tax effects of unusual items, prior period items, and changes in accounting policies and estimates.

Definitions
.03 For purposes of this Statement, the following terms are used:
Unusual items are gains or losses that derive from events or transactions that are distinct from the ordinary activities of the enterprise and therefore are not expected to recur frequently or regularly.
Prior period items are charges or credits that arise in the current period as a result of errors or omissions in the preparation of the financial statements of one or more prior periods.

EXPLANATION
.04 The income statement is the principal financial statement used to present the results of operations of an enterprise for a period. Two views are commonly expressed about which items should be included in the amount described as net income for the period. They are commonly referred to as "the current operating performance concept" and "the all inclusive concept".

\(^1\) Terms such as earnings or net profit may also be used; if a loss is incurred the term employed is net loss.

\(^2\) This financial statement may also be known as a profit and loss account.
.05 Under the current operating performance concept, non-recurring items are excluded from reported net income. These items are shown after the determination of net income or as adjustments to retained earnings. Some consider that this approach facilitates comparisons between the current and prior periods because only items related to the recurring operations of the enterprise are included in the income statement. However, there is a danger that the importance of items excluded from reported net income may not be clearly recognised by users of the financial statements.

.06 Under the all-inclusive concept, transactions causing a net increase or decrease in shareholders' interests during the period, other than dividends and other transactions between the enterprise and its shareholders, are included in the net income for the period. Non-recurring items, including unusual items arising in the current period, prior period items, or adjustments related to changes in accounting policies, are included in net income but there may be separate disclosure of the individual amounts.

.07 Advocates of the all-inclusive concept claim that reporting in the income statement of items affecting the shareholders' interests during the period, other than dividends and other transactions between the enterprise and its shareholders, provides more useful information for the users of financial statements to enable them to evaluate the importance of the items and their effects on operating results. Although the all-inclusive concept is generally supported, there are circumstances in which it may be considered desirable to report certain items outside the income statement for the current period. However, unusual items are generally included in net income.

Income Attributable to Ordinary Activities

.08 Under both concepts referred to in paragraph .04, income from the ordinary activities of the enterprise generally is identified separately from unusual items. The fact that an item, otherwise typical of the ordinary activities of the enterprise, is abnormal in amount or infrequent in occurrence does not qualify the item as unusual. It remains a part of income from the ordinary activities although separate disclosure of its nature and amount may be appropriate. An example of such an item would be the write-off of a very large receivable from a regular trade customer.

Unusual Items

.09 Items described in some countries as extraordinary or special items are included within the term "unusual item" as used in this Statement. In those countries the terms extraordinary or special items have a defined meaning and a requirement
norm ally exists for the incorporation of a sub-total within the income statement described as "income before extraordinary (or special) items". This Statement does not set forth the specific format of the income statement. Instead it places emphasis on the separate disclosure of unusual items with an explanation of their nature.

.10 The gains or losses that may require separate disclosure as unusual items are not determined solely by the nature of the event or transaction but by the nature of the event or transaction in relation to the business ordinarily carried on by the enterprise. For example, in an enterprise which regularly trades in properties, the gains or losses arising on the sale of property would not be an unusual item.

**Prior Period Items**

.11 In rare circumstances, events come to light in the current financial period which show that the financial statements of one or more previous periods were prepared and presented on a wrong or inaccurate basis as a result of an error or an omission. The financial adjustments arising out of such events are referred to in this Statement as prior period items. Prior period items should not be confused with accounting estimates which are, by their nature, approximations that may need correction as additional information becomes known in subsequent periods. The charge or credit arising on the outcome of a contingency, which at the time of occurrence could not be estimated accurately, does not constitute the correction of an error but rather a change in estimate. Such an item is not treated as a prior period item.

.12 Prior period items are sometimes reported by adjusting opening retained earnings in the financial statements for the current period and amending the comparative information in respect of prior years which is included in the financial statements. Sometimes prior period items are reported as unusual items in the determination of net income for the current period. Supplementary information may be presented on a pro forma basis to show what the effect on income in prior periods would have been if the items had been reported in the period to which they relate.

.13 In order to facilitate comparisons between one period and another, amendment of the comparative information which is included in financial statements in respect of prior periods is useful to correct erroneous financial information presented in the previous financial statements. Whichever method is adopted, there is full disclosure of the amount and nature of the prior period items.
Changes in Accounting Policies

.14 A fundamental accounting assumption is that accounting policies are consistently applied—see International Accounting Standard 1 [section 9001], Disclosure of Accounting Policies. A change in an accounting policy used for reporting purposes is made only if the adoption of a new accounting policy is required by statute or by an accounting standard setting body, or if it is considered that the change would result in a more appropriate presentation of the financial statements of an enterprise. In all cases, it is necessary to present an explanation of the reason for a change.

.15 A change in an accounting policy can be introduced into the financial statements in different ways. The new policy may be applied:

(a) to the current and future financial statements. When practicable, supplementary information is presented on a pro forma basis to show what the effect on income in prior periods would have been if the new policy had then been in use;

(b) retroactively, as though it had always been in use. When a new policy is applied retroactively, the statements of income for all periods presented may be adjusted to reflect the new policy; or

(c) by presenting as a single item in the income statement for the current period the amount of the cumulative effect on retained earnings at the beginning of the period in which the change is made. Pro forma information is ordinarily presented to show what the effect on income of prior periods would have been if the new policy had then been in use.

Changes in Accounting Estimates

.16 The preparation of financial statements involves making estimates which are based on the circumstances existing at the time when the financial statements are prepared. For example, estimates are required of uncollectable receivables, inventory obsolescence, and the useful lives of depreciable assets. It may be necessary to revise an estimate in a subsequent period if there is a change in the circumstances on which the estimate was based. Revision of an estimate does not bring the resulting amount within the definition either of an unusual item or of a prior period item. Revision of an estimate that relates to an item that was treated as an unusual item is itself reported as unusual. A change in an accounting estimate sometimes has so material an effect on the income trend of the enterprise that there is a need to disclose the effects of the change.
.17 It is sometimes difficult to distinguish between a change in an accounting policy and a change in an accounting estimate. For example, an enterprise may change from deferring and amortising a cost to reporting it as an expense when incurred because the estimated future benefits have become uncertain. In those cases where it is difficult to draw a clear distinction, it is usual for such changes to be treated as changes in accounting estimates, with appropriate disclosure.

INTERNATIONAL ACCOUNTING STANDARD 8

UNUSUAL AND PRIOR PERIOD ITEMS AND CHANGES IN ACCOUNTING POLICIES

International Accounting Standard 8 comprises paragraphs .18—.24 of this Statement. The Standard should be read in the context of paragraphs .01—.17 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.18 Income from the ordinary activities of the enterprise during the period should be disclosed in the income statement as part of net income 3. Unusual items should be included in net income; the nature and amount of each such item should be separately disclosed.

.19 Prior period items and the amount of the adjustments, if any, resulting from changes in accounting policies should be either:

(a) reported by adjusting opening retained earnings in the financial statements for the current period and amending the comparative information in respect of prior years which is included in the financial statements, or

(b) separately disclosed in the current income statement as part of net income.

In either case the disclosure relating to these items should be adequate to facilitate comparisons of the figures for the periods presented.

.20 A change in an accounting policy should be made only if the adoption of a different accounting policy is required by statute or by an accounting standard setting body or if it is considered that the change would result in a more appropriate presentation of the financial statements of an enterprise.

.21 If there is a change in an accounting policy that has a material effect in the current period, or may have a material effect in subsequent periods, the effect of the change should be

---

3 Terms such as earnings or net profit may also be used; if a loss is incurred, the term employed is net loss.
disclosed and quantified together with the reasons for the change (see International Accounting Standard 1 [section 9001], Disclosure of Accounting Policies).

.22 A change in an accounting estimate should be accounted for as part of income from the ordinary activities of the enterprise in:

(a) the period of change if the change affects the period only, or

(b) the period of change and future periods if the change affects both.

Revision of an estimate that relates to an item that was treated as an unusual item should itself be reported as unusual.

.23 If there is a change in an accounting estimate that has a material effect in the current period, or may have a material effect in subsequent periods, the effect of the change should be disclosed and quantified.

Effective Date

.24 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1979.

**Accounting for Research and Development Activities**

INTRODUCTION

.01 This Statement deals with accounting for research and development activities.

.02 The Statement does not deal with the following specialised activities:

(a) research and development activities conducted for others under a contract

(b) exploration for oil, gas and mineral deposits

(c) research and development activities of development stage enterprises.

Definitions

.03 The following terms are used in this Statement with the meanings specified:

*Research* is original and planned investigation undertaken with the hope of gaining new scientific or technical knowledge and understanding.

*Development* is the translation of research findings or other knowledge into a plan or design for the production of new or substantially improved materials, devices, products, processes, systems or services prior to the commencement of commercial production.

EXPLANATION

.04 An enterprise undertakes a programme of creative work to increase the stock of its scientific and technical knowledge and to devise new applications which will contribute to the maintenance of its business and its competitive position. The accounting treatment and disclosure of the costs of research and development activities are therefore important for users of financial statements.
The Costs of Research and Development Activities

.05 There can be practical difficulties in deciding the amounts of the costs specifically attributable to research and development activities. In order to achieve a reasonable degree of comparability between enterprises, and between accounting periods of the same enterprise, it is necessary to identify the elements comprising research and development costs.

.06 The costs incurred for research and development activities include the following:

(a) salaries, wages and other related costs of personnel
(b) the costs of materials and services consumed
(c) the depreciation of equipment and facilities
(d) a reasonable allocation of overhead costs. This allocation is made on bases similar to those used in allocating overhead costs to inventories (see International Accounting Standard 2 [section 9002], Valuation and Presentation of Inventories in the Context of the Historical Cost System)
(e) other costs, such as the amortisation of patents and licences.

.07 Costs incurred to maintain production or to promote sales of existing products are excluded from the costs of research and development activities. Thus, the costs of routine or periodic minor modifications to existing products, production lines, manufacturing processes and other ongoing operations as well as routine or promotional costs of market research activities are excluded.

.08 However, market research activities undertaken prior to the commencement of commercial production to establish the usefulness of a product or the existence of a potential market are similar to development activities. In these cases, the related costs are sometimes treated in the same way as development costs and are written off or deferred based on the same considerations.

The Accounting Treatment of Research and Development Costs

.09 The allocation of the costs of research and development activities to accounting periods is determined by their relationship to the expected future benefits to be derived from these activities. In most cases there is little, if any, direct relationship between the amount of current research and development costs and future benefits because the amount of such benefits, and the periods over which they will be received, are usually too uncertain. Research and development costs are therefore usually
charged to expense in the period in which they are incurred.  
.10 If it can be demonstrated, however, that the product or process is technically and commercially feasible and that the enterprise has adequate resources to enable the product or process to be marketed, the uncertainties referred to in paragraph .09 may be significantly reduced. In such circumstances, it may be appropriate to defer the costs of development activities to future periods. Development costs previously written off are not reinstated because they were incurred at a time when the technical and commercial feasibility of the project was too uncertain to establish a relationship with future benefits and they were therefore proper charges to those past periods.

.11 Deferred development costs are amortised on a systematic basis, either by reference to the sale or use of the product or process or by reference to a reasonable time period. Technological and economic obsolescence creates uncertainties that restrict the number of units and the time period over which deferred costs are to be amortised.

Disclosure

.12 The accounting policy adopted for the costs of research and development activities is included in the statement of accounting policies (see International Accounting Standard 1 [section 9001], Disclosure of Accounting Policies). When applicable, information about amortisation practices is also required (see International Accounting Standard 5 [section 9005], Information to Be Disclosed in Financial Statements).

.13 The disclosure of (a) research and development costs, including the amortisation of deferred development costs, charged as an expense of each period, and (b) the unamortised balance, if any, of deferred development costs, enables the users of financial statements to consider the significance of such activities in relation to those of other enterprises as well as to the other activities of the enterprise itself.

.14 Further information which might usefully be provided could include a general description of the project, the stage which the project has reached, and the estimated future costs to complete it.
INTERNATIONAL ACCOUNTING STANDARD 9

ACCOUNTING FOR RESEARCH AND DEVELOPMENT ACTIVITIES

International Accounting Standard 9 comprises paragraphs .15-.25 of this Statement. The Standard should be read in the context of paragraphs .01-.14 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.15 Research and development costs should include:
   (a) the salaries, wages and other related costs of personnel engaged in research and development activities
   (b) the costs of materials and services consumed in research and development activities
   (c) the depreciation of equipment and facilities to the extent that they are used for research and development activities
   (d) overhead costs related to research and development activities,
   (e) other costs related to research and development activities, such as the amortisation of patents and licences.

.16 The amount of the research and development costs described in paragraph .15 should be charged as an expense of the period in which they are incurred except to the extent that development costs are deferred in accordance with paragraph .17.

.17 Development costs of a project may be deferred to future periods if all the following criteria are satisfied:
   (a) the product or process is clearly defined and the costs attributable to the product or process can be separately identified;
   (b) the technical feasibility of the product or process has been demonstrated;
   (c) the management of the enterprise has indicated its intention to produce and market, or use, the product or process;
   (d) there is a clear indication of a future market for the product or process or, if it is to be used internally rather than sold, its usefulness to the enterprise can be demonstrated; and
   (e) adequate resources exist, or are reasonably expected to be available, to complete the project and market the product or process.
.18 The deferral of development costs of a project under the criteria in paragraph .17 should be limited to the amount that, taken together with further development costs, related production costs, and selling and administrative costs directly incurred in marketing the product, can reasonably be expected to be recovered from related future revenues.

.19 If an accounting policy of deferral of development costs is adopted, it should be applied to all development projects that meet the criteria in paragraph .17.

.20 If development costs of a project are deferred, they should be allocated on a systematic basis to future accounting periods by reference either to the sale or use of the product or process or to the time period over which the product or process is expected to be sold or used.

.21 The deferred development costs of a project should be reviewed at the end of each accounting period. When the criteria of paragraph .17, which previously justified the deferral of the costs, no longer apply, the unamortised balance should be charged as an expense immediately. When the criteria for deferral continue to be met but the amount of deferred development costs (and other relevant costs as set out in paragraph .18) that can reasonably be expected to be recovered from related future revenues is exceeded by the unamortised balance of such costs, the excess should be charged as an expense immediately.

.22 Development costs once written off should not be reinstated even though the uncertainties which had led to their being written off no longer exist.

Disclosure

.23 The total of research and development costs, including amortisation of deferred development costs, charged as expense should be disclosed.

.24 The movement in and the balance of unamortised deferred development costs should be disclosed. The basis, proposed or adopted, for the amortisation of the unamortised balance should also be disclosed.

Effective Date

.25 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1980.
COMPARISON OF INTERNATIONAL ACCOUNTING STANDARD 9 WITH GENERALLY ACCEPTED ACCOUNTING PRINCIPLES IN THE UNITED STATES

Paragraph 11 of Statement of Financial Accounting Standards No. 2 [section 4211.11] provides that the costs of research and development activities shall include the costs of materials, equipment, facilities, and intangibles that are acquired for a particular research and development project and have no alternative future use. Those costs are to be charged to expense when the items are acquired even if that precedes the period in which they are consumed or used.

In describing the costs of research and development activities, International Accounting Standard 9 makes no distinction between the cost of items that are acquired for a particular research and development project and have no alternative future use and the cost of other items acquired for research and development activities.

Paragraph 6 of International Accounting Standard 9 states:

"The costs incurred for research and development activities include the following . . .
(b) the costs of materials and services consumed
(c) the depreciation of equipment and facilities . . .
(e) other costs, such as the amortisation of patents and licences."

Thus, the cost of items that are acquired for a particular research and development project and have no alternative future use (in other research and development projects or otherwise) are, according to Statement of Financial Accounting Standards No. 2 [section 4211], to be expensed when the items are acquired and, according to International Accounting Standard 9, are to be expensed when the items are consumed.

AC Section 9010

Contingencies and Events
Occurring After the
Balance Sheet Date

INTRODUCTION
.01 This Statement deals with the treatment in financial statements of:
(a) contingencies, and
(b) events occurring after the balance sheet date.

.02 The following subjects, which may result in contingencies, are excluded from the scope of this Statement:
(a) liabilities of life assurance companies arising from policies issued
(b) obligations under retirement benefit plans
(c) commitments arising from long-term lease contracts
(d) taxes on income.

Definitions
.03 The following terms are used in this Statement with the meanings specified:

A contingency is a condition or situation, the ultimate outcome of which, gain or loss, will be confirmed only on the occurrence, or non-occurrence, of one or more uncertain future events.

Events occurring after the balance sheet date are those events, both favourable and unfavourable, that occur between the balance sheet date and the date on which the financial statements are authorised for issue. Two types of events can be identified:
(1) those that provide further evidence of conditions that existed at the balance sheet date, and
(2) those that are indicative of conditions that arose subsequent to the balance sheet date.

EXPLANATION
Contingencies
.04 The term contingencies used in this Statement is restricted to conditions or situations at the balance sheet date, the financial effect of
which is to be determined by future events which may or may not occur. Many such conditions or situations are reflected in accruals in financial statements in following the fundamental accounting concept of accrual.

.05 Estimates are required in financial statements for many on-going and recurring activities of an enterprise. However, the fact that an estimate is involved does not of itself create the type of uncertainty which characterises a contingency, although the procedures for determining the amounts stated in the financial statements may be similar. For example, the fact that estimates of useful life are used to determine depreciation does not make depreciation a contingency; the eventual expiry of the useful life of the asset is not uncertain. Also, amounts owed for services received are not contingencies as defined in paragraph .03, even though the amounts may have been estimated; there is nothing uncertain about the fact that these obligations have been incurred.

.06 The uncertainty relating to future events can be expressed by a range of outcomes. This range may be presented as quantified probabilities, but in most circumstances this suggests a level of precision that is not supported by the available information. The range of outcomes can also be presented by general description, using terms ranging from probable to remote.

.07 The estimates of the outcome and of the financial effect of contingencies are determined by the judgement of the management of the enterprise. This judgement is based on consideration of information available up to the date on which the financial statements are authorised for issue and will include a review of events occurring after the balance sheet date, supplemented by experience of similar transactions and, in some cases, reports from independent experts.

The Accounting Treatment of Contingent Losses

.08 The accounting treatment of a contingent loss is determined by the expected outcome of the contingency. If it is probable that a contingency will result in a loss to the enterprise then it is prudent to accrue that loss in the financial statements.

.09 The estimation of the amount of a contingent loss to be accrued in the financial statements may be based on information that provides a range of amounts of loss which could result from the contingency. The best estimate of the loss within such a range is accrued. When no amount within the range is indicated as a better estimate than any other amount, at least the minimum amount in the range is accrued. Disclosure of any additional exposure to loss is made if there is a possibility of loss in excess of the amount accrued.
If there is conflicting or insufficient evidence on which to estimate the amount of a contingent loss, then disclosure is made of the existence and nature of the contingency.

A potential loss to an enterprise may be reduced or avoided because a contingent liability is matched by a related counter-claim or claim against a third party. In such cases the amount of any accrual may be determined after taking into account the probable recovery under the claim.

The existence and amount of guarantees, obligations arising from discounted bills of exchange and similar obligations undertaken by an enterprise are generally disclosed in financial statements by way of note, even though it is remote that a loss to the enterprise will occur.

Amounts accrued for general or unspecified business risks do not relate to conditions or situations existing at the balance sheet date, and therefore are not justified as provisions for contingencies.

The Accounting Treatment of Contingent Gains

Contingent gains are not accrued in financial statements since this may result in the recognition of revenue which may never be realised. However, when the realisation of a gain is virtually certain, then such a gain is not a contingency and accrual of the gain is appropriate.

The Determination of the Amounts at which Contingencies are Included in Financial Statements

The amount at which a contingency is stated in the financial statements is based on the information which is available at the date on which the financial statements are authorised for issue. Events occurring after the balance sheet date that indicate that an asset may have been impaired or that a liability may have existed at the balance sheet date are therefore taken into account in identifying contingencies and in determining the amounts at which such contingencies are included in financial statements.

In some cases each contingency can be separately identified, and the special circumstances of each situation considered in the determination of the amount of the contingency. A substantial legal claim against the enterprise may represent such a contingency. Among the factors taken into account by management in evaluating the contingency are the progress of the claim at the date on which the financial statements are authorised for issue, the opinions of legal experts or other advisers, the experience of the enterprise in similar cases and the experience of other enterprises in similar situations.

If the uncertainties which created a contingency in respect of an individual transaction are common to a large number of similar trans-
actions, then the amount of the contingency need not be individually determined, but may be based on the group of similar transactions. Examples of such contingencies may be warranties for products sold and the estimated uncollectable portion of accounts receivable. These costs are usually incurred frequently and experience provides a means by which the amount of the liability or loss can be estimated with reasonable precision although the particular transactions that may result in a loss are not identified. Accrual of these costs results in their recognition in the same accounting period in which the related transactions took place.

**Events Occurring After the Balance Sheet Date**

.18 Events which occur between the balance sheet date and the date on which the financial statements are authorised for issue may indicate the need for adjustments to assets and liabilities or may require disclosure.

.19 The process involved in the authorisation for issue of the financial statements will vary depending upon the management structure and procedures followed in preparing and finalising the financial statements, but the date of authorisation for issue would normally be the date on which the statements are authorised for issue outside the enterprise.

.20 Adjustments to assets and liabilities are required for events occurring after the balance sheet date that provide additional information for determining the amounts relating to conditions existing at the balance sheet date. For example, adjustments may be made for a loss on a trade receivable account which is confirmed by the bankruptcy of a customer which occurs after the balance sheet date.

.21 Adjustments to assets and liabilities are not appropriate for events occurring after the balance sheet date, if such events do not relate to conditions existing at the balance sheet date. An example is the decline in market value of investments between the balance sheet date and the date on which the financial statements are authorised for issue. The fall in market value does not normally relate to the condition of the investments at the balance sheet date, but reflects circumstances which have occurred in the following period. However, disclosure is generally made of events in subsequent periods that represent unusual changes to the condition of assets or liabilities at the balance sheet date; for example, the destruction of a major production plant by a fire after the balance sheet date.

.22 Events occurring after the balance sheet date that are indicative of conditions that arose subsequent to the balance sheet date are disclosed if their non-disclosure would affect the ability of the users of the financial statements to make proper evaluations and decisions. An example of such an event would be a major acquisition of another enterprise.
.23 There are events which, although they take place after the balance sheet date, are sometimes reflected in the financial statements because of statutory requirements or because of their special nature. In some countries these special items include the amount of the dividend proposed or declared after the balance sheet date in respect of the period covered by the financial statements.\[1\]

.24 Events occurring after the balance sheet date may indicate that the whole or part of the business of the enterprise ceases to be a going concern. A deterioration in operating results and financial position after the balance sheet date may indicate a need to consider whether it is proper to use the going concern assumption in the preparation of the financial statements.

Disclosure—Contingencies

.25 If a contingent loss is not accrued, its nature and an estimate of its financial effect are generally disclosed by way of note unless the possibility of a loss is remote. However, if a reliable estimate of the financial effect cannot be made, this fact is disclosed. Contingencies which are accrued may warrant separate disclosure. The existence and nature of contingent gains are usually disclosed by way of note in financial statements if it is probable that the gain will be realised by the enterprise. It is important that the disclosure avoid giving misleading implications as to the likelihood of realisation.

Disclosure—Events Occurring After the Balance Sheet Date

.26 When the effects of events occurring after the balance sheet date are disclosed in the notes to the financial statements, to enable users of financial statements to make proper evaluations and decisions, the information given includes a description of the events and an estimate, if possible, of their financial effects.

\[1\] [Editor's Note] This paragraph refers to the situation in some countries in which dividends are formally attributed to a particular period. That situation does not exist in the U. S. where generally no liability for payment of dividends exists until dividends are declared. Under generally accepted accounting principles, dividends declared after the balance sheet date are generally not required to be disclosed. For the treatment of stock dividends declared after the balance sheet date, see APB Opinion No. 15, paragraph 48 [AC section 2011A.03].

AICPA Professional Standards
INTERNATIONAL ACCOUNTING STANDARD 10

Contingencies and Events Occurring After the Balance Sheet Date

International Accounting Standard 10 comprises paragraphs .27-.35 of this Statement. The Standard should be read in the context of paragraphs .01-.26 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

Contingencies

.27 The amount of a contingent loss should be accrued by a charge in the income statement if:
   (a) it is probable that future events will confirm that, after taking into account any related probable recovery, an asset has been impaired or a liability incurred at the balance sheet date, and
   (b) a reasonable estimate of the amount of the resulting loss can be made.

.28 The existence of a contingent loss should be disclosed in the financial statements if either of the conditions in paragraph .27 is not met, unless the possibility of a loss is remote.

.29 Contingent gains should not be accrued in financial statements. The existence of contingent gains should be disclosed if it is probable that the gain will be realised.

Events Occurring After the Balance Sheet Date

.30 Assets and liabilities should be adjusted for events occurring after the balance sheet date that provide additional evidence to assist with the estimation of amounts relating to conditions existing at the balance sheet date or that indicate that the going concern assumption in relation to the whole or a part of the enterprise is not appropriate.

.31 Dividends stated to be in respect of the period covered by the financial statements and that are proposed or declared after the balance sheet date but before approval of the financial statements should be either adjusted for or disclosed.  

.32 Assets and liabilities should not be adjusted for, but disclosure should be made of, those events occurring after the balance sheet date that do not affect the condition of assets or liabilities at the balance sheet date, but are of such importance that non-disclosure would affect the ability

[2] See footnote 1 at paragraph .23.
of the users of the financial statements to make proper evaluations and decisions.

Disclosure

.33 If disclosure of contingencies is required by paragraphs .28 or .29 of this Statement, the following information should be provided:

(a) the nature of the contingency
(b) the uncertain factors that may affect the future outcome
(c) an estimate of the financial effect, or a statement that such an estimate cannot be made.

.34 If disclosure of events occurring after the balance sheet date is required by paragraph .32 of this Statement, the following information should be provided:

(a) the nature of the event
(b) an estimate of the financial effect, or a statement that such an estimate cannot be made.

Effective Date

.35 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1980.

The next page is 11,181.
INTRODUCTION

.01 This Statement deals with accounting for construction contracts in the financial statements of contractors.

.02 For the purposes of this Statement a construction contract is a contract for the construction of an asset or of a combination of assets which together constitute a single project. Examples of activity covered by such contracts include the construction of bridges, dams, ships, buildings and complex pieces of equipment.

.03 The feature which characterises a construction contract dealt with in this Statement is the fact that the date at which the contract activity is entered into and the date when the contract activity is completed fall into different accounting periods. The specific duration of the contract performance is not used as a distinguishing feature of a construction contract.

.04 Contracts for the provision of services come within the scope of this Statement to the extent that they are directly related to a contract for the construction of an asset. Examples of such service contracts are contracts for the services of project managers and architects and for technical engineering services related to the construction of an asset.

EXPLANATION

.05 The principal problem relating to accounting for construction contracts is the allocation of revenues and related costs to accounting periods over the duration of the contract.

Types of Construction Contracts

.06 Construction contracts are formulated in a variety of ways, but generally fall into two basic types:

(a) fixed price contracts—the contractor agrees to a fixed contract price, or rate, in some cases subject to cost escalation clauses.
(b) cost plus contracts—the contractor is reimbursed for allowable or otherwise defined costs, plus a percentage of these costs or a fixed fee.
Both types of contract are within the scope of this Statement.

The Accounting Treatment of Construction Contract Costs and Revenues

.07 Two methods of accounting for contracts commonly followed by contractors are the 'percentage of completion' method and the 'completed contract' method.

.08 Under the percentage of completion method, revenue is recognised as the contract activity progresses. The costs incurred in reaching the stage of completion are matched with this revenue, resulting in the reporting of results which can be attributed to the proportion of work completed.

.09 Under the completed contract method, revenue is recognised only when the contract is completed or substantially completed; that is, when only minor work is expected other than warranty work. Costs and progress payments received are accumulated during the course of the contract but revenue is not recognised until the contract activity is substantially completed.

.10 Under both methods, provision is made for losses for the stage of completion reached on the contract. In addition, provision is usually made for losses on the remainder of the contract.

.11 It may be necessary for accounting purposes to combine contracts made with a single customer or to combine contracts made with several customers if the contracts are negotiated as a package or if the contracts are for a single project. Conversely, if a contract covers a number of projects and if the costs and revenues of such individual projects can be identified within the terms of the overall contract, each such project may be treated as equivalent to a separate contract.

The Costs to be Accumulated for Construction Contracts

.12 The total period to be considered for identifying the costs attributable to a contract is the period that commences with the securing of the contract and closes when the contract is completed.

.13 Therefore, costs incurred by the contractor before a contract is secured are usually treated as expenses of the period in which they are incurred. However, if costs attributable to securing the contract can be separately identified and there is a clear indication that the contract will be obtained, the costs are often treated as applicable to the contract and are deferred. As a practical matter, costs are sometimes deferred until it is clear whether the contract has been secured or not.
.14 Costs attributable to a contract include expected warranty costs. Warranty costs are provided for when such costs can be reasonably estimated (see International Accounting Standard 10 [section 9010], Contingencies and Events Occurring After the Balance Sheet Date).

.15 The costs incurred by an enterprise that undertakes construction contracts can be divided into:

(a) Costs that relate directly to a specific contract
(b) Costs that can be attributed to the contract activity in general and can be allocated to specific contracts
(c) Costs that relate to the activities of the enterprise generally, or that relate to contract activity but cannot be related to specific contracts.

.16 Examples of costs that relate directly to a specific contract include:
- site labour costs, including supervision;
- materials used for project construction;
- depreciation of plant and equipment used on a contract;
- costs of moving plant and equipment to and from a site.

.17 Examples of costs that can be attributed to the contract activity in general and can be allocated to specific contracts include:
- insurance;
- design and technical assistance;
- construction overhead.

.18 Examples of costs that relate to the activities of the enterprise generally, or that relate to contract activity but cannot be related to specific contracts, include:
- general administration and selling costs;
- finance costs;
- research and development costs;
- depreciation of idle plant and equipment that is not used on a particular contract.

.19 Costs referred to in paragraph .18 are usually excluded from the accumulated contract costs because they do not relate to reaching the present stage of completion of a specific contract. However, in some circumstances general administrative expenses, development costs and finance costs are specifically attributable to a particular contract and are sometimes included as part of accumulated contract costs.

The Basis for Recognising Revenue on Construction Contracts

The Percentage of Completion Method

.20 Under the percentage of completion method, the amount of revenue recognised is determined by reference to the stage of completion of the
contract activity at the end of each accounting period. The advantage of
this method of accounting for contract revenue is that it reflects revenue
in the accounting period during which activity was undertaken to earn
such revenue.

.21 The stage of completion used to determine revenue to be recognised
in the financial statements can be measured in a variety of ways; for
example, by calculating the proportion that costs incurred to date bear
to the estimated total costs of the contract, by surveys which measure
work performed and completion of a physical proportion of the contract
work or by a combination of ways.

.22 Progress payments and advances received from customers do not
necessarily reflect the stage of completion and therefore cannot usually
be treated as equivalent to revenue earned.

.23 If the percentage of completion method is applied by calculating
the proportion that costs to date bear to the latest estimated total costs
of the contract, adjustments are made to include only those costs that
reflect work performed. Examples of items which may need adjustment
include:
   (a) the costs of materials that have been purchased for the contract
       but have not been installed or used during contract performance,
       and
   (b) payments to subcontractors to the extent that they do not reflect
       the amount of work performed under the sub-contract.

.24 The application of the percentage of completion method is subject
to a risk of error in making estimates. For this reason, profit is not
recognised in the financial statements unless the outcome of the contract
can be reliably estimated. If the outcome can not be reliably estimated,
the percentage of completion method is not used.

.25 In the case of fixed price contracts, the conditions which will usually
provide this degree of reliability are:
   (a) total contract revenues to be received can be reliably estimated,
       and
   (b) both the costs to complete the contract and the stage of contract
       performance completed at the reporting date can be reliably
       estimated, and
   (c) the costs attributable to the contract can be clearly identified so
       that actual experience can be compared with prior estimates.

.26 In the case of cost plus contracts, the conditions which will usually
provide this degree of reliability are:
   (a) the costs attributable to the contract can be clearly identified, and
costs other than those that will be specifically reimbursable under the contract can be reliably estimated.

The Completed Contract Method

27 The principal advantage of the completed contract method is that it is based on results as determined when the contract is completed or substantially completed rather than on estimates which may require subsequent adjustment as a result of unforeseen costs and possible losses. The risk of recognising profits that may not have been earned is therefore minimised.

28 The principal disadvantage of the completed contract method is that periodic reported income does not reflect the level of activity on contracts during the period. For example, when a few large contracts are completed in one accounting period but no contracts have been completed in the previous period or will be completed in the subsequent period, the level of reported income can be erratic although the level of activity on contracts may have been relatively constant throughout. Even when numerous contracts are regularly completed in each accounting period, and reported income may appear to reflect the level of activity on contracts, there is a continuous lag between the time when work is performed and the related revenue is recognised.

Selection of Method

29 The selection of a method of accounting for a construction contract depends on the view taken by the contractor in respect of the uncertainties attached to the estimates of contract costs and revenues. In some cases, the contractor may decide that the level of uncertainty, produced by variations in work which render recoverable costs and revenue subject to further negotiation or by the inherent problem of making estimates, is so significant that the completed contract method is applied. In other cases, the outcome of the contracts can be reliably estimated and some or all of the contracts may be accounted for using the percentage of completion method. The contractor may be using both methods simultaneously for different contracts.

30 When a contractor uses a method for a particular contract, then all other contracts that meet similar criteria ought to be accounted for by the same method.

31 In addition to the consideration of uncertainties, a contractor may use pre-determined criteria for the selection of an accounting method for construction contracts. For example, contracts for which the revenue is less than a stated value, or which have a duration of less than a certain period of time, may be accounted for by the completed contract method even when the outcome of contracts can be reliably estimated.
.32 The methods of accounting used by the contractor and the criteria adopted in selecting the methods represent an accounting policy that is consistently applied (see International Accounting Standard 1 [section 9001], Disclosure of Accounting Policies).

Change in Accounting Policy

.33 When there is a change in the accounting policy used for construction contracts, there is disclosure of the effect of the change and its amount, together with the reasons for the change (see International Accounting Standard 8 [section 9008], Unusual and Prior Period Items and Changes in Accounting Policies). If the contractor changes from the percentage of completion method to the completed contract method, it may not be possible to quantify the full effect of the change in the current accounting period. In such cases, there is disclosure in respect of contracts in progress at the beginning of the accounting period of at least the amount of attributable profits reported in prior years.

Provision for Foreseeable Losses

.34 When current estimates of total contract costs and revenues indicate a loss, provision is made for the entire loss on the contract irrespective of the amount of work done. In some circumstances, the foreseeable losses may exceed the costs of work done to date. Provision is nevertheless made for the entire loss on the contract.

.35 When a contract is of such magnitude that it can be expected to absorb a considerable part of the capacity of the enterprise for a substantial period, indirect costs to be incurred during the period of the completion of the contract are sometimes considered to be directly attributable to the contract and included in the calculation of the provision for loss on the contract.

.36 If a provision for loss is required, the amount of such provision is usually determined irrespective of:
   (a) whether or not work has commenced on the contract, and
   (b) the stage of completion of contract activity, and
   (c) the amount of profits expected to arise on other unrelated contracts.

.37 The determination of a future loss on a contract may be subject to a high degree of uncertainty. In some cases, it may be possible to accrue the future loss and in other cases only the existence of a contingent loss is disclosed (see International Accounting Standard 10 [section 9010], Contingencies and Events Occurring After the Balance Sheet Date).
Claims and Variations Arising Under Construction Contracts

.38 Amounts due in respect of claims made by the contractor and of variations in contract work approved by the customer are recognised as revenue in the financial statements only in circumstances when, and only to the extent that, the contractor has evidence of the acceptability of the amount of the claim or variation.

.39 Claims or penalties payable by the contractor arising out of delays in completion or from other causes are provided for in full in the financial statements as costs attributable to the contract. Claims in the nature of contingencies are treated in accordance with International Accounting Standard 10 [section 9010], Contingencies and Events Occurring After the Balance Sheet Date.

Progress Payments, Advances and Retentions

.40 Progress payments and advances received from customers in respect of construction contracts are disclosed in financial statements either shown as a deduction from the amount of contract work in progress or as a liability.

.41 Progress payments due but not received and amounts retained by customers until the satisfaction of conditions specified in the contract for release of such amounts are either recognised in financial statements as receivables or alternatively indicated by way of a note.
INTERNATIONAL ACCOUNTING STANDARD 11

ACCOUNTING FOR CONSTRUCTION CONTRACTS

International Accounting Standard 11 comprises paragraphs .42-.49 of this Statement. The Standard should be read in the context of paragraphs .01-.41 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.42 In accounting for construction contracts in financial statements, either the percentage of completion method or the completed contract method should be used.

.43 The percentage of completion method may be used only if the outcome of the contract can be reliably estimated. In the case of fixed price contracts, this degree of reliability would be provided only if all the following conditions are satisfied:

(a) total contract revenues to be received can be reliably estimated, and
(b) both the costs to complete the contract and the stage of contract performance completed at the reporting date can be reliably estimated, and
(c) the costs attributable to the contract can be clearly identified so that actual experience can be compared with prior estimates.

In the case of cost plus contracts, this degree of reliability would be provided only if both the following conditions are satisfied:

(a) the costs attributable to the contract can be clearly identified, and
(b) costs other than those that will be specifically reimbursable under the contract can be reliably estimated.

.44 The costs included in the amount at which construction contract work is stated should comprise those costs that relate directly to a specific contract and those that are attributable to the contract activity in general and can be allocated to specific contracts.

.45 When a contractor uses a method for a particular contract, then all other contracts that meet similar criteria should be accounted for by the same method.

.46 A foreseeable loss on a contract should be provided for in the financial statements, both for the stage of completion reached on the contract and for future work on the contract.
Disclosure

.47 There should be disclosure in the financial statements of:
(a) the amount of construction work in progress, and
(b) cash received and receivable as progress payments, advances and retentions on account of contracts included in construction work in progress, and
(c) the amount receivable under cost plus contracts not included in construction work in progress.

If both the percentage of completion method and the completed contract method are simultaneously used by the contractor, the amount of contract work described in (a) above should be analysed to disclose separately the amounts attributable to contracts accounted for under each method.

.48 Disclosure of changes in an accounting policy used for construction contracts should comply with International Accounting Standard 8 [section 9008], Unusual and Prior Period Items and Changes in Accounting Policies. However, if a contractor changes from the percentage of completion method to the completed contract method for contracts in progress at the beginning of the year, it may not be possible to comply with that standard and quantify the effect of the change. In such cases, disclosure should be made of the amount of attributable profits reported in prior years in respect of contracts in progress at the beginning of the accounting period.

Effective Date

.49 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1980.

AC Section 9012

Accounting for Taxes on Income

INTRODUCTION

.01 This Statement deals with the accounting for taxes on income in financial statements. This includes the determination of the amount of the expense or saving related to taxes on income in respect of an accounting period and the presentation of such an amount in the financial statements.

.02 This Statement does not deal with the methods of accounting for government grants or investment tax credits, and the following taxes are not considered to be within the scope of this Statement:

(a) taxes based on income that are refundable to the enterprise to the extent that the amount of income upon which the tax was based is distributed in the form of dividends;
(b) taxes paid by the enterprise at the time a dividend is distributed that the enterprise may offset against taxes due in respect of its income.

Definitions

.03 In this Statement the following terms are used with the meanings specified:

Accounting income is the aggregate income or loss for a period, including unusual items as reported in the income statement, before deducting related income tax expense or adding related income tax saving.

The tax expense or tax saving for the period is the amount of the taxes charged or credited in the income statement, excluding the amount of taxes related and allocated to those items not dealt with in the current income statement.

Taxable income (tax loss) is the amount of the income (loss) for a period, determined in accordance with the rules established by the taxation authorities, upon which the provision for taxes payable (recoverable) is determined.

Provision for taxes payable is the amount of taxes currently payable in respect of taxable income for the period.

1 Unusual items is defined in International Accounting Standard 8 [section 9008], Unusual and Prior Period Items and Changes in Accounting Policies.
Timing differences are the differences between the taxable income and accounting income for a period that arise because the period in which some items of revenue and expense are included in taxable income does not coincide with the period in which they are included in accounting income. Timing differences originate in one period and reverse in one or more subsequent periods.

Permanent differences are the differences between taxable income and accounting income for a period that originate in the current period and do not reverse in subsequent periods.

EXPLANATION

.04 The provision for taxes payable is calculated in accordance with rules for determining taxable income established by taxation authorities. In many circumstances these rules differ from the accounting policies applied to determine accounting income. The effect of this difference is that the relationship between the provision for taxes payable and accounting income reported in the financial statements may not be representative of the current level of tax rates.

.05 One reason for a difference between taxable income and accounting income is that certain items are considered to be appropriately included in one calculation but are required to be excluded from the other. For example, under many systems of taxation some donations are not an allowable deduction in determining taxable income; however, such amounts would be deducted in determining accounting income. Differences such as these are described as "permanent differences."

.06 Another reason for a difference between taxable income and accounting income is that certain items, considered in determining both amounts, are included in the calculation for different periods. For example, accounting policies may specify that certain revenues are included in accounting income at the time goods or services are delivered but tax rules may require or allow their inclusion at the time cash is collected. The total of these revenues included in accounting income and taxable income will ultimately be the same, but the periods of inclusion will differ. Another example is when the depreciation rate used in determining taxable income differs from that used in determining accounting income. These types of difference are described as "timing differences."

.07 When gains or losses are credited or charged directly to shareholders' interests, timing differences and permanent differences may also occur.

.08 The origination and reversal of timing differences may relate to more than one accounting period. Information on the nature and amount of these timing differences is often considered to be useful to the users of financial statements. However, the method of reflecting the effect of
Accounting for Taxes on Income

Timing differences varies. Sometimes the information is included in notes to the financial statements; sometimes the effect of these differences is reflected by the application of tax effect accounting methods.

.09 The revaluation of individual assets in the financial statements or the general application of current value accounting may result in differences between taxable income and accounting income. This matter is dealt with in paragraphs .28-.30.

Taxes Payable Method

.10 Under the taxes payable method, tax expense in respect of the current period is normally equal to the provision for taxes payable. The extent and potential tax effect of timing differences are sometimes disclosed in notes to the financial statements.

.11 Support for this method may be based on the view that taxes are a distribution of income rather than an operating expense of the enterprise. However, there is a broad consensus that taxes on income are expenses. Other support for the taxes payable method may be based on the view that tax effects of timing differences are part of the tax expense of the period in which they are part of taxable income. This view is not in accordance with the accrual assumption, which states that revenues and costs are accrued, that is, recognised as they are earned or incurred (and not as money is received or paid) and recorded in the financial statements of the periods to which they relate—see International Accounting Standard 1 [section 9001], Disclosure of Accounting Policies.

Tax Effect Accounting Methods

.12 Under tax effect accounting methods, taxes on income are considered to be an expense incurred by the enterprise in earning income and are accrued in the same periods as the revenue and expenses to which they relate. The resulting tax effects of timing differences are included in the tax expense in the income statement and in the deferred tax balances in the balance sheet. Tax effect accounting methods are used in a number of countries in accounting for taxes on income. Those in common use are described as the deferral method and the liability method.

Deferral Method

.13 Under the deferral method, the tax effects of current timing differences are deferred and allocated to future periods when the timing differences reverse. Since deferred tax balances in the balance sheet are not considered to represent rights to receive or obligations to pay money, they are not adjusted to reflect changes in the tax rate or the imposition of new taxes.
.14 Under the deferral method, the tax expense for a period comprises:
   (a) the provision for taxes payable, and
   (b) the tax effects of timing differences deferred to or from other periods.

.15 The tax effects of timing differences originating in the current period are determined using the current tax rate. The tax effects of individual timing differences originating in previous periods and reversing during the current period are generally determined using the tax rates originally applied. For ease of applying the method, similar timing differences may be grouped.

**Liability Method**

.16 Under the liability method, the expected tax effects of current timing differences are determined and reported either as liabilities for taxes payable in the future or as assets representing advance payment of future taxes. Deferred tax balances are adjusted for changes in the tax rate or for new taxes imposed. The balances may also be adjusted for expected future changes in tax rates.

.17 Under the liability method, the tax expense for a period comprises:
   (a) the provision for taxes payable,
   (b) the amount of taxes expected to be payable or considered to be prepaid in respect of timing differences originating or reversing in the current period, and
   (c) the adjustments to deferred tax balances in the balance sheet necessary to reflect either a change in the tax rate or the imposition of new taxes.

.18 Under the liability method, the tax effects of timing differences originating or reversing in the current period and adjustments to deferred tax balances are determined using the current tax rate, unless other information indicates that another rate would be more appropriate, for example, where a change in tax rates has been announced as applicable to future years.

**Application**

.19 Normally, tax effect accounting methods are applied to all timing differences. However, under certain circumstances a partial application is used.

.20 Under the partial application, tax expense for a period excludes the tax effects of certain timing differences when there is reasonable evidence that those timing differences will not reverse for some considerable period (at least three years) ahead. It is also necessary for there to be no indication that after this period these timing differences are likely to reverse.
Deferred Tax Debits
.21 The accounting for timing differences may result in a debit balance or a debit to the deferred tax balance. The consideration of prudence requires that such a debit be carried forward in the balance sheet only if there is a reasonable expectation of realisation, for example, if sufficient future taxable income will be generated in the period in which the timing differences will reverse.

Tax Losses
.22 Tax legislation frequently provides that tax losses of the current period may be used either to recover tax paid within a specified carryback period or to reduce or eliminate tax to be paid in future periods. The loss provides a tax saving in the period of the loss or a potential tax saving in some subsequent period. The accounting period in which such a tax saving is included in determining net income in the financial statements varies.

.23 A recovery of taxes through the application of a tax loss to the carryback period represents a tax saving that is effectively realised in the period of loss and is included in net income or net loss in the financial statements for that period. In determining the amount of the saving, appropriate adjustment of existing deferred tax balances may be necessary.

.24 The realisation of a potential tax saving related to the amount of a tax loss remaining after the carryback described in paragraph .23 requires the existence of taxable income in future periods. For this reason the potential tax saving related to a tax loss carryforward is generally not included in the determination of net income in the period of the loss.

.25 However, in rare circumstances, the inclusion of this potential tax saving in the determination of net income for the period of the loss may be considered appropriate. If a potential tax saving is to be dealt with in this manner, the consideration of prudence requires that there is assurance beyond any reasonable doubt that future taxable income will be sufficient to allow the benefit of the loss to be realised. For example, the condition of assurance beyond any reasonable doubt would be satisfied if the following conditions exist:

(a) the loss results from an identifiable and non-recurring cause, and
(b) a record of profitability by the enterprise has been established over a long period and is expected to continue.

.26 The existence of a credit amount in the deferred tax balance may provide evidence that the tax saving related to a tax loss carryforward can be realised at least in part. The reversal of the timing differences reflected in the deferred tax credit balance will of itself create a corresponding amount of taxable income, against which the tax loss can be offset to realise a tax saving. If the tax rules limit the period during which a tax loss may be
carried forward for offset against future taxable income, only those timing
differences that will reverse or can be reversed during the limited period
are considered in offsetting a tax loss to realise a tax saving. The tax saving
as a result of offsetting a tax loss is included in net income for the period
of the loss and the debit is carried forward as part of the deferred tax credit
balance in the balance sheet. The amount of such a debit may be disclosed.

27 If the tax saving related to a past tax loss was not included in net income
in the year of the loss, a tax saving later realised by offsetting such a tax
loss against taxable income is included in net income in the period of
realisation and disclosed.

Revaluation of Assets

28 In circumstances in which an asset is revalued in the financial statements
at an amount in excess of its historical cost or previous revaluation, the
substituted amounts do not generally form the basis for the determination
of taxes payable. To the extent that revalued assets give rise to charges or
credits in accounting income that are not based on historical cost or other
bases permitted under the tax rules there will be a difference between
taxable income and accounting income. The accounting treatment of this
type of difference depends on the accounting treatment accorded the
revaluation.

29 One approach is to determine the tax effect related to the increase in
the carrying value of the asset and transfer that amount from the revalua-
tion account to the deferred tax balance. Under this approach when a
difference such as described in paragraph 28 occurs in a period sub-
sequent to the revaluation the tax effect relating to that difference is
charged to the deferred tax balance and consequently is not reflected
in the tax expense. In some cases the tax effect is reflected in tax
expense and a corresponding amount is transferred from the deferred
tax balance to the revaluation account.

30 Another approach is to disclose in the notes to the financial statements
the amount of the potential tax effect related to the increase in the carrying
value of the asset at the date of the revaluation. In subsequent periods the
amount of potential tax effect is revised to reflect the tax effect of the
differences described in paragraph 28.

Undistributed Earnings of Subsidiaries and Associated Companies

31 Taxes payable by either the parent company or subsidiaries on distribu-
tion to the parent company of the undistributed profits of subsidiaries are
accrued unless it is reasonable to assume that those profits will not be
distributed or that a distribution will not give rise to a tax liability. A reason
for not accruing may be the parent company’s intention and power to retain
those profits in the subsidiary for long-term reinvestment. If taxes are not accrued in respect of undistributed profits, there is sometimes disclosure of the cumulative amount of those profits.

.32 For investments in associated companies accounted for on the equity method, taxes that would be payable on distribution to the investor of the investor’s share of the undistributed profits of the investee are sometimes accrued in full when the profits are recognised by the investor. However, since most enterprises do not distribute all of their earnings, these taxes are sometimes accrued only to the extent of expected distributions. If taxes are not accrued in full, there is sometimes disclosure of the cumulative amount of the portion of undistributed profits applicable to the investor on which taxes are not accrued.

Financial Statement Presentation

.33 Taxes on income are generally accounted for as tax expense in the determination of net income of the enterprise. However, in some circumstances in which the effect of a transaction is charged or credited directly to shareholders’ interests, the related tax effect of the transaction is accounted for and disclosed in the same manner so that the taxes may be directly related to the item to which they apply.

.34 The tax expense related to accounting income from the ordinary activities of the enterprise is usually presented as a separate item in the income statement. The tax attributable to an unusual item is included with that item because it directly relates to it. Disclosure is made of this related tax amount.

.35 Deferred tax balances are not part of the shareholders’ interests and are generally presented as separate items in the balance sheet. Debit and credit balances representing deferred taxes may be offset.

.36 In circumstances in which a distinction is made between current and long-term assets and liabilities in the financial statements, the net current and the net long-term portions of the deferred tax balance are sometimes presented separately so as to maintain the appropriate distinction between current and long-term items.

.37 Taxes on income which were previously paid and are due to be recovered as a result of the application of a tax loss in accordance with paragraph .23 are shown in the balance sheet as a receivable separate from deferred tax balances.

1 This expands on the explanation of this subject given in paragraph 29 of International Accounting Standard 3 [section 9003.29], Consolidated Financial Statements.
.38 Loss carryforward benefits resulting from the application of tax losses in accordance with paragraph .25 are different from other deferred tax balances. The amounts of such carryforward benefits may be disclosed separately in the balance sheet.

.39 The relationship between tax expense and accounting income may be affected by such factors as permanent differences, and tax rates in the locations of foreign based operations. Accordingly, an explanation of the relationship is sometimes presented in the financial statements.
INTERNATIONAL ACCOUNTING STANDARD 12

ACCOUNTING FOR TAXES ON INCOME

International Accounting Standard 12 comprises paragraphs .40-.56 of this Statement. The Standard should be read in the context of paragraphs .01-.39 of this Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.40 The tax expense for the period should be included in the determination of net income of the enterprise.

.41 The taxes on income relating to an item that is charged or credited to shareholders’ interests should be accounted for in the same manner as the relevant item and the amount should be disclosed.

Tax Effect Accounting

.42 The tax expense for the period should be determined on the basis of tax effect accounting, using either the deferral or the liability method. The method used should be disclosed.

.43 The tax effect accounting method used should normally be applied to all timing differences. However, the tax expense for the period may exclude the tax effects of certain timing differences when there is reasonable evidence that these timing differences will not reverse for some considerable period (at least three years) ahead. There should also be no indication that after this period these timing differences are likely to reverse. The amount of timing differences, both current and cumulative, not accounted for should be disclosed.

.44 The tax effect of timing differences that result in a debit balance or a debit to the deferred tax balance should not be carried forward unless there is a reasonable expectation of realisation.

.45 Deferred tax balances should be presented in the balance sheet of the enterprise separately from the shareholders’ interests.

Tax Losses

.46 Taxes relating to a previous period which are recovered as a result of carrying back a tax loss should be included in net income in the period of the loss. Amounts recoverable but not yet received should be included in the balance sheet as receivables.
The potential tax saving related to a tax loss that is available to be carried forward for the determination of taxable income in future periods should not be included in net income until the period of realisation, except as described in paragraphs .48 and .49.

The potential tax saving relating to a tax loss carryforward may be included in the determination of net income for the period of the loss if there is assurance beyond any reasonable doubt that future taxable income will be sufficient to allow the benefit of the loss to be realised.

If the criterion set out in paragraph .48 is not satisfied, the tax saving relating to a tax loss carryforward should be included in the determination of net income for the period of the loss to the extent of the net credits in the deferred tax balance that will reverse or can be reversed within the period during which the loss can be claimed as a tax benefit.

The following items in respect of tax losses should be disclosed:
(a) the amount of the tax saving included in net income in the period of the loss in accordance with the criteria in paragraphs .48 and .49,
(b) the amount of the tax saving included in net income for the current period as a result of the realisation of a tax loss carryforward that had not been accounted for in the year of the loss, and
(c) the amount and future availability of tax losses for which the related tax effects have not been included in the net income of any period.

Taxes payable by either the parent company or subsidiaries on distribution to the parent company of the undistributed profits of subsidiaries should be accrued unless it is reasonable to assume that those profits will not be distributed or that a distribution will not give rise to a tax liability.

For investments in associated companies accounted for on the equity method, taxes that would be payable on distribution to the investor of the investor's share of the undistributed profits of the investee should be accrued when the profits are recognised by the investor. An exception may be made when it is reasonable to assume that those profits will not be distributed or that a distribution will not give rise to a tax liability.

The following should be disclosed separately:
(a) the tax expense related to income from the ordinary activities of the enterprise,
(b) the tax expense relating to unusual items, to prior period items, and to changes of accounting policy—see International Accounting Standard 8 [section 9008], Unusual and Prior Period Items and Changes in Accounting Policies,
(c) the tax effects, if any, related to assets that have been revalued to amounts in excess of historical cost or previous revaluation, and
(d) an explanation of the relationship between tax expense and accounting income if not explained by the tax rates effective in the country of the reporting enterprise.

Tax Contingencies
.54 Any contingency related to taxes on income not referred to in paragraphs .40-.53 should be dealt with in accordance with International Accounting Standard 10 [section 9010], Contingencies and Events Occurring After the Balance Sheet Date.

Transitional Provisions
.55 On the first occasion that the tax expense is presented in the financial statements using a tax effect accounting method, an enterprise that has previously used the taxes payable method should either (a) adjust its financial statements in accordance with International Accounting Standard 8 [section 9008] to record the accumulated deferred tax balance or balances or (b) disclose in the period of change and subsequently any unrecorded amount of deferred taxes that have accumulated prior to the adoption of the tax effect accounting basis. The tax expense deducted in computing reported income should be the same as that which would have resulted if tax effect accounting had been in effect from the beginning. When (b) is adopted, the adjustment to account for the reversal of timing differences not accounted for when they arose should be either charged (credited) to retained earnings or treated in the income statement as an unusual item.

Effective Date
.56 This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1981.
Presentation of Current Assets and Current Liabilities

INTRODUCTION
.01 This Statement deals with the meaning and presentation of current assets and current liabilities in financial statements. This Statement does not deal with the basis of valuation of these assets and liabilities.

EXPLANATION
.02 The identification of current assets and current liabilities has traditionally been considered useful information to assist users of financial statements in analysing an enterprise's financial position.

.03 An excess of current assets over current liabilities is often referred to either as "net current assets" or as "working capital."

Alternative Views of Current Assets and Current Liabilities
.04 Some regard the classification of assets and liabilities into "current" and "non-current" as being intended to give an approximate measure of an enterprise's liquidity, that is, its ability to carry on its activities on a day to day basis without encountering financial stringencies. Others regard this classification as providing an identification of those resources and obligations of the enterprise that are continuously circulating.

.05 These purposes are to a certain extent incompatible. This is because, in measuring liquidity, the criterion for classifying assets and liabilities as current or non-current is whether the items will be realised or liquidated in the near future. The criterion for identifying assets and liabilities as circulating, however, is whether they are consumed or settled in the production of revenue within the normal operating cycle of an enterprise. For example, construction work in progress would, under the first criterion, be largely excluded from current assets, while under the second criterion it would be included.

1The operating cycle of an enterprise normally refers to the average time between the acquisition of materials entering into the process and the final cash realisation.
Present Practice

.06 These competing considerations have led to the adoption in many countries of a position whereby items are included in current assets on the basis of whether they are expected to be realised within one year or within the normal operating cycle of the enterprise, whichever is the longer; items are included in current liabilities if they are payable at the demand of the creditor or are expected to be liquidated within one year. Even when this approach is used as the general rule, there are instances of the inclusion or exclusion of individual items based on different criteria. Hence, the classification of items as current or non-current in practice is largely based on convention rather than on any one concept. Paragraphs .07-.12 below describe practice as to the classification of certain items.

Items Included in Current Assets

.07 Cash and bank balances are included in current assets unless restrictions on their use make them unavailable for current operations.

.08 Trade and other receivables are included in current assets to the extent that they are expected to be realised within one year. Sometimes all trade receivables are included in current assets, in which case the amount not expected to be realised within one year may be disclosed.

.09 Inventories are usually included in current assets in their entirety, notwithstanding that they may include items not expected to be realised within one year or within the normal operating cycle.

Items Included in Current Liabilities

.10 A loan stated to be payable at the demand of the creditor is usually included in current liabilities. However, if the creditor has agreed to a schedule of repayment, the loan is sometimes classified on the basis of scheduled repayment, notwithstanding the creditor's right to demand payment at any time.

.11 The portion of a long-term liability payable within one year is usually classified as a current liability. This item is sometimes excluded from current liabilities if the enterprise intends to refinance the obligation on a long-term basis and there is reasonable assurance that the enterprise will be able to do so. Similarly, the portion of a long-term liability payable within one year is sometimes classified as non-current if assets existing at the balance sheet date, out of which settlement is to be made, have been excluded from current assets.
.12 When an enterprise excludes a liability from the current classification in accordance with paragraph.11, the amount and the circumstances are often disclosed.

Presentation in the Financial Statements

.13 The usefulness of the current:non-current distinction is improved by grouping and totalling current assets and current liabilities.

.14 To permit adequate identification of the separate assets and liabilities of the enterprise, the amount at which a current asset or current liability is stated is generally not reduced by deducting another current liability or current asset. However, such offsetting might be appropriate when a legal right of set-off exists and the offsetting represents the expectation as to the realisation or settlement of the asset or liability.

Limitations of the Current: Non-Current Distinction

.15 The current:non-current distinction is generally believed to provide an identification of a relatively liquid portion of an enterprise's total capital that constitutes a margin or buffer for meeting obligations within the ordinary operating cycle of an enterprise. However, as long as a business is a going concern, it must, for example, continuously replace the inventory that it realises with new inventory in order to carry on its operations. Also, current assets may include inventories that are not expected to be realised in the near future. On the other hand, many enterprises finance their operations with bank loans that are stated to be payable on demand and are hence classified as current liabilities. Yet, the demand feature may be primarily a form of protection for the lender and the expectation of both borrower and lender is that the loan will remain outstanding for some considerable period of time.

.16 Many regard an excess of current assets over current liabilities as providing some indication of the financial well-being of an enterprise, while an excess of current liabilities over current assets is regarded as an indication of financial problems. It is not appropriate to draw such conclusions without considering the nature of the operations of the enterprise and the individual components of its current assets and current liabilities.

.17 The segregation of assets and liabilities between current and non-current is usually not considered appropriate in the financial statements of enterprises with indeterminate or very long operating cycles.

.18 Thus, while many believe that the identification of current assets and liabilities is a useful tool in financial analysis, others believe that the
limitations of the distinction make it of little use or even misleading in many circumstances. Imposition of a general requirement to identify current assets and liabilities in financial statements might impede further consideration of these questions. Accordingly, this Statement is intended only to harmonise practices followed by enterprises that choose to identify current assets and liabilities in their financial statements.
INTERNATIONAL ACCOUNTING STANDARD 13

PRESENTATION OF CURRENT ASSETS AND CURRENT LIABILITIES

International Accounting Standard 13 comprises paragraphs .19-.28 of this Statement. The Standard should be read in the context of paragraphs .01-.18 of the Statement and of the Preface to Statements of International Accounting Standards [section 9000].

.19 Each enterprise should determine whether or not to present current assets and current liabilities as separate classifications in its financial statements. Paragraphs .21-.27 of this Standard apply when the current: non-current distinction is made.

.20 When the current:non-current distinction is not made in the financial statements of an enterprise, no sub-totals of the amounts of assets and of liabilities should be given that would imply that such distinction is made.

Application of the Current: Non-Current Distinction

Current Assets

.21 Among the items included in current assets should be:
(a) Cash and bank balances available for current operations. Cash or bank balances whose use for current operations is subject to restrictions should be included as a current asset only if the duration of the restrictions is limited to the term of an obligation that has been classified as a current liability or if the restrictions lapse within one year.
(b) Securities not intended to be retained and capable of being readily realised.
(c) Trade and other receivables expected to be realised within one year of the balance sheet date. Trade receivables may be included in their entirety in current assets, provided that the amount not expected to be realised within one year is disclosed.
(d) Inventories.
(e) Advance payments on the purchase of current assets.
(f) Expense prepayments expected to be used up within one year of the balance sheet date.
Current Liabilities

.22 Among the items included in current liabilities should be obligations payable at the demand of the creditor and those parts of the following obligations whose liquidation is expected within one year of the balance sheet date:

(a) Bank and other loans. If a loan is repayable in accordance with a schedule of repayment agreed with the creditor, the loan may be classified in accordance therewith, notwithstanding a right of the creditor to demand current payment.

(b) The current portion of long-term liabilities, unless excluded under the provisions of paragraph .23.

(c) Trade liabilities and accrued expenses.

(d) Provision for taxes payable (see International Accounting Standard 12 [section 9012], Accounting for Taxes on Income).

(e) Dividends payable.

(f) Deferred revenues and advances from customers.

(g) Accruals for contingencies (see International Accounting Standard 10 [section 9010], Contingencies and Events Occurring After the Balance Sheet Date).

.23 The current portion of a long-term liability may be excluded from current liabilities if the enterprise intends to refinance the obligation on a long-term basis and there is reasonable assurance that the enterprise will be able to do so. Demonstration of this ability would require either:

(a) the issue of share capital or a long-term obligation after the date of the balance sheet; or

(b) a non-cancellable financing agreement that does not expire within one year of the balance sheet date and that the lender or investor is financially capable of honouring.

.24 When an enterprise excludes a liability from the current classification in accordance with paragraph .23, the amount of the liability and the terms of the refinancing should be disclosed.

Presentation in the Financial Statements

.25 The amount at which a current asset or current liability is stated in the financial statements should not be reduced by the deduction of another current liability or current asset unless a legal right of set-off exists and the offsetting represents the expectation as to the realisation of the asset or settlement of the liability.
Progress payments and advances may be deducted from the amount of related construction work in progress, provided disclosure is made in accordance with International Accounting Standard 11 [section 9011], Accounting for Construction Contracts.

The total amount of current assets and the total amount of current liabilities should be disclosed in the financial statements.

Effective Date

This International Accounting Standard becomes operative for financial statements covering periods beginning on or after 1 January 1981.
During the time the Accounting Principles Board was in existence, the Institute staff was authorized to issue interpretations of accounting questions having general interest to the profession. The purpose of the interpretations was to provide guidance on a timely basis without the formal procedures required for an APB Opinion and to clarify points on which past practice may have varied and been considered generally accepted. These interpretations, which were reviewed with informed members of the profession, were not pronouncements of the Board and did not establish standards enforceable under the Institute's Code of Professional Ethics. Responsibility for their preparation rested with Richard C. Lytle, at that time administrative director of the Accounting Principles Board. Unless otherwise stated, the interpretations were not intended to be retroactive.

Accounting Changes:  
Accounting Interpretations 
of Section 1051

1. Changing EPS Denominator for Retroactive Adjustment to Prior Period

.001 Question—Section 1051.27 specifies that certain accounting changes should be reported by retroactively restating all prior periods presented. Section 1051.28 requires that the effect of these changes on the prior periods’ earnings per share amounts be disclosed. The anti-dilution prohibitions of sections 2011.30 and 2011.40 require the exclusion from earnings per share computations of securities whose conversion, exercise, or other contingent issuance would have the effect of increasing the earnings per share amount or decreasing the loss per share amount. If these securities were originally included in the earnings per share computation in a prior period but would have been excluded if the retroactively restated amount had been reported in the prior period, should the securities be included or excluded when computing the restated earnings per share amount?

.002 Interpretation—A retroactively restated earnings per share amount should always be computed as if the restated income or loss had been originally reported in the prior period. Common stock assumed to be issued for exercise, conversion, etc., and included in the original earnings per share denominator should, therefore, in circumstances such as those described below be excluded from the denominator in computing the restated earnings per share amount.

.003 For example, assume that a corporation which reported $200,000 net income in the immediately preceding year changes its method of accounting for long-term construction-type contracts from the completed contract method to the percentage of completion method. In applying this change retroactively (see section 1051.27), the net income originally reported for the immediately preceding year is decreased $290,000 and restated as a net loss of
$90,000. Further assume that in the prior year the corporation had 900,000 shares of common stock and 150,000 warrants outstanding for the entire year. Each warrant could be exercised to purchase one share of common stock for $10 while the market price of common was $30 throughout the year. Earnings per share were originally reported as $.20 based on $200,000 net income divided by a denominator of 1,000,000 common shares (900,000 shares outstanding plus 100,000 shares for warrants computed under the treasury stock method). The assumption of exercise of warrants is anti-dilutive when there is a loss, so the restated amount would be reported as a net loss of $.10 per share based on $90,000 net loss divided by a denominator of 900,000 common shares outstanding.

.004 Note that retroactive restatement could also cause securities originally determined to be anti-dilutive to become dilutive. For example, assume the same facts as given in the preceding illustration except a $90,000 net loss was originally reported and is restated as $200,000 net income. Exercise of the warrants would not have been assumed in the original per share computation because the result would have been anti-dilutive but would be assumed in computing the restated earnings per share because the result is dilutive.

.005 Retroactive restatement may also cause the earnings per share numerator to change by an amount different from the amount of the retroactive adjustment. For example, assume that a corporation changes from the LIFO method of inventory pricing to the FIFO method, retroactively increasing net income for the immediately preceding year by $400,000 (see section 1051.27). Further assume that the corporation originally reported a net income of $800,000 in the prior year and had 800,000 shares of common stock outstanding. In addition, 200,000 shares of preferred stock were outstanding which were convertible into common stock on a one-for-one basis. The preferred stock is a common stock equivalent and paid a dividend of $1 per share. Earnings per share were originally reported as $.75 based on an earnings per share numerator of $600,000 ($800,000 net income less $200,000 preferred dividends) and a denominator of 800,000 common shares. The assumption
of conversion in the original computation would have been anti-dilutive. Restated net income is $1,200,000 and restated earnings per share is $1.20 based on a numerator of $1,200,000 and a denominator of 1,000,000 shares (800,000 common shares outstanding plus 200,000 common shares for the assumed conversion of preferred stock). Although restatement increased net income and, therefore, the earnings per share numerator $400,000 in this case, the assumed conversion of the preferred stock increased the earnings per share numerator by another $200,000.

.006 In addition to a retroactive adjustment for a change in accounting principle under section 1051.27, the guidelines given above in this Interpretation apply to (a) retroactive restatement under section 1051.29-.30, (b) restatement of prior periods for a change in the reporting entity as described in section 1051.34-.35, (c) the correction of an error in previously issued financial statements as described in section 1051.36-.37, and (d) a prior period adjustment as described in sections 2010.17, 2014.11 and 2014.13-.14. These guidelines will likewise apply whenever an APB Opinion requires that it be applied retroactively, including Opinions which may be issued in the future.

.007 Also, these guidelines should be applied in computing the pro forma earnings per share amounts for the types of changes in accounting principle described in section 1051.19. Although these types of changes in accounting principle are not applied retroactively, sections 1051.19d and 1051.21 require that the pro forma effects of retroactive application be disclosed.

.008 A change in the earnings per share denominator (and perhaps numerator) from that originally used in the computation may create certain complications in reporting the effect of a retroactive change. These complications may be illustrated by considering the data in the table below, for the examples presented earlier in this Interpretation.
Earnings per share amounts:

<table>
<thead>
<tr>
<th>As previously reported</th>
<th>$ .20(^a)</th>
<th>$ .75(^c)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of retroactive change</td>
<td>(.30)</td>
<td>.45</td>
</tr>
<tr>
<td>As adjusted</td>
<td>$(.10)(^b)</td>
<td>$1.20(^d)</td>
</tr>
</tbody>
</table>

Computational Notes:

(a) \(\frac{200,000}{(900,000 + 100,000)}\) shares
(b) \(\frac{90,000}{900,000}\) shares
(c) \(\frac{800,000 - 200,000}{800,000}\) shares
(d) \(\frac{1,200,000}{(800,000 + 200,000)}\) shares

.009 In both of the above examples, the earnings per share amounts shown for "effect of retroactive change" are computed by subtracting the previously reported amounts from the adjusted amounts. Determining the per share amount of the change by subtraction comprehends the effects of any necessary changes in the denominator and the numerator by reason of retroactive application.

[Issue Date: March, 1973]

2. EPS for "Catch-up" Adjustment

.010 Question—Section 1051.20 requires the per share amount of the cumulative effect of most accounting changes (see sections 1051.18 and 1051.19) to be shown on the face of the income statement similar to the manner in which an extraordinary item would be shown. Footnote 10, section 2011.30, giving an exception to the anti-dilution prohibition in primary earnings per share computations, states that: The presence of a common stock equivalent or other dilutive securities together with income from continuing operations and extraordinary items may result in diluting one of the per share amounts which are required to be disclosed on
the face of the income statement—i.e., income from continuing operations, income before extraordinary items and before the cumulative effect of accounting changes, if any, and net income—while increasing another. In such a case, the common stock equivalent or other dilutive securities should be recognized for all computations even though they have an anti-dilutive effect on one of the per share amounts. Footnote 16, section 2011.40, gives a similar reference for fully diluted computations. How does reporting the cumulative effect of an accounting change in a manner similar to an extraordinary item affect the application of these two footnotes in computing earnings per share?

.011 Interpretation—The cumulative effect of an accounting change (sometimes referred to as a “catch-up” adjustment) is considered the same as an extraordinary item, whether or not extraordinary items are present, in computing earnings per share. Therefore, a common stock equivalent which has a dilutive effect on the primary earnings per share computation for (a) income from continuing operations, if discontinued operations are reported, or (b) income before extraordinary items (if any) and the cumulative effect of a change in accounting principle or (c) net income should be recognized in all computations of primary earnings per share for the period. Likewise, a common stock equivalent or other potentially dilutive security which has a dilutive effect on the fully diluted earnings per share computation for either (a) income from continuing operations, if discontinued operations are reported, or (b) income before extraordinary items (if any) and cumulative effect of a change in accounting principle or (c) net income should be recognized in all computations of fully diluted earnings per share for the period. Note that, under these exceptions to the anti-dilution prohibitions of section 2011, a common stock equivalent or other potentially dilutive security may have an anti-dilutive effect on “a”, “b” or “c” but not on all. The per share amount of an extraordinary item or a “catch-up” adjustment is always computed by using the same denominator used to compute the other earnings per share amounts. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]

.012 However, the exceptions to the anti-dilution prohibitions do not permit an assumed exercise, conversion,
etc., to cause fully diluted net income (loss) per share to be anti-dilutive in relation to primary net income (loss) per share. That is, the assumed exercise, conversion, etc., of a security may have an anti-dilutive effect within primary earnings per share or within fully diluted earnings per share, but the assumed exercise, conversion, etc., should not have the effect of increasing (decreasing) the fully diluted net income (loss) per share amount to more (less) than the primary net income (loss) per share amount. (See footnote 5, section U2011.016, Computing Earnings per Share.)

.013 Although the "catch-up" adjustment is considered the same as an extraordinary item in computing earnings per share, the earnings per share reporting requirement for the two items is different. Section 2011 does not require that per share amounts be reported for extraordinary items, although this presentation may generally be desirable (see Interpretation 16, section U2011.084-.086, Computing Earnings per Share). Section 1051.20 does require per share data for a "catch-up" adjustment to be shown on the face of the income statement. Preferably, when both an extraordinary item and a "catch-up" adjustment are reflected in net income for a period, per share data for both should be presented on the face of the income statement.

[Issue Date: March, 1973]
Accounting for Business Combinations: Accounting Interpretations of Section 1091

1. Ratio of Exchange

.001 Question—Section 1091.46a defines the initiation date for a business combination as the earlier of (1) the date the major terms of a plan, including the ratio of exchange of stock, are announced publicly or otherwise formally made known to the stockholders of any one of the combining companies or (2) the date that stockholders of a combining company are notified in writing of an exchange offer. Does the announcement of a formula by which the ratio of exchange will be determined in the future constitute the initiation of a plan of combination?

.002 Interpretation—Yes, the actual exchange ratio (1 for 1, 2 for 1, etc.) need not be known to constitute initiation of a business combination so long as the ratio of exchange is absolutely determinable by objective means in the future. A formula would usually provide such a determination.

.003 A formula to determine the exchange ratio might include factors such as earnings for some period of time, market prices of stock at a particular date, average market prices for some period of time, appraised valuations, etc. The formula may include upper and/or lower limits for the exchange ratio and the limits may provide for adjustments based upon appraised valuations, audit of the financial statements, etc. Also, the formula must be announced or communicated to stockholders as specified by section 1091.46a to constitute initiation.

.004 If a formula is used after October 31, 1970 to initiate a business combination which is intended to be accounted for by the pooling of interests method, the actual exchange ratio would have to be determined by the consummation date and therefore no later than one year after the initiation date to meet the conditions of section 1091.47a.
Also, changing the terms after October 31, 1970 of a formula used to initiate a business combination before November 1, 1970 would constitute the initiation of a new plan of combination (see section 1091.47, footnote 6).

[Issue Date: December, 1970.]

2. Notification to Stockholders

.005 Question—Section 1091.46a specifies that a business combination is initiated on the earlier of (1) the date major terms of a plan are formally announced or (2) the date that stockholders of a combining company are notified in writing of an exchange offer. Does communication in writing to a corporation's own stockholders that the corporation plans a future exchange offer to another company without disclosure of the terms constitute initiation of a business combination?

.006 Interpretation—No. Section 1091.46a defines "initia­tion" in terms of two dates. The first date is for the announcement of an exchange offer negotiated between representatives of two (or more) corporations. The second date is for a tender offer made by a corporation directly or by newspaper advertisement to the stockholders of another company. It is implicit in the circumstances of a tender offer that the plan is not initiated until the stockholders of the other company have been informed as to the offer and its major terms, including the ratio of exchange.

.007 Therefore, in the second date specified for initiation in section 1091.46a, "a combining company" refers to the company whose stockholders will tender their shares to the issuing corporation. "An exchange offer" means the major terms of a plan including the ratio of exchange (or a formula to objectively determine the ratio).

.008 A corporation may communicate to its own stockholders its intent to make a tender offer or to negotiate on the terms of a proposed business combination with another company. However, intent to tender or to negotiate does not constitute "initiation." A business combination is not initiated until the major terms are "set" and announced publicly or formally communicated to stockholders.

[Issue Date: December, 1970.]
3. Intercorporate Investment Exceeding 10 Per Cent Limit

.009 Question—Section 1091.46b (the “independence” condition) states that the pooling of interests method of accounting for a business combination may not be applied if at the dates the plan of combination is initiated and consummated the combining companies hold as intercorporate investments more than 10 per cent in total of the outstanding voting common stock of any combining company. Would an intercorporate investment of 10 per cent or less at the initiation and consummation dates but exceeding 10 per cent between these dates (for example, through a cash purchase and subsequent sale of the voting common stock of a combining company) prohibit accounting for a business combination under the pooling of interests method?

.010 Interpretation—Section 1091.46b would not be met if between the initiation and consummation dates combining companies hold as intercorporate investments more than 10 per cent of the outstanding voting common stock of any combining company even though the intercorporate investments do not exceed 10 per cent at either the initiation or consummation date. Although the section mentions only the initiation and consummation dates, intercorporate investments exceeding 10 per cent in the interim would violate the spirit of the independence condition and the business combination would be an acquisition accounted for under the purchase method. For the 10 per cent computation, however, intercorporate investments exclude voting common stock that is acquired after the date the plan of combination is initiated in exchange for the voting common stock issued to effect the combination.

[Issue Date: December, 1970.]

4. Consummation Date for a Business Combination

.011 Question—Sections 1091.46-.48 specify certain conditions which require a business combination to be accounted for by the pooling of interests method. Among these conditions in sections 1091.46b and 1091.47b are quantitative measurements which are to be made on the consummation date. When does the “consummation date” occur for a business combination?

.012 Interpretation—A plan of combination is consummated on the date the combination is completed, that is,
the date assets are transferred to the issuing corporation. The quantitative measurements specified in sections 1091.46b and 1091.47b are, therefore, made on the date the combination is completed. If they and all of the other conditions specified in sections 1091.46-.48 are met on that date, the combination must be accounted for by the pooling of interests method.

.013 It should not be overlooked that section 1091.47a states the plan of combination must be completed in accordance with a specific plan within one year after it is initiated unless delay is beyond the control of the combining companies as described in that paragraph. Therefore, ownership of the issuing corporation's common stock must pass to combining stockholders and assets must be transferred from the combining company to the issuing corporation within one year after the initiation date (unless the described delay exists) if the business combination is to be accounted for by the pooling of interests method. Physical transfer of stock certificates need not be accomplished on the consummation date so long as the transfer is in process.

.014 If any of the conditions specified in sections 1091.46-.48 are not met, a business combination is an acquisition which must be accounted for by the purchase method. Section 1091.93 specifies that the date of acquisition should ordinarily be the date assets are received and other assets are given or securities are issued, that is, the consummation date. However, this paragraph allows the parties for convenience to designate the end of an accounting period falling between the initiation and consummation dates as the effective date for the combination.

.015 The designated effective date is not a substitute for the consummation date in determining whether the purchase or pooling of interests method of accounting applies to the combination. In designating an effective date as some date prior to the consummation date, the parties would automatically be anticipating that the business combination would be accounted for as a purchase since sections 1091.51 and 1091.61 specify that a business combination accounted for by the pooling of interests method must be recorded as of the date the combination is consummated.

[Issue Date: December, 1970.]
5. Pooling Not Completed Within One Year

.016 Question—Section 1091.47a specifies that a condition for a business combination to be accounted for by the pooling of interests method is for the combination to be completed in accordance with a specific plan within one year after the plan is initiated unless delay is beyond the control of the combining companies. This paragraph also indicates that new terms may be offered if earlier exchanges of stock are adjusted to the new terms. If completion of a business combination is delayed beyond one year, would the offering of new terms during the delay period meet the condition of paragraph .47-a for a business combination to be accounted for by the pooling of interests method?

.017 Interpretation—New terms may be offered under the conditions of paragraph .47-a more than one year after the initiation date if delay in completion is beyond the control of the combining companies because of certain circumstances and earlier exchanges of stock are adjusted to the new terms (but see section 1091.47, footnote 6 for plans in effect on October 31, 1970). However, the only delays permitted under paragraph .47-a are proceedings of a governmental authority and litigation.

.018 Proceedings of a governmental authority for this purpose include deliberations by a federal or state regulatory agency on whether to approve or disapprove a combination where the combination cannot be effected without approval. They do not include registration of the securities with the SEC or a state securities commission. Litigation for this purpose means, for example, an antitrust suit filed by the Justice Department or a suit filed by a dissenting minority stockholder to prohibit a combination.

[Issue Date: December, 1970.]

6. Registered Stock Exchanged for Restricted Stock

.019 Question—The pooling of interests method of accounting for a business combination is required by section 1091 if the conditions specified in paragraphs .46 through .48 are met showing that stockholder groups have combined their rights and risks. Would the exchange of unrestricted voting common stock of the issuing corporation for the shares owned by a substantial common stockholder of a combining company whose stock was restricted as to voting
or public sale indicate the conditions were not met if the stock issued could be sold immediately?

.020 Interpretation—Stockholder groups have combined their rights and risks so long as stockholders holding substantially all classes of the voting common stock in the combining company receive shares of the majority class of voting common stock of the issuing corporation exactly in proportion to their relative voting common stock interest before the combination was effected. The fact that unrestricted voting common stock is exchanged for stock previously held in a voting trust would not negate accounting for a business combination by the pooling of interests method. Likewise, the fact that "registered" voting common stock of the issuing corporation is exchanged for "restricted" voting common stock of the combining corporation also would not negate accounting for a business combination by the pooling of interests method.

[Issue Date: December, 1970.]

7. Pooling Under "Old Rules"

.021 Question—Section 1091.97 states that business combinations initiated before November 1, 1970 and consummated on or after that date under the terms prevailing on October 31, 1970 may be accounted for in accordance with section 1091 or the applicable previous pronouncements of the Board or its predecessor committee. Paragraph .97 also contains a reference to paragraph .47-a which, among other things, states that a combination must be completed within one year after the plan is initiated to be accounted for by the pooling of interests method. Does this mean a business combination initiated before November 1, 1970 must be consummated within one year after it was initiated to be accounted for as a pooling of interests under the "old rules"?

.022 Interpretation—No, a business combination initiated before November 1, 1970 need only be consummated under the terms in effect on October 31, 1970 to be accounted for under the "old rules." There is no time limit for consummating the combination.

.023 The reference to paragraph .47-a is intended to call attention to the discussion of a change in terms in that
paragraph and to footnote 6 which specifies that an adjustment after October 31, 1970 in the terms of exchange in effect on October 31, 1970 always constitutes initiation of a new plan. A new plan of combination, naturally, would be subject to the provisions of section 1091.

.024 To require a business combination initiated before November 1, 1970 to be consummated within one year after initiation would be retroactive application of section 1091. For example, a business combination initiated on December 31, 1969 would need to be consummated no later than December 31, 1970 if the section were retroactive. The section was not intended to be retroactive and retroactive application is in fact prohibited by paragraph .98 for business combinations consummated before November 1, 1970.

[Issue Date: December, 1970.]

8. Applying Purchase Accounting

.025 Question—Section 1091 clearly applies when one corporation obtains at least 90 per cent of the voting common stock of another corporation, whether through a purchase or a pooling of interests. Does the section also apply when one corporation acquires less than 90 per cent of the voting common stock of another corporation?

.026 Interpretation—Section 1091 discusses a 90 per cent "cutoff" (paragraph .47-b) only as one of the conditions to be met to account for a business combination by the pooling of interests method. If this condition—or any other condition in paragraphs .46 through .48—is not met, a business combination must be accounted for by the purchase method.

.027 The section does not create new rules for purchase accounting. The purchase section (paragraphs .66 through .96) merely discusses valuation techniques in much greater detail than is given in prior APB Opinions and Accounting Research Bulletins. Thus, section 1091 provides more guidance for the application of purchase accounting, whether the item purchased is an entire company, a major portion of the stock of a company or a manufacturing plant and regardless of whether the consideration given is cash, other assets, debt, common or preferred stock or a combination of these.
.028 An investment by a corporation in the voting common stock of another company which does not meet the 90 per cent condition must be accounted for as a purchase. The purchase method of accounting applies even though the investment is acquired through an exchange of the voting common stock of the companies.

.029 The acquisition by a corporation of voting control over another corporation creates a parent-subsidiary relationship. Generally, domestic subsidiaries either are consolidated or are included in consolidated financial statements under the equity method of accounting (see sections 5131 and 2051).

.030 Since a controlling interest is usually considered to be more than 50 per cent of the outstanding voting stock in another corporation, the fair value of the assets and liabilities of the subsidiary would be determined when control is acquired if the resulting subsidiary is either consolidated in the financial statements or included under the equity method of accounting. Also, section 5141 specifies the appropriate accounting for intangible assets, if any, recognized for these cases.

.031 In addition, the subsequent acquisition of some or all of the stock held by minority stockholders of a subsidiary is accounted for by the purchase method (see sections 1091.05 and 1091.43). Thus, after a business combination has been completed or a controlling interest in a subsidiary has been obtained, the acquisition of some or all of the remaining minority interest is accounted for by the purchase method. The purchase method applies even though the minority interest is acquired through an exchange of common stock for common stock, including the acquisition of a minority interest remaining after the completion of a business combination accounted for by the pooling of interests method.

[Issue Date: April, 1971.]

9. "Two-Year" Provisions at Effective Date

.032 Question—Sections 1091.46a and 1091.47e specify conditions to be met for two years prior to the initiation of a business combination which is to be accounted for by the pooling of interests method. Since the section applies to combinations initiated after October 31, 1970, must the con-
ditions of paragraph .46-a (each company is autonomous) and paragraph .47-c (no changes in equity interests) be met for a combination initiated in November 1970 to be accounted for by the pooling of interests method?

.033 Interpretation—No, a corporation which has had a change in the equity interest in its voting common stock or which was a division that was spun-off as a separate corporation prior to November 1, 1970 could be a party to a business combination initiated on or after that date and meet the conditions for accounting by the pooling of interests method without regard to the two-year period.

[Issue Date: April, 1971.]

10. Effect of Termination

.034 Question—Section 1091.46a defines the initiation of a plan of combination as the date the major terms of an exchange offer are announced publicly or communicated to stockholders even though the plan is still subject to approval of stockholders and others. What is the effect of termination of a plan of combination prior to approval by stockholders and the subsequent resumption of negotiations between the parties?

.035 Interpretation—Paragraph .47-a specifies that a combination must be completed in accordance with a specific plan. Therefore, if negotiations are formally terminated after a plan has been initiated (as defined in paragraph .46-a), the subsequent resumption of negotiations always constitutes a new plan. Formal announcement of the major terms of the new plan constitutes a new initiation, even if the terms are the same as the terms of the old plan. Any shares of stock exchanged under the old plan become subject to the conditions of paragraphs .46-b and .47-b (the 10 per cent and 90 per cent tests) upon initiation of the new plan.

[Issue Date: April, 1971.]

11. Use of Restricted Stock to Effect a Business Combination

.036 Question—Section 1091.47b states as a condition for accounting for a business combination by the pooling of interests method that a corporation may issue only common stock with rights identical to those of the majority of its outstanding voting common stock in exchange for the voting
common stock of another company. Would restrictions on the sale of the shares of common stock issued result in different rights for these shares?

.037 Interpretation—The "rights" pertinent to paragraph .47-b are those involving relationships between stockholders and the corporation rather than between the stockholders and other parties. The "rights" therefore pertain to voting, dividends, liquidation, etc., and not necessarily to a stockholder's right to sell stock. Restrictions imposed on the sale of the stock to the public in compliance with governmental regulations do not ordinarily cause the "rights" to be different, but other restrictions may create different rights.

.038 For example, voting common stock issued by a publicly held corporation to effect a business combination may be restricted as to public sale until a registration with the SEC or a state securities commission becomes effective. If a registration were in process or the issuing corporation agreed to register the stock subsequent to the combination, the rights of the stock would not be different because of the restriction.

.039 However, a restriction imposed by the issuing corporation upon the sale of the stock in the absence of a governmental regulation would probably create different rights between previously outstanding and newly issued stock. Such a restriction might also indicate the previously separate stockholder groups would not be sharing the same risks in the business combination (see paragraph .45 and introductory statements in paragraphs .46 and .47). Likewise, a restriction upon the sale of the stock to anyone other than the issuing corporation or an affiliate would not meet the "absence of planned transactions" condition specified in paragraph .48-a.

[Issue Date: April, 1971.]

12. Warrants May Defeat Pooling

.040 Question—May a business combination be accounted for by the pooling of interests method if the issuing corporation exchanges voting common stock and warrants for the voting common stock of a combining company?

.041 Interpretation—Section 1091.47b specifies that in a business combination accounted for by the pooling of
interests method a corporation may issue only common stock in exchange for at least 90 per cent of the common stock of another company. Therefore, a pro rata distribution of warrants of the issuing corporation to all stockholders of a combining company would not meet this condition and the business combination would be accounted for as a purchase.

.042 In some cases, however, warrants may be used in a business combination accounted for by the pooling of interests method. Warrants (as well as cash or debt) could be used, for example, to acquire up to 10 per cent of the common stock of a combining company under paragraph .47-b and the combination could still qualify as a "pooling" so long as the common stock acquired plus other intercorporate investments plus any remaining minority interest would allow the 90 per cent test to be met.

.043 Warrants may be issued in exchange for the combining company's outstanding preferred stock or debt.

.044 The issuing corporation may exchange its warrants for the combining company's outstanding warrants. Any warrants issued could not provide for the purchase of a greater number of shares than could be obtained if the warrants were exercised. For example, if the issuing corporation will exchange three of its common shares for each of the combining company's common shares outstanding and the combining company has warrants outstanding allowing the holders to purchase two common shares per warrant, each warrant issued in exchange for the outstanding warrants could provide for the purchase of no more than six of the issuing corporation's common shares. (It should be noted that warrants issued by either company in contemplation of effecting the combination might not meet the conditions of paragraph .47-c.)

[Issue Date: April, 1971.]

13. Two-Class Common for Pooling

.045 Question—Section 1091.47b specifies that a corporation must issue common stock "with rights identical to those of the majority class of its outstanding voting common stock" in a business combination which is to be accounted for by the pooling of interests method. Could the
common stock issued be designated as a class of stock different from majority class (for example, Class A if the majority class has no class designation) and meet this condition?

.046 Interpretation—Paragraph .47-b does not prohibit designating the common stock issued as a different class if it has rights identical to those of the majority class of outstanding voting common stock. Thus, the different class must have the same voting, dividend, liquidation, preemptive, etc., rights as the majority class with the stipulation that these rights cannot be changed unless a corresponding change is made in the rights of the majority class.

.047 Issuing a different class of common stock with rights identical to other common stock would generally serve no useful purpose. It would be suspected that the parties might have secretly agreed that they would in the future change the rights of the different class to restrict voting; grant a preference in liquidation; or increase, guarantee or limit dividends.

[Issue Date: April, 1971.]

14. Contingent Shares Defeat Pooling

.048 Question—Section 1091.47g specifies that in a business combination to be accounted for by the pooling of interests method a corporation may not (1) agree to issue additional shares of stock at a later date or (2) issue to an escrow agent shares which will later be transferred to stockholders or returned to the corporation. Would this condition be met if the corporation issued some maximum number of shares to stockholders of the combining company under an agreement that part of the shares would be returned if future earnings are below a certain amount or the future market price of the stock is above a stipulated price?

.049 Interpretation—No, contingent shares based on earnings, market prices and the like require a business combination to be accounted for as a purchase. Paragraph .47-g states that the combination must be “resolved at the date the plan is consummated.”

The only contingent arrangement permitted under paragraph .47-g is for settlement of a contingency pending at consummation, such as the later settlement of a lawsuit. A contingent arrangement would also be permitted for an
additional income tax liability resulting from the examination of "open" income tax returns.

[Issue Date: April, 1971.]

15. **Paragraph .99 Is Not Mandatory**

.050 **Question**—Section 1091 requires business combinations meeting the conditions of paragraphs .46 through .48 to be accounted for by the pooling of interests method and all other business combinations to be accounted for by the purchase method. However, paragraph .99 provides a "grandfather clause" permitting certain exceptions to the pooling conditions for business combinations which meet the conditions of that paragraph. Under paragraph .99 the accounting treatment is: (1) the excess of cost of the investment in common stock acquired prior to November 1, 1970 over equity in net assets when the stock investment was acquired is allocated to identifiable assets and goodwill regardless of the percentage of ownership on October 31, 1970 and (2) the pooling of interests method is applied for the common stock issued in the combination if the combination meets the conditions for accounting by the pooling of interests method. That is, the combination is accounted for as a "part-purchase, part-pooling." Is the application of paragraph .99 mandatory for a business combination meeting the conditions of that paragraph?

.051 **Interpretation**—No, the accounting described in paragraph .99 is an election available to an issuing corporation to apply the pooling of interests method to account for a business combination not otherwise meeting the conditions of paragraphs .46-b and .47-b. Paragraph .99 specifies "the resulting business combination may [emphasis added] be accounted for by the pooling of interests method provided. . . ."

.052 Paragraph .99 applies only for intercorporate investments held at October 31, 1970. The provision was inserted to avoid retroactivity by allowing pooling of interest accounting for a combination that would not have met the conditions of paragraphs .46-b and .47-b because an intercorporate investment held at October 31, 1970 then was near or exceeded 10 per cent of the outstanding voting common stock of the combining company. [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)
A business combination meeting all of the conditions of paragraphs .46 through .48 as well as the conditions of paragraph .99 would be accounted for by the pooling of interests method. Paragraph .99 would not apply and the intercorporate investment would be accounted for as described in paragraph .55. A business combination meeting the conditions of paragraph .99 but not otherwise meeting the conditions of paragraphs .46-b and .47-b may either be accounted for as a “part-purchase, part-pooling” as described in paragraph .99 or as a purchase.

[Issue Date: April, 1971.]

16. Changes in Intercorporate Investments

Question—How do sales of investments in another corporation’s voting common stock owned at October 31, 1970 and acquisitions of additional investments of the same class of stock after that date affect computations under the “grandfather clause” in section 1091.99?

Interpretation—Sales after October 31, 1970 of investments in another corporation’s voting common stock which was owned at that date are always considered as reductions of the common stock to which the “grandfather clause” in paragraph .99 applies, in other words, on a first-in, first-out basis. This reduction is made even though the common stock sold is identified as having been acquired after October 31, 1970.

The “grandfather clause” in paragraph .99 does not apply to acquisitions after October 31, 1970 of voting common stock of the same class as was owned at that date. Any stock so acquired is therefore subject to the conditions of paragraphs .46-b and .47-b.

[Issue Date: April, 1971.]

17. Intercorporate Investment at 10/31/70

Question—Section 1091.99 contains a “grandfather clause” which exempts minority interests held on October 31, 1970 from certain provisions of the section in business combinations initiated after that date. The paragraph is written in terms of an intercorporate investment owned by the corporation which effects the combination by issuing voting common stock. Does this paragraph also apply to stock of the issuing corporation which is owned by the other combining company on October 31, 1970? [As amended,
Accounting for Business Combinations

12,615

effective November 1, 1975, by FASB Statement No. 10.]
(See section 1092.)

.058 Interpretation—Paragraph .99 was intended to exempt intercorporate investments owned on October 31, 1970 by all of the parties to the business combination in the circumstances described. Thus, stock of the issuing corporation which is owned by the other combining company on October 31, 1970 may be ignored in computing the 90 per cent condition described in paragraph .47-b.

.059 For example, assume that on October 31, 1970 Baker Company owned 500,000 of the 3,000,000 shares of the voting common stock of Adam Corporation. Subsequently, Adam Corporation initiated a business combination by offering the stockholders of Baker Company one share of Adam common for each share of Baker common outstanding. The combination was consummated in a single transaction within one year after initiation. Of the 1,000,000 Baker common shares outstanding at initiation and consummation, 950,000 shares were tendered to Adam Corporation. Assume also that the combination meets all of the conditions of paragraphs .46 through .48 to be accounted for by the pooling of interests method except the conditions of paragraph .46-b (no more than 10 per cent intercorporate investments) and paragraph .47-b (the 90 per cent condition). [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

.060 Under paragraph .99 as interpreted here, the business combination may be accounted for by the pooling of interests method since the 500,000 Adam shares owned by Baker Company need not be considered in applying the conditions of paragraphs .46-b and .47-b. Under the pooling of interests method, the 500,000 Adam shares would become treasury stock of Adam Corporation as specified by paragraph .55.

[Issue Date: April, 1971.]

18. Wholly Owned Subsidiary

.061 Question—Section 1091.46a states that a wholly owned subsidiary may distribute voting common stock of its parent corporation in a "pooling" combination if its parent would have met all of the conditions in paragraphs .46-.48 had the parent issued its stock directly to effect the
combination. As a practical matter, a parent may be unable to own all of a subsidiary’s stock. State laws generally require a certain number of the directors of a corporation to own some of the corporation’s shares, so a parent would not legally own a few “qualifying directors’ shares” registered in the names of “inside” directors. Also, even though a parent attempts to purchase all of a subsidiary’s shares owned by outsiders, a few shareholders may never be located and others may refuse to sell their shares for a reasonable amount. If a parent company owns substantially all of the outstanding voting stock of a subsidiary, will the subsidiary be considered “wholly” owned for purposes of applying paragraph .46-a?

.062 Interpretation—Yes, a subsidiary is considered “wholly” owned under paragraph .46-a if its parent owns substantially all of the subsidiary’s outstanding voting stock. The subsidiary may therefore “pool” with another company by distributing the parent company’s voting common stock if the parent would have met the conditions of paragraphs .46-.48 in a direct issuance.

.063 What constitutes “substantially all” of a subsidiary’s voting stock will vary according to circumstances. Generally, the shares not owned by the parent would be expected to be an insignificant number, such as qualifying directors’ shares. A parent might also be considered as owning “substantially all” of a subsidiary’s voting stock if the parent had attempted to buy all of the stock but some owners either could not be located or refused to sell a small number of shares at a reasonable price. In no case, however, would less than 90 percent be considered “substantially all” (see section 1091.47b) and generally the percentage would be expected to be much higher.

.064 The reason for using the subsidiary as the combining company would also be important in determining if “substantially all” of its voting stock is owned by the parent. A parent would be expected to own all but a few of its subsidiary’s shares, other than qualifying directors’ shares, in a combination in which either the parent or subsidiary could engage if the parent is to be considered as owning “substantially all” of its subsidiary’s voting stock. A somewhat greater percentage of outside owner-
ship would be acceptable in a combination between a subsidiary authorized to operate in a state where the parent is not authorized to operate and another company operating in that state. An even larger outside ownership (but not more than 10 percent) would be acceptable in a regulated industry (where a subsidiary in the industry—but not its parent outside the industry—could combine with another company in the industry) when a subsidiary engages in a combination that its parent could not undertake directly.

[Issue Date: September, 1971.]

19. Equity and Debt Issued for Common Before Pooling

.065 Question—Section 1091.47b states that the issuing corporation may exchange only voting common stock for outstanding equity and debt securities of the other combining company that have been issued in exchange for voting common stock of that company during a period beginning two years preceding the date a “pooling” combination is initiated. What is the purpose of this provision?

.066 Interpretation—Section 1091.47c prohibits accounting for a business combination by the pooling of interests method if equity and/or debt securities have been issued by a combining company in exchange for or to retire its voting common stock in contemplation of effecting the combination within two years before the plan of combination was initiated or between the dates of initiation and consummation. In paragraph .47-b, there is an implied presumption that all such transactions of the other combining company were made in contemplation of effecting a combination, thereby violating the condition of paragraph .47-c. However, the issuance of voting common stock of the issuing corporation to the holders of such equity and debt securities of the other combining company in exactly the same ratio as their former holdings of voting common stock of the other combining company will restore the holders of the securities to their former position and, hence, will “cure” the violation of the condition of paragraph .47-c.

[Issue Date: September, 1971.]
20. Treasury Stock Allowed with Pooling

.067 Question—Section 1091.47d states as a condition for "pooling" that each of the combining companies may reacquire shares of voting common stock (as treasury stock) only for purposes other than business combinations. Also, paragraphs .47-c and .47-d of section 1091 include provisions related to the reacquisition of treasury stock within two years prior to initiation and between initiation and consummation of a business combination which is planned to be accounted for by the pooling of interests method. For what purposes may treasury stock be reacquired during this period?

.068 Interpretation—The statement "for purposes other than business combinations" means combinations initiated under section 1091 which are to be accounted for by the pooling of interests method. Therefore, acquisitions of treasury stock for specific purposes that are not related to a particular business combination which is planned to be accounted for by the pooling of interests method are not prohibited by the conditions of either paragraph .47-c or .47-d.

.069 In the absence of persuasive evidence to the contrary, however, it should be presumed that all acquisitions of treasury stock during the two years preceding the date a plan of combination is initiated (or from October 31, 1970 to the date of initiation if that period is less than two years) and between initiation and consummation were made in contemplation of effecting business combinations to be accounted for as a pooling of interests. Thus, lacking such evidence, this combination would be accounted for by the purchase method regardless of whether treasury stock or unissued shares or both are issued in the combination.

.070 The specific purposes for which treasury shares may be reacquired prior to consummation of a "pooling" include shares granted under stock option or compensation plans, stock dividends declared (or to be declared as a recurring distribution), and recurring distributions as provided in paragraph .47-d. Likewise, treasury shares reacquired for issuance in a specific "purchase" or to resolve an existing contingent share agreement from a prior business combination would not invalidate a concurrent "pool-
ing.” Treasury shares reacquired for these purposes should be either reissued prior to consummation or specifically reserved for these purposes existing at consummation.

.071 To the extent that treasury shares reacquired within two years prior to initiation or between initiation and consummation have not been reissued or specifically reserved, an equivalent number of shares of treasury stock may be sold prior to consummation to “cure” the presumed violation of paragraphs .47-c and .47-d. If the number of shares not reserved or disposed of prior to consummation of a combination is material in relation to the number of shares to be issued to effect the combination, the combination should be accounted for by the purchase method.

.072 Treasury shares reacquired more than two years prior to initiation may be reissued in a “pooling.” Also, “tainted” treasury shares purchased within two years prior to initiation or between initiation and consummation and not disposed of or reserved may be reissued in a “pooling” if not material in relation to the total number of shares issued to effect the combination. Treasury shares reissued in a “pooling” should be accounted for as specified in section 1091.54.

.073 It should be noted that earnings and market price contingencies were permitted in both “purchases” and “poolings” under “old rules.” These contingencies in a combination consummated under section 1091 require the combination to be accounted for as a “purchase.” Although “liability-type” contingencies may exist in a “pooling” as specified in paragraph .47-g, treasury stock may not be reacquired to satisfy such a contingency.

[Issue Date: September, 1971.]

21. Pooling with “Bailout”

.074 Question—Section 1091.48a specifies that a combined corporation may not agree to directly or indirectly retire or reacquire all or part of the common stock issued to effect a business combination and paragraph .48-b specifies that a combined corporation may not enter into financial arrangements for the benefit of the former stockholders of a combining company if a business combination
is to be accounted for by the pooling of interests method. Would an arrangement whereby a third party buys all or part of the voting common stock issued to stockholders of a combining company immediately after consummation of a business combination cause the combination to not meet these conditions?

.075 Interpretation—The fact that stockholders of a combining company sell voting common stock received in a business combination to a third party would not indicate failure to meet the conditions of paragraphs .48-a and .48-b. “Continuity of ownership interests,” a criterion for a pooling of interests under ARB No. 48, is not a condition to account for a business combination by the pooling of interests method under section 1091. The critical factor in meeting the conditions of paragraphs .48-a and .48-b is that the voting common stock issued to effect a business combination remains outstanding outside the combined corporation without arrangements on the part of any of the corporations involving the use of their financial resources to “bailout” former stockholders of a combining company or to induce others to do so.

.076 Either the combined corporation or one of the combining companies may assist the former stockholders in locating an unrelated buyer for their shares (such as by introductions to underwriters) so long as compensation or other financial inducements from the corporation are not in some way involved in the arrangement. If unregistered stock is issued, the combined corporation may also agree to pay the costs of initial registration.

[Issue Date: September, 1971.]

22. Disposition of Assets to Comply with an Order

.077 Question—As a condition to account for a business combination by the pooling of interests method, section 1091.48c prohibits the planned disposal of a significant part of the assets of the combining companies within two years after the consummation date other than disposals in the ordinary course of business and eliminations of duplicate facilities or excess capacity. Likewise, paragraph .47-c prohibits a change in the equity interests of the voting common stock—such as through the “spin-off” of a division or a subsidiary—in contemplation of effecting a “pooling”
combination either within two years before initiation or between initiation and consummation. Does a prior or a planned disposition of a significant part of the assets of a combining company to comply with an order of a governmental authority or judicial body constitute a violation of this condition?

.078 Interpretation—No. The prior or planned disposition of a significant part of the assets of a combining company (even though in contemplation of effecting or planned subsequent to a combination) does not negate accounting for a business combination as a “pooling” if the disposition is undertaken to comply with an order of a governmental authority or judicial body or to avoid circumstances which, on the basis of available evidence, would result in the issuance of such an order. This is generally consistent with paragraph .46-a (autonomy of combining companies) which permits subsidiaries disposed of in compliance with an order of a governmental authority or judicial body to be considered autonomous for purposes of that condition.

.079 Any gain or loss resulting from a disposal within two years after consummation of a pooling of interests should be accounted for in accordance with sections 1091.59-.60.

[Issue Date: September, 1971.]

23. Retroactive Disclosure of Pooling

.080 Question—Section 1091.61 specifies that a business combination accounted for by the pooling of interests method should be recorded as of the date the combination is consummated. This paragraph prohibits a combining company from retroactively reflecting in the financial statements for the current year a combination consummated after the close of the year but before financial statements are issued. However, this paragraph requires a corporation to disclose as supplemental information, in notes to financial statements or otherwise, the substance of a combination consummated before financial statements are issued and the effects of the combination on reported financial position and results of operations. Could this disclosure be in the form of a statement with side-by-side columns reporting financial data for (1) the issuing corporation and (2) the
combined corporations, and, perhaps, (3) the other combining company?

.081 Interpretation—Section 1091 does not prohibit the side-by-side columnar format described above, nor alternatively, does it prohibit an above-and-below columnar format. The term or otherwise included in paragraph .61 is sufficiently broad to permit disclosure of the information on the face of the financial statements in either side-by-side or above-and-below columns.

.082 Because section 1091 prohibits retroactive pooling for a combination completed after the close of the year but before the financial statements are issued, however, the individual columns in the presentation should be separately identified as primary or supplemental information. That is, data for the issuing corporation would be identified as the primary financial statements and data for the combined corporation would be identified as supplemental information. If presented, data for the combining company would also be identified as supplemental information.

.083 It might be noted that a side-by-side presentation will disclose information in greater detail than is required by paragraph .65 (which requires that only revenue, net income, earnings per share and the effects of anticipated changes in accounting methods be disclosed as if the combination had been consummated at the date of the financial statements). Although both paragraphs .61 and .65 specify disclosure in notes to the financial statements and paragraph .65 specifies only note disclosure without the or otherwise provision, this paragraph refers back to paragraph .61 so the columnar format is not prohibited by paragraph .65 as long as the information is properly identified as primary and supplemental.

.084 Information for the combined corporation identified as supplemental information (as described above) would be reported as primary information in statements for the following period when the combination was consummated if comparative financial statements are presented. Reporting and disclosure requirements for the period when a business combination is consummated and for prior periods are contained in paragraphs .51-.58, .63 and .64.
Notes to the statements and other disclosures which are included in the statements are a part of the financial statements. Accordingly, the auditor's opinion—unless appropriately modified—would apply to disclosure (in notes to the statements or in columnar format) of the substance of a combination consummated after the close of the year but before the financial statements were issued. The auditor's opinion might be modified, however, to disclaim an opinion on the supplemental information if it had not been included in the auditor's examination.

[Issue Date: September, 1971.]

24. "Grandfather" for Subsidiaries

Question—Section 1091.46a prohibits use of pooling accounting for a business combination initiated after October 31, 1970 (the effective date of section 1091) which involves an entity which was a "subsidiary." However, notes to APB Opinions state that they are not intended to be retroactive. Section 1091.46a appears to impose a retroactive effect on subsidiaries with significant minority interests that may have been considering engaging in pooling combinations. Was this intended?

Interpretation—Section 1091.46a was not intended to have the retroactive effect described above. Subsidiaries which had a significant outstanding minority interest at October 31, 1970 may take part in a pooling combination providing the significant minority also exists at the initiation of the combination. In addition, the combination must meet all of the other pooling conditions specified in sections 1091.46 through 1091.48 both directly and indirectly (i.e., the parent company cannot take actions on behalf of the subsidiary that the subsidiary could not take itself). [As amended, effective November 1, 1975, by FASB Statement No. 10.] (See section 1092.)

For purposes of this Interpretation, a significant minority means that at least 20 percent of the voting common stock of the subsidiary is owned by persons not affiliated with the parent company.

This "grandfathering" is consistent with section 1091.99 and applies both to combinations where the subsidiary with a significant minority interest is the issuing
corporation and those where it is the other combining company. However, it does not permit a pooling between a subsidiary and its parent.

[Issue Date: November, 1971.]

25. All Shares Must Be Exchanged to Pool

.090 Question—Section 1091.47b specifies that an issuing corporation must exchange only voting common stock for at least 90 percent of the voting common stock interest of a combining company to account for the combination as a pooling of interests. Section 1091.47 permits cash or other consideration to be exchanged for the remaining shares or they may continue outstanding as a minority interest. Under section 1091.47b, assuming the issuing corporation exchanges common stock for at least 90 percent of the common stock of the combining company, may an individual common shareholder of the combining company exchange some of his shares for shares of the issuing corporation and either retain the balance of his shares or sell the shares to the issuing corporation for cash?

.091 Interpretation—If a business combination is to be accounted for as a pooling of interests, each common shareholder of the combining company must either agree to exchange all of his shares for common shares of the issuing corporation or refuse to exchange any of his shares.

.092 It would be contrary to the “pooling” concept expressed in section 1091 for an individual shareholder of a combining company to exchange some of his shares and keep some of his shares in a pooling of interests or for the issuing corporation to exchange common stock for some of an individual shareholder’s shares and pay cash for some of his shares. The “pooling” concept would be violated in these cases even though the issuing corporation exchanged its common stock for at least 90 percent of the common stock of the combining company as required by section 1091.47b.

.093 Theoretically two or more entire common stockholder groups join together as a single entity in a pooling of interests to share the combined risks and rights represented by the previously independent interests without the distribution of corporate assets to any of the common stock-
holders (see section 1091.45). Section 1091.46 states as an attribute of "pooling" that independent ownership interests are combined in their entirety. Section 1091.46 indicates that combining only selected assets or ownership interests would be more akin to disposing of or acquiring interests than to sharing rights and risks. Section 1091.47 states that acquisitions of common stock for assets or debt and other transactions that reduce the common stock interest are contrary to the idea of combining existing stockholder interests.

.094 Section 1091 permits the theoretical concept of "pooling" to be modified only within strict limits to accommodate practical obstacles that may be encountered in many combinations. Thus, the 90 percent "test" in section 1091.47b recognizes that, as a practical matter, some shareholders of a combining company may refuse to exchange their shares even though most shareholders agree to a combination.

.095 Section 1091.47b permits cash or other consideration to be distributed by the issuing corporation for shares held by these dissenting shareholders of the combining company. However, a shareholder who assents to exchange part of his shares can hardly be considered a dissenting shareholder.

.096 In addition, the exchange by an individual shareholder of a combining company of only part of his shares for common stock of the issuing corporation would not meet section 1091.47e. Section 1091.47e states that each individual shareholder who exchanges his stock must receive a voting common stock interest in proportion to his relative voting common stock interest in the combining company before the combination.

.097 Usually the determination of whether or not a shareholder of a combining company is exchanging all of his shares for common stock of the issuing corporation will be made at consummation. However, transactions prior to consummation between the issuing corporation and a shareholder of a combining company who exchanges shares at consummation may also preclude a "pooling." In the absence of persuasive evidence to the contrary, it should be presumed that the purchase was made in contemplation of
effecting the combination (see section 1091.47c) if the issuing corporation purchased shares of a combining company within two years prior to initiation and before consummation from a shareholder who also exchanges shares at consummation.

.098 To overcome another purely practical problem, section 1091.47b also allows cash or other consideration to be distributed by the issuing corporation in lieu of fractional shares. There is no essential difference between the payment of cash to a common shareholder for a fraction of a share and the payment of cash for some of his shares. Therefore, the payment of more than a reasonable amount of cash to a shareholder for a fractional share would also be contrary to the "pooling" concept expressed in section 1091. Thus, the payment for fractional shares among shareholders must be reasonable in amount and should be proportional to each shareholder's fractional share interest.

[Issue date: November, 1971.]

26. Acquisition of Minority Interest

.099 Question—How should a corporation account for the acquisition of all or part of the minority interest of a subsidiary?

.100 Interpretation—Section 1091.05 states, "The acquisition of some or all of the stock held by minority shareholders of a subsidiary is not a business combination, but paragraph .43 of this section specifies the applicable method of accounting." Paragraph .43 states that the acquisition of some or all of the stock held by minority stockholders of a subsidiary—whether acquired by the parent, the subsidiary itself, or another affiliate—should be accounted for by the purchase method. Thus, purchase accounting applies when (a) a parent exchanges its common stock or assets or debt for common stock held by minority shareholders of its subsidiary, (b) the subsidiary buys as treasury stock the common stock held by minority shareholders, or (c) another subsidiary of the parent exchanges its common stock or assets or debt for common stock held by the minority shareholders of an affiliated subsidiary.
.101 In addition, section 1091.46b precludes pooling when the combining companies hold as intercorporate investments more than 10 percent of the outstanding voting common stock of any combining company (except when section 1091.99 applies, as discussed later). Therefore, pooling is precluded in the exchange by a subsidiary of its common stock for the outstanding voting common stock of its parent (usually referred to as a "downstream merger"). Instead, purchase accounting applies and the transaction should be accounted for as if the parent had exchanged its common stock for common stock held by minority shareholders of its subsidiary. (Whether a parent acquires the minority or a subsidiary acquires its parent, the end result is a single shareholder group, including the former minority shareholders, owning the consolidated net assets.) The same would be true if a new corporation exchanged its common stock for the common stock of the parent and the common stock of the subsidiary held by minority shareholders.

.102 An exception to the requirement for purchase accounting in the acquisition of a minority interest may exist in some rare cases under section 1091.99. This paragraph permits pooling accounting to be elected on a "grandfather" basis under certain conditions, one condition being a combination in which one corporation owns no more than 50 percent of the voting common stock of the other combining company. Since a parent company may control a subsidiary even though the parent owns less than 50 percent of the subsidiary's voting common stock (e.g., by owning voting preferred stock in addition to voting common stock—see section 2051.03), the exchange by the parent of its voting common stock for the voting common stock of the subsidiary owned by outsiders could qualify for pooling accounting. However, it should be noted that section 1091.99 would require the parent to allocate the excess of the cost of its previously existing investment over its proportionate equity in the subsidiary's net assets to the subsidiary's identifiable assets (and to goodwill, if any) based on fair values at the consummation date.

[Issue Date: December, 1971]
27. Entities Under Common Control in a Business Combination

.103 Question—Section 1091.05 states that the provisions of section 1091 should be applied as a general guide in a business combination involving one or more unincorporated businesses. Section 1091.46a requires that each company in a pooling be autonomous and have not been a subsidiary or division for two years prior to initiation. How does section 1091 apply to a combination involving one entity controlled by one or a few individuals who control several other entities?

.104 Interpretation—A proprietorship or a partnership may be a party to a business combination accounted for under section 1091 as stated in the first sentence of section 1091.05. Many of these entities are very similar, except for legal form of organization, to a closely held corporation. Often a single individual may own one or more proprietorships and also may own the controlling interest in one or more corporations and in addition may have an interest in one or more partnerships.

.105 Considerable judgment will usually be required to determine the substance of a combination involving one (or more) of several companies under common control. For example, it may be necessary to look beyond the form of the legal organizations to determine substance when an unincorporated business or a closely held corporation owned by one or a few individuals who also control other entities is involved since the dividing lines may not be as “sharp” as they would be in publicly held corporations with wide ownership interests.

.106 An individual who owns two separate businesses organized as corporations theoretically is a “parent” with two “subsidiaries.” The same would be true if the businesses were organized as two proprietorships or as one proprietorship and one corporation. To apply section 1091.46a to a combination involving one of these businesses, however, the relationship between the two businesses is more important than the fact that each business is theoretically a subsidiary, because section 1091.46a precludes fragmenting a business and pooling only a part of the business. The following examples demonstrate these points.
.107 If both businesses are grocery stores, a combination involving only one business should presumably be accounted for as a purchase because the two stores presumably are part of a single kind of business and the two separate legal organizations should be ignored.

.108 On the other hand, if one business is a grocery store and the other is an automobile dealership, a combination involving only one business would be accounted for as a pooling of interests if all other conditions of sections 1091.46-.48 are met because the individual is operating two unrelated businesses. In these examples, a "line of business" is an indicator of a single business.

.109 Also, a combination involving two or more businesses owned by one individual must be accounted for by a single method. For example, if both the grocery store and the automobile dealership are to be combined with another unrelated company, one could not be a purchase and the other a pooling. (Section 1091.47b discusses a combination of more than two companies and section 1091.43 states the two methods are not alternatives in accounting for the same combination.)

.110 In general, the same guidelines apply to a business with a few owners rather than an individual owner. They would apply, for example, to two partnerships having the same partners, two closely held corporations having the same stockholders, or to a partnership and a closely held corporation whose stockholders are the partners in the partnership. If the various individuals are all members of one family, the effect may be the same (but is not always the same) as if there were only an individual owner rather than several partners and/or several stockholders.

.111 Because the ratios of ownership of the different businesses may differ or the ownership groups may overlap but be different, however, several owners of different businesses create complexities which are not present if there is a single owner. Because of the diversity of the situations which might be encountered in practice, stating guidelines beyond those given above is impossible.

[Issue Date: December, 1971]
28. Pooling by Subsidiary of Personal Holding Company

.112 Question—A single individual may control other corporations (for federal income tax reasons) through a personal holding company. Section 1091.46a requires that each company in a pooling be autonomous and have not been a subsidiary or division for two years prior to the initiation of a combination. Does this preclude a pooling by a corporation which is controlled by a personal holding company?

.113 Interpretation—The legal form may sometimes be ignored in a combination involving a subsidiary of a personal holding company. Under section 1091.46a a personal holding company is technically a parent corporation and the corporations it controls are technically subsidiaries. In many cases, a parent-subsidiary relationship does in fact exist and should be considered as such in applying section 1091.46a if the personal holding company or any of its subsidiaries is involved in a business combination.

.114 In other cases, a personal holding company is a convenience established for federal income tax reasons and the various “subsidiaries” are in fact operated by the “owners” as if the personal holding company did not exist. In a combination involving such a “subsidiary,” the personal holding company may be disregarded and the various “subsidiaries” considered autonomous in applying section 1091.46a. However, the guidelines described in Accounting Interpretation No. 27, “Entities Under Common Control in a Business Combination,” should be applied in determining the appropriate method of accounting for the combination and all other conditions of sections 1091.46-.48 must be met in a pooling.

[Issue Date: December, 1971]

29. Option May Initiate Combination

.115 Question—Section 1091.46a specifies the requirements for initiation of a business combination. Does an option to exchange substantially all of their shares at a future date (for example, three years hence) granted by the shareholders of a closely held company to another company constitute the initiation of a business combination?
.116 Interpretation—An option that requires unilateral performance by either party or bilateral performance by both parties constitutes initiation. Thus, if one company is required to issue stock upon the tendering of shares by the shareholders of another company or if the shareholders are required to tender their shares upon demand, the date the option is granted is the initiation date. The combination must be consummated within one year thereafter to be accounted for by the pooling of interests method (see section 1091.47a).

.117 However, an agreement which grants only the right of "first refusal" does not constitute initiation. This would be the case, for example, where the stockholders of a closely held company agree to negotiate with one company before negotiating with any other company if the shareholders should in the future decide to consider entering into a business combination. Neither party may be obligated to perform, however, or to pay damages in the absence of performance.

.118 The payment of cash or other consideration by either company for a "first refusal" agreement would also be contrary to the pooling concept expressed in section 1091. Individual shareholders, however, may pay cash to obtain the agreement so long as company resources are not directly or indirectly involved.

30. Representations in a Pooling

.119 Question—Section 1091.47g specifies that in a business combination accounted for as a pooling of interests there can be no agreement to contingently issue additional shares of stock or other consideration at a later date and no escrowing of shares until a contingency is resolved. This paragraph allows, however, revision of the number of shares issued upon the settlement of a contingency at an amount different from that recorded by a combining company. May an issuing company reserve or escrow some shares against the representations of the management of a combining company in a pooling?

.120 Interpretation—Section 1091.47g is intended to require purchase accounting when an earnings or market
price contingency agreement is present in a business combination. However, this paragraph does not prohibit certain kinds of contingency agreements in a pooling so long as they provide for the sharing of rights and risks arising after consummation and are not in effect earnings or market price contingency agreements.

.121 A contingency agreement which is not prohibited in a pooling may provide for the reservation by the issuing company of a portion of the shares being issued, the issuance of additional shares, the return of shares by former shareholders of the combining company, or the issuance of shares to an escrow agent who will subsequently transfer them to the former shareholders of the combining company or return them to the issuing company. (Note that the former shareholders of the combining company must be able to vote any shares issued, reserved, or escrowed to meet the condition of section 1091.47f.)

.122 The most common type of contingency agreement not prohibited in a pooling by section 1091.47g is the "general management representation" which is present in nearly all business combinations. In such a representation, management of a combining company typically warrants that the assets exist and are worth specified amounts and that all liabilities and their amounts have been disclosed. The contingency agreement usually calls for an adjustment in the total number of shares exchanged up to a relatively small percentage (normally about 10 percent) for variations from the amounts represented, but actual adjustments of the number of shares are rare.

.123 A contingency agreement for a "general management representation" does not violate section 1091.47g if it provides for a substantial sharing of rights and risks beginning with consummation and the complete sharing within a reasonable period of time. In this light, the contingency agreement is merely a device to provide time for the issuing company to determine that the representations are accurate so it does not share risks arising prior to consummation. Although the time required will vary with circumstances, these determinations should be completed within a few months following consummation of the combination. In any case, the maximum time should not extend
Accounting for Business Combinations

beyond the issuance of the first independent audit report on the company making the representations following consummation of the combination. Thereafter, the combined shareholder interests share the risks of inventory obsolescence, collection of receivables, etc. However, if the complete sharing of risks is unduly delayed or if the risk sharing is not substantial at consummation, a "general management representation" may in effect indicate an earnings contingency agreement.

.124 Section 1091.47g specifically allows certain contingency agreements in a pooling to cover specific situations whose outcome cannot be reasonably determined at consummation and perhaps even for several years thereafter. Although management of a combining company may make specific representations as to these contingencies that are known at the consummation of a pooling and as to those which may arise within a reasonable period thereafter, the combined shareholder interests are expected to share the risks and rights of all other contingencies if section 1091.47g is to be met. Likewise, the former shareholders of a combining company must be able to vote any shares issued, reserved, or escrowed for a specific contingency until it is finally resolved if section 1091.47f is to be met. The contingency agreement may provide, however, that any dividends during the contingency period on contingent shares "follow" the shares when the contingency is resolved.

.125 It should also be noted that any change in the number of shares (as originally recorded for a pooling of interests) upon the final resolution of either a general or a specific representation contingency is recorded as an adjustment to stockholders' equity (see section 1091.53). The effect of the resolution of a contingency involving an asset or liability, whether or not previously recorded,
Accounting for Business Combinations

is reflected currently in net income or as a prior period adjustment in accordance with section 2014. In no case may a contingency agreement for either a general or a specific representation in a pooling be used as a means of relieving current or prior net income of an amount which should be reflected therein. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

[Issue Date: December, 1971]

31. Employment Contingencies in a Pooling

.126 Question—Section 1091.47g stipulates that in a business combination accounted for as a pooling of interests there can be no agreement for contingent issuance of additional shares of stock or distribution of other consideration to the former stockholders of a combining company. Would the granting of an employment contract or a deferred compensation plan by the combined corporation to former stockholders of a combining company cause this condition to not be met?

.127 Interpretation—An employment contract or a deferred compensation plan granted by the combined corporation to former stockholders of a combining company would not automatically constitute failure of section 1091.47g. The critical factors would be the reasonableness of the arrangement and restriction of the arrangement to continuing management personnel. Generally, reasonable contracts or plans entered into for valid business purposes would meet section 1091.47g. Substance, however, is more important than form.

.128 As an example, the granting of employment contracts to former stockholders of a combining company who were active in its management and who will be active in management of the combined corporation would meet section 1091.47g if the contracts are reasonable in relation to existing contracts granted by the issuing corporation to its management. However, the granting of employment contracts to former stockholders of a combining company who were not or will not be active in management probably indicates a contingent pay-out arrangement. Likewise,
"consultant" contracts for former stockholders might also indicate a contingent pay-out arrangement.

.129 Employment contracts and deferred compensation plans entered into by a combining company between the initiation and consummation dates may also cause a business combination to not meet section 1091.47g. For example, a combining company may not enter into a "contingency-type" compensation agreement in contemplation of the combination and meet section 1091.47g if the issuing corporation could not also enter into the same agreement under the paragraph.

[Issue Date: December, 1971]
32. **Stock Options in a Pooling**

.130 *Question*—Section 1091.47g states that in a business combination accounted for as a pooling of interests the combined corporation may not agree to contingently issue additional shares of stock to the former stockholders of a combining company. Would this condition be violated if the combined corporation granted stock options to these stockholders?

.131 *Interpretation*—Generally, stock options granted by the combined corporation as current compensation to former stockholders of a combining company would not violate section 1091.47g. That is, the former stockholders of a combining company who are employees or directors of the combined corporation may participate in a stock option plan adopted by the combined corporation for its employees and/or directors.

.132 Section 1091.47g would be violated, however, if the stock option plan in reality is an arrangement to issue additional shares of stock at a relatively low cost to these former stockholders of the combining company to satisfy a contingency agreement. Also, a stock option plan to accomplish the same result adopted by the combining company prior to consummation but *in contemplation* of the combination would not meet sections 1091.47c and 1091.47g.

[Issue Date: December, 1971]

33. **Costs of Maintaining an “Acquisitions” Department**

.133 *Question*—A corporation maintains an “acquisitions” department to find, evaluate, and negotiate with possible merger candidates. The president of the corporation also spends a considerable portion of his time negotiating business combinations. Cost records are excellent and the total cost is determined for each investigation and negotiation, whether it is successful or unsuccessful. What accounting is specified by section 1091 for these costs?

.134 *Interpretation*—All “internal” costs associated with a business combination are deducted *as incurred* in determining net income under section 1091. This answer applies to costs incurred for both “poolings” (see section 1091.58) and “purchases” (see section 1091.76). Naturally, costs incurred in unsuccessful negotiations are also deducted as incurred.
.135 Section 1091.76 specifies that in a business combination accounted for by the purchase method the cost of a company acquired includes the direct costs of acquisition. These direct costs, however, are "out-of-pocket" or incremental costs rather than recurring internal costs which may be directly related to an acquisition. The direct costs which are capitalized in a purchase therefore include, for example, a finder's fee and fees paid to outside consultants for accounting, legal, or engineering investigations or for appraisals, etc. All costs related to effecting a pooling of interests, including the direct costs listed above, are charged to expense as specified in section 1091.58.

[Issue Date: December, 1971]

34. Forced Sale of Stock

.136 Question—A publicly held corporation wants to effect a business combination with a large closely held corporation and to account for the combination as a pooling of interests. Because management of the publicly held corporation prefers not to have a single stockholder owning a large block of its stock, the agreement to combine requires the majority stockholder of the closely held corporation to sell 25 percent of the voting common stock he receives immediately following consummation and to sell another 25 percent within one year thereafter. The stock is to be sold in public offerings and all of the shares will remain outstanding outside the combined corporation. Since section 1091 does not have the "continuity of ownership interests" criterion of ARB No. 48 as a condition for pooling, should this combination be accounted for as a pooling of interests or as a purchase?

.137 Interpretation—The combination is a purchase because of the requirement imposed on a shareholder to sell some of the voting common stock received. Any requirement imposed on a stockholder (other than by a government authority) either to sell or to not sell stock received in a business combination is contrary to the pooling concept expressed in section 1091 of the sharing of rights and risks by the previously independent stockholder interests. While such a requirement does not violate any spe
cific condition for pooling described in sections 1091.46-48, it violates the whole pooling concept of section 1091.

[Issue Date: January, 1972]

35. Registration Costs in a Purchase

.138 Question—If a company issues previously registered equity securities in a business combination accounted for by the purchase method, the fair value of the securities issued is credited to the capital accounts of the issuing corporation. However, if the securities issued have not been previously registered, section 1091.76 specifies that the costs of registering and issuing equity securities are a reduction of the otherwise determinable fair value of the securities. How should a corporation account for the costs of a registration which will not be undertaken until after the securities are issued?

.139 Interpretation—A publicly held company issuing unregistered equity securities in an acquisition with an agreement for subsequent registration should credit the fair value of the securities (the otherwise determinable fair value less registration costs) to its capital accounts. The present value of the estimated costs of registration should be accrued as a liability at the date of acquisition (see section 1001.88h) with an immediate charge to the assets acquired (in most cases, to “goodwill”). Any difference between the actual costs of registration and the amount accrued at the payment date (the original accrual plus imputed interest) would be an adjustment to the recorded goodwill. Total assets (including goodwill) and total capital will thereby be recorded at the same amounts as if previously registered securities had been issued except for any difference in fair value ascribed to restrictions prohibiting sale of the securities at time of issuance.

.140 Agreements for the subsequent registration of unregistered securities issued in business combinations often specify that the securities will be registered “piggy-back” (that is, included in the registration of a planned future offering of other securities). In such a case, only the incremental costs of registering the equity securities issued in the acquisition would be accrued or subsequently charged to “goodwill” as described above and amortized.
prospectively over the remaining term of the period of amortization of the initial goodwill.

[Issue Date: January, 1972]

36. No Pooling with Wholly Owned Sub

.141 Question—Company A initiated a combination by making a tender offer for Company B which was at the time an independent company. Company C, which owned a large interest in, but not control of, Company B, subsequently and without Company A's knowledge purchased all of the remaining outstanding voting common stock of Company B and operated Company B as a wholly owned subsidiary. Within one year of the date Company A made the tender offer, Company C tendered all of the voting common stock of Company B to Company A in exchange for voting common stock of Company A at the ratio of exchange of the tender offer. Section 1091.46a generally precludes accounting for a business combination by the pooling of interests method if one of the combining companies has been a subsidiary of another corporation within two years prior to initiation of the combination. Does the fact that Company B became a wholly owned subsidiary of Company C following initiation of the combination by Company A preclude pooling in this case?

.142 Interpretation—Yes, pooling is precluded and Company A should account for the combination as a purchase. (Company C, in effect, sold its wholly owned subsidiary B to Company A.) Section 1091.46a provides that a wholly owned subsidiary may pool only by distributing the stock of its parent company.

.143 Although section 1091.46a refers to not being a subsidiary "within two years before the plan of combination is initiated," the intent of the paragraph is that a combining company in a pooling has not been a subsidiary during a period beginning two years prior to initiation and ending at consummation of a combination.

[Effective for combinations consummated after May 31, 1972]

37. Combination Contingent on "Bailout"

.144 Question—Accounting Interpretation No. 21, section U1091.074-.076, "Pooling with 'Bailout'," issued in
September 1971 indicates that former shareholders of a combining company may sell voting common stock received in a business combination accounted for as a pooling of interests. Would the accounting for a combination be affected by the fact that its consummation is contingent upon the purchase by a third party or parties of all or part of the voting common stock to be issued in the combination?

.145 Interpretation—Yes. A business combination should be accounted for as a purchase if its consummation is contingent upon the purchase by a third party or parties of any of the voting common stock to be issued. This would be the case, for example, if the parties to the combination have agreed that consummation of the combination will not occur until there is a commitment by a third party for a private purchase, a firm public offering, or some other form of a guaranteed market for all or part of the shares to be issued. Including such a contingency in the arrangements of the combination, either explicitly or by intent, would be considered a financial arrangement which is precluded in a pooling by section 1091.48(b).

.146 It should be noted that this accounting interpretation does not modify the previous interpretation, "Pooling with 'Bailout'," which states that shareholders may sell stock received in a pooling and that the corporation may assist them in locating an unrelated buyer for their shares. Although shareholders may sell stock received in a pooling, consummation of the business combination must first occur without regard to such a sale and cannot be contingent upon a firm commitment by the potential purchaser of the shares to be issued.

[Issue Date: November, 1972]

38. Several Companies in a Single Business Combination

.147 Question—How does section 1091 apply when more than two companies are involved in a single business combination?

.148 Interpretation—When more than two companies negotiate a combination which is contingent upon the mutual agreement by the several companies to the terms, the resulting combination is deemed a single business combination regardless of the number of companies involved. Each
company must meet all of the conditions of section 1091.46-.48 if the combination is to be accounted for by the pooling of interests method. In particular, sections 1091.46b and 1091.47b specify how the 10 percent and 90 percent tests should be made when more than two companies are involved in a single combination.

.149 Section 1091.43 specifies that a single method should be applied to account for an entire combination. Therefore, if any condition in section 1091.46-.48 is not met by any company, the entire combination would be accounted for by the purchase method.

.150 However, it should be noted that a corporation may be involved in more than one business combination at the same time and that different methods of accounting may apply to the different combinations.

[Issue Date: March, 1973]

39. Transfers and Exchanges Between Companies Under Common Control

.151 Question—Section 1091.05 states section 1091 does not apply to a transfer of net assets or to an exchange of shares between companies under common control. What are some examples of the types of transactions excluded from section 1091 by this provision and what accounting should be applied?

.152 Interpretation—In general, section 1091.05 excludes transfers and exchanges that do not involve outsiders. For example, a parent company may transfer the net assets of a wholly owned subsidiary into the parent company and liquidate the subsidiary, which is a change in legal organization but not a change in the entity. Likewise, a parent may transfer its interest in several partially owned subsidiaries to a new wholly owned subsidiary, which is again a change in legal organization but not in the entity. Also, a parent may exchange its ownership or the net assets of a wholly owned subsidiary for additional shares issued by the parent’s partially owned subsidiary, thereby increasing the parent’s percentage of ownership in the partially owned subsidiary but leaving all of the existing minority interest outstanding.
None of the above transfers or exchanges is covered by section 1091. The assets and liabilities so transferred would be accounted for at historical cost in a manner similar to that in pooling of interests accounting.

It should be noted, however, that purchase accounting applies when the effect of a transfer or exchange is to acquire all or part of the outstanding shares held by the minority interest of a subsidiary (see section 1091.43). The acquisition of all or part of a minority interest, however acquired, is never considered a transfer or exchange by companies under common control. (See Interpretation No. 26, section U1091.099-.102, "Acquisition of Minority Interest.")

AC Section U2010

Reporting the Results of Operations: Accounting Interpretations of Section 2010

1. Losses Caused by Bankruptcies

.001 Question—Recent railroad bankruptcies raise the question of whether companies holding receivables from these railroads should account for losses arising from charging off such assets as ordinary losses or as extraordinary losses in determining net income. The Interstate Commerce Commission has ruled that railroads must write off certain past due payments from other railroads (e.g., interline receivables) as extraordinary losses. Is this accounting treatment appropriate in the annual reports to railroads’ shareholders and in the annual reports to shareholders of other (nonrailroad) companies?

.002 Interpretation—No, section 2012.23 specifies that losses from receivables do not constitute extraordinary losses. The fact that the loss arises from a receivable from a company in bankruptcy proceedings does not alter this answer in any way. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

.003 Regulatory authorities often rule on the accounting treatment to be applied by companies under their jurisdiction. The above question is covered by section 6011.03-.04. An auditor should in his opinion take an exception to any loss from an interline receivable classified as an extraordinary item in a railroad’s annual report to shareholders.

INTRODUCTION

Comparison of APB Opinion No. 9 and Section 2011

.001 Section 2011, *Earnings per Share*, is an extension of the issues discussed in Part II, "Computation and Reporting of Earnings Per Share," of APB Opinion No. 9.

.002 APB Opinion No. 9 included certain "residual" securities as the equivalent of common stock in earnings per share computations, established "supplementary pro forma" earnings per share for reporting what the effect on earnings per share would have been if all residual and contingently issuable securities had been issued, and strongly recommended that both earnings per share and supplementary pro forma earnings per share be disclosed in the income statement.

.003 Section 2011 supersedes Part II of APB Opinion No. 9, modifies the concept of residual securities and replaces the term *residual securities* with the new designation *common stock equivalents*. Under section 2011, dilutive common stock equivalents are included with outstanding common stock in computing "primary" earnings per share. Common stock, dilutive common stock equivalents and other potentially dilutive securities are included in computing "fully diluted" earnings per share.

.004 Section 2011 requires that earnings per share be presented on the face of corporate income statements or summaries of such statements with both the primary and fully diluted amounts presented when potential dilution of earnings per share exists. Also, section 2011 specifically

*See FASB Statement No. 21 [section 2083], Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.*
prohibits including anti-dilutive\textsuperscript{1} securities in earnings per share computations (except in special situations to be discussed later) while APB Opinion No. 9 discussed dilution but did not specifically prohibit anti-dilution.

Interpretation of Section 2011

.005 These Accounting Interpretations are intended to explain the provisions of section 2011. They do not in any way amend or modify section 2011. They do not presume to answer all questions which might be raised in applying section 2011 but rather are addressed to questions raised since section 2011 was issued.

.006 Some Interpretations are concerned with simple situations; others are concerned with rather complex situations. And just as APB Opinions are not necessarily applicable to immaterial items, these Interpretations do not necessarily apply to immaterial items. In many cases the refinements described will be material, but in many other cases they will not. When the difference is not significant, the refinements need not be applied. For example, the quarterly share averaging procedure for options and warrants described in Interpretations 58-62 [section U2011.202-.222] need not be used when the market price of common stock is stable throughout the year and always above the exercise price. In such a case the treasury stock method could be applied on an annual basis.

.007 Although the Interpretations are not binding on Institute members, they reflect informed consideration of the situations posed and express what the Institute staff believes to be the preferred practices for earnings per share computations under section 2011.

Arrangement

.008 These Interpretations of section 2011 are divided into two parts. Part I is an overview of section 2011. Although Part I summarizes the basic provisions of section 2011, familiarity with section 2011 is assumed and terms used in section 2011 are not defined in this part. Part I also serves as a brief description of the underlying concepts of section 2011. Part II contains definitional Interpretations followed by individual Interpretations in question and answer form. The Interpretations are numbered sequentially and are arranged generally in the order in

\textsuperscript{1} See Interpretation 5 [section U2011.058-.060] for the definition of an anti-dilutive security.
which the topics appear in Part I. Exhibits follow Part II. A cross-reference table which lists each section 2011 paragraph cited (as explained below) and the location of the citation, is included in Appendix D, page 15,081.

0.009 Numbers appearing in brackets at the end of paragraphs indicate references (in numerical order) to paragraph numbers in section 2011 (and its appendixes) relevant to the material being discussed.

PART I: AN OVERVIEW OF SECTION 2011
Presentation of Earnings per Share

0.010 Section 2011 requires nearly all corporations to report earnings per share data on the face of income statements or earnings summaries issued for periods beginning after December 31, 1968. Each presentation must include per share data for income or loss before extraordinary items (if extraordinary items are reported on the income statement) and per share data for net income or loss. Corporations with capital structures containing securities that do not, in the aggregate, dilute earnings per share 3% or more need present only earnings per common share. This exception for corporations whose securities do not dilute earnings per share by at least 3% is based upon the immateriality of dilution of less than 3%. In section 2011 the Board specified the point at which dilution becomes material rather than allowing different judgments to determine different levels of materiality. All other corporations are required to have the “dual” presentation of primary earnings per share and fully diluted earnings per share. All computations of earnings per share data are to be based on a weighted average of shares assumed to be outstanding during the period. [.12, .13, .14, .15, 2011A.02]

Assumptions

0.011 Earnings per share computations for corporations with complex capital structures are based on various assumptions which are required by section 2011. These assumptions are made to reflect (1) what a corporation’s earnings per share would have been if common stock had been issued to replace all dilutive securities considered to be the equivalent of common stock and (2) the additional

---

2 See Interpretation 9 [section U 2011.068—.071] for the exceptions.
dilution which would have resulted if common stock had been issued to replace all of the corporation's other potentially dilutive securities.³ [.20, .24-.27, .41]

.012 Assumptions to be made are specified for exercise, conversion, and issuance of securities, prices to be used, and methods to be applied to reflect the dilution which would have resulted if the transactions and events underlying those assumptions had actually occurred. Although specific methods for applying the assumptions are designated, the Board realized that the events and transactions assumed for the computations might not actually occur. Rather, the Board specified the assumptions and the methods as a practical approach to obtaining comparable determinations of earnings per share. [.34, .36]

**Classification of Securities**

.013 The advent of securities which are not common stock in form but which enable their holders to obtain common stock modifies some of the traditional relationships among securities. While common stock is regarded as the basic equity security and nonconvertible preferred stock and nonconvertible debt are regarded as senior securities, those securities which enable their holders to obtain common stock are classified as either common stock equivalents or as other potentially dilutive securities for earnings per share computations. This classification is made at time of issuance and does not change thereafter.⁴ [.25, .28, .41]

.014 A security is classified solely for purposes of determining earnings per share. The accounting for securities, their presentation in the financial statements, and the determination of book value per share are not affected by the classification of securities for earnings per share computations. [.39]

.015 Common stock equivalents are included in both primary and fully diluted earnings per share computations. Other potentially dilutive securities are included only in fully diluted earnings per share computations. However, common stock equivalents and other potentially dilutive

³ See Interpretation 3 [section U 2011.054—.055] for the special context in which the term other potentially dilutive securities is used in these Accounting Interpretations of section 2011. The term is not used in section 2011.

⁴ Except as explained in Interpretations 29 and 30 [section U 2011.126—.131].
Computing Earnings per Share

securities are included in the computations only when their effect is dilutive. Both are excluded from the computations whenever their effect is anti-dilutive except in the situations described in the following paragraph. Thus, a security retains its status as a common stock equivalent or as an other potentially dilutive security after its classification has been determined, but it may enter earnings per share computations in one period and not in another period. [.15, .30]

Anti-dilutive Securities

.016 Anti-dilutive securities are excluded from earnings per share computations unless (1) common stock was issued during the period on an anti-dilutive exercise or conversion or (2) a security is anti-dilutive in earnings per share for income before extraordinary items but is dilutive in earnings per share for net income or vice versa. or (3) an aggregate computation is required which has a net dilutive effect but which may include anti-dilutive securities or anti-dilutive computations. All other anti-dilutive securities are excluded from earnings per share computations even when some anti-dilutive securities are included in the computation because of one or more of the above exceptions. In an aggregate computation, only when the net result is dilutive may anti-dilutive securities be included in the earnings per share computation. [.14, .30, .30 fn. 10, .38, .40, .41]

Primary Earnings per Share

.017 Primary earnings per share data are based upon outstanding common stock and common stock assumed to be outstanding to reflect the dilutive effect of common

Note that primary earnings per share for income from continuing operations or primary earnings per share for income before extraordinary items and the cumulative effect of accounting changes may be anti-dilutive when common stock equivalents are present together with discontinued operations, and/or extraordinary items and/or accounting changes. The common stock equivalents may have an anti-dilutive effect upon one of these amounts so long as the effect is dilutive upon the other amounts. The same type of anti-dilution may be reflected within fully diluted earnings per share when common stock equivalents and other potentially dilutive securities are present together with discontinued operations, and/or extraordinary items and/or accounting changes. However, fully diluted earnings per share for net income would not be anti-dilutive with respect to primary earnings per share for net income unless the anti-dilution is caused by actual exercises or conversions. (See also section 2011.30, footnote 10.) [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.] (See section 2012.)

For example, an aggregate computation is required by section 2011.38 when the number of common shares issuable upon the exercise of all options, warrants, and their equivalents exceed 20% of the number of common
stock equivalents. Convertible securities which yield less than two-thirds of the bank prime interest rate at the time of issuance are classified as common stock equivalents. Convertible securities issued with the same terms as those of an outstanding common stock equivalent are classified as common stock equivalents regardless of their yield. Outstanding convertible securities which are not common stock equivalents become common stock equivalents if another convertible security with the same terms is issued and is classified as a common stock equivalent. [.28, .33]

.018 Convertible securities which allow or require the payment of cash at conversion are considered the equivalents of warrants. Options, warrants and their equivalents, stock purchase contracts, and certain agreements to issue common stock in the future are classified as common stock equivalents. Some participating securities and two-class common stocks are also classified as common stock equivalents. [.27, .37]

Fully Diluted Earnings per Share

.019 Fully diluted earnings per share data are based on outstanding common stock and common stock assumed to be outstanding to reflect the maximum dilutive effect of common stock equivalents and other potentially dilutive securities. Thus, convertible securities, options, warrants, stock purchase contracts, participating securities, two-class common stocks and agreements to issue stock in the future are included in the computation of fully diluted earnings per share. The difference between the primary and the fully diluted earnings per share amounts is the additional dilution resulting from other potentially dilutive securities outstanding. [.16, .40]

Earnings Applicable to Common Stock

.020 To compute earnings per share, net income must often first be adjusted to determine earnings applicable to common stock. The adjustments to net income do not in any way change reported net income but rather are made to compute the earnings for the period to which common stock has a claim. Corporations with nonconvertible pre-

shares outstanding at the end of the period for which the computation is being made. An aggregate computation would also be made for an anti-dilutive option which must be exercised before a dilutive option may be exercised. (See Interpretation 49 [section U 2011.163—.166].)
ferred stock, for example, must deduct any preferred dividends paid, declared, or accumulated for the period in adjusting net income to determine earnings applicable to common stock. [.39, 2011A.05]

.021 Only dividends which are applicable to the period covered by the income statement would be deducted. Dividends declared or accumulated during a prior period and paid during the period covered by the income statement are not deducted since they were considered in computing earnings applicable to common stock during the prior period and their payment merely retires the liability.

.022 Corporations with common stock equivalents or other potentially dilutive securities may have to make more complex adjustments or may not make some adjustments which would otherwise be made. For example, interest, less tax effect, on convertible bonds deducted in arriving at net income would be added back to net income to determine earnings applicable to common stock when the convertible bonds are assumed to be converted. Since dividends on convertible preferred stock are not deducted in arriving at net income, they would not be added back to net income to determine earnings applicable to common stock when convertible preferred stock is assumed to be converted. [2011A.06, 2011A.07]

Convertible Securities

.023 Convertible securities are included in earnings per share computations under the "if converted" method. Under this method, the security is assumed to have been converted into common stock at the beginning of the period being reported upon (or time of issuance of the security, if later). The common stock which would have been issued upon conversion is considered outstanding from the date of the assumed conversion. Interest deductions applicable to convertible debt reduced by the income taxes attributable to such interest are added back to net income because the interest would not have been incurred if the debt had been converted into common stock. Nondiscretionary adjustments based on net income or income before taxes (for items such as profit sharing or royalty agreements, etc.) are recomputed after the interest adjustment is made. Any difference (less income tax) from the amount originally computed is also included in the adjusted net income. [2011A.06]
.024 Convertible securities which *require* the payment of cash at conversion are considered the equivalent of warrants for computational purposes. Both the treasury stock method and the if converted method must be applied. Convertible securities which *permit* the payment of cash as an alternative at conversion are also considered the equivalent of warrants. But when conversion without the payment of cash would be more advantageous to the holder with this alternative, only the if converted method is applied. No proceeds would be received to which the treasury stock method could be applied. [.35, .37]

.025 When conversion is not assumed because the result would be anti-dilutive, dividends declared for the period (or accumulated for the period even though not declared) are deducted from net income to determine earnings applicable to common stock. [.30, .40, 2011A.05]

**Options and Warrants**

.026 The basic method for including options and warrants and their equivalents in earnings per share computations is the treasury stock method. Under this method, exercise of options and warrants and their equivalents is assumed at the beginning of the period (or time of issuance, if later). Shares of common stock are assumed to be issued and the proceeds from exercise are assumed to be used to purchase common stock at the exercise date. Common stock outstanding is assumed to increase by the difference between the number of shares issued and the number of shares purchased. The provision against reflecting anti-dilution in earnings per share computations generally prohibits the assumption of exercise of any option or warrant or their equivalents when the assumed purchased price of the common stock is below the exercise price of the option or warrant. [.36, .42]

.027 Section 2011 recommends as a practical matter that exercise not be assumed for earnings per share computations until the market price of the common stock has been higher than the exercise price for substantially all of three consecutive months ending with the last month of the period for which the share computation is being made. Thus, exercise need not be assumed until this three-month test has once been met. [.36]
After the test has been met, however, an ending market price which is above the average market price is used for fully diluted computations if the result is dilutive. Therefore, options and warrants may be reflected in fully diluted earnings per share even though they are not reflected in primary earnings per share. Options and warrants may also be included in the computations in some periods but not be included in other periods. [.42]

Some warrants require or permit the tendering of debt or other securities in payment of all or part of the exercise price. Upon the assumed exercise of such warrants, the debt or other securities are assumed to be tendered (unless tendering cash would be more advantageous to the warrant holder when permitted and the treasury stock method is applied). Interest, net of income tax, on any debt tendered is added back to net income. The treasury stock method is applied for proceeds assumed to be received in cash. [.37]

The proceeds from the exercise of some warrants must be applied to retire debt under the terms of the debt. Upon the assumed exercise of such warrants, the proceeds are applied to purchase the debt at its market price rather than to purchase common stock under the treasury stock method. The treasury stock method is applied, however, for excess proceeds from the assumed exercise. Interest, net of income tax, on any debt assumed to be purchased is added back to net income.

Some convertible securities require or permit the payment of cash upon conversion and are considered the equivalent of warrants. The treasury stock method must be applied to purchase common stock from proceeds assumed to be received. The if converted method must also be applied for the convertible security.

The application of the treasury stock method is modified when the number of common shares which would be issued if all outstanding options and warrants and their equivalents were exercised exceeds 20% of the number of common shares outstanding at the end of the period. This 20% test is based only on common shares actually outstanding, not considering any assumed conversion or contingently issuable shares. [.38]
.033 When the 20% test is met, all options and warrants and their equivalents are assumed to be exercised (or converted) regardless of whether each would be dilutive or anti-dilutive. The treasury stock method is first applied to purchase no more than 20% of the number of common shares outstanding at the end of the period with the proceeds from exercise. The balance of any proceeds remaining after applying the treasury stock method is then applied to reduce any short-term or long-term debt of the issuer to the extent that the debt may be retired. Finally, any remaining balance of proceeds is assumed to be invested in U. S. government securities or commercial paper. Appropriate recognition is given to any necessary interest adjustments (and related income tax effect) for both debt retirement and investment in determining earnings applicable to common stock. [.35,.38]

.034 The results of the foregoing computations are then aggregated. If the net aggregate effect is dilutive, all of these computations enter into earnings per share computations. However, all are omitted if the net aggregate effect is anti-dilutive. (See Interpretation 74 for a description of the distinction between the 20% test and the 20% limitation.)

**Delayed Effectiveness and Changing Rates or Prices**

.035 Some convertible securities are not convertible until a future date or their conversion rates may increase or decrease in the future. Similarly, some options or warrants are not exercisable until a future date or their exercise prices may increase or decrease in the future. [2011A.11]

.036 For primary earnings per share computations, the conversion rate or exercise price in effect for the period presented is used. If the holder does not have the right to convert or exercise the security until after that period, the earliest effective conversion rate or exercise price during the five years following the close of the period is used. [2011A.12]

.037 For fully diluted earnings per share computations, the most advantageous conversion rate or exercise price (to the security holder) becoming effective within ten years following the close of the period being reported upon is used. [2011A.13]
Computing Earnings per Share

Other Securities

.038 Although section 2011 does not describe in depth the treatment to be accorded to other types of securities, they were contemplated by section 2011 and some guidelines given. The earnings per share treatments of two-class common stock, participating securities, common stock issuable in the future upon the satisfaction of specified conditions, securities of subsidiaries, and options or warrants to purchase convertible securities are discussed in the Interpretations which follow in Part II. Situations or securities not expressly covered in section 2011 should be dealt with in accordance with their substance following the guidelines and criteria of section 2011 and these Accounting Interpretations. [.43]

Restatement of Previously Reported Data

.039 The earnings per share amounts reported in a prior period generally will be reported at the same amounts when that prior period is included in a later comparative income statement. Section 2011 specifically prohibits retroactive restatement (1) for changes in market prices of common stock when the treasury stock method has been applied for options and warrants, (2) when conversion rates of convertible securities or exercise prices of options or warrants change, (3) when convertible securities are actually converted, and (4) for primary earnings per share, when the number of shares issued upon the attainment of increased earnings levels differs from the number of shares previously considered outstanding. [.22, .36, .41, 2011A.12, 2011A.17]

.040 Section 2011 requires retroactive restatement (1) to give effect to prior period adjustments,7 (2) to give effect to stock dividends, stock splits, and reverse splits, including those occurring after the close of the period being reported upon, (3) to give effect to a pooling of interests, (4) to give effect to changes in the number of shares contingently issuable or issued when such changes are caused by changes in market prices of the stock, and (5) to give effect to a reduction in the number of shares contingently issuable

7 See FASB Statement No. 16 [section 2014], Prior Period Adjustments. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.]
Accounting Interpretations

when the term of an agreement to issue additional shares expires and the conditions have not been met.\(^8\) [2011A.03, 2011A.04, 2011A.17, 2011A.18]

.041 Section 2011 recommends retroactive restatement of earnings per share data for periods beginning before January 1, 1969 when such data are presented in comparative income statements including a period beginning after December 31, 1968 and election "b" of section 2011.46 has been made. Retroactive restatement of such data is required, however, when election "a" of section 2011.46 has been made. Otherwise, part of the data would conform to the provisions of Part II of APB Opinion No. 9 which is superseded by section 2011. [45, 46]

Business Combinations and Reorganizations

.042 A business combination accounted for as a purchase of another business should, in the weighted average of shares, give effect to additional securities issued only from the date of acquisition. Results of operations of the acquired business are also included in the statement of income only from the date of acquisition. [2011A.04]

.043 In a pooling of two or more corporations, the weighted average outstanding securities of the constituent corporations adjusted to the equivalent securities of the surviving corporation should be used for the earnings per share computation for all periods presented. The results of operations of the constituent businesses are also combined for all periods presented.

.044 After a reorganization or quasi-reorganization, the earnings per share computations should be based on an analysis of the particular transaction applying the guidelines of section 2011.

Disclosure

.045 Disclosure is required to explain the rights and privileges of the holders of the various securities outstanding; the bases upon which primary and fully diluted earnings per share were computed; the number of shares issued upon conversion, exercise or satisfaction of required con-

\(^8\) But note that restatement is prohibited for primary earnings per share when increased earnings levels are attained and shares are issued which were not previously considered outstanding for prior primary computations. (See point 4 in the preceding paragraph and section 2011A.17.)
Computing Earnings per Share

ditions; and other information necessary for a clear understanding of the data presented. (For example, if the fully diluted amount is the same as the primary amount because certain anti-dilutive securities which are not common stock equivalents are omitted from the fully diluted computation, that fact would be disclosed.) [.15-.16, .19, .20]

Supplementary Data

.046 Supplementary earnings per share data* are to be furnished for the latest period when conversion occurs and primary earnings per share would have increased or decreased at least 3% if the conversion had occurred at the beginning of the period. Supplementary data are also to be furnished when common stock or common stock equivalents are sold and the proceeds are used to retire preferred stock or debt. It may also be desirable to furnish supplementary earnings per share data for each period presented giving the cumulative retroactive effect of all such issuances. [.14 fn. 4, .22-.23]

.047 Supplementary data show what primary earnings per share would have been if the situations described above had occurred at the beginning of the period being reported upon rather than during the period. Thus, supplementary data are helpful for reflecting the trend of earnings per share data when primary amounts are affected by an increase in the number of shares included in the computation without an increase in the capital employed in the business.

Effective Date

.048 Section 2011 is effective for fiscal periods beginning after December 31, 1968. Earnings per share must therefore be reported on the faces of all income statements for periods beginning January 1, 1969 and thereafter. Securities are to be classified under the provisions of section 2011 regardless of the time of issuance except that an election is granted for securities with a time of issuance prior to June 1, 1969 for computing primary earnings per share to either:

*Supplementary earnings per share data should not be confused with fully diluted earnings per share. As used in section 2011, "supplementary earnings per share data" are additional data which are disclosed in a note. (APB Opinion No. 9 used the term "supplementary pro forma earnings per share" to describe data which are described as "fully diluted earnings per share" in section 2011.)
(a) classify all such securities under the provisions of section 2011, i.e., apply section 2011 retroactively regardless of when the securities were issued, or

(b) classify all securities outstanding at May 31, 1969 as common stock equivalents if they were residual securities under APB Opinion No. 9.

All securities subject to the election must be classified under election "a" or all securities must be classified under election "b." The election may not be changed after it is made. Thus, the classification of all securities issued prior to June 1, 1969 once determined under election "a" or election "b" never change. All securities with a time of issuance after May 31, 1969 must be classified under the provisions of section 2011. [45, 46]

.E049 Election "b" allows a corporation to ignore options and warrants issued before June 1, 1969 in primary earnings per share computations unless they were considered residual securities under APB Opinion No. 9. The election was provided because the Board has traditionally not made its Opinions retroactive. Section 2011 therefore does not apply new rules to securities which were issued under a prior section and which were already outstanding when section 2011 was issued.

.E050 The election applies only to primary earnings per share computations. Fully diluted earnings per share computations include all common stock equivalents and other potentially dilutive securities without regard to the election. However, supplementary pro forma earnings per share determined under APB Opinion No. 9 are not necessarily the same as fully diluted earnings per share determined under section 2011. Therefore, the Board recommends that previously reported earnings per share data be restated when reported in comparative income statements including an earnings per share amount computed under

Securities no longer outstanding at May 31, 1969 are classified as common stock equivalents if they were residual securities under APB Opinion No. 9 at the statement date. This applies only for income statements for periods prior to May 31, 1969 when such income statements are subsequently included in comparative income statements after that date. See Interpretations 29 and 30 for exceptions.

Although pro forma earnings per share and fully diluted earnings per share could be the same, they might be different. Any differences would result principally from the anti-dilution provisions of section 2011 and from different computational methods for options and warrants.
the provisions of section 2011 if election "b" of section 2011.46 has been made. Restatement for all prior periods presented is accomplished by retroactively applying (1) the security classifications determined under election "b" and (2) the computational methods prescribed by section 2011. [.45, .46]

.051 Both primary and fully diluted earnings per share amounts for prior periods must be retroactively restated if election "a" of section 2011.46 has been made when the prior period data are reported in comparative income statements including earnings per share data computed under the provisions of section 2011.

PART II: ACCOUNTING INTERPRETATIONS OF SECTION 2011

DEFINITIONAL INTERPRETATIONS

1. Security

.052 The term security is used in sections 2010, 2011 and in these Interpretations in a broad context to include instruments not usually considered to be securities. Securities are usually thought of as being common stocks, preferred stocks (both nonconvertible and convertible), bonds (both ordinary and convertible), and warrants. In a broad context, the term security also includes all debt instruments, options to purchase stock (or other securities), stock purchase contracts, stock subscriptions, and agreements to issue stock (or other securities) at a future date. Several securities may be included in a single instrument, which may or may not be separable. [.37, .37]

2. Common Stock Equivalents

.053 A common stock equivalent is defined by section 2011 as: "A security which, because of its terms or the circumstances under which it was issued, is in substance equivalent to common stock." (See section 2011D.05.) A common stock equivalent is not common stock in form but rather derives a large portion of its value from its common stock characteristics or conversion privileges. Such a security typically contains provisions enabling its holder to become a common stockholder. Its value tends to change with changes in the value of the common stock to which it is related. Examples of common stock equivalents are: options
and warrants, preferred stock or debt convertible into common stock if the stock or debt yields less than 66\(\frac{2}{3}\)% of the bank prime interest rate at time of issuance, and agreements to issue common stock with the passage of time as the only condition to issuance. [.25, .27, .33, .35]

3. Other Potentially Dilutive Securities

.054 Other potentially dilutive securities is a term used in this Interpretation to designate a classification of securities which are similar to common stock equivalents but which for one reason or another do not meet the tests for common stock equivalents under section 2011. Other potentially dilutive securities are included only in fully diluted earnings per share computations while common stock equivalents are, in effect, included in both primary and fully diluted earnings per share computations.

.055 Examples of other potentially dilutive securities are convertible senior securities (convertible preferred stock and convertible debt) and options or warrants issued prior to June 1, 1969 if election "b" of section 2011.46 is made and the options or warrants were not classified as residual securities under APB Opinion No. 9. [.41, .46]

4. Dilution—Dilutive Security

.056 Dilution, as used in section 2011, is a reduction of the amount which would otherwise be reported as earnings per share. A dilutive security is a security which results in a decrease in the amount reported as earnings per share. As explained in Interpretations 5 and 15, there is no dilution of net loss per share when a corporation reports a net loss on its income statement. [.14 fn. 4, .30, .40]

.057 A dilutive security increases the number of common shares which are considered to be outstanding during

---

*The term is not used in section 2011 in this strict context. Potentially dilutive securities, as that term is used in section 2011, includes common stock equivalents. (For example, see section 2011.14.) Section 2011 discusses convertible senior securities which are not common stock equivalents and other contingent issuances which are not common stock equivalents. Securities which are not common stock equivalents but which enable their holders to obtain common stock are described in these Interpretations as "other potentially dilutive securities." Therefore, convertible senior securities described in section 2011 are classified as "other potentially dilutive securities" in these Interpretations.

*See Interpretation 46 for an explanation of why these options and warrants are not classified as common stock equivalents.
the period for which the earnings per share computation is being made. Thus, a dilutive security increases the denominator used in the earnings per share computation. Earnings applicable to common stock, the numerator in the computation, may also increase. But so long as the numerator increase per additional denominator share is less than earnings per outstanding share, the security will be dilutive. [2011A.06]

5. Anti-Dilution—Anti-Dilutive Security

.058 Anti-dilution is an increase in the amount which would otherwise be reported as earnings per share or a decrease in the amount of the net loss per share. Anti-dilution therefore has an incremental effect on earnings per share data. An anti-dilutive security is a security which would result in an increase in the amount reported as earnings per share or a decrease in the amount reported as net loss per share. [.30, .40]

.059 When a net income is reported, an anti-dilutive option or warrant under the treasury stock method reduces the number of common shares considered outstanding during a period. Such options or warrants, if permitted to enter the computation, would increase earnings per share by reducing the denominator used. Anti-dilutive convertible debt would increase the denominator. However, its interest adjustment would increase earnings applicable to common stock, the numerator used in the computation, by a greater amount per additional share than earnings per share computed without assuming conversion. Any numerator increase per additional denominator share which is greater than earnings per share computed without assuming conversion would have an incremental effect on earnings per share and would be anti-dilutive. Convertible preferred stock is anti-dilutive when its dividend per common share obtainable upon conversion exceeds earnings per share computed without assuming conversion.

.060 When a net loss is reported, exercise or conversion is not assumed.15 Any computation is anti-dilutive which increases the number of shares considered outstanding during a period for which a net loss is reported. Exercise of options and warrants is not assumed since this would

15 See Part I, paragraph .016, footnote 5.
increase the number of shares considered outstanding. Likewise, conversion would increase the number of shares considered outstanding. In addition, the if converted adjustments for convertible debt would decrease the amount of the loss. Not deducting dividends on convertible preferred stock would also decrease the amount of the loss applicable to common stock.

6. Dual Presentation

.061 The dual presentation has two groups of earnings per share data; one is primary earnings per share data and the other is fully diluted earnings per share data. Both must be presented with equal prominence on the face of the income statement. [.16]

.062 The dual presentation of primary and fully diluted earnings per share data should not be confused with the two earnings per share amounts which must be presented when a corporation reports extraordinary items on its income statement. Even when the dual presentation is not required, a corporation reporting extraordinary items must report (1) earnings per share for income before extraordinary items and (2) earnings per share for net income. When the dual presentation is required, a corporation reporting extraordinary items must report both amounts for primary earnings per share and both amounts for fully diluted earnings per share. [.13]

.063 A corporation with no extraordinary items on its income statement would report only earnings per share for net income. But this must be reported for both primary and fully diluted earnings per share by a corporation when the dual presentation is required.

7. Primary Earnings per Share

.064 Primary earnings per share is the amount of earnings attributable to each share of common stock outstanding and common stock assumed to be outstanding to reflect the dilutive effect of common stock equivalents. Primary earnings per share data include an earnings per share amount for income before extraordinary items and an earnings per share amount for net income. These data may also include an earnings per share amount for extraordinary items. [.13, .15]
Computing Earnings per Share

.065 Primary earnings per share is used in section 2011 and in these Interpretations as a convenient means of designating the presentation of these data which must appear on the face of an income statement of a corporation when the dual presentation is required. Thus, "primary" is a communication tool used merely to identify this group of earnings per share data to be presented and is not suggested as a caption to be used on the income statement. The term "primary" is not intended in any way to attribute greater significance to this group of data than is attributed to the fully diluted data.

8. Fully Diluted Earnings per Share

.066 Fully diluted earnings per share is the amount of earnings attributable to each share of common stock outstanding and common stock assumed outstanding to reflect the dilutive effect of common stock equivalents and other potentially dilutive securities. Fully diluted earnings per share data include an earnings per share amount for income before extraordinary items and an earnings per share amount for net income. These data may include an earnings per share amount for extraordinary items. [.13, .15]

.067 Fully diluted earnings per share is used in section 2011 and in these Interpretations as a convenient means of designating the presentation of these data which must appear on the face of an income statement of a corporation when the dual presentation is required. Thus, "fully diluted" is a communication tool used merely to identify this group of earnings per share data to be presented and is not suggested as a caption to be used on the income statement.

APPLICABILITY OF SECTION 2011

9. Corporations and Financial Presentations Excepted *

.068

Q—Does section 2011 require all corporations to present earnings per share on all income statements?

A—All corporations which are not specifically excepted by section 2011 must present earnings per share on the face of any income statement or summary of such a statement for periods beginning after December 31, 1968.

* See FASB Statement No. 21 [section 2083], Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.
The only corporations excepted from the provisions of section 2011 are:

1. Mutual companies without common stock or common stock equivalents outstanding (for example, mutual savings banks, cooperatives, credit unions, etc.).
2. Companies registered under the Investment Company Act of 1940.
3. Corporations owned by political subdivisions or municipal, county, state, federal or foreign governments.
4. Not-for-profit corporations (for example, colleges, universities, medical or scientific research entities, trade and professional associations, religious organizations, etc. which are incorporated).

Section 2011 applies to all financial presentations which purport to present results of operations in conformity with generally accepted accounting principles and to summaries of those presentations for all corporations except those listed above. However, the following financial presentations are also excepted from the provisions of section 2011:

1. Parent company statements accompanying consolidated financial statements.
2. Statements of wholly owned subsidiaries.
3. Special purpose statements.

Special purpose statements (as described in Statement on Auditing Standards No. 14 [AU section 621]) by definition are not prepared in accordance with generally accepted accounting principles. Special purpose statements are not, however, merely those prepared for specific purposes if they purport to present results of operations in conformity with generally accepted accounting principles. For example, SEC Form S-9 for registration of certain high-grade, nonconvertible, fixed-interest debt securities requires disclosure of ratios of earnings to fixed charges for each year in the summary (or statement) of earnings. Although the SEC does not require that earnings per share data be reported in Form S-9, this form is not a "special purpose
Earnings per share must therefore be reported under section 2011.

10. Closely Held Corporations *

Q—Does section 2011 apply to closely held corporations?

A—Yes, closely held corporations which are not wholly owned subsidiaries of other corporations must report earnings per share on their income statements in accordance with section 2011. A corporation whose stock is all owned by a single individual is not a wholly owned subsidiary [05, 06]

11. Dilution Less Than 3%

Q—Must a corporation with few dilutive securities outstanding make the dual presentation? May such a corporation ignore the dilutive securities and report earnings per share based on common shares outstanding?

A—The required reporting of earnings per share data depends on the materiality of the amount of dilution produced by securities which enable their holders to obtain common stock in the future. Aggregate dilution from all such securities which is less than 3% of earnings per common share outstanding need not be reported for either primary or fully diluted earnings per share, since such dilution is not considered to be material. Thus, if both the primary and fully diluted amounts are more than 97% of earnings per common share outstanding, earnings per share may be based on only common shares outstanding. [*fn. 4]

.074 The 3% provision applies to fully diluted earnings per share compared to earnings per common share outstanding, not compared to primary earnings per share. Anti-dilutive securities are not dilutive by definition and should be excluded in computing aggregate dilution. The 3% provision also applies to the reporting of any other earnings per share information, such as supplementary

* See FASB Statement No. 21 [section 2083], Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.
data. Aggregate dilution of less than 3% generally should be reported when it is anticipated that earnings per share data for a period when the provision applies might subsequently be included in a comparative income statement in which the following period reflects dilution of 3% or more. Otherwise, dilution in the following period would appear greater than it in fact was. [.15, .17]

.075 The Board intended the 3% provision to provide relief from complex computations to corporations which would have insignificant dilution if all obligations to issue common stock in the future were fulfilled currently. This would be the case, for example, for a corporation which has no obligations to issue common stock except for a small amount of stock under options granted to its executives. [.14 fn. 4]

12. 3% Test

.076 Q—Is there a simple test which can be applied to determine if dilution would be at least 3%?

A—Yes. As a "rule of thumb," make both the primary and fully diluted computations whenever the number of additional common shares which must be assumed to be issued exceeds 3% of the number of outstanding common shares. If the dilution produced by either computation is at least 3%, the dual presentation is required. [.15]

.077 Dilutive options and warrants are included in earnings per share computations under the treasury stock method, which produces incremental shares (as explained in Interpretation 51). The number of incremental shares the treasury stock method will produce can be approximated by applying a simple formula. Since stock options are the only obligations of many closely held corporations to issue common stock, the formula is useful when the test described above is to be applied and only options or warrants are considered. [.36]
The following formula\(^\text{17}\) will approximate the number of incremental shares which will result from applying the treasury stock method for options or warrants:

\[
I = \frac{M - E}{M} (N)
\]

Where:

- \(I\) is the number of incremental shares which would be produced by the treasury stock method.
- \(M\) is the market price (or fair value) per share of common stock.
- \(E\) is the exercise price of the option or warrant per common share obtainable upon exercise.
- \(N\) is the total number of shares obtainable on exercise.

Subject to the constraint\(^\text{18}\) that \(M > E\)

An example of the application of the formula follows. Assume that a corporation has granted options to its officers to purchase 10,000 shares of common stock at $6 per share and the common stock has a market price (or fair value) of $10 per share.

Applying the formula for the information given, the amounts to be substituted for the letters are:

- \(I\) = unknown
- \(M\) = $10
- \(E\) = $6
- \(N\) = 10,000

Therefore:

\[
I = \frac{10 - 6}{10} (10,000) = 4(10,000) = 40,000
\]

\(^{17}\) The formula should not be used when section 2011.38 applies, i.e., when the number of common shares obtainable on the exercise of all options and warrants and their equivalents exceeds 20% of the number of common shares outstanding.

\(^{18}\) The formula would not be used unless the market price is greater than the exercise price since the result could be anti-dilutive.
If the 4,000 incremental shares exceed 3% of the number of outstanding common shares, actual dilution would be computed to determine if dilution is at least 3%.

13. **Subchapter S Corporations** *

   Q—Does section 2011 apply to the financial statements of corporations electing under Subchapter S of Chapter 1 of the Internal Revenue Code?

   A—Yes, such corporations must report earnings per share on the face of their income statements. Net income is computed without regard to taxes on that income which will be paid by stockholders rather than by the corporation. Undistributed earnings of the corporation taxed to the stockholders increase the stockholders' tax bases in the shares they own, but the number of shares outstanding does not increase unless the corporation issues additional shares. The amount per share of income tax the corporation would have paid in the absence of the Subchapter S election would be useful information to disclose. [.05, .06]

14. **Unaudited Financial Statements** *

   Q—Does section 2011 apply to unaudited financial statements?

   A—Yes. If a CPA is associated with an unaudited income statement which does not report earnings per share, the CPA should phrase his disclaimer of opinion on the statement in accordance with the provisions of Statement on Auditing Standards No. 26 [AU section 504], Association with Financial Statements, as is appropriate under the circumstances of the engagement. [.05, .06] [As modified, November 1979, by SAS No. 26.] (See AU section 504.)

**EARNINGS PER SHARE PRESENTATION**

15. **Reporting Loss per Share**

   Q—Must net loss per share be reported?

   A—Yes, net loss per share must be reported under the same requirements that earnings per share must be reported. Net loss per share, however, is based on outstanding

---

*See FASB Statement No. 21 [section 2083], Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises.
common shares. Assuming exercise of options and warrants or conversion of convertible securities would be antidi- dilutive since an increase in the number of shares assumed to be outstanding would reduce the amount of the loss per share.\textsuperscript{19} The amount of the loss is increased by any dividends declared (or cumulative even though not declared) for the period on preferred stocks. \textsuperscript{[.12, 2011A.05]}

16. **EPS for Extraordinary Items**

Q.—Must earnings per share be presented for extraordinary items?

A.—No, although this presentation may generally be desirable. Section 2011.13 states that earnings per share data should be reported consistent with the income statement presentation required by section 2012.11. Thus, it would appear that earnings per share should be presented for (1) income before extraordinary items, (2) extraordinary items less applicable income tax, and (3) net income as required by section 2012.11 when an extraordinary item is reported on the income statement. This presentation is used in the example in section 2011C.03, Exhibit B. \textsuperscript{[.13]}

\textsuperscript{[As amended, effective for events and transactions occurring after September 30, 1973, by APB Opinion No. 30.]}

However, section 2011.13 requires that earnings per share data be presented for only (1) income before extraordinary items and (2) net income. Although the two requirements appear to conflict, earnings per share need not be presented for extraordinary items. A reader of the financial statements can determine earnings per share for extraordinary items by subtraction if it is not reported.

\textsuperscript{.086} Naturally, the earnings per share data will be more complete if an amount is reported for extraordinary items when such items are reported on the income statement. This presentation, although not required, may therefore be generally desirable. In some cases, reporting all three earnings per share amounts would be particularly helpful to the reader, such as in the situation described in section 2011.30, footnote 10 (where the effect on either income before extraordinary items or on net income is antidilutive but is dilutive on the other). \textsuperscript{[.30, fn. 10]}

\textsuperscript{19} See paragraph .016, footnote 5.
**17. Simple Capital Structure**

Q—What is a simple capital structure for purposes of computing earnings per share?

A—A corporation has a simple capital structure for purposes of computing earnings per share if during the period it had no securities outstanding (or agreements to issue securities) that in the aggregate dilute earnings per outstanding common share. [.14]

**18. Complex Capital Structure**

Q—What is a complex capital structure for purposes of computing earnings per share?

A—A corporation has a complex capital structure for purposes of computing earnings per share if it has issued, in addition to common stock, securities which have a dilutive effect on earnings per outstanding common share. Among the securities which may have a dilutive effect are convertible preferred stock, convertible debt, options, warrants, participating securities, different classes of common stock, and agreements to issue such securities or shares of common stock in the future. [.15, .27, .41]

.089 As explained in Interpretation 11, if the aggregate dilution for the period produced by all such securities which are dilutive does not reduce earnings per outstanding common share by at least 3%, a corporation may be considered as having a simple capital structure for purposes of computing earnings per share. It may be desirable, however, to report the actual dilution in such a case, particularly if the period being reported upon might later be included in a comparative income statement which includes one or more periods with dilution of 3% or more. [.14, .14 fn. 4, .17]

**19. EPS for Simple and Complex Capital Structures**

Q—How does the reporting of earnings per share data differ for corporations with simple capital structures and corporations with complex capital structures?
A corporation with a simple capital structure is required to have a single presentation of "earnings per common share" on the face of its income statement. A corporation with a complex capital structure is required to have a dual presentation of both primary and fully diluted earnings per share on the face of its income statement. [.14, .15]

.091 Exceptions which apply to corporations with simple capital structures are explained in Interpretation 20. An exception which applies to corporations with complex capital structures is explained in Interpretation 18.

20. Dual Presentation for Corporation with Simple Capital Structure

.092 Q—Is a corporation with a simple capital structure ever required to have the dual presentation?

A—Yes, the dual presentation is required if common stock was issued during the period on exercise, conversion, etc. and primary earnings per share would have increased or decreased if the issuance had taken place at the beginning of the period. [.41]

.093 A corporation has a simple capital structure when it has no dilutive securities outstanding. If outstanding anti-dilutive securities are exercised or converted, however, such a corporation would be required to have the dual presentation if primary earnings per share would have been affected as described above. Thus the dual presentation may be required for a corporation with a simple capital structure to report the incremental effect of an anti-dilutive exercise or conversion. [.14, .41]

.094 Also, the dual presentation is required for all periods presented in a comparative income statement if it is required for any period. The dual presentation may therefore be required for one or more periods in a comparative income statement when the corporation had a simple capital structure. [.17]

21. Primary v. Fully Diluted EPS

.095 Q—How do fully diluted earnings per share differ from primary earnings per share?
A—Primary earnings per share computations include only common stock and dilutive common stock equivalents. Fully diluted earnings per share computations include common stock and dilutive common stock equivalents together with other potentially dilutive securities. Fully diluted earnings per share also include those exercises or conversions for which common stock was issued during the period whether their effect is dilutive or anti-dilutive. [.24, .41]

.096 Fully diluted earnings per share show the maximum potential dilution of all dilutive contractual obligations to issue common stock and their effect on current earnings per share on a prospective basis. The difference between primary and fully diluted earnings per share shows (1) the maximum extent of potential dilution of current earnings which would occur from the conversions of securities that are not common stock equivalents or the contingent issuance of common stock not included in the computation of primary earnings per share and (2) the effect of all issuances of common stock on exercises or conversions during the year as if the issuance had occurred at the beginning of the year. [.16, .40, .41]

22. Captions for Earnings per Share Presentations

.097

Q—What captions should be used for reporting earnings per share amounts in the dual presentation?

A—Precise designations are not prescribed by section 2011 except that the term “earnings per common share” should not be used unless a corporation has a simple capital structure or the term is appropriately qualified. The qualification is determined by whether the corporation has only common stock equivalents or also has other potentially dilutive securities. [.16]

.098 Listed below are five captions which might be used to designate earnings per share amounts. Following the captions is a table indicating the captions a corporation might use when it has various combinations of securities outstanding. The first two columns of the table indicate the combinations of securities a corporation might have. The numbers in the other three columns refer to the numbers listed beside the captions which might be used to
Computing Earnings per Share

designate the earnings per share amounts. For example, a corporation having both dilutive common stock equivalents and other potentially dilutive securities outstanding could designate the primary amounts "Earnings per common and common equivalent share" and could designate the fully diluted amounts "Earnings per common share—assuming full dilution."

SUGGESTED EARNINGS PER SHARE CAPTIONS
1. Earnings per common share.
2. Earnings per common share—assuming no dilution.
3. Earnings per common share—assuming full dilution.
4. Earnings per common and common equivalent share.
   (If both dilutive and anti-dilutive common stock equivalents are present, the caption may be: Earnings per common and dilutive common equivalent share.)
5. Earnings per common share—assuming issuance of all dilutive contingent shares.

Notes:
* Or dilution is less than 3% if such securities are present.
* In a note, disclose the existence of the anti-dilutive securities.
* Primary and fully diluted amounts will be the same.

23. Captions in Comparative Statements

What presentation is required in a comparative income statement when a corporation has a simple capital structure in one period and a complex capital structure in another period?
A—The dual presentation is required for all periods presented if it is required for any period presented. Since the corporation had a complex capital structure in one period presented, the dual presentation is required for that period and for all other periods presented in the comparative income statement. [.17]

.100 In a comparative income statement the captions used should be appropriate for the most dilutive presentation. For example, if there were no common stock equivalents in one period, anti-dilutive common stock equivalents in one period, and dilutive common stock equivalents in another period in a comparative income statement, the primary amounts could have a designation such as "earnings per common and dilutive common equivalent share." Explanatory disclosure in a note may also be appropriate.

COMPUTING EARNINGS PER SHARE
24. Earnings Applicable to Common Stock

.101 Q—How is "earnings applicable to common stock" determined for earnings per share computations?

A—For a corporation with a simple capital structure, earnings applicable to common stock is net income reduced by dividends declared or paid for the period to preferred stock. Cumulative preferred dividends for the current period not paid or declared also are deducted from net income in determining earnings applicable to common stock. However, preferred dividends which are cumulative only if earned are deducted only to the extent they are earned. Interest on debt need not be adjusted in determining earnings applicable to common stock since it was deducted in arriving at net income. [2011A.05]

.102 For example, assume that a corporation has a net income of $6,000 and has 1,000 shares of common stock outstanding. Also outstanding are 1,000 shares of nonconvertible noncumulative preferred stock and $10,000 of 6% nonconvertible bonds. The corporation has a simple capital structure. If no dividends were paid on preferred stock, earnings applicable to common stock would be $6,000. Earnings per common share would be $6 per share ($6,000 net income divided by 1,000 common shares). The declaration of a dividend of $1 per share on preferred stock would
result in earnings applicable to common stock of $5,000 ($6,000 net income less $1,000 for preferred dividends) and earnings per common share of $5 per share. The same result would be obtained if the dividend were cumulative and had not been declared. The same result would also be obtained whether or not the corporation paid (or declared) a dividend on common stock. [14, 2011A.05]

.103 For a corporation with a complex capital structure, net income is reduced by dividends on nonconvertible preferred stock as described above. When the if converted method is applied for outstanding convertible securities, however, dividends for convertible preferred stock are not deducted from net income but other adjustments may be necessary. Under the if converted method, convertible dividends are not deducted when conversion is assumed, and interest (less applicable income tax) is added back to net income when convertible debt is assumed to be converted. [2011A.06]

.104 For example, assume that a corporation has a net income of $6,000 and has 1,000 shares of common stock outstanding. Also outstanding are 1,000 shares of common stock equivalent convertible preferred stock (convertible one common share for each preferred share) and $10,000 of 6% convertible bonds (convertible three common shares for each $100 bond) which are not common stock equivalents. The corporation has a complex capital structure. Assume also that the corporation paid a $1 per share dividend on both common and preferred stock and the income tax rate is 22%. For primary earnings per share, earnings applicable to common stock is $6,000 and earnings per common and common equivalent share is $3 per share ($6,000 divided by 2,000 shares, composed of 1,000 common shares and 1,000 common equivalent shares from the assumed conversion of the convertible preferred stock). For fully diluted earnings per share, earnings applicable to common stock is $6,468 ($6,000 net income plus $600 interest less $132 additional tax payable if the interest had not reduced net income). Earnings per common share assuming full dilution is $2.81 per share [$6,468 divided by 2,300 shares; composed of 1,000 common shares, 1,000 common equivalent shares, and 300 shares from the assumed conversion of the convertible bonds). [15, 2011A.06]
25. **Weighted Average of Shares Outstanding**

.105

**Q—** What is the effect on earnings per share computations of issuing common stock or other securities which may be converted or exercised to obtain common stock or of reacquiring common stock or such securities during a period?

**A—** Such issuances or reacquisitions of common stock or other securities during a period require that a weighted average of shares be computed for the denominator to be used in the earnings per share computations. A weighted average gives due consideration to all shares outstanding and assumed to have been outstanding during a period. Shares issued or retired during a period are weighted by the fraction of the period they were outstanding. The weighted number of shares is added to the number of shares outstanding for the entire period to obtain the weighted average number of shares outstanding during the period.

[2011A.02]

.106 For example, assume that a corporation had 100,000 common shares outstanding on January 1 and issued 6,000 additional common shares on March 1. The weighted average would be 102,000 shares for the quarter ending March 31 or 104,000 shares for the six months ending June 30 or 105,000 shares for the year ending December 31.

**COMPUTATIONAL NOTES:**

\[
\begin{align*}
100,000 + \frac{1}{3} (6,000) & = 102,000 \\
100,000 + \frac{4}{6} (6,000) & = 104,000 \\
100,000 + \frac{10}{12} (6,000) & = 105,000
\end{align*}
\]

The same answers would result if the 6,000 shares issued on March 1 were merely assumed to have been issued to reflect the dilutive effect of common stock equivalents issued on March 1. It should be noted that the number of shares in the weighted average for the quarter and for the year are different.

.107 Reacquired shares are included in the weighted average only for the time they were outstanding. For example, assume that a corporation had 100,000 shares outstanding on January 1 and reacquired 6,000 shares on March 1. The weighted average would be 98,000 shares for the quarter ending March 31 or 96,000 shares for the six
months ending June 30 or 95,000 shares for the year ending December 31.

COMPUTATIONAL NOTES:

\[
\begin{align*}
100,000 - 6,000 &= 94,000 \\
94,000 + \frac{2}{3} (6,000) &= 98,000 \\
94,000 + \frac{2}{6} (6,000) &= 96,000 \\
94,000 + \frac{2}{12} (6,000) &= 95,000
\end{align*}
\]

The same answers would result if the 100,000 shares had included common stock equivalents and the corporation had reacquired 100 dilutive common stock equivalent convertible bonds (convertible 60 common shares for one bond) on March 1.

.108 More complex methods for computing a weighted average could be used if the number of shares involved changes frequently, such as computing an average weighted by days. (See Exhibit 4, paragraph .360.)

.109 The weighted average discussed in section 2011 and in these Interpretations is technically an arithmetical mean average of shares outstanding and assumed to be outstanding for earnings per share computations. The most precise average would be the sum of the shares determined on a daily basis divided by the number of days in the period. Less precise averaging methods may be used, however, as illustrated above, if they produce reasonable results. But methods which introduce artificial weighting are not acceptable for computing a weighted average of shares for earnings per share computations. For example, the "Rule of 78" method, which weights shares for the first month of the year by 12 and weights shares for the last month of the year by 1, is not an acceptable method.

.110 Retroactive recognition is given for all periods presented to any stock dividend, stock split or reverse split, including those occurring after the end of the period for which the computation is being made but before the statements are issued.

CONVERTIBLE SECURITIES

26. Classification and Assumed Conversion

.Q—Which convertible securities are assumed to be converted for primary earnings per share computations
and which are assumed to be converted for fully diluted earnings per share computations?

A—Convertible securities which are classified as common stock equivalents are assumed to be converted for both primary and fully diluted earnings per share computations.Convertible securities which are not common stock equivalents are classified as other potentially dilutive securities and are assumed to be converted only for fully diluted earnings per share computations. [.15, .31]

.112 Conversion is assumed for either computation only when the result is dilutive unless (1) the security is included in an aggregate computation which has a net dilutive effect or (2) for fully diluted earnings per share, common stock was issued during the period on an antidilutive conversion, that is, a conversion which would have had the effect of increasing earnings per share if it had occurred at the beginning of the period. When conversion is assumed, the if converted method is applied. 20 When conversion is not assumed because the result would be antidilutive, interest or dividends on the securities reduce the amount of earnings or increase the amount of loss otherwise applicable to common stock. [.30, .38, .40, .41, 2011A.05, 2011A.06]

.113 Most convertible securities are classified on the basis of their yield at time of issuance. (The exceptions are discussed in the following paragraphs of this Interpretation.) Under the yield test, convertible securities which yield less than 66\(\frac{2}{3}\)\% of the bank prime interest rate at time of issuance are common stock equivalents; those yielding at least 66\(\frac{2}{3}\)\% of the prime rate are other potentially dilutive securities. [.33]

.114 If a convertible security has a change scheduled in its interest or dividend rate within five years after issuance, its yield at issuance is considered to be the lowest scheduled rate within the five years. (See Interpretation 28 for the treatment of convertible securities which are not convertible until a future date.) A convertible security which would not otherwise be a common stock equivalent at time of issuance is classified as a common stock equiva-

20 See paragraph .023 of this Interpretation and section 2011A.06 for a description of the if converted method.
lent if it is issued with the same terms as those of an outstanding convertible security which is a common stock equivalent. [..28]

.115 Convertible securities issued prior to June 1, 1969 are classified by the issuer under one of two alternative elections specified in section 2011.46. (The election made applies to all securities issued before that date, not just to convertible securities.) Under election "a," all convertible securities issued prior to June 1, 1969 are classified as either common stock equivalents or other potentially dilutive securities under the provisions of section 2011. Under election "b," all convertible securities issued prior to June 1, 1969 which were classified as residual securities under APB Opinion No. 9 are classified as common stock equivalents; those which were classified as nonresidual securities are classified as other potentially dilutive securities. [..46]

.116 Convertible securities which require or permit the payment of cash upon conversion are considered the equivalents of warrants and are classified as common stock equivalents. (See Interpretation 71 for the treatment of such securities.) A few convertible participating securities are common stock equivalents for which the two-class method may be applied. (See Interpretation 87 for the treatment of such securities.) The if converted method is applied when any convertible security is assumed to be converted except for unusual cases when the two-class method is applied. [..35,.37,2011A.06,2011A.14]

27. Time of Issuance

.117

Q—What is the "time of issuance" of a convertible security?

A—"Time of issuance" is generally the date when agreement as to terms has been reached and announced even though subject to further actions, such as directors' or stockholders' approval. In this context, time of issuance is often referred to in financial jargon as the "handshake" date. Thus, time of issuance will usually precede the actual date of issuance of a security by some period which might be as long as several months or as short as a few hours. [..29]
12,786 Accounting Interpretations

.118 "Agreement as to terms" means that all of the terms have been set, not merely that the parties have reached an agreement in principle but the number of securities to be issued or the issue price is still to be determined at a later date. Agreement as to terms is reached when the parties are obligated to complete the transaction if it is ratified by the directors and/or stockholders, that is, neither party may legally terminate the agreement except for failure to receive approval from the directors or stockholders. The fact that the agreement is subject to a "favorable" ruling from the Treasury Department or a regulatory agency does not affect time of issuance so long as all of the terms of the agreement have been set.

.119 The classification of a convertible security is determined at time of issuance and does not change when the security is actually issued except as discussed in Interpretation 29.

.120 When time of issuance occurs before a year end but the agreement has not been approved by either the directors or stockholders before the financial statements are issued, the securities are not considered outstanding in the financial statements being issued or in earnings per share computations. (The securities are similar to a contingent issuance whose conditions are not currently being met.) [2011A.17]

28. Classification and Computation Not Always the Same

.121 Q—Are convertible securities included in earnings per share computations at time of issuance?

A—Convertible securities are classified at time of issuance. Generally they are assumed to be converted for earnings per share computations from this date also. Although a convertible security is classified at time of issuance, in some cases it is not assumed to be converted for earnings per share computations until a later date. [.28, 2011A.06]

.122 If the conversion privilege is not effective during the period being reported upon, the length of time before the privilege becomes effective determines when the security is eligible for assumed conversion in earnings per share computations. Conversion is not assumed for either primary or fully diluted computations if the conversion privi-
Computing Earnings per Share

.123 For example, assume that a corporation issued a debt security at the end of its 1969 reporting year that may be converted into common stock after twelve years (at the end of 1981). The security’s yield at time of issuance requires that it be classified as a common stock equivalent. Conversion would not be assumed for 1969 or 1970 earnings per share computations (interest would reduce net income in 1970, however). Conversion would be assumed whenever the effect is dilutive for fully diluted computations beginning in 1971 and for both primary and fully diluted computations beginning in 1976. Thus, the security is classified at time of issuance but conversion is not assumed for earnings per share computations until later. [.28]

.124 Time of issuance and classification of a convertible security may precede the obligation to issue and actual issuance by as much as several months, but a convertible security is not considered outstanding in the interim until there is a valid obligation to issue the security. For example, assume that agreement as to terms for a business combination is reached and announced on December 1, 1969. Final approval by stockholders occurs on February 16, 1970 and a convertible security is to be issued March 2, 1970. Classification of the security is determined at December 1, 1969. The security would be omitted from 1969 earnings per share computations if the financial statements are issued before February 16, 1970, but the impending issuance would be disclosed.

.125 If the business combination is accounted for as a purchase, the security would be considered outstanding from the date of the acquisition in 1970 earnings per share computations if the stockholders in fact ratify the agreement. If the business combination is accounted for as a pooling of interests, prior periods’ earnings per share data would be retroactively restated in comparative income.
statements issued subsequently to reflect the security as outstanding for all periods presented. (See Part I, paragraphs .042-.044.) [2011.A.04]

29. Change of Classification of Convertible Security

Q—When does the classification of a convertible security change?

A—A convertible security’s classification is generally determined only at time of issuance and does not change thereafter. However, a change of classification (usually from other potentially dilutive security status to common stock equivalent status) may be required in two situations. These are when (1) an incorrect estimate of the security’s value at time of issuance was made in the absence of a market price or (2) a common stock equivalent convertible security is issued with the same terms as an already outstanding convertible security which is not a common stock equivalent. (See Interpretation 30.) [.26, .29]

.127 If a convertible security does not have a market price at time of issuance, an estimate must be made of the security’s fair value to apply the yield test. If the estimate of the security’s value is too low, a convertible security which should be classified as a common stock equivalent might not be so classified. In such a case, the security would have to be reclassified as a common stock equivalent at actual issuance. Typically, an obviously incorrect estimate would be evidenced by materially higher market transactions for the security at actual issuance shortly after the time of issuance. [.29, .33 fn. 11]

.128 A change of the classification of the security would not be appropriate in such a case, however, if the higher market prices resulted from an external change over which the issuer had no control. (A general increase in the market prices of other securities might indicate an external change.) A change of the classification would also not be appropriate if convertible securities were sold for cash and the gross proceeds to the issuer were substantially equal to the total amount of the original fair value estimate for the securities. In this case, the total of the net amount received by the issuer plus brokerage commissions paid is approximately equal to the original estimate of fair value of the securities.
30. **Change of Classification Is Mandatory**

Q—Would convertible securities issued prior to June 1, 1969 and classified as other potentially dilutive securities under section 2011.46 become common stock equivalents if another convertible security is issued with the same terms after May 31, 1969 and is classified as a common stock equivalent? [46]

A—Yes, a change in classification is required by the second sentence of section 2011.28 for any outstanding convertible security which is not a common stock equivalent but which has the same terms as those of another convertible security being issued which is classified as a common stock equivalent at time of issuance. Thus, an outstanding convertible security which is not a common stock equivalent would be reclassified as a common stock equivalent if another convertible security is issued with the same terms and is classified as a common stock equivalent at time of issuance. [28]

.130 Although this reclassification is an exception to the general rule that securities do not change status subsequent to time of issuance, reclassification is mandatory. All of a corporation’s convertible securities issued with the same terms therefore are classified the same for earnings per share computations.

.131 For example, assume that convertible securities were issued with the same terms on May 2, June 2, and July 2, 1969. Only the July 2 issue is a common stock equivalent if classification is based on yield at time of issuance because of an increase in the bank prime interest rate. Under section 2011.28, however, both the May 2 and June 2 issues become common stock equivalents also.

31. **Definition of “Same Terms”**

Q—What are the “same terms” (as used in the second sentence of section 2011.28) for the subsequent issuance of a convertible security?

A—The “same terms” are identical terms, not merely similar terms. Thus, any change in dividend or interest rates, conversion rates, call prices or dates, preferences in liquidation, etc. is a change in terms. Market price or issue price is not considered a “term.” (See Interpretation 32.) [28]
32. **Issue Price Is Not a "Term"**

Q—Do different issue prices for different issuances of convertible securities constitute a change in "terms" if all other terms for the securities are the same?

A—No, different issue prices for convertible securities with the same terms otherwise is not a change in terms. Thus, two convertible securities issued at different prices but with the same stated dividend or interest rates, conversion rates, call prices and dates, preferences in liquidation, etc. have the same terms. [.28]

33. **Sale of Treasury Securities Is a New Issue**

Q—Are convertible securities sold by an issuer from securities held as treasury securities to be classified as a new issue or as part of the original issue under the provisions of the second sentence of section 2011.28?

A—When convertible securities are acquired by the issuing corporation and subsequently reissued, they constitute a new issue with the same terms as the existing outstanding convertible security. The “new” issue’s status (as a common stock equivalent or not) should be determined under both the common stock equivalent test and the provisions of the second sentence of section 2011.28. If deemed a common stock equivalent, the “new” issue could also affect the status of outstanding securities with the same terms as described in the second sentence of section 2011.28. For example, if the outstanding securities are not common stock equivalents and the reissued securities are common stock equivalents under the yield test (because of a change in market prices or the prime rate), the outstanding securities also become common stock equivalents. [.29]

34. **Determining a Convertible Security’s Cash Yield**

Q—Upon what return is a convertible security’s cash yield based?

A—Cash yield for most convertible securities is based upon the stated amount of interest or dividends the security is scheduled to pay each year. See Interpretation 26 for the amount to be used when a convertible security has a change of interest or dividends scheduled.
Computing Earnings per Share

on convertible preferred stock are not cumulative, yield might have to be based on some lesser amount, particularly if the stated amount appears impossible to pay. Low earnings or contractual provisions on outstanding debt, for example, might prohibit payment of the stated amount. The same would apply for preferred dividends which are cumulative only if earned. [.33]

35. Computing a Convertible's Cash Yield

Q—How is a convertible security’s cash yield at time of issuance computed?

A—Yield is a security’s return expressed as a percentage of its value. For example, a $1,000 bond which is paying $45 annual interest to the holder and selling at 90

\[(\text{computed} \frac{45}{900} \times 100)\]

(i.e., $900) yields 5% if the time factor to maturity is ignored. Although yield is generally computed to maturity, the yield test described in section 2011 for convertible securities uses only the stated annual return expressed as a percentage of the security's market price (ignoring commissions and transfer taxes) at time of issuance. If the security does not have a market price at time of issuance, the test is based on the security's fair value. [.33]

36. Cash Yield of Convertible Security in a “Package”

Q—How is the cash yield determined for a convertible security issued in a “package,” i.e., a convertible security is one of two or more securities issued as a unit?

A—When two or more securities are issued as a unit, the unit price at time of issuance should be allocated to each security based on the relative fair values of the securities at time of issuance. For example, assume that a “package” consisting of one share of common stock, one share of convertible preferred stock, and one nonconvertible $100 bond with a detachable warrant is sold as a unit for a total price of $200. At time of issuance, fair values were $42 per share of common stock, $63 per share of convertible preferred stock, $99.75 per bond and $5.25 per warrant. The $200 unit amount would be allocated to each security as follows:
Accounting Interpretations

<table>
<thead>
<tr>
<th></th>
<th>Fair Value at Issuance</th>
<th>Percentage of Total</th>
<th>Allocated Amount of $200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common stock</td>

If the convertible preferred stock is scheduled to pay a dividend of $3.15 per share each year, it would yield 5.25%

\[
\frac{\$3.15}{\$60.00} \times 100
\]

[.33, fn. 11*]

37. Property Included in Cash Yield

Q—May the fair value of property to be paid as dividends or interest be included in computing cash yield since section 2011 specifically states only “cash”?

A—Yes, the fair value of property to be paid in lieu of cash may be included in computing the cash yield of a convertible security. The property so treated may include non-convertible senior securities of the same company. But it may not include the same issue for which common stock equivalency is being determined. And it may not include securities of the issuer or its parent or subsidiary which are currently or potentially dilutive and enter into the computation of either primary or fully diluted earnings per share. [.33]

For example, any common stock or common stock equivalent of the issuer and securities such as those described in sections 2011A.14, 2011A.15, and 2011A.20-24 would not be considered property for this purpose. Also, “extra” dividends to be paid on convertible stock on a non-recurring basis would not be considered in computing cash yield in conformity with the “lowest scheduled rate” provision of section 2011.33.

38. Prime Rate Used in Yield Test

Q—What bank prime interest rate should be used to determine the status of a convertible security as a com-

*Also see APB Opinion No. 14 [section 5516].
mon stock equivalent or not in applying the yield test when more than one rate is in effect in a country?

A—The prime interest rate in effect at the bank where the issuer borrows is used when more than one bank prime interest rate (or its equivalent in foreign\textsuperscript{22} countries) is in effect in the U. S. If the issuer borrows from more than one bank and the different banks have different prime rates in effect, an average of the rates is used. If the issuer does not borrow from a bank where the prime interest rate is offered and more than one bank prime interest rate is in effect, an average of the rates would be used unless the issuer can show that the predominant rate is more appropriate than an average rate. \[.34\]

39. Prior Period Prime Rates

Q—What source should be considered authoritative in determining the bank prime interest rate which was in effect in the U. S. during prior periods when applying election “a” of section 2011.46? \[.46\]

A—The Federal Reserve Bulletin may be considered an authoritative source for determining the bank prime interest rate at any time. When a “split” prime rate is in effect, the provisions of Interpretation 38 \[section U 2011.140\] are applied. For readers’ convenience, the dates of changes in the prime rate and the rates in effect from 1954 through 1970 have been extracted and appear in paragraph .357. \[.34\]

40. Original Issue Premium or Discount on Convertible Securities

Q—What happens to original issue premium or discount when convertible securities are assumed to be converted and common stock is assumed to be issued for earnings per share computations?

A—Any original issue premium or discount amortized during the period (to compute the effective interest deducted from net income for a debt security) is eliminated from net income in arriving at earnings applicable to common stock. The unamortized original issue premium or

\textsuperscript{22} See The Banker, February 1969, p. 117 ff., for a discussion of rates in foreign countries which are the equivalents of the U. S. bank prime interest rate.
discount balance at the date of assumed conversion (the ending balance plus the amount amortized during the period) is then ignored for earnings per share computations. The if converted method only assumes conversion of the securities; it does not assume retirement. The converted securities are assumed to be held by the issuer as treasury securities during the period being reported upon and balance sheet accounts related to those securities are not affected by the assumed conversion. Note that these assumptions are made only for earnings per share computations; the issuer’s balance sheet and net income for the period are not affected in any way by the assumptions made for earnings per share computations. [.39, 2011A.06]

41. No Anti-Dilution from Convertible Preferred Stock

Q—When is convertible preferred stock antidilutive and therefore not assumed to be converted for earnings per share computations?

A—Convertible preferred stock is anti-dilutive and conversion is not assumed whenever the amount of the dividend paid or declared for the current period (or accumulated if not paid) per common share obtainable upon conversion exceeds the earnings per share amount computed without assuming conversion. [.30, 40, 2011A.05]

.144 For example, assume that a corporation had a net income of $1,500 and had 1,000 shares of common stock outstanding. Also outstanding were 1,000 shares of preferred stock convertible on a one-for-one basis and classified as a common stock equivalent. A $1 per share dividend was paid to the convertible shareholders. Assumption of conversion would be anti-dilutive in this case since earnings per outstanding common share is $.50 per share. (Earnings per common and common equivalent share would be $.75 per share if conversion were assumed.) Conversion would not be assumed, but rather the preferred dividend would be deducted to compute earnings applicable to common stock. Earnings per share would be computed on the basis of actual common stock outstanding. The same result would be obtained if the dividend were cumulative and not paid.

23 See Interpretation 44 [section U 2011.151-.153] for an exception when actual conversion occurs.
42. No Anti-Dilution from Convertible Debt

Q—When is convertible debt anti-dilutive and therefore not assumed to be converted for earnings per share computations?

A—Convertible debt is anti-dilutive and conversion is not assumed whenever its interest (net of tax) per common share obtainable on conversion exceeds the earnings per share computed without assuming conversion. [30, 40, 2011A.05]

For example, assume that a corporation had a net income of $500 and had 1,000 shares of common stock outstanding. Also outstanding were 1,000 convertible bonds with a par value of $100 each paying interest at 3% per annum and convertible into one share of common stock each. Assume the bonds are classified as common stock equivalents and that the effective income tax rate is 50%. The earnings per common share outstanding (ignoring conversion of the bonds) is $.50 per share. Assuming conversion, $3,000 interest would be added back less $1,500 of additional income tax, resulting in a net increase of $1,500 and earnings applicable to common stock of $2,000. The $1.00 earnings per share for the 2,000 common and common equivalent shares would be anti-dilutive and conversion would therefore not be assumed.

43. Conversion Assumed for Primary Only

Q—When a common stock equivalent convertible security is assumed to be converted for primary earnings per share computations, must it also be assumed to be converted for fully diluted earnings per share computations?

A—Generally, a common stock equivalent convertible security is assumed to be converted for both computations. However, if fully diluted earnings per share would be increased by the assumed conversion, conversion would be assumed only for the primary earnings per share computation. Such a situation could occur if two convertible securities were outstanding and the dividend on one classified as a common stock equivalent exceeds fully diluted earnings per share but not primary earnings per share. [15, 31, 40]

24 See Interpretation 44 for an exception when actual conversion occurs.
.148 For example, assume that a corporation had a net income of $9,500 and had 2,000 shares of common stock outstanding. Also outstanding were 1,000 shares of Class A convertible preferred stock which was a common stock equivalent and 1,500 shares of Class B convertible preferred stock which was not a common stock equivalent. The Class A paid a dividend of $2.50 per share and the Class B paid a dividend of $1 per share. Both are convertible into common on a one-for-one basis.

.149 Primary earnings per share is $2.67 per share assuming conversion of the Class A convertible preferred ($9,500 — $1,500 = $8,000 earnings applicable to common divided by 3,000 shares). Fully diluted earnings per share would be $2.11 per share if conversion were assumed for both the Class A and Class B convertible preferred ($9,500 ÷ 4,500 shares). However, fully diluted earnings per share is $2.00 per share if conversion is assumed for only the Class B ($9,500 — $2,500 = $7,000 earnings applicable to common divided by 3,500 shares). The difference between $2.11 and $2.00 is caused by the incremental effect of assuming conversion of the Class A. Since the Class A dividend per common share obtainable upon conversion exceeds fully diluted earnings per share computed without assuming conversion, conversion would be anti-dilutive. (See Interpretation 41.) Therefore, primary earnings per share is reported at $2.67 per share and fully diluted earnings per share is reported at $2.00 per share since this is the maximum dilutive amount.

.150 This example illustrates the fact that earnings per share amounts may be affected by changes either in the numerator or in the denominator used in the computation. Naturally, in some cases, both change.

44. If Converted Method at Actual Conversion

.151 Q—Is the if converted method applied differently for primary and fully diluted earnings per share computations when actual conversion occurs?

A—When a common stock equivalent convertible security is converted during a period, the if converted method
is applied from the beginning of the period 25 to the date of conversion for both primary and fully diluted earnings per share computations if the result is dilutive. [A1]

.152 If the result is anti-dilutive, however, conversion is not assumed for the primary computation. But when an actual conversion occurs during a period, conversion is assumed at the beginning 25 of the period for the fully diluted computation and the if converted method is applied, regardless of whether the result is dilutive or anti-dilutive. [.30, A1]

.153 Upon actual conversion, common stock issued is included in the weighted average of shares outstanding in both the primary and fully diluted computations from the date of conversion. The securities tendered by the holder for conversion are thereafter considered to be retired. [2011A.02]

45. Securities Convertible into Other Convertible Securities

.154 Q—How is a convertible security which is convertible into another convertible security included in earnings per share computations?

A—Such convertible securities enter earnings per share computations according to their provisions and their characteristics. [.43]

.155 A convertible security issued by a subsidiary which is convertible only into a parent company’s convertible security is a senior security from the standpoint of the subsidiary, i.e., the yield test does not apply. For consolidated earnings per share computations, however, the subsidiary’s security would be assumed to be converted into the parent’s security. The parent’s security would then be assumed to be converted under the if converted method (if the net result is dilutive). If the parent’s convertible security is not a common stock equivalent, conversion of the parent’s security would be assumed only for fully diluted computations. If it is a common stock equivalent, conversion of the parent’s security would be assumed for both primary and fully diluted computations. (See Interpretation 93.)

25 For convertible securities issued and converted during the period, conversion is assumed only from time of issuance rather than from the beginning of the period.
Convertible securities which are convertible at the option of the holder into either another convertible security or a nonconvertible security are assumed to be converted into the security which would be more advantageous for the holder (but not if the result is anti-dilutive). If conversion is assumed into the other convertible security, that security is then assumed to be converted into common stock for earnings per share computations (but not if the net result is anti-dilutive). If conversion is assumed into the nonconvertible security, dividends which would have been applicable to the nonconvertible security, as if it had been outstanding, are deducted in determining earnings applicable to common stock. If converted adjustments may also be applicable. The classification (determined under the yield test) as a common stock equivalent or other potentially dilutive security of convertible securities which are convertible at the option of the holder as discussed in this paragraph determines whether conversion is assumed for both primary and fully diluted computations or only for fully diluted computations. [AC § U 2011.11, 2011A.13]

In some cases, the security which would be more advantageous for assumed conversion cannot be determined. This might be the case, for example, if the nonconvertible security pays a high dividend and the second convertible security has good prospects for an increase in its market price. If the more advantageous security to the holders cannot be determined, the computation should give effect to the greater earnings per share dilution.

OPTIONS AND WARRANTS AND THEIR EQUIVALENTS

46. Classification of Options and Warrants

Q—How are options, warrants and their equivalents classified for earnings per share computations?

A—Options, warrants and their equivalents are always common stock equivalents unless all of the following conditions are met: (1) they were issued prior to June 1, 1969 and (2) the issuer makes election “b” under section 2011.46 and (3) they were not classified as residual securities under APB Opinion No. 9. Options, warrants and other equivalents classified under this exception are not common stock equivalents but are other potentially dilutive securities and are included only in fully diluted earnings per share com-
Computing Earnings per Share

All other options, warrants and their equivalents are included in both primary and fully diluted earnings per share computations. \[.35, .42, .46\]

47. No Anti-Dilution from Options and Warrants

Q—When are options and warrants anti-dilutive under the treasury stock method?

A—Generally, options and warrants are anti-dilutive whenever their exercise price exceeds the market price of the common stock obtainable on exercise. This is because application of the treasury stock method in such a case would reduce the number of common shares included in the computation which would increase the earnings per share amount. \[.36, .36 fn. 14\]

The prohibition against anti-dilution in applying the treasury stock method recognizes the economic fact that an option or warrant would not be exercised if the exercise price were above the market price because the stock could be purchased in the market for less than it could be purchased by exercising the option or warrant. However, if for some reason options or warrants are exercised when the market price is below the exercise price, the market price at the exercise date is applied in the fully diluted computation for the exercised options or warrants for the period they were outstanding. (See Interpretation 62.) However, anti-dilution is not reflected in the primary computation prior to exercise. \[.30, .40, .42\]

In special cases for which other methods are applied (see sections 2011.37 and 2011.38), the factors which cause dilution or anti-dilution are, of course, different. These special cases are discussed in Interpretations 50 and 65-71. \[.37, .38\]

48. Equivalents of Options and Warrants

Q—What kinds of securities are considered the equivalents of options and warrants and therefore always classified as common stock equivalents?

A—Stock purchase contracts, stock subscriptions not fully paid, deferred compensation plans providing for the

\[.37, .38\]
issuance of common stock, and convertible debt and convertible preferred stock allowing or requiring the payment of cash at conversion (regardless of the yield of such convertible securities at time of issuance) are considered the equivalents of options or warrants. The treasury stock method should be applied for all of these securities unless their terms or the provisions of sections 2011.37 and 2011.38 require that another method be applied for the computation of earnings per share. [.27, .35, .36, .37, .38]

49. Grouping Options and Warrants

Q—May anti-dilutive options and warrants be grouped with dilutive options and warrants in applying the treasury stock method?

A—No, except in the special situations discussed below. [.30, .40]

.164 Section 2011.35, footnote 13, allows reasonable grouping of like securities, i.e., options and warrants with the same exercise prices per common share to be issued. For example, it would be appropriate to group an option to purchase one share of common stock for $20 with a warrant to purchase two shares of common stock for $40. Assuming a market price of $15 per share for common stock, these options and warrants would not be grouped with a warrant to purchase one share of common stock for $10. [.35 fn. 13]

.165 If an aggregate computation is required, however, anti-dilutive and dilutive securities must be included in the same computation. Section 2011.38 provides for an aggregate computation, for example. An anti-dilutive option which must be exercised before a dilutive option may be exercised must also be included in an aggregate computation. [.38]

.166 For example, assume an option is exercisable at $30 to purchase one share of common stock and a second option is exercisable at $10 to purchase one share of common stock after the first option is exercised. The two options would be grouped and considered as a "two-step" option to buy two shares of common stock for $40. Their aggregate effect would be dilutive whenever the market price of common stock exceeds $20 per share. An aggre-
gate computation would not be made for a dilutive option which must be exercised before an anti-dilutive option may be exercised, because the anti-dilutive option would not be exercised in such a situation.

50. Methods Used for Options and Warrants

Q—Since different methods are described for the treatment of options and warrants in section 2011, in what order should the different methods be applied?

A—In determining the effect of options and warrants and their equivalents in earnings per share computations, apply section paragraphs in the following order (to the extent that each is pertinent):

- Section 2011.37
- Section 2011.38
- Section 2011.36

Section 2011.37 applies to options and warrants or their equivalents (1) which either allow or require the tendering of debt at exercise or (2) whose proceeds from exercise must be applied to retire debt or other securities under the terms of those securities. Section 2011.37 also applies to convertible securities which either allow or permit the payment of cash at conversion. Such convertibles are considered the equivalents of warrants.

Section 2011.38 applies only when the number of common shares obtainable upon exercise of all outstanding options and warrants and their equivalents exceed 20% of the number of common shares outstanding at the end of the period.

Section 2011.36 (the treasury stock method) applies to all other options and warrants and their equivalents.

51. Treasury Stock Method Reflects Dilution of Options and Warrants

Q—How does the treasury stock method reflect the dilutive effect of options and warrants?

A—The treasury stock method increases the number of shares assumed to be outstanding when the exercise price of an option or warrant is below the market price of common stock obtainable on exercise. The dilutive effect of the
treasury stock method is demonstrated in the following example. [.36 fn. 14]

.172 Assume that a corporation earned $125,000 during a period when it had 60,000 shares of common stock outstanding. The common stock sold at an average market price of $20 per share during the period. Also outstanding were 10,000 warrants which could be exercised to purchase one share of common stock for $15 for each warrant exercised. Earnings per common share outstanding would be $2.08 per share ($125,000 ÷ 60,000 shares).

.173 Applying the treasury stock method, the 10,000 warrants would be assumed to have been exercised by their holders at the beginning of the period. Upon exercise, 10,000 shares of common stock would be assumed to have been issued by the corporation to the holders. The $150,000 proceeds (10,000 warrants at an exercise price of $15 per share) would be assumed to have been used by the corporation to purchase 7,500 shares ($150,000 ÷ $20 per share average market price) of common stock in the market on the exercise date. Common stock would therefore increase 2,500 shares.27 (10,000 shares issued less 7,500 shares purchased results in 2,500 incremental shares.) A total of 62,500 shares would be considered as outstanding for the entire period. The amount to be reported as primary earnings per share would be $2.00 per share ($125,000 ÷ 62,500 shares), or dilution of $.08 per share.

.174 Fully diluted earnings per share would also be $2.00 per share if the ending market price of the common stock were $20 per share or less. But an ending market price above $20 per share would cause more dilution to be reflected in fully diluted earnings per share. For example, an ending market price of $25 per share would produce 4,000 incremental common shares28 which would result in fully diluted earnings per share of $1.95 per share. Dilution would be $.13 per share from earnings per outstanding share and $.05 per share from primary earnings per share. [.42]

27 The incremental number of shares may be more simply computed

\[
\frac{20 - 15}{20} \times 10,000 = 2,500
\]

using the formula given in Interpretation 12.

28 For fully diluted incremental shares, the computation would be

\[
\frac{25 - 15}{25} \times 10,000 = 4,000.
\]
**52. Market Prices Used for Treasury Stock Method**

.175  
**Q**—What market prices of common stock are used in applying the treasury stock method for options and warrants?  

**A**—The average market price of common stock during each three-month quarter included in the period being reported upon is used to determine the number of incremental shares included in primary earnings per share computations. When a period of less than three months is being reported upon, the average market price during that period is used. [.36, 2011C.03]

.176  
The average market price during each three-month quarter included in the period being reported upon is also used to determine the number of incremental shares included in fully diluted earnings per share computations unless (1) the ending market price for the quarter is higher than the average market price or (2) options or warrants were exercised during the quarter. [.42, 2011C.03]

.177  
A higher ending market price for the quarter is used in fully diluted computations rather than the average market price. For the fully diluted year-to-date computation, the number of incremental shares produced by applying the ending market price is compared to the number of shares determined by computing a year-to-date weighted average of incremental shares included in the quarterly fully diluted computations. The number of incremental shares used in the fully diluted year-to-date computation is the greater of the number of incremental shares determined from the ending market price or from the weighted average of quarters. (See Interpretation 60 and paragraph .359 for examples.)

.178  
When options or warrants are exercised, the market price on the exercise date is applied for the exercised options or warrants from the beginning of the year to the exercise date for fully diluted computations. Thus, the incremental share computations for quarters prior to the exercise date use the market price at the exercise date rather than the ending or average market price. (See Interpretations 61 and 62 for examples.)

.179  
In accordance with the anti-dilution provisions of section 2011 exercise of options or warrants is not as-
sumed for any quarter when the exercise price is higher than the market price determined for the computation (as described above) except when options or warrants have in fact been exercised. However, anti-dilutive options or warrants would be included in an aggregate computation resulting in a net dilutive effect. [.30, .38, .40, .42]

.180 Thus, options and warrants may be included in the computations in some quarters but not in other quarters. Also, options and warrants may be included in fully diluted earnings per share computations in a quarter when the ending market price is above the exercise price but not included in primary earnings per share computations for the quarter because the average market price is below the exercise price. [.30, .42]

53. How Many Market Prices?

.181

Q—How many market prices should be used to determine the average market price of common stock when applying the treasury stock method?

A—As many market prices as are needed to compute a meaningful average would be used. [.36]

.182 Theoretically, every market transaction for a company’s common stock (both the number of shares and the price per share) could be included in determining the average market price. For example, consider four transactions of: 100 shares at $10 per share, 60 shares at $11 per share, 30 shares at $12 per share, and 10 shares at $13 per share. The average of the four prices would be $11.50 (a simple average) but the average price for the 200 shares would be $10.75 per share (a weighted average).

.183 As a practical matter, however, a simple average of monthly prices is adequate so long as prices do not fluctuate significantly. If prices fluctuate greatly, weekly or daily prices probably would be used. Only if volume of common shares traded and prices at which trades occurred both fluctuated significantly would it be necessary to compute a weighted average to obtain a meaningful average market price.

54. What Market Price to Use?

.184

Q—Should the market price used in computing the average described in Interpretation 53 be the high, low, close or an average of high and low prices?
Computing Earnings per Share

A—Generally, closing market prices would be adequate for use in computing the average market price. When prices fluctuate widely, however, an average of the high and low prices for the period the price represents (whether a month, week, or day) would usually produce a more representative price to be used. [.36]

.185 Perhaps more important than the price selected is that the particular price selected be used consistently unless it is no longer representative because of changed conditions. For example, a company using the closing price during several years of relatively stable market prices could change to an average of high and low prices if prices started fluctuating greatly and the closing market price would no longer produce a representative average market price. Likewise, a company using an average of high and low prices during several years of relatively stable volume could use an average weighted by the number of shares included in market transactions during the period if both prices and volume started fluctuating greatly and the simple average of high and low prices would no longer produce a representative average market price. Shorter periods would be more appropriate than longer periods in this case also, as noted in Interpretation 53.

.186 Changing the price, period or method used in computing the average market price would only be done when it becomes obvious that a representative average market price would not be obtained if the change were not made. In the absence of changed conditions a change would not be made.

55. Over-the-Counter and Listed Stocks Not Traded

.187 Q—What price should be used when applying the treasury stock method for an over-the-counter stock or a listed stock not traded?

A—If available, market prices at which trades occur would be used in applying the treasury stock method. For stocks traded over-the-counter, the actual trade prices may not be known. Bid and asked quotations generally are available, however, for both over-the-counter stocks and listed stocks not traded. [.36]

.188 The price which will be representative of the market price may have to be computed from the information.
available. An average of the bid and asked quotations might produce a representative price. In some cases, an average of quotations from several dealers could be used. Generally the method selected would be used consistently in the absence of actual market prices.

.189 It should be noted that although bid quotations produce a conservative estimate of a stock’s market value, asked quotations are more conservative for earnings per share computations. This is because a higher market price produces more incremental shares under the treasury stock method than does a lower price. Therefore, to obtain a conservative answer, the asked quotation would be used in applying the treasury stock method for listed common stocks not traded and for common stocks traded over the counter.

56. Fair Value Used If No Market Price

.190

Q—How should the average market price be determined, to apply the treasury stock method for options and warrants, if a company’s common stock is not traded (for example, for a closely held company with only options outstanding)?

A—When a company’s common stock is not traded and market prices are therefore not available, the fair value per share of its common stock is used to apply the treasury stock method for options and warrants. [.33 fn. 11]

.191 Estimating the fair value of a share of common stock which is seldom, if ever, traded is often difficult. Various methods of valuation may be appropriate under different circumstances. While book value or liquidation value per share may provide some indication of fair value, these amounts usually would not be used without adjustment. Estimations based on replacement value or capitalized earnings value, however, might be used in determining fair value.

.192 In some cases documents may be used as a basis for estimating the fair value of a company’s common stock. Personal financial statements of stockholders prepared in accordance with Audits of Personal Financial Statements (An AICPA Industry Audit Guide published by the American Institute of CPAs in 1968) would present the estimated
value of their stock ownership in the company. Buy and sell agreements contain provisions for determining the value of a stockholder’s interest in a company in the event of death or retirement or withdrawal from participation in the company’s activities. Estate tax valuations established for recently deceased stockholders may provide a basis for estimating the current value of a company’s stock. Merger or sales negotiations entered into by the company and valuations or appraisals obtained by a stockholder or the company for credit purposes may provide established values appropriate for use in estimating the fair value of a company’s common stock. A fair value estimate of the stock might also be projected currently from the relationship at the time of issuance of the warrant or option to earnings (on a per share basis) or to the book value of the common stock.

.193 External sources may also be used to obtain a fair value estimate for a company’s stock. Traded securities of other companies in the same industry, their price-earnings ratios, dividend yields, and the relationship of their market prices to book values per share may provide guidance for estimating the value of a stock which is not traded. In addition to the methods suggested above, articles in professional publications may suggest other valuation methods and provide more specific guidance for applying selected techniques (for example, see The Journal of Accountancy, August 1969, pages 35-47, and March 1966, pages 47-55). Revenue Ruling 59-60 also provides guidance for valuing stocks with no quoted market prices. In some instances, companies have engaged investment bankers to estimate the value of the common stock when management believed a fair value could not be obtained any other way.

.194 When a fair value estimate is used in the absence of market prices for a company’s common stock, this fact and the method used to estimate the fair value would be disclosed as required by section 2011.20. The disclosure would usually be contained in a note to the earnings per share amounts presented (such as the example in section 2011C.04). [.20]

57. Options and Warrants Outstanding Part of a Period .195

Q—How should dilutive options or warrants which are outstanding for only part of a period be treated for earnings per share computations?
A—Dilutive options or warrants which are issued during a period or which expire or are cancelled during a period are reflected in both primary and fully diluted earnings per share computations for the time they were outstanding during the period being reported upon. The common equivalent shares to be considered enter earnings per share computations as a weighted average as described in section 2011A.02. [.36, .41, 2011A.02]

.196 For example, assume that a corporation whose financial reporting year ends on December 31 issued 100,000 warrants for one share each on October 8, 1969 with an exercise price of $10. Assume also an average market price for common stock during the intervening twelve-week period of $12 per share. Applying the treasury stock method for primary earnings per share computations for the fourth quarter, the 16,667 incremental shares

$12 - $10

$12

computed \( \frac{16,667}{100,000} = 16,667 \)

would be weighted 12/13, since they were outstanding for only twelve of the thirteen weeks during the quarter, and would represent 15,385 common shares \( (16,667 \times \frac{12}{13}) \) in the fourth quarter of 1969. In the annual earnings per share computation for 1969, these warrants would represent 3,846 common shares \( (15,385 \div 4) \).

.197 If the market price at December 31, 1969 for common stock exceeded the $12 average market price, the higher market price would be used in computing fully diluted earnings per share to reflect maximum potential dilution as specified in section 2011.42. For a market price of common stock on December 31 of $12.50 per share, the shares to be added for the fourth quarter fully diluted earnings per share would be computed as follows:

\[
\frac{12.50 - 10}{12.50} \times 100,000 = 20,000
\]

\[
\frac{12/13 \times 20,000}{18,462} \text{ shares.}
\]

The shares to be added for 1969 annual fully diluted earnings per share in this case would be 4,615.

.198 If the warrants described in the above example expired or were cancelled on March 25, 1970 and we assume
an average market price for common stock during the twelve weeks then ended of $12, the same results as above would be obtained for primary earnings per share computations for the first quarter of 1970. That is, assumed exercise of the 100,000 warrants would produce 16,667 incremental shares weighted 12/13 and would represent 15,385 common shares in the first quarter of 1970. In the annual earnings per share computations for 1970, these warrants would represent 3,846 common shares.

.199 If the market price of common stock on the last day the warrants were outstanding (March 25, 1970) exceeded the $12 average market price for the twelve week period, the higher market price would be used in computing fully diluted earnings per share to reflect maximum dilution. For a market price of $12.50 on March 25, 1970 in this example, 18,462 shares would be added for the first quarter computations and 4,615 shares would be added for the 1970 annual computations in computing fully diluted earnings per share. [.42]

.200 Generally, options or warrants which expire or are cancelled will not affect earnings per share computations. The above examples are included only for those rare cases when they do. Most dilutive options and warrants will be exercised prior to expiration or cancellation. Anti-dilutive options and warrants do not enter earnings per share computations, since they would not be exercised when common stock could be purchased for less in the market than through exercise. [.30, .40]

.201 When dilutive options or warrants expire or are cancelled during a period, it may also be desirable to furnish supplementary earnings per share data as described in section 2011.22, but previously reported earnings per share data would not be retroactively adjusted for expirations or cancellations of warrants or options. [.22]

58. What Is a Period?

.202 Q—What is a “period” as the term is used in section 2011?

A—A “period” is the time for which net income is reported and earnings per share are computed.

* Except in the unusual situations described in section 2011.38 and in Part I, paragraph .016, fn. 6.
.203 However, when the treasury stock method or any method requiring the computation of an average market price is used and the reporting period is longer than three months, a separate computation is made for each three-month period. [2011C.03]

.204 If a period of less than a quarter is being reported upon, the average market price of common stock during the period encompassed by the income statement is used in applying the treasury stock methods. Other methods requiring the use of average market prices also use the prices in effect during this shorter period.

59. Share Averaging

.205 —When the reporting period is longer than three months and the treasury stock method is applied, how is the weighted average of shares computed for the reporting period?

A —A weighted average of shares is computed based on the average market prices during each three months included in the reporting period. Thus, if the period being reported upon is six months, nine months, or one year, a weighted average of shares is computed for each quarter. The weighted averages for all quarters are then added together, and the resulting total is divided by the number of quarters to determine the weighted average for the period. [2011C.03]

.206 Assume, for example, that a corporation had 25,000 shares of common stock outstanding during a year and also had granted options which resulted in the following incremental shares computed using the treasury stock method: 500 in the first quarter, none in the second quarter because they would have been anti-dilutive, 1,400 in the third quarter, and 1,000 in the fourth quarter. The weighted average of shares for the year could be computed either

\[
\frac{25,500 + 25,000 + 26,400 + 26,000}{4} = 25,725
\]

or

\[
\frac{500}{4} + \frac{1,400}{4} + \frac{1,000}{4} = 725
\]

\[
725 + 25,000 = 25,725
\]

\[30\] For example, see Interpretations 67, 70, 77 and 79.

\[31\] See Interpretation 25 and paragraph .359 for examples of computing a weighted average.
60. Applying Ending and Average Market Prices

Q—How do the computations of primary and fully diluted earnings per share differ when the treasury stock method is applied for options and warrants and the ending market price of common stock is different from the average market price?

A—When the ending market price of common stock is higher than the average market price for the period, the ending market price is used for the fully diluted computation to reflect maximum potential dilution. The use of different market prices for primary and fully diluted earnings per share computations naturally results in different numbers of shares for the two computations. The use of a higher ending market price for fully diluted computations may also result in the assumption of exercise for fully diluted earnings per share but not for primary earnings per share. Year-to-date computations for fully diluted earnings per share may also be more complex when market prices of common stock increase and then decrease during the year, since the share computation is then made two ways and the greater number of shares is used in computing year-to-date fully diluted earnings per share. The above situations are illustrated in the following example. \[.42\]

Assume stock options are outstanding to obtain 5,000 shares of common stock at an exercise price of $10 per share. Assume also the following average and ending market prices of common stock during the calendar year:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Average Market Price</th>
<th>Ending Market Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>$11.11</td>
<td>$12.00</td>
</tr>
<tr>
<td>Second quarter</td>
<td>9.75</td>
<td>11.00</td>
</tr>
<tr>
<td>Third quarter</td>
<td>13.89</td>
<td>14.00</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>12.50</td>
<td>13.00</td>
</tr>
</tbody>
</table>

For primary earnings per share, the treasury stock method would produce the following number of incremental shares to reflect the dilutive effect of the options:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Primary Incremental Shares</th>
<th>Year-to-Date</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EPS</td>
<td>EPS</td>
</tr>
<tr>
<td>First quarter</td>
<td>500(1)</td>
<td>500</td>
</tr>
<tr>
<td>Second quarter</td>
<td>-0-</td>
<td>250(2)</td>
</tr>
<tr>
<td>Third quarter</td>
<td>1,400(3)</td>
<td>633(4)</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>1,000(5)</td>
<td>725(6)</td>
</tr>
</tbody>
</table>
COMPUTATIONAL NOTES:
(1) $11.11 - $10 \times 5,000 = 500$
\[11.11\]
(2) $500 + 0 = 500. \quad 500 \div 2 = 250$
(3) $\frac{13.89 - $10}{500} \times 5,000 = 1,400$
\[13.89\]
(4) $500 + 0 + 1,400 = 1,900. \quad 1,900 + 3 = 633$
(5) $\frac{12.50 - $10}{500} \times 5,000 = 1,000$
\[12.50\]
(6) $500 + 0 + 1,400 + 1,000 = 2,900. \quad 2,900 \div 4 = 725$

.210 For fully diluted earnings per share, the treasury stock method would produce the following number of incremental shares to reflect the maximum dilutive effect of the options:

<table>
<thead>
<tr>
<th>Quarterly</th>
<th>Year-to-Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>EPS (1)</td>
<td>EPS</td>
</tr>
<tr>
<td>First quarter</td>
<td>833</td>
</tr>
<tr>
<td>Second quarter</td>
<td>455(2)</td>
</tr>
<tr>
<td>Third quarter</td>
<td>1,429</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>1,154</td>
</tr>
</tbody>
</table>

COMPUTATIONAL NOTES:
(1) Based on ending market price for each quarter.
(2) Note that the average market price for this quarter was anti-dilutive, so the computation is made only for fully diluted earnings per share.
(3) $833 + 455 = 1,288. \quad 1,288 + 2 = 644$
Use 644 weighted average since 644 is greater than 455 incremental shares based on ending market price.
(4) $833 + 455 + 1,429 = 2,717. \quad 2,717 + 3 = 906.$
Use 1,429 incremental shares based on the ending market price since 1,429 is greater than 906.
(5) $833 + 455 + 1,429 + 1,154 = 3,871. \quad 3,871 + 4 = 968.$
Use 1,154 incremental shares based on the ending market price since 1,154 is greater than 906.

.211 Note that the two computations made for year-to-date fully diluted incremental shares may in some cases cause different market prices to be applied for the quarterly and year-to-date fully diluted computations. For example, assume that in the above illustration the average market price in the fourth quarter was $13 and the ending market price was $12.50. The $13 average market price would produce 1,154 incremental shares in the fourth quarter for both primary and fully diluted computations. In the annual fully diluted computation, however, the $12.50 ending market price would produce 1,000 incremental shares while the average number of shares for the four quarters would be only 968 (see computational note 5 above under fully diluted).
Therefore the average market price would be used for the fourth quarter fully diluted computation and the ending market price would be used for the annual fully diluted computation.

.212 A more comprehensive example of these points appears in paragraph .359.

61. **Treasury Stock Method at Exercise**

.Q—How is the treasury stock method applied for options and warrants which are exercised?

.A—Common stock issued upon the exercise of options or warrants is included in the weighted average of outstanding shares from the exercise date. The treasury stock method is applied for exercised options or warrants from the beginning of the period to the exercise date. For primary earnings per share, the computation for the period prior to exercise is based on the average market price of common stock during the period the exercised options or warrants were outstanding (if the result is dilutive). Incremental shares are weighted for the period the options or warrants were outstanding and shares issued are weighted for the period the shares were outstanding. For fully diluted earnings per share, however, the computation for the period prior to exercise is based on the market price of common stock when the options or warrants were exercised regardless of whether the result is dilutive or anti-dilutive. Incremental shares are weighted for the period the options or warrants were outstanding and shares issued are weighted for the period the shares are outstanding. These situations are illustrated in the following example. [.42, 2011A.02]

.214 Assume stock options are outstanding to obtain 5,000 shares of common stock at an exercise price of $10 per share. Assume also the following average and ending market prices of common stock during the calendar year:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Average Market Price</th>
<th>Ending Market Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>$11.11</td>
<td>$12.00</td>
</tr>
<tr>
<td>Second quarter</td>
<td>9.75</td>
<td>11.00</td>
</tr>
<tr>
<td>Third quarter</td>
<td>13.89</td>
<td>14.00</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>12.50</td>
<td>13.00</td>
</tr>
</tbody>
</table>

Also assume that 1,000 options were exercised May 1 when the market price of common stock was $10.50 per share and
another 1,000 options were exercised September 1 when the market price of common stock was $15 per share. The average market price from April 1 to May 1 was $11.25 and from July 1 to September 1 was $13.

.215 For primary earnings per share, the treasury stock method would produce the following number of incremental shares to reflect the dilutive effect of the options:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Primary Incremental Shares</th>
<th>Year-to-Date</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EPS</td>
<td>EPS</td>
</tr>
<tr>
<td>First quarter</td>
<td>500</td>
<td>500</td>
</tr>
<tr>
<td>Second quarter</td>
<td>37(1)</td>
<td>269(2)</td>
</tr>
<tr>
<td>Third quarter</td>
<td>994(3)</td>
<td>510(4)</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>600</td>
<td>533(5)</td>
</tr>
</tbody>
</table>

COMPUTATIONAL NOTES:
(1) $\frac{1}{3}$ of 111 incremental shares for 1,000 options exercised May 1 (using $11.25 average market price for the period the options were outstanding). Remaining options are anti-dilutive.
(2) $500 + 37 = 537$. $537 + 2 = 269$
(3) 840 incremental shares for 3,000 options outstanding all of the quarter (exercise assumed at $13.89 average market price for the quarter) plus $\frac{3}{4}$ of the 231 incremental shares for 1,000 options outstanding for two months of the quarter (exercise assumed at $13 average market price for the period the options were outstanding). $840 + 154 = 994$
(4) $500 + 37 + 994 = 1,531$. $1,531 + 3 = 510$
(5) $500 + 37 + 994 + 600 = 2,131$. $2,131 + 4 = 533$

In addition, outstanding shares would increase as follows to reflect options exercised May 1 and September 1:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Increase in Outstanding Shares</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Quarterly</td>
</tr>
<tr>

</tr>
<tr>
<td>Third quarter</td>
<td>1,079(3)</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>692(5)</td>
</tr>
</tbody>
</table>

### COMPUTATIONAL NOTES:

1. 364 incremental shares for 4,000 options outstanding all of the quarter (using $11 ending market price) plus 1/2 of 48 incremental shares for 1,000 options exercised May 1 (using $10.50 market price at exercise date).

2. \((667 + 48) + 380 = 1,095\). \(1,095 + 2 = 548\). For the first quarter, 667 incremental shares for 4,000 options (using $12 ending market price) plus 48 incremental shares for 1,000 options exercised May 1 (using $10.50 market price at exercise date). See note 1 for second quarter. The incremental shares for the two quarters are then weighted.

3. 857 incremental shares for 3,000 options outstanding all of the quarter plus \(\frac{3}{5}\) (333) = 222 incremental shares for 1,000 options exercised September 1 and outstanding two months.

4. 857 incremental shares for 3,000 options outstanding for all of the three quarters based on $14 higher ending market price applied for all of the three quarters plus \(\frac{4}{9}\) (48) = 21 for the May 1 exercise plus \(\frac{8}{9}\) (333) = 296 for the September 1 exercise.

5. Based on $13 market price and 3,000 options.

6. \(500 + 273 + 857 + 692 = 2,322\). \(2,322 + 4 = 581\) incremental shares for 3,000 options outstanding for four quarters using market prices of $12, $11, $14 and $13 for the respective quarters for computing the weighted average of incremental shares. Since 692 incremental shares determined by applying the ending market price is greater than 581 weighted incremental shares, 692 is used. The 692 is increased by \(\frac{4}{12}\) (48) = 16 shares for the May 1 exercise plus \(\frac{8}{12}\) (333) = 222 for the September 1 exercise. 692 + 16 + 222 = 930.

In addition, outstanding shares would increase by the same number of shares as illustrated for the primary earnings per share computation for the options exercised on May 1 and September 1, i.e., 667 shares in the second quarter, 1,333 in the third quarter, 2,000 in the fourth quarter, 333 for the first six months, 667 for the first nine months, and 1,000 for the year.

### 62. Anti-Dilutive Exercise

Q—Is the treasury stock method applied for options and warrants which are exercised when the market price is below the exercise price?

A—Options or warrants usually would not be exercised in such a situation. The common stock obtainable upon exercise could be purchased in the market for less than the exercise price. However, in those rare cases where such an exercise does occur, the treasury stock method is applied from the beginning of the year to the exercise date for fully diluted computations using the market price at the exercise date. The result will be anti-dilutive. [.42]
For primary computations, the average market price from the beginning of the quarter to the exercise date is used, but only if the result is dilutive. Thus, when the average market price is less than the exercise price while the exercised options or warrants were outstanding, the exercised options or warrants are omitted from primary computations. [.30, .36]

Common stock issued upon exercise is included in the weighted average of outstanding shares from the exercise date for both primary and fully diluted computations. Shares produced by the treasury stock method are included in the weighted average of outstanding shares for the time the exercised options or warrants were outstanding. [2011A.02]

For example, assume stock options are outstanding to obtain 5,000 shares of common stock at an exercise price of $10 per share. Assume also the following average and ending market prices of common stock during the calendar year.

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Average Market Price</th>
<th>Ending Market Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>$11.11</td>
<td>$12.00</td>
</tr>
<tr>
<td>Second quarter</td>
<td>9.75</td>
<td>11.00</td>
</tr>
<tr>
<td>Third quarter</td>
<td>13.89</td>
<td>14.00</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>12.50</td>
<td>13.00</td>
</tr>
</tbody>
</table>

On June 1, 1,000 options were exercised when the market price of common stock was $9.50 per share. The average market price from April 1 to June 1 was $9.65 per share.

For primary earnings per share, the treasury stock method would produce the following number of incremental shares to reflect the dilutive effect of the options:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Primary Incremental Shares</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>500</td>
</tr>
<tr>
<td>Second quarter</td>
<td>0—(1)</td>
</tr>
<tr>
<td>Third quarter</td>
<td>1,120(2)</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>800</td>
</tr>
</tbody>
</table>

COMPUTATIONAL NOTES:
(1) Average market price for both outstanding options and exercised options are anti-dilutive.
(2) 1,120 incremental shares for 4,000 options outstanding all of the quarter.
(3) $500 + 0 + 1,120 = 1,620. $1,620 + 3 = 540
(4) $500 + 0 + 1,120 + 800 = 2,420. 2,420 + 4 = 605
In addition, outstanding shares would increase as follows to reflect options exercised June 1:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Increase in Outstanding Shares</th>
<th>Year-to-Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Second quarter</td>
<td>333(1)</td>
<td>167(2)</td>
</tr>
<tr>
<td>Third quarter</td>
<td>1,000(3)</td>
<td>444(4)</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>1,000(5)</td>
<td>583(6)</td>
</tr>
</tbody>
</table>

COMPUTATIONAL NOTES:
(1) $\frac{1}{2}$ of 1,000 shares issued June 1 and outstanding for one month.
(2) $0 + 333 = 333$. $333 + 2 = 167$
(3) 1,000 shares issued June 1.
(4) $0 + 333 + 1,000 = 1,333$. $1,333 + 3 = 444$
(5) 1,000 shares issued June 1.
(6) $0 + 333 + 1,000 + 1,000 = 2,333$. $2,333 + 4 = 583$

.222 For fully diluted earnings per share, the treasury stock method would produce the following number of incremental shares to reflect the maximum dilutive effect of the options:

<table>
<thead>
<tr>
<th>Quarter</th>
<th>Fully Diluted Incremental Shares</th>
<th>Year-to-Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>First quarter</td>
<td>833</td>
<td>833</td>
</tr>
<tr>
<td>Second quarter</td>
<td>329(1)</td>
<td>472(2)</td>
</tr>
<tr>
<td>Third quarter</td>
<td>1,143(3)</td>
<td>1,114(4)</td>
</tr>
<tr>
<td>Fourth quarter</td>
<td>923(5)</td>
<td>901(6)</td>
</tr>
</tbody>
</table>

COMPUTATIONAL NOTES:
(1) 364 incremental shares for 4,000 options outstanding all of the quarter less $\frac{1}{2} (1,000—1,053) = — 35 to reflect the anti-dilutive effect of the exercise of 1,000 options outstanding 2 months during the quarter. $364 — 35 = 329$
(2) $(667 — 53) + (364 — 35) = 943$. $943 + 2 = 472$. See note 1. For the first quarter, 667 incremental shares for 4,000 options are reduced by 53 anti-dilutive shares for 1,000 options exercised June 1. The net incremental shares for the two quarters are then weighted.
(3) 1,143 incremental shares for 4,000 options outstanding all of the quarter.
(4) 1,143 incremental shares for 4,000 options outstanding for all of the three quarters based on $14 higher ending market price applied for all of the three quarters less 5/9 (53) = — 29 for the June 1 anti-dilutive exercise.
(5) Based on $13 market price and 4,000 options.
(6) $667 + 364 + 1,143 + 923 = 3,097$. $3,097 + 4 = 774$ incremental shares for 4,000 options outstanding for four quarters using market prices of $12, $11, $14 and $13 for the respective quarters for computing the weighted average of incremental shares. Since 923 incremental shares determined by applying the ending market price is greater than 774 weighted incremental shares, 923 is used. The 923 is decreased by 5/12 (— 53) = — 22 for the June 1 anti-dilutive exercise. $923 — 22 = 901$.

In addition, outstanding shares would increase by the same number of shares as illustrated for the primary earnings per share computation for the options exercised on June 1, i.e., 333 shares in the second quarter, 1,000 shares in the third and fourth quarters, 167 shares for the first six

AICPA Professional Standards

AC § U 2011.222
months, 444 shares for the first nine months, and 583 shares for the year.

63. "Substantially All" of Three Months

Q—How long is "substantially all" of a three-month period and why should exercise of options and warrants not be assumed in applying the treasury stock method "until" the market price has exceeded the exercise price for such a period?

A—"Substantially all" is not defined in section 2011. Following the recommendation to not assume exercise before the three-month test is met (1) eliminates the need to make the computation until the market price has exceeded the exercise price for a significant period and (2) reduces "flip-flop" of options and warrants in and out of the computation because of the common stock’s market price fluctuations above and below the exercise price. [36]

Presumably, eleven weeks would be substantially all of a thirteen-week quarter. Therefore, the computation would be made for any quarter after the market price has once been above the exercise price for any eleven weeks during a quarter.

Note that this is a one-time test. Exercise need not be assumed for the computations until the test has been met, not unless the test is met in a particular quarter. Thus, once the test is met, the average market price would be computed thereafter unless the market prices are clearly anti-dilutive.

The test applies for both primary and fully diluted computations. But after the test has once been met, an ending market price which is above the exercise price is used for the fully diluted computation even though the average market price is below the exercise price. [42]

This recommendation also applies to earnings per share computations for income statements prepared for periods which are less than a quarter. When applied to shorter periods, however, virtually all market prices in the

---

223 The Board recommended that exercise of options and warrants not be assumed for earnings per share data until the market price has been above the exercise price for substantially all of the three months ending with the month for which the computation is being made.
shorter period should be above the exercise price or exercise need not be assumed. For a one-month statement, for example, the market prices during that month and for most of the two preceding months should be above the exercise price. [.36]

64. Total of Quarters May Not Equal Annual EPS

Q—Are previously reported earnings per share data ever retroactively adjusted or restated for changes in the incremental number of shares computed using the treasury stock method?

A—No, retroactive adjustment or restatement of previously reported earnings per share data are not made when the incremental number of shares determined by applying the treasury stock method changes. The Board realized that the total of four quarter’s earnings per share might not equal the earnings per share for the year when market prices change and the treasury stock method is applied. [.36, .41]

Computations for each quarter or other period are independent. Earnings per share data would not either be restated retroactively nor adjusted currently to obtain quarterly (or other period) amounts to equal the amount computed for the year or year to date.

65. Unusual Warrants and Their Equivalents

Q—To what kinds of securities does section 2011.37 apply?

A—Section 2011.37 must be applied for earnings per share computations for the following kinds of securities, all of which are classified as common stock equivalents:

1. Warrants which require the tendering of debt or other securities of the issuer or its parent or its subsidiary in full or partial payment of the exercise price.

2. Warrants which permit as an alternative the tendering of debt or other securities of the issuer or its parent or its subsidiary in full or partial payment of the exercise price.

3. Warrants whose proceeds from exercise must be applied toward the retirement of debt or other securities of the issuer. Such debt or other securities would have
been issued with the warrants and the requirement to apply any proceeds toward retirement would usually be written into an indenture, making the requirement a contractual obligation.

4. Convertible securities which require the payment of cash upon conversion (regardless of their yield at time of issuance).

5. Convertible securities which permit the payment of cash as an alternative upon conversion, for example, to obtain a greater number of common shares than could be obtained from straight conversion (regardless of their yield at time of issuance). [37]

66. Securities Subject to Section 2011.37 Tests

Q—Are all of the securities listed in the preceding Interpretation subject to the two tests described in section 2011.37?

A—The two tests described in section 2011.37 are tests to determine whether certain warrants are dilutive or antidilutive. The “a” test is the usual test to determine if a warrant is dilutive. The “b” test is applied when securities can be tendered in lieu of cash to exercise a warrant. The computations to be made when either or both tests are met are described in Interpretations 67-70. [37]

.232 The “a” test (the market price of the related common stock must exceed the exercise price of the warrant or the convertible security considered the equivalent of a warrant) applies to warrants (1) which require the tendering of debt, (2) which permit the tendering of debt, and (3) whose proceeds must be used to retire debt.

.233 The “b” test (the security to be tendered is selling at enough discount to establish an effective exercise price below the market price of the common stock obtainable) applies only to the debt or other securities which must or may be tendered toward the exercise price of the warrant (the debt listed in 1 and 2 in Interpretation 65). The “b” test gives recognition to the possibility that a warrant holder could purchase debt in the market at a discount and exercise a warrant by tendering the debt at its face amount, thereby effecting the purchase of the common stock for less than its market price.
These tests are demonstrated in the following example. Assume that a warrant may be exercised to purchase two shares of common stock by tendering either $100 cash or a $100 face value debenture when market prices are $48 per common share, $94 per debenture, and $6 per warrant. The “a” test is not met (2 × $48 = $96 market price of common does not exceed the exercise price of $100 cash). The “b” test is met. (The $94 market price of the debenture is below the $96 market price for two shares of common. This may also be computed

\[
\frac{\text{market price of debenture}}{\text{tender value of debenture}} \times \frac{50}{\text{exercise price per share}} = \frac{94}{50} = 1.88 \times \frac{94}{50} = 47 \text{ effective exercise price per share.}
\]

Note that the market price of the warrant is not considered in either test.

The “a” and “b” tests apply to securities on an individual basis. However, when section 2011.38 applies (see Interpretations 72-74), the securities subject to these tests are included in the aggregate computation required by that paragraph whether their individual effect is dilutive or anti-dilutive. [.35, .38]

67. Market Prices Used in Section 2011.37 Tests

Q.—What market prices are used for the two tests described in section 2011.37?

A.—The market prices used for these two tests and for the computations when the tests are met correspond to the market prices used for the treasury stock method (see Interpretations 52-56). Therefore, the computations are made for each quarter and the shares for the quarters are averaged for annual primary computations. [.37]

The market price of common stock for both tests is the average market price during each three-month quarter included in the period being reported upon. The ending market price of common stock is used, however, for fully diluted earnings per share if the ending price is higher than the average price. [.42, 2011C.03]

For the “b” test, the average market price of the debt or other security during each three-month quarter included in the period being reported upon is used. The
ending market price of the debt or other security is used, however, for fully diluted earnings per share if the ending price is lower than the average price. [.37]

.239 Usually, only one test will be met. In some cases, however, both tests will be met. Also, different tests may be met for primary and fully diluted computations. The computations to be made in these situations are explained in Interpretations 68 and 69. When neither test is met, these securities are not included in earnings per share computations unless section 2011.38 applies. [.35, .38]

68. Computations for Warrants Requiring the Tendering of Debt

.240 Q—What computations are made under the “a” and “b” tests specified in section 2011.37 for warrants which require that debt or other securities be tendered upon exercise?

A—If either the “a” or “b” test described in Interpretations 66 and 67 is met when debt or other securities must be tendered toward the exercise price, exercise of the warrants is assumed. The debt or other security is tendered at the amount it must be tendered (usually face amount). Interest, net of tax, on the debt is added back to net income in determining earnings applicable to common stock. Common stock is assumed to be issued on the exercise date. The treasury stock method is applied for any cash proceeds when cash is also to be tendered with the debt. The fact that both tests may sometimes be met does not affect the computations. [.37]

69. Computations for Warrants Allowing the Tendering of Debt

.241 Q—What computations are made under the “a” and “b” tests specified in section 2011.37 for warrants which permit the tendering of debt or other securities upon exercise?

A—The computations depend upon the test met. If both tests are met, the computations depend upon the alternatives available since some warrants and their equivalents provide two or more exercise or conversion alternatives to the holder. For example, a warrant may be exercisable by paying $60 cash to obtain one share of common stock
Computing Earnings per Share

or by tendering $100 face value debt to obtain two shares of common stock. In such a case, debt may be tendered but is not required to be tendered. [.37]

.242 When only the "a" test is met (because the debt or other security is selling for more than the amount for which it may be tendered), the treasury stock method is applied since the debt or other security would not be tendered toward exercise of the warrant or its equivalent.

.243 When only the "b" test is met (the debt or other security which may be tendered is selling at enough discount to create an effective exercise price below the market price of the common stock), the procedures described in Interpretation 68 (for when debt or other securities must be tendered) are applied.

.244 If both the "a" and "b" tests described above are met when debt or other securities may be tendered toward the exercise price or if two or more exercise or conversion alternatives meet one test (whether or not both tests are met), the computation should be based upon the alternative which meets the test and is more (or most) advantageous to the holder of the warrant or its equivalent. [2011A.15]

.245 The "a" and "b" tests are applied for each quarter using the market prices specified in Interpretation 67. When either test is met, the computations are made for that quarter. Different tests may apply for different quarters in the period. The shares determined for each quarter are averaged for year-to-date primary computations. In fully diluted year-to-date computations, the greater of the average number of shares included in the fully diluted quarterly computations or the number of shares determined by applying ending market prices is used. [2011C.03]

70. Computations for Warrants Whose Proceeds Are Applied To Retire Debt

.246

Q—How are warrants whose proceeds must be used to retire debt or other securities included in earnings per share computations?

A—When debt or other securities of the issuer require that the proceeds from the exercise of warrants or their
equivalents be applied toward retirement of those securities, exercise of the warrants is assumed at the beginning of the period (or time of issuance, if later). The proceeds from exercise are assumed to have been used to purchase the securities to be retired at the date of assumed exercise. [.37]

.247 These computations are made on a quarterly basis. The shares determined for each quarter are averaged for annual earnings per share computations. The purchase price to be used is the average market price during each three-month quarter for the securities assumed to have been purchased. To reflect maximum potential dilution, the purchase price for the computation of fully diluted earnings per share is the market price of the securities to be retired at the end of the period if this price is higher than the average market price. [.42, 2011C.03]

.248 Exercise of the warrants is not assumed for either primary or fully diluted earnings per share unless the market price of the related common stock exceeds the exercise price of the warrants.33 When exercise is assumed and the proceeds from exercise are used to purchase securities to be retired, interest (net of tax) on any debt retired must be added back to net income in determining earnings applicable to common stock. Any excess amount from the assumed exercise of the warrants above the amount needed for the purchase of securities is used to purchase common stock under the treasury stock method.; [.30, .37, .40]

71. Treasury Stock Method for Convertibles

.249 Q—How are convertible securities which require or permit the payment of cash at conversion included in earnings per share computations?

A—Convertible securities which require or permit the payment of cash at conversion are considered the equivalents of warrants and are therefore always common stock equivalents. [.37]

.250 Convertible securities requiring the payment of cash are assumed to be converted at the beginning of the

---

*Exercise may be assumed, however, if section 2011.38 applies. See Interpretations 72-74.
*Unless issued before June 1, 1969 and classified under election “b” of section 2011.46.
Computing Earnings per Share

period (or time of issuance, if later) and the if converted method is applied. Proceeds from conversion are used to purchase common stock under the treasury stock method. Thus, the incremental number of shares assumed to be outstanding is the difference between the number of shares issued upon assumed conversion and the number of shares assumed purchased under the treasury stock method. If the net result of the aggregate computation of applying both the if converted method and the treasury stock method is dilutive, these computations are included in both primary and fully diluted earnings per share. The computations are not included, however, if the net result is anti-dilutive.\[35\]

.251 Some convertible securities permit the payment of cash at conversion to obtain a more favorable conversion rate. The procedures described in the preceding paragraph are applied for such securities except that no proceeds are assumed to be received upon conversion whenever the amount of cash to be paid exceeds the market value of the additional shares obtainable. The treasury stock method therefore cannot be applied when this condition exists and only the if converted method is applied (if the result is dilutive).\[35\] [\.37, 2011A.13]

.252 When several conversion alternatives exist (for example, permitting the payment of different amounts of cash for different conversion rates), the computation should give effect to the alternative which is most advantageous to the holder of the convertible security. [2011A.13]

72. Anti-Dilutive Options and Warrants Included

.253

Q—When section 2011.38 applies (the number of common shares obtainable upon exercise of all options and warrants exceeds 20% of the number of common shares outstanding at the end of the period), are anti-dilutive options and warrants assumed to be exercised as well as dilutive options and warrants?

A—Yes, when section 2011.38 applies, all options and warrants and their equivalents are assumed to be exercised (or converted) whether they are dilutive or anti-
dilutive. Under this exception to the general rule that computations should not give effect to anti-dilution, all of the computations specified in sections 2011.36, 2011.37 and 2011.38 are made and aggregated. If the net result is dilutive, all are included. If the net result is anti-dilutive, all are excluded. [35, 36, 37, 38]

73. No Order for Exercise

Q—When section 2011.38 applies and several issues of options and warrants with different exercise prices are outstanding, which options and warrants should be assumed to be exercised to obtain common stock under the treasury stock method, i.e., may anti-dilutive options and warrants be used in applying the treasury stock method or is the treasury stock method applicable only for dilutive options and warrants?

A—All options and warrants are assumed to be exercised when section 2011.38 applies without regard to whether the proceeds will be applied to purchase common stock under the treasury stock method or will be applied to the retirement of debt. Specific options or warrants are not to be allocated for the treasury stock method, but rather all options and warrants are assumed to be exercised and the number of common shares assumed to be repurchased under the treasury stock method may not exceed 20% of the number of common shares outstanding at the end of the period. [38]

74. Explanation of 20% Provision

Q—How is the 20% provision described in section 2011.38 applied?

A—20% is used in two ways in section 2011.38. First, a 20% test is applied to outstanding common shares. If the 20% test is met, an aggregate computation is required and all options and warrants and their equivalents are assumed to be exercised. Then a 20% limitation is applied to the number of common shares purchased under the treasury stock method. [38]

*A corporation which has made election "b" of section 2011.46 would apply this test for both primary and fully diluted earnings per share computations, since the number of shares obtainable from options and warrants may differ for the two computations as described in Interpretation 81.
Even though the 20% test is met, the number of shares purchased under the treasury stock method may be below the 20% limitation if the market price is high relative to the exercise price. For example, if 1,000,000 common shares and warrants to obtain 500,000 shares were outstanding, the 20% test would be met and the 20% limitation for the treasury stock method would be 200,000 shares. At an exercise price of $10 and a market price of $50, however, only 100,000 shares could be purchased under the treasury stock method.

Note that the 20% limitation applies only to shares assumed purchased under the treasury stock method. It does not apply to the number of incremental shares which results from the computation. In the above example, 400,000 incremental shares resulted from the assumed issuance of 500,000 shares upon exercise and the assumed purchase of 100,000 shares under the treasury stock method.

In addition, some warrants and their equivalents for which the treasury stock method may not be applicable result in the assumed issuance of common stock. They are therefore included in applying the 20% test and are included in the aggregate computation if the test is met. For example, warrants whose proceeds must be used to retire debt are included in applying the 20% test and in the aggregate computation if the test is met. Only the proceeds in excess of the amount required for debt retirement would be eligible for the treasury stock method, however. Warrants assumed to be exercised by tendering debt or other securities would also be included in applying the 20% test and in the aggregate computation if the test is met. But only if both cash and debt or other securities were assumed tendered would there be any proceeds eligible for the treasury stock method. Convertible securities which require or permit the payment of cash at conversion are considered the equivalent of warrants. Such convertible securities would be included in applying the 20% test and in the aggregate computation if the test is met. [35, 37, 38]

Most convertible securities, however, (those which do not require or permit the payment of cash at conversion) are not included in applying the 20% test. Nor are other securities which are not options or warrants or

AICPA Professional Standards

AC § U 2011.259
their equivalents included in the 20\% test. For example, the usual participating securities, two-class common stocks and common stock issuable when specified conditions are met are not included in the 20\% test. [.27, .33]

.260 Securities which are not included in the 20\% test are not included in the aggregate computation 57 described in section 2011.38. Thus, even if the net result of the aggregate computation is anti-dilutive and therefore not included in the earnings per share computation, other securities not included in the aggregate computation would be included in the earnings per share computations if they are dilutive. [.15, .38]

75. Original Issue Premium or Discount

.261 Q—What treatment is accorded to any original issue premium or discount when debt is assumed acquired under the provisions of sections 2011.37 and 2011.38?

A—Original issue premium or discount is treated as specified in Interpretation 40, i.e., applicable premium or discount amortized during the period is eliminated from net income. Unamortized premium or discount is not included in earnings applicable to common stock and does not affect earnings per share. [2011A.06]

76. Redemption Premium or Discount

.262 Q—What treatment is accorded to any redemption premium or discount when debt is assumed acquired under the provisions of sections 2011.37 and 2011.38?

A—Redemption premium or discount, i.e., the difference between the purchase price and the “book” carrying amount of debt, is ignored for earnings per share computations. [2011A.06]

.263 Redemption premium or discount could occur only when the proceeds from the assumed exercise of options and warrants are applied to purchase debt at the market price under the provisions of either section 2011.37 or 2011.38. Redemption premium or discount is not included

57 However, convertible debt assumed to be retired with proceeds from exercise in excess of the amount required for applying the treasury stock method would be included in the aggregate computation and its interest would be eliminated as described in section 2011A.06.
Computing Earnings per Share

in earnings applicable to common stock and does not affect earnings per share.

.264 Common shares are, of course, assumed to be issued for all options and warrants assumed to be exercised. [.36, .42]

77. Debt Purchased Under Section 2011.38

.265 Q—What debt may the issuer assume is purchased when the provisions of section 2011.38 apply?

A—The issuer may select any debt which is eligible to be retired for assumed purchase when the provisions of section 2011.38 apply. This includes convertible debt (both common stock equivalents and other potentially dilutive securities) except that convertible debt may not be assumed purchased if the purchase would be anti-dilutive (that is, result in less dilution). Debt is eligible to be retired when it either may be "called" or is trading and could be purchased in the market. [.30, .38, .40]

.266 The same debt is assumed purchased for both primary and fully diluted earnings per share computations. Different amounts of debt may be assumed purchased, however, since different market prices may have to be used for the primary and fully diluted computations for the treasury stock method. The average market price of the debt during each quarter for which the computations are made is used for both the primary and fully diluted computations under section 2011.38. [.38]

78. Compensating Balances Excluded

.267 Q—When section 2011.38 applies and a loan is assumed to be paid, what treatment is accorded to any compensating balance maintained for the loan?

A—A compensating balance maintained for a loan assumed to be paid is excluded from consideration in applying section 2011.38. Although a compensating balance increases the effective interest rate on a loan to the borrower, only the actual interest paid or accrued (less applicable income tax) is adjusted against net income for earnings per share computations. [.38]
79. Investments Under Section 2011.38

Q—What securities are eligible for assumed purchase as investments when the provisions of section 2011.38 apply?

A—Only U. S. government securities and commercial paper are eligible for assumed purchase as investments when the provisions of section 2011.38 apply. Tax-exempt securities of state and local governments are not eligible. The same securities are assumed purchased as investments for both primary and fully diluted earnings per share computations. Different amounts may have to be assumed invested for primary and fully diluted computations, however. [...]

U. S. government securities, in the context of section 2011.38, are securities issued by the federal government, not merely securities guaranteed by the federal government. Typically the securities to be considered would be short-term securities, such as Treasury bills.

80. Debt Eligible Only While Outstanding

Q—When section 2011.38 applies and debt assumed purchased was actually outstanding only part of the period, may the assumed purchase apply for the entire period?

A—No, debt issued or retired during the period may be assumed purchased at its average market price under section 2011.38 only for the time the debt was actually outstanding. Since all computations under this paragraph are made on a quarterly basis, the issue or retirement typically affects only one quarter. An investment in U. S. government securities or commercial paper must be assumed for the time when debt was not outstanding and therefore could not be purchased. Any difference in interest (net of tax) between the debt and the investment naturally is reflected in earnings applicable to common stock. [...]

81. Computations May Differ for Primary and Fully Diluted when Section 2011.38 Applies

Q—Will section 2011.38 always apply for both primary and fully diluted computations if it applies to either?
A—No, in some cases section 2011.38 may apply for fully diluted computations but not for primary computations. This could occur when an issuer has made election "b" under section 2011.46 and the common shares obtainable upon exercise of options and warrants issued before June 1, 1969 exceed 20% of the common shares outstanding. Section 2011.38 applies in such a case for fully diluted but not for primary computations because the options and warrants issued before June 1, 1969 are included only in fully diluted computations. [.38, .46]

.272 Even if the common shares obtainable upon exercise of options and warrants issued before June 1, 1969 do not exceed 20% of the outstanding common shares when election "b" is in effect, the subsequent issuance of additional options or warrants could cause section 2011.38 to apply for fully diluted but not for primary computations. In such a case, section 2011.38 would be applied only for fully diluted computations because options and warrants issued before June 1, 1969 would not be included in primary computations. [.38, .46]

.273 The computation of primary and fully diluted earnings per share would also differ if section 2011.38 applied for both computations, but the net result in primary is anti-dilutive and is dilutive in fully diluted. This could occur when the ending market price is above the exercise price but the average market price is below the exercise price. In such a case, the computations would be included only for determining fully diluted earnings per share. [.30, .36, .38, .42]

82. Deferred Compensation Stock Option *
.274

Q—What treatment for earnings per share computations should be accorded to an employee deferred compensation plan with the compensation to be paid in stock?

A—Stock to be issued to an employee under a deferred compensation plan is considered a stock option. The time of issuance is the agreement date (or "date of grant"). The fact that the employee may not receive (or be able to sell) the stock until more than five or ten years from the statement date does not affect the computation. Accord-

* See also FASB Interpretation No. 31, Treatment of Stock Compensation Plans in EPS Computations (section 2011-1).
ingly, all shares to be issued are considered outstanding and the treasury stock method is applied to determine the incremental number of shares to be included in the earnings per share computations. The exercise amount of the option is the sum of the amount the employee must pay, the unamortized deferred compensation, and any tax benefit credited to capital surplus. The exercise amount is divided by the market price per share of the common stock to determine the number of shares assumed to be purchased.

For primary earnings per share computations, the average unamortized deferred compensation for the period and the average market price of the issuer’s common stock are used. For fully diluted earnings per share computations, the unamortized deferred compensation at the end of the period and, if higher than the average market price, the ending market price of the issuer’s common stock are used.

For example, assume that on January 2, 1973 a corporation grants options to its president for the purchase of 6,000 shares of its common stock at $2 per share, with options for 1,000 shares exercisable each July 1 and January 1 for three years as partial compensation for services during the preceding six months. The shares issued cannot be sold within three years of the issue date. At time of the grant of the options (January 2, 1973), the 6,000 shares have a market price of $10 per share. Also assume

---

38 The tax benefit credited to capital surplus is the “windfall” tax credit resulting from an increase in the market price of the stock between the date the plan is entered into and the date the compensation charge is deductible for tax purposes. Since the compensation is charged on the financial statements against the period benefited, the tax related to the charge results in a timing difference for interperiod tax allocation. If the market price of the stock increases, the additional reduction in taxes (i.e., a “windfall” gain) should be credited to capital surplus and considered part of the proceeds from the stock compensation plan which would be used to purchase stock under the treasury stock method.

39 The unadjusted quoted market price of a share of stock of the same class that trades freely in an established market should be used. If a quoted market price is not available, the best estimate of what the market price would be (not reduced for any restrictions imposed) should be used.

40 Grants or awards made prior to January 1, 1973 are subject to section 4061 rather than section 4062. Accordingly, fair value per share rather than market price is used if a restriction on the sale of the stock makes it worth less than the market price of freely trading stock.

41 If the corporation has made election “b” under section 2011.46 as to grants or awards made prior to June 1, 1969, only the fully diluted computations would apply, since “time of issuance” of these options is the date of grant.

AC § U 2011.275 Copyright © 1980, American Institute of Certified Public Accountants, Inc.
that the market price per share increases steadily during the three years at the rate of $1 per quarter and the tax rate is 50%. The total compensation to be charged to expense over the three-year period is $48,000 ($10 market price reduced by the $2 option price results in $8 per share compensation multiplied by 6,000 shares).

At March 31, 1973, the unamortized deferred compensation is $44,000 ($48,000 — $4,000) and the windfall tax benefit is $3,000 ($1.00 × 6,000 = $6,000 increase in market price multiplied by .50 tax rate). The total exercise price is $12,000 (6,000 × $2). For primary computations, averages of $46,000 unamortized deferred compensation and $1,500 windfall tax benefit plus the $12,000 total exercise price produce $59,500 "proceeds" for the total exercise amount. Dividing by the average market price of $10.50 ($10 + $11 = $21 divided by 2) results in 5,667 shares assumed repurchased under the treasury stock method. Therefore, 333 incremental shares (6,000 — 5,667) are assumed to be outstanding for the first quarter in the primary computation. For fully diluted computations, 636 incremental shares are computed:

\[
\begin{align*}
44,000 + 3,000 + 12,000 &= 59,000 \\
59,000 ÷ 11 &= 5,364 \\
6,000 — 5,364 &= 636
\end{align*}
\]

At June 30, 1973, the second quarter primary computation would include 913 incremental shares and fully diluted would include 1,167 incremental shares computed:

\[
\begin{align*}
42,000 + 4,500 + 12,000 &= 58,500 \\
58,500 ÷ 11.50 &= 5,087 \\
6,000 — 5,087 &= 913 \\
40,000 + 6,000 + 12,000 &= 58,000 \\
58,000 ÷ 12 &= 4,833 \\
6,000 — 4,833 &= 1,167
\end{align*}
\]

On July 1, 1973, 1,000 shares would be issued to the president and are outstanding shares thereafter.\(^{42}\)

\(^{42}\) The amount of the tax benefit for each share issued will be the lesser of the difference between the $2 exercise price and (1) the market price of the unrestricted stock when the restricted stock is issued or (2) the market price when restrictions lift. Changes in the windfall tax gain after the stock is issued are ignored in this computation since the compensation paid in stock is considered finalized upon issuance in this example.
At September 30, 1973, the treasury stock method would produce 660 incremental shares for the third quarter primary and 885 incremental shares for fully diluted computed:

\[
\begin{align*}
$38,000 + 6,250 + 10,000 &= 54,250 \\
54,250 \div 12.50 &= 4,340 \\
5,000 - 4,340 &= 660 \\
$36,000 + 7,500 + 10,000 &= 53,500 \\
53,500 \div 13 &= 4,115 \\
5,000 - 4,115 &= 885
\end{align*}
\]

At December 31, 1973, the treasury stock method would produce 1,093 incremental shares for the fourth quarter primary and 1,286 incremental shares for fully diluted computed:

\[
\begin{align*}
$34,000 + 8,750 + 10,000 &= 52,750 \\
52,750 \div 13.50 &= 3,907 \\
5,000 - 3,907 &= 1,093 \\
$32,000 + 10,000 + 10,000 &= 52,000 \\
52,000 \div 14 &= 3,714 \\
5,000 - 3,714 &= 1,286
\end{align*}
\]

The deferred compensation payable in stock would produce the following shares of common stock to be included in the corporation's 1973 annual earnings per share computations:

Computing Earnings per Share

COMPUTATIONAL NOTES:

(1) 636 incremental shares computed for first quarter fully diluted not used in annual computation. 1,167 incremental shares based on $12 market price at July 1 “exercise date” when the stock was issued.

(2) 885 incremental shares computed for third quarter fully diluted not used in annual computation. 1,286 incremental shares based on $14 ending market price for the fourth quarter.

.282 If the market price of the stock should subsequently fall below the market price at the date of grant, the application of the treasury stock method would be antidilutive. In such a case, the treasury stock method would not be applied and any unissued shares would not be considered outstanding for earnings per share computations. [.30, .40]

.283 The procedures described above are also used for deferred compensation plans to be paid in stock which do not require the employee to make a payment to obtain the stock. In such plans, the option price is zero. The period for measuring compensation under such plans is generally the period over which the restrictions lift. Although the plans are different, the procedures described in this Interpretation are applied with the zero option price offset by an increase in the unamortized deferred compensation. Also, these procedures would be applied for earnings per share computations whether or not the plan has been recorded by the company prior to the issuance of the stock. [.35, .36, .39]

[.284—.286] [Superseded, effective December 15, 1979, by FASB Interpretation No. 31.] (See section 2011-1.)

83. Stock Subscriptions Are Warrants

.287

Q—How are stock subscriptions included in earnings per share computations?

A—Fully paid stock subscriptions are considered outstanding stock whether or not the shares have actually been issued. Partially paid stock subscriptions are considered the equivalents of warrants and are therefore always 43

The next page is 12,837
common stock equivalents. The unpaid balance is assumed to be proceeds used to purchase stock under the treasury stock method. [.35]

.288 The number of shares included in earnings per share computations for partially paid stock subscriptions is the difference between the number of shares subscribed and the number of shares assumed to be purchased under the treasury stock method.

.289 The procedures described above are used for subscriptions to purchase convertible securities as well as for subscriptions to purchase common stock. Any incremental convertible securities resulting are then assumed to be converted into common stock if the result is dilutive (see Interpretation 84).

84. Options or Warrants to Purchase Convertible Securities

.290 Q—What treatment is accorded options or warrants to purchase convertible securities?

A—Options or warrants to purchase convertible securities are assumed to be exercised to purchase the convertible security whenever the market price of both the convertible security and the common stock obtainable upon conversion are above the exercise price of the warrant. However, exercise is not assumed unless conversion of the outstanding convertible securities is also assumed. The treasury stock method is applied to determine the incremental number of convertible securities which are assumed to be issued and immediately converted into common stock. The if converted adjustments which would be applicable to the incremental convertible securities are ignored since the adjustments would be self-cancelling, i.e., any interest or dividends imputed to the incremental convertible securities would be cancelled in applying the if converted method. [.30, .40, .36, 2011A.06]

.291 For example, assume that a corporation issued 10,000 warrants exercisable to obtain its $100 par value 5% convertible debt. Each warrant may be exercised at $90 to obtain one convertible bond. Each bond is convertible into two shares of common stock. The market prices of the securities are $46 per common share and $95 per convertible
bond. The warrants are dilutive ($2 \times 46 = 92$ which is greater than the $90$ exercise price).

.292 Assumption of exercise would produce $900,000 proceeds, which would be used to purchase 9,474 convertible bonds, resulting in 526 incremental bonds. Conversion would be assumed and 1,052 shares of common ($2 \times 526 = 1,052$) would be assumed issued to replace the 526 convertible bonds. [.36]

.293 If the market price of common were $45$ per share or less, exercise would not be assumed (for example, at $42$ per share, $2 \times 42 = 84$ which is less than $90$).

.294 The classification of the convertible security as a common stock equivalent or other potentially dilutive security determines whether the incremental number of common shares enters primary and fully diluted or enters only fully diluted earnings per share computations. [.33]

TWO-CLASS COMMON STOCK AND PARTICIPATING SECURITIES

85. EPS Treatment of Two-Class and Participating Securities

.295 Q—How are two-class common stocks and participating securities treated for earnings per share computations?

A—Two-class common is a term applied when a corporation has issued more than one class of common stock (for example, Class A and Class B). A participating security is a security eligible to participate in dividends with common stock; often a fixed amount is guaranteed to the participating security, then common is paid a dividend at the same rate, and the security participates with common on a reduced ratio thereafter. Classes of common stock other than “ordinary” common stock and the participating securities may be convertible into “ordinary” common stock or may be nonconvertible and may or may not be senior to common stock.

.296 For example, some stocks may be designated as common stock (e.g., Class B Common), but their terms and conditions are equivalent to preferred stock (by limiting their voting rights or the amount of dividends they may receive and by giving them preferences in liquidation).
dividends are guaranteed in some way but limited in participation to a maximum amount for a particular class of common stock, that common stock is considered the equivalent of a senior security to the extent it is to share in earnings.

.297 If dividend participation for a particular class of common stock is not limited but the participation is at a rate different from the "ordinary" common stock (for example, participating equally to some amount per share and partially participating thereafter), the two-class method is used. The two-class method is also used for participating preferred stock which is not limited as to participation in dividends with common stock. The two-class method is modified, however, when it is applied for a convertible security. (See Interpretation 87.) To be applied for a convertible security, the two-class method must result in greater dilution than would result from application of the if converted method. [2011A.09, 2011A.10]

.298 A determination of the status of a two-class common stock or other participating security as a common stock equivalent or as an other potentially dilutive security is based on an analysis of all the characteristics of the security, including the ability to share in the earnings potential of the issuing corporation on substantially the same basis as the common stock. Dividend participation *per se* does not make such a security a common stock equivalent. [2011A.15]

.299 The two-class method of computation for nonconvertible securities is discussed in Interpretation 86. The two-class method of computation for convertible securities is discussed in Interpretation 87.

86. Two-Class Method for Nonconvertible Securities

.300

Q—How is the two-class method applied for nonconvertible securities?

A—The two-class method for nonconvertible securities is an earnings allocation formula which determines earnings per share for each class of common stock and participating security according to dividends paid and participation rights in undistributed earnings. [2011A.10]
.301 Under the two-class method, net income is first reduced by the amount of dividends actually paid for the period to each class of stock and by the contractual amount of any dividends (or interest on participating income bonds) which must be paid (for example, unpaid cumulative dividends or dividends declared during the period and paid during the following period). The remaining unencumbered undistributed earnings is secondly allocated to common stock and participating securities to the extent each security may share in earnings. The total earnings allocated to each security is determined by adding together the amount allocated for dividends and the amount allocated for a participation feature.

.302 This amount is divided by the number of outstanding shares of the security to which the earnings are allocated to determine the earnings per share for the security. For this computation, outstanding common stock (the "ordinary" class of common stock) includes the usual common stock equivalent securities assumed to be converted or exercised for primary computations and includes these securities and all other potentially dilutive securities assumed to be converted or exercised for fully diluted computations. Although reporting earnings per share for each class of security may be desirable, earnings per share must be reported for the "ordinary" class of common stock.

.303 The application of the two-class method for a nonconvertible security is illustrated in the following example. Assume that a corporation had 5,000 shares of $100 par value nonconvertible preferred stock and 10,000 shares of $50 par value common stock outstanding during 1969 and had a net income of $65,000. The preferred stock is entitled to a noncumulative annual dividend of $5 per share before any dividend is paid on common. After common has been paid a dividend of $2 per share, the preferred stock then participates in any additional dividends on a 40:60 per share ratio with common. That is, after preferred and common have been paid dividends of $5 and $2 per share respectively, preferred participates in any additional dividends at a rate of two-thirds of the additional amount paid to common on a per share basis. Also assume that for 1969 preferred shareholders have been paid $27,000 (or $5.40 per
Computing Earnings per Share

share) and common shareholders have been paid $26,000 (or $2.60 per share). Earnings per share for 1969 would be computed as follows under the two-class method for non-convertible securities:

Net income .................................... $65,000

Less dividends paid:
Preferred ___________________ $27,000
Common ____________________ 26,000 53,000

Undistributed 1969 earnings

Allocation of undistributed earnings:
To preferred:

\[
\frac{.4(5,000)}{.4(5,000) + .6(10,000)} \times \$12,000 = \$3,000
\]

$3,000 ÷ 5,000 shares = $.60 per share.

To common:

\[
\frac{.6(10,000)}{.4(5,000) + .6(10,000)} \times \$12,000 = \$9,000
\]

$9,000 ÷ 10,000 shares = $.90 per share.

Earnings per share amounts:

87. **Two-Class Method for Convertible Securities**

Q—How is the two-class method applied for convertible securities?

A—Most convertible two-class common stocks and other convertible participating securities are assumed to be converted and the if converted method is applied for earnings per share computations. The two-class method is rarely appropriate for such convertible securities and may be applied only when it results in greater dilution than
would result from the if converted method. [2011A.06, 2011A.09]

.305 When the two-class method is used for a convertible two-class common or other convertible participating security, net income is first allocated under the procedure described in Interpretation 86 for dividends for the current period which were paid or declared or are cumulative if not paid or declared. Conversion of the convertible two-class common and participating securities is then assumed, but adjustments to net income usually made for the if converted method are not made. Unencumbered undistributed earnings is divided by the total of all common shares outstanding and assumed outstanding from conversions and exercise. The resulting amount per share is added to the amount of the dividends per share allocated to each class of security to determine the earnings per share for each class of security. Although reporting earnings per share for each class of security may be desirable, earnings per share must be reported for the "ordinary" class of common stock. [2011A.10]

.306 The application of the two-class method for a convertible security is illustrated in the following example. Assume that a corporation had 10,000 shares of Class A common stock (the "ordinary" common) and 5,000 shares of Class B common stock outstanding during 1969 and had a net income of $65,000. Each share of Class B is convertible into two shares of Class A. The Class B is entitled to a non-cumulative annual dividend of $5 per share. After Class A has been paid a dividend of $2 per share, Class B then participates in any additional dividends on a 40:60 per share ratio with Class A. For 1969 the Class A shareholders have been paid $26,000 (or $2.60 per share) and the Class B shareholders have been paid $27,000 (or $5.40 per share). Earnings per share for 1969 would be computed as follows:

Under the if converted method:

\[
\frac{\$65,000}{20,000 \text{ shares}^*} = \$3.25 \text{ per share}
\]

* Conversion of Class B is assumed.
Computing Earnings per Share

Under the two-class method for convertible securities:

- Net income: $65,000
- Less dividends paid:
  - Class A common: $26,000
  - Class B common: 27,000
- Undistributed 1969 earnings: $12,000

Allocation of undistributed earnings:

\[
\frac{12,000}{20,000} = \$0.60 \text{ per Class A share.}
\]

\[
2 \times 0.60 = \$1.20 \text{ per Class B share.}
\]

Earnings per share amounts:

The two-class method may be used in this case since it results in greater dilution than the if converted method.

SECURITIES ISSUABLE UPON SATISFACTION OF SPECIFIED CONDITIONS

88. Contingent Shares

Q—How is common stock contingently issuable or subject to recall classified and treated in earnings per share computations?

A—Common stock contingently issuable or subject to contingent recall is always "classified as a common stock equivalent unless it will be issued upon the mere passage of time and is therefore considered to be outstanding for both

"Unless their time of issuance (see Interpretation 89) is prior to June 1, 1969 and the issuer makes election “b” of section 2011.46 and they were not considered residual securities under APB Opinion No. 9. Contingent shares meeting these three conditions are other potentially dilutive securities."
primary and fully diluted computations. Whether (1) the stock will be issued in the future upon the satisfaction of specified conditions, (2) the stock has been placed in escrow and part must be returned if specified conditions are not met, or (3) the stock has been issued but the holder must return part if specified conditions are not met does not affect the classification of contingent shares. [2011A.16]

.309 When certain conditions are not met, however, contingent shares are omitted from primary or from primary and fully diluted earnings per share computations. Typical examples of the conditions to be met for contingent shares are (1) the passage of time along with other conditions, (2) the maintenance of some level of earnings, (3) the attainment of some level of earnings, and (4) changes in market prices which modify the number of shares to be issued.

.310 Contingent shares are included in both primary and fully diluted computations when the conditions for their issuance are currently being met. If additional shares would be contingently issuable if a higher earnings level were being attained currently, the additional shares are included only in fully diluted computations (giving effect to the higher earnings level) but only if dilution results. Contingent shares based on (1) the attainment of increased earnings levels above the present earnings level or (2) the maintenance of increased earnings above the present level of earnings over a period of years are included only in fully diluted computations (giving effect to the higher earnings level) but only if dilution results. [2011A.17]

.311 When contingent shares have been included in an earnings per share computation, they continue to be included in the computations in following periods until the expiration of the term of the agreement providing for the contingent issuance of additional shares. However, contingent shares are excluded from the computations whenever their effect would be anti-dilutive. [.30, .40]

.312 Prior period primary and fully diluted earnings per share should be retroactively restated whenever the number of shares issued or contingently issuable changes from the number of shares originally included in the com-
Computing Earnings per Share

putation. However, prior period earnings per share data are not retroactively restated for shares actually issued when the condition was the attainment of specified increased earnings levels and the shares were not previously considered outstanding. [2011A.17-.19]

89. Time of Issuance for Contingent Issuances

Q—What is the time of issuance of a contingently issuable security?

A—The time of issuance of a contingently issuable security is the date when agreement to terms has been reached and announced even though subject to further actions, such as directors' or stockholders' approval. But, contingently issuable common stock is considered outstanding for earnings per share computations only when the terms become binding. (See Interpretations 27 and 28.) [.29]

90. Market Price Conditions

Q—How do market price conditions affect the number of contingent shares included in earnings per share computations?

A—The number of contingently issuable shares may depend on market prices for an issuer's common stock. Generally, these market price conditions for contingent shares may be classified as (1) maximum future market price guarantees, (2) market prices for base number of shares to be determined, and (3) minimum future market price guarantees. Additionally, some agreements based on market prices for an issuer's common stock specify that no less than some minimum number of shares and/or no more than some maximum number of shares will be issued regardless of market prices. [2011A.18, 2011A.19]

.315 Conditions which guarantee a maximum future price provide "upside" assurance. That is, the issuer guarantees that the market price per share will increase to some stated amount within some time period. To the extent that the market price does not increase as guaranteed, the issuer agrees to issue additional shares or pay cash to make up the difference. Such a guarantee may extend to shares already issued as well as shares to be issued.
.316 Conditions for market prices to determine the base number of shares to be issued may relate to periodic prices (such as the end of each year), an average of prices over some period, or some final price (such as at the end of five years). The conditions may also specify maximum or minimum market price guarantees.

.317 Conditions which guarantee a minimum future price provide "downside" protection. That is, the issuer guarantees that the market price per share will not decrease below some stated amount within some time period. To the extent that the market price goes below that amount, the issuer agrees to issue additional shares or pay cash to make up the difference. Such a guarantee may extend to shares already issued as well as to shares to be issued.

.318 When the number of contingently issuable shares depends on the future market price of an issuer's common stock, earnings per share computations reflect the number of shares which would be issuable based on the market price at the close of the period being reported upon. If a minimum and/or maximum number of shares is also specified, the number of shares determined from the market price at the close of the period would, if necessary, be adjusted to not less than the minimum nor more than the maximum number of shares so specified.

.319 When additional shares are to be issued for an "upside" or a "downside" guarantee and the market price at the close of the period is less than the guaranteed price, earnings per share computations should give effect to the additional shares which would be issued.

.320 The number of contingently issuable shares may differ for primary and fully diluted computations based upon earnings levels. But market price conditions do not cause different numbers of contingently issuable shares to be included in primary and fully diluted computations. Specifically, more shares are not included in fully diluted than in primary computations because of market price guarantees. A market price guarantee has the same effect on both computations. [2011A.17, 2011A.18, 2011A.19]

.321 Prior period earnings per share would be retroactively restated if the number of shares issued or contin-
gently issuable subsequently changes because of market price changes.

91. Earnings Conditions

Q—How does an earnings condition affect the number of contingent shares included in earnings per share computations?

A—Earnings conditions for the contingent issuance of common stock vary. Some earnings conditions determine the total number of shares to be issued, for example, one share for each $100 earned (1) each year for five years or (2) based on a formula, such as ten times the average annual earnings for five years. [2011A.17, 2011A.19]

Other earnings conditions determine the additional number of shares to be issued. Typically, additional shares are to be issued based on either (1) the maintenance of (a) the present level of earnings or (b) a higher level of earnings or (2) the attainment of (a) a higher level of earnings or (b) successively higher levels of earnings.

Earnings conditions may specify a minimum and/or a maximum number of shares to be issued regardless of earnings. Shares may be issued each year or only at the end of several years. Earnings conditions may apply to each year individually or may apply to all years on some cumulative or average basis. Various combinations of the earnings conditions described above may be contained in an agreement.

Some maximum number of shares may be issued initially (or placed in escrow) with the stipulation that unearned shares are to be returned to the issuer. Such plans specifying that shares are returnable are treated the same as contingently issuable shares for earnings per share computations. [2011A.16]

Because of the diversity of earnings conditions, stating general guidelines which will apply to all agreements is difficult. The number of shares included in earnings per share computations for an earnings agreement should conform to the provisions of sections 2011A.17 and 2011A.19 and to the guidelines given below.
.327 If shares would at some time be issuable based on the present level of earnings, the shares issuable based on that level of earnings projected to the end of the agreement are considered outstanding for both primary and fully diluted computations. If shares previously considered outstanding become unissuable (for example, because of a decline in earnings), previously reported earnings per share data would be retroactively restated when the term of the condition expires and it is determined that the shares will not be issued. [2011A.17, 2011A.19]

.328 If additional shares would at some time be issuable if a level of earnings higher than the present level were attained, the additional shares issuable based on the higher level (or levels) projected to the end of the agreement are considered outstanding only for the fully diluted computation, giving effect to the higher earnings level. If different levels of earnings are specified, the level which results in the greatest dilution is used. If additional shares previously considered outstanding become unissuable (for example, because the higher earnings level is not maintained), previously reported earnings per share data would be retroactively restated when it is determined that the shares will not be issued. If in giving effect to the higher earnings level dilution does not result, the additional shares are not included in the computation. When such additional shares were not included in prior earnings per share computations but are subsequently issued (for example, because the higher earnings level was actually attained), previously reported earnings per share data are not retroactively restated.

.329 When an earnings condition specifies a minimum and/or a maximum number of shares to be issued, no less than the minimum nor no more than the maximum number specified would be included in the earnings per share computations. If shares are issued each year and a total minimum and/or maximum number is specified, the minimum and/or maximum would be reduced by the number of shares issued.

92. Convertible Securities Contingently Issuable

.330 Q—How are contingently issuable convertible securities treated for earnings per share computations?
Computing Earnings per Share

A—Contingently issuable convertible securities are included in earnings per share computations under the guidelines described for convertible securities and the guidelines described for contingently issuable common stock. That is, additional convertible securities are assumed to be issued in conformity with the conditions specified for their issuance. (See Interpretations 88-91 for an explanation of how conditions affect the number of securities considered outstanding.) [.33, 2011A.06, 2011A.16-19]

.331 Time of issuance of the contingently issuable convertible securities is the date when agreement as to terms has been reached and announced. The classification of the contingently issuable convertible security as a common stock equivalent or other potentially dilutive security is determined at time of issuance based on its yield at that time and does not change when the security is actually issued. A change in the bank prime interest rate or the market price of the security between the time of issuance and actual issuance of a contingently issuable convertible security has no effect on its classification. [.29]

.332 Those contingently issuable convertible securities classified as common stock equivalents are included in both primary and fully diluted computations. However, such common stock equivalents based on the attainment or maintenance of earnings above the present level are included only in fully diluted computations. Contingently issuable convertible securities classified as other potentially dilutive securities are included only in fully diluted computations. [.33, 2011A.17]

.333 When contingently issuable convertible securities are to be included in earnings per share computations, conversion of the additional securities is assumed. However, conversion is not assumed for the additional securities unless conversion is also assumed for their counterpart outstanding convertible securities. Interest or dividends are not imputed for the additional contingently issuable convertible securities since any imputed amount would be

* Unless it has the same terms as the terms of an outstanding convertible security which is a common stock equivalent. A convertible security contingently issuable at May 31, 1969 would be classified under either election "a" or election "b" of section 2011.46.

* Except in the situations described in Interpretations 29 and 30.
reversed by the if converted adjustments for assumed conversion. [2011A.06]

PARENT AND CONSOLIDATED FINANCIAL STATEMENTS

93. Securities Issued by Subsidiaries

Q—How do convertible securities and options and warrants issued by a subsidiary affect parent and/or consolidated earnings per share?

A—The effect of options and warrants and convertible securities issued by a subsidiary upon consolidated earnings per share (or parent company earnings per share when parent company statements are prepared as the primary financial statements using the equity method) depends upon whether the securities issued by the subsidiary to the public enable their holders to obtain common stock of the subsidiary company or common stock of the parent company. [2011A.20]

Securities issued by a subsidiary which enable their holders to obtain the subsidiary’s common stock are included in computing the subsidiary’s earnings per share data. These earnings per share data are then included in the parent or consolidated earnings per share computations based on the consolidated group’s holdings of the subsidiary’s securities. [2011A.21-.22]

Options and warrants issued by a subsidiary which enable their holders to purchase parent company common stock are common stock equivalents for parent or consolidated earnings per share computations. Securities of a subsidiary convertible into parent company common stock are classified as common stock equivalents or other potentially dilutive securities for parent or consolidated earnings per share computations under the yield test. [2011A.23-.24]

The following example illustrates the earnings per share computations for a subsidiary’s securities which enable their holders to obtain the subsidiary’s common stock. Assume that a parent corporation had a net income

---

47 Unless issued prior to June 1, 1969 and the parent company makes election "b" specified by section 2011.46.
48 See Interpretation 45 for a description of the treatment of a subsidiary security convertible into a parent company’s convertible security.
of $10,000 from operations (excluding any dividends paid by the subsidiary), had 10,000 shares of common stock outstanding and had not issued any other securities. The parent corporation owned 900 of the common shares of a domestic subsidiary corporation and also owned 40 warrants and 100 shares of convertible preferred stock issued by the subsidiary. The subsidiary corporation had a net income of $3,600 and had outstanding 1,000 shares of common stock, 200 warrants exercisable to purchase 200 shares of its common at $10 per share (assume $20 average and ending market price for common), and 200 shares of preferred stock convertible into two of its common shares for each preferred share. The convertible preferred paid a dividend of $1.50 per share and is not a common stock equivalent. Assume that no intercompany eliminations or adjustments are necessary except for dividends. (Income taxes have been ignored in the following computations for simplicity.) [2011A.21-22]

**Earnings per share for the subsidiary**

Primary earnings per share $3.00

Computed:

\[
\frac{3,600^a - 300^b}{1,000^c + 100^d}
\]

* Subsidiary’s net income.
* Dividends paid by subsidiary on convertible preferred stock.
* Shares of subsidiary’s common stock outstanding.
* Incremental shares of subsidiary’s common stock assumed outstanding applying the treasury stock method for warrants (computed \(\frac{20-10}{20} \times 200\)).

Fully diluted earnings per share $2.40

Computed:

\[
\frac{3,600^*}{1,000 + 100 + 400^f}
\]

* Subsidiary’s earnings applicable to common stock applying the if converted method for convertible preferred stock.
* Shares of subsidiary’s common stock assumed outstanding from conversion of convertible preferred stock.
Parent or consolidated earnings per share

Primary earnings per share........................................... $1.29

Computed:

\[
\frac{10,000^a + 150^b + 2,700^c + 60^d}{10,000^a}
\]

* Parent's net income.
* Dividends received by parent on subsidiary's convertible preferred stock.
* Parent’s proportionate interest in subsidiary’s earnings attributable to common stock, computed: \(\frac{1,000 \text{ shares} \times $3 \text{ per share}}{1,000}\).
* Parent’s proportionate interest in subsidiary’s earnings attributable to warrants, computed: \(\frac{100 \text{ incremental shares} \times $3 \text{ per share}}{200}\).
* Shares of parent’s common stock outstanding.

Fully diluted earnings per share.................................. $1.27

Computed:

\[
\frac{10,000 + 2,160^f + 48^g + 480^h}{10,000}
\]

* Parent’s proportionate interest in subsidiary’s earnings attributable to common stock, computed: \(\frac{1,000 \text{ shares} \times $2.40 \text{ per share}}{1,000}\).
* Parent’s proportionate interest in subsidiary’s earnings attributable to warrants, computed: \(\frac{100 \text{ incremental shares} \times $2.40 \text{ per share}}{200}\).
* Parent’s proportionate interest in subsidiary’s earnings attributable to convertible preferred stock, computed: \(\frac{400 \text{ shares from conversion} \times $2.40 \text{ per share}}{200}\).

The above computations apply only to earnings per share data. Parent or consolidated net income is determined in the usual manner as follows:

Parent net income from operations................................... $10,000
Subsidiary net income............................................. $3,600
Less minority interest:

<table>
<thead>
<tr>
<th>Preferred</th>
<th>$150^i</th>
<th>480</th>
<th>3,120</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common</td>
<td>330^j</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Parent or consolidated net income................................ $13,120
Computing Earnings per Share

Computed:

1. 50% (200 preferred shares × $1.50 dividend per share).
2. 10% ($3,600 net income—$300 preferred dividends).

Note that parent or consolidated net income is not the basis for parent or consolidated earnings per share computations.

.339 These computations would be different if the subsidiary’s securities could be exercised or converted only to obtain the parent company’s common stock. For example, assume the same facts as were given in the preceding illustration except (1) the warrants and convertible securities are all owned by outsiders, (2) the subsidiary’s warrants are exercisable only to obtain parent company common stock, and (3) the subsidiary’s preferred stock is convertible only into parent company common stock.

Earnings per share for the subsidiary

Primary earnings per share ................................ $3.30

Computed:

\[
\frac{\$3,600 - \$300}{1,000} = 3.30
\]

Fully diluted earnings per share ....................... $3.30

Computed:

\[
\frac{\$3,600 - \$300}{1,000} = 3.30
\]

Parent or consolidated earnings per share

Primary earnings per share ................................ $1.28

Computed:

\[
\frac{\$10,000^a + \$2,970^b}{10,000^c + 100^d} = 1.28
\]

\(^a\) Parent’s net income.
\(^b\) Parent’s proportionate interest in subsidiary’s earnings attributable to common stock, computed: \(\frac{900}{1,000} \times \$3.30\) per share.
\(^c\) Shares of parent’s common stock outstanding.
\(^d\) Incremental shares of parent’s common stock assumed outstanding applying the treasury stock method for warrants issued by subsidiary exercisable to obtain parent’s common stock (computed \(\frac{\$20 - \$10}{\$20} \times 200\)).
Fully diluted earnings per share: $1.26

Computed:

\[
\frac{10,000 + 2,970 + 300}{10,000 + 100 + 400}
\]

*Dividends paid by subsidiary on convertible preferred stock which would not have been received by outsiders if the subsidiary's preferred stock had been converted into parent's common stock at the beginning of the period.

†Shares of parent's common stock assumed outstanding from conversion of subsidiary's preferred stock convertible into parent's common stock.

.340 Parent or consolidated net income would be determined as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent net income from operations</td>
<td>$10,000</td>
</tr>
<tr>
<td>Subsidiary net income</td>
<td>$3,600</td>
</tr>
<tr>
<td>Less: Dividends on preferred stock</td>
<td>$300</td>
</tr>
<tr>
<td>Minority common interest (10%)</td>
<td>330</td>
</tr>
<tr>
<td></td>
<td>630</td>
</tr>
<tr>
<td></td>
<td>2,970</td>
</tr>
<tr>
<td>Parent or consolidated net income</td>
<td>$12,970</td>
</tr>
</tbody>
</table>

Note that parent or consolidated net income is not the basis for parent or consolidated earnings per share computations.

.39

EFFECTS OF SCHEDULED CHANGES

94. Changing Exercise Prices and Conversion Rates

.341

Q—How do changes which may occur in exercise prices or conversion rates affect earnings per share computations?

A—Except as discussed in the next paragraph, if an exercise price or conversion rate is in effect during a period, that exercise price or conversion rate is used for primary computations. When no exercise price or conversion rate is in effect during a period, the earliest effective exercise price or conversion rate during the following five years...
Computing Earnings per Share

is used for primary computations. The most advantageous exercise price or conversion rate available to the holder within ten years is always used for fully diluted computations. Previously reported earnings per share data are not restated for subsequent changes in the conversion rate or exercise price. [2011A.12, 2011A.13]

.342 If a convertible security having an increasing conversion rate is issued in exchange for another class of security of the issuing company and is at some time convertible back into as many of the same or a similar security as was exchanged, the conversion rate used in the computation does not result in a reduction of the number of common shares (or common stock equivalents) existing before the exchange.

.343 For example, assume that a corporation issued 100,000 shares of convertible preferred to officers and principal stockholders in exchange for 300,000 shares of common stock and each preferred share is convertible back into one common share the first year, two common shares the second year, three common shares the third year, and four common shares the fourth year and thereafter. The convertible preferred would be included as 300,000 common equivalent shares for primary earnings per share computations and 400,000 common equivalent shares for fully diluted earnings per share computations for the first three years and 400,000 common equivalent shares thereafter for both computations.

ELECTION TO CLASSIFY OUTSTANDING SECURITIES

95. Factors in Section 2011.46 Election

.344 Q—What factors would be considered in classifying securities issued prior to June 1, 1969 under the elections provided in section 2011.46?

A—The following factors might be considered for elections “a” and “b” provided in section 2011.46:

1. The section 2011 recommends restatement of prior periods’ earnings per share data if election “b” is made
and such data are included in financial statements issued after May 31, 1969, e. g., included in a comparative income statement. Restatement is not required under election "b." Although retroactive restatement is recommended, restatement may not greatly change previously reported earnings per share data. Such data therefore could be included in a comparative income statement without restatement and without a significant loss of comparability.

If election "a" is made, however, all prior periods' earnings per share data must be retroactively recomputed and restated under the provisions of section 2011 when prior periods' data are subsequently presented.

2. Section 2011 includes all options and warrants as common stock equivalents and establishes a test at issuance for convertible securities to determine their classification as common stock equivalents or not. APB Opinion No. 9 excluded the effect of options and warrants from the first EPS amount (unless they were classified as residual securities) and allowed a convertible security to move from senior security to residual status and vice versa based on the value of its conversion rights and common stock characteristics. [46]

Therefore, election "b" would generally exclude options and warrants issued before May 31, 1969 from primary earnings per share computations. Election "a," on the other hand, would cause convertible securities classified as residual under APB Opinion No. 9 at May 31, 1969 which would not be common stock equivalents at issuance under section 2011 to be reclassified as other potentially dilutive securities. If a corporation had options and warrants and convertible securities as described above, the effects of both types of securities would probably be considered in determining the election to be made.

96. Effect of New Issue of Common Stock Equivalents

Q—When securities are classified under election "b" of section 2011.46, can the classifications of those securities change in the future?

A—Generally, the classification of a security does not change after either election is made. However, convertible securities issued before June 1, 1969 would change from
other potentially dilutive security status to common stock equivalent status if another convertible security is issued with the same terms which is a common stock equivalent as specified by the second sentence of section 2011.28. (See Interpretation 30.) [.28, .46]

97. No Change for Options and Warrants

Q—Would outstanding options or warrants issued prior to June 1, 1969 classified as non-residual securities under election "b" of section 2011.46 become common stock equivalents under the second sentence of section 2011.28 if another option or warrant were issued with the same terms after May 31, 1969?

A—No, such a change of classification applies only to convertible securities. Although this creates a difference of treatment between convertible securities and options and warrants, the Board was explicit in naming only convertible securities. [.28]

Because warrants are often traded, identification of a warrant being exercised as having been issued "before" or "after" may be impossible. When an exercised warrant cannot definitely be identified as having been issued after May 31, 1969, exercise is assumed on a FIFO basis. That is, the first warrants issued are assumed to be the first exercised when specific identification is impossible. The same treatment applies for options, except options usually are not transferable and the specific option being exercised can usually be identified.

98. Prior Period Restatement Recommended

Q—Must earnings per share reported under the provisions of APB Opinion No. 9 be restated under the provisions of section 2011?

A—When election "b" of section 2011.46 is made, section 2011 recommends that earnings per share amounts previously reported under APB Opinion No. 9 be restated so the previously outstanding securities conform to the classifications determined under election "b" when such amounts are reported in comparative income statements and election "b" applies to at least one period in the statement. To the extent that the Opinions differ, following this recom-
mendation will have the effect of retroactively restating previously reported earnings per share amounts. [.45]

.350 If election "a" of section 2011.46 is made, section 2011 must be applied for all periods presented. [.46]

.351 If election "b" of section 2011.46 is made, some companies might prefer not to restate previously reported earnings per share amounts and such restatement is not required by section 2011. There may be cases, however, where the corporation or its auditor may believe that disclosure of the restated earnings per share data is particularly appropriate.

99. Is Prior Period Restatement Permitted?

.352 Q—May prior period earnings per share amounts be retroactively restated other than when restatement is required, for example, for changes in the number of shares computed under the treasury stock method or when a convertible security being issued is determined to be a common stock equivalent and causes outstanding convertible securities with the same terms which were not common stock equivalents at issuance to also become common stock equivalents?

A—No, previously reported earnings per share amounts generally are retroactively restated only when restatement is required (see Part I, paragraphs .039-.041). Earnings per share data are not restated because of changes in the number of shares computed under the treasury stock method. Nor should primary earnings per share data be restated when a convertible security’s classification changes because of the subsequent issuance of another convertible security with the same terms. [.28, .36]

DISCLOSURE

100. Required Disclosure

.353 Q—What information related to earnings per share is required to be disclosed in addition to earnings per share data?

A—Section 2011 requires disclosure of the following information:

1. Restatement for a prior period adjustment.
2. Dividend preferences.
3. Liquidation preferences.
4. Participation rights.
5. Call prices and dates.
6. Conversion rates and dates.
7. Exercise prices and dates.
8. Sinking fund requirements.
9. Unusual voting rights.
10. Bases upon which primary and fully diluted earnings per share were calculated. (The computations would not, however, appear upon the face of the income statement.)
11. Issues which are common stock equivalents.
12. Issues which are potentially dilutive securities.
13. Assumptions and adjustments made for earnings per share data.
14. Shares issued upon conversion, exercise, and conditions met for contingent issuances.
15. Recapitalization occurring during the period or before the statements are issued.
16. Stock dividends, stock splits or reverse splits occurring after the close of the period before the statements are issued.
17. Claims of senior securities entering earnings per share computations.
18. Dividends declared by the constituents in a pooling.
19. Basis of presentation of dividends in a pooling on other than a historical basis.
20. Per share and aggregate amount of cumulative preferred dividends in arrears.

101. Supplementary Data

.354

Q—When must supplementary earnings per share data be furnished?

A—Supplementary earnings per share data must be furnished for the latest period when common stock is issued on conversion during the period or after the close of the
period before the report is issued if primary earnings per share would have increased or decreased at least 3% if the issuance had occurred at the beginning of the period. It may also be desirable to furnish supplementary earnings per share data for each period presented giving the cumulative retroactive effect of all such issuances, but primary earnings per share as reported in those periods should not be retroactively adjusted. [.22, .14 fn. 4]

.355 Supplementary earnings per share data generally would also be furnished whenever common stock or common stock equivalents have been sold for cash and the proceeds have been or are to be used to retire preferred stock or debt. The supplementary data would be furnished even though the sale occurred shortly after the close of the period but before completion of the financial report. [.23]

.356 When the issuance of a convertible security classified as a common stock equivalent causes outstanding convertible securities with the same terms classified as other potentially dilutive securities to be reclassified as common stock equivalents, supplementary earnings per share data may be useful to explain the change in classification. The supplementary data would show what previously reported primary earnings per share would have been if the convertible securities had been classified as common stock equivalents since issuance and thus reconstruct the primary earnings trend. Previously reported primary earnings per share would not be retroactively restated for prior periods in a comparative income statement because of such a change in classification. [.22, .28]

**Notes:**

1. 5.75% predominant rate with 5.50% in effect at some banks.
2. 6.25% predominant rate with 6% in effect at some banks.
3. 8.50% predominant rate. Starting on February 25, 1970, however, and on several days thereafter, several small banks reduced their prime rates to 8%. At least one bank announced a 7 1/2% prime rate. (See Interpretation 38.)
4. Many major banks reduced their prime rates to 8% on March 25 and others followed on March 26. The 8% rate was the predominant rate in effect the date this table was prepared (May 6, 1970).
EXHIBIT 2
EXAMPLES OF COMPUTING AVERAGE MARKET PRICES

An average market price may be computed various ways in applying the treasury stock method for options and warrants. (See Interpretations 53 and 54.) In first applying the treasury stock method, the computation depends upon the stability of the market price of the common stock.

In the following example, an average market price has been computed eight different ways for one quarter. First, the computation is based upon weekly prices. The weekly prices are then averaged to determine a monthly average, which is then averaged to determine a quarterly average. (Although not illustrated, a quarterly average could also be computed by adding weekly prices and dividing by 13, thereby eliminating the computation of a monthly average.) In the second example, the computation is based upon monthly prices.

The "High-Low" computation is based upon an average of the high and low prices for the week or month. In the weighted averages, the market prices are weighted by the number of shares involved in the transactions.

Assume the following market transactions for a corporation's common stock during a three-month period:

<table>
<thead>
<tr>
<th>Week</th>

(1) Computed by adding incremental shares of each quarter included and dividing by number of quarters included in the year-to-date.
(2) Incremental shares for all quarters included based on ending market price.
EXHIBIT 4
DAYS BETWEEN TWO DATES

.360 The table on page 12,869 is useful in computing a weighted average of shares outstanding when the number of shares outstanding changes frequently during the year. The table includes numbered days for two years; one day must be added after February 28 during leap year. Corporations reporting on a calendar year basis should use the first 366 numbers; all other corporations should use both tables.

Since the number of days between two dates is determined by subtraction, the number used for the last day of the year is the first day of the following year. That is, a corporation reporting on a calendar year having a stock transaction on June 20 should weight the shares outstanding before the transaction by 170 (determined $171 - 1 = 170$) and the shares outstanding after the transaction by 195 (determined $366 - 171 = 195$). The 170 days before plus the 195 days after then equal 365 days. For leap year, corresponding computations would be $172 - 1 = 171$ and $367 - 172 = 195$, so $171 + 195 = 366$.

An example of how to use the table follows. Assume a corporation reports on a fiscal year ending June 30. At July 1, 1969 the corporation had 100,000 shares of common stock outstanding. On August 25, 1969 the corporation distributed a 5% stock dividend to its shareholders. On September 18, 1969 the corporation purchased 525 shares of its stock. On April 8, 1970 the corporation issued 10,000 shares of its stock for cash. On May 21, 1970 the corporation split its stock 2-for-1.

The days to be used for weighting are:

<table>
<thead>
<tr>
<th>Transaction Day</th>
<th>Number for Transaction Day</th>
<th>Number for Beginning Day</th>
<th>Days for Weighting</th>
</tr>
</thead>
<tbody>
<tr>
<td>September 18, 1969</td>
<td>261</td>
<td>182</td>
<td>79</td>
</tr>
<tr>
<td>April 8, 1970</td>
<td>463</td>
<td>261</td>
<td>202</td>
</tr>
<tr>
<td>End of year</td>
<td>547</td>
<td>463</td>
<td>84</td>
</tr>
<tr>
<td>Total days</td>
<td></td>
<td></td>
<td>365</td>
</tr>
</tbody>
</table>

The August 25, 1969 stock dividend and the May 21, 1970 stock split are reflected retroactively in the weighted average of shares outstanding as computed below:
### Shares and Stock Dividends

<table>
<thead>
<tr>
<th>Date</th>

<td></td>
</tr>
</tbody>
</table>

#### Totals

Weighted average number of shares outstanding:

\[
\frac{78,029,700}{365} = 213,780
\]

\(^{**}\)Note that stock dividends and stock splits are retroactive adjustments rather than transactions to be weighted by the number of days a stock dividend or split was outstanding.
102. Two-Class Method for Warrants Issued by REITs

.361 Question—The capitalization of a real estate investment trust (REIT) includes shares of beneficial interest (common stock) and an equal number of warrants. This REIT is not subject to federal income tax with respect to the income it distributes to its shareholders because it distributes at least 90 percent of its annual taxable income (as defined by the Internal Revenue Code) and elects not to be taxed on the income distributed. How should this entity treat warrants in computing earnings per share under section 2011?

.362 Interpretation—The "two-class" method of computing primary earnings per share should be used by any REIT which elects under the Internal Revenue Code not to be subject to tax on income distributed and which pays dividends equal to 90 percent or more of its taxable income. Under this method, dividends are deducted from net income and the remaining amount (the undistributed earnings) is allocated to the total of common shares and common share equivalents with use of warrant proceeds applied as described in paragraph .36 or .38. Per share distributions to common shareholders (total dividends divided by the weighted average of common shares outstanding) are added to this per share amount to determine primary earnings per share.

.363 For example, the REIT described in the question above should compute primary earnings per share under the "two-class" method in conjunction with section 2011.38. Assume that this REIT has a net income of $1,000,000 and distributes $900,000 in dividends on 1,000,000 common shares outstanding. Warrants exercisable at $5 per share for 1,000,000 common shares are also outstanding. Assuming a market price of $23 per share for common and a 3 percent interest rate for debt and/or investments in commercial paper or U.S. government securities, primary earnings per share would be determined applying the two-class method and paragraph .38 as follows:
### Computing Earnings per Share

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Net income</td>
<td>$1,000,000</td>
</tr>
<tr>
<td>Less dividends</td>
<td>900,000</td>
</tr>
<tr>
<td>Undistributed earnings</td>
<td>$100,000</td>
</tr>
<tr>
<td>Proceeds from the exercise of warrants: 1,000,000 × $5</td>
<td>$5,000,000</td>
</tr>
<tr>
<td>Purchase of treasury stock under paragraph .38-a</td>
<td></td>
</tr>
<tr>
<td>200,000 shares × $23</td>
<td>4,600,000</td>
</tr>
<tr>
<td>Balance to retire debt under paragraph .38-b</td>
<td>400,000</td>
</tr>
<tr>
<td>Interest rate on debt retired</td>
<td>.03</td>
</tr>
<tr>
<td>Interest adjustment</td>
<td>12,000</td>
</tr>
<tr>
<td>Adjusted undistributed earnings</td>
<td>$112,000</td>
</tr>
<tr>
<td>Common shares outstanding</td>
<td>1,000,000</td>
</tr>
<tr>
<td>Common shares assumed issued for warrants</td>
<td>1,000,000</td>
</tr>
<tr>
<td>Less treasury stock purchased</td>
<td>200,000</td>
</tr>
<tr>
<td>Incremental shares for warrants</td>
<td>800,000</td>
</tr>
<tr>
<td>Common and common equivalent shares</td>
<td>1,800,000</td>
</tr>
</tbody>
</table>

#### Primary earnings per share:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distributed earnings ($900,000 ÷ 1,000,000)</td>
<td>$ .90</td>
</tr>
<tr>
<td>Undistributed earnings ($112,000 ÷ 1,800,000)</td>
<td>.06</td>
</tr>
<tr>
<td>Total earnings per common and common equivalent share</td>
<td>$ .96</td>
</tr>
</tbody>
</table>

.364 If the per share amount computed above had exceeded earnings per outstanding common share of $1.00 (computed: $1,000,000 ÷ 1,000,000 shares), the result would be anti-dilutive and primary earnings per share would be reported as $1.00 in accordance with paragraph .30.

.365 The two-class method should not be used by a REIT in computing fully diluted earnings per share in order to reflect maximum potential dilution. Therefore, fully diluted earnings per share computed for the above example would be $ .56 (computed: $1,012,000 ÷ 1,800,000 shares) applying only paragraph .38.

.366 Although dividends declared after the close of the taxable year may be included in meeting the 90 percent
requirement for federal income tax purposes, only divi-
dends paid or declared during the period for which the com-
putation is being made should be considered in applying
the two-class method. However, a dividend declaration (or
official company policy in lieu of actual declaration) before
the close of the period stated as a percentage of taxable
earnings (the amount to be determined after the close of
the period) will be considered as being declared during the
period if the dividend is paid by the date the financial
statements are issued.

[Issue Date: September, 1971.]
Reporting The Results of Operations: Accounting Interpretation of Section 2012

1. Illustration of the Application of Section 2012

.001 Question—As stated in section 2012.19, judgment is required to segregate in the income statement the effects of events or transactions that are extraordinary items. What factors must be considered in determining whether the effects of a particular event or transaction are extraordinary items or should otherwise be set forth in the income statement, and how are these factors applied in practice?

.002 Interpretation—The first question which generally should be considered in determining the appropriate classification of profit or loss items which appear to be unusual, infrequently occurring or extraordinary is:

Does the event or transaction involve the sale, abandonment or other manner of disposal of a segment of a business as defined in section 2012.13?

.003 Discussion—As explained in section 2012.08, results of discontinued operations of a segment of a business and any gain or loss from disposal of the segment should be reported separately in the income statement, but should not be designated as extraordinary items. The term “segment of a business” is defined in section 2012.13 as a component of an entity whose activities represent a separate major line of business or class of customer. Section 2012 further provides guidelines for the determination of a segment of a business and distinguishes between the disposal of a segment and the disposal of assets incident to the evolution of an entity’s business. The following are illustrative of disposals which should be classified as disposals of a segment of a business:

(1) A sale by a diversified company of a major division which represents the company’s only activities in the electronics industry. The assets and results of
operations of the division are clearly segregated for internal financial reporting purposes from the other assets and results of operations of the company.

(2) A sale by a meat packing company of a 25% interest in a professional football team which has been accounted for under the equity method. All other activities of the company are in the meat packing business.

(3) A sale by a communications company of all its radio stations which represent 30% of gross revenues. The company's remaining activities are three television stations and a publishing company. The assets and results of operations of the radio stations are clearly distinguishable physically, operationally and for financial reporting purposes.

(4) A food distributor disposes of one of its two divisions. One division sells food wholesale primarily to supermarket chains and the other division sells food through its chain of fast food restaurants, some of which are franchised and some of which are company-owned. Both divisions are in the business of distribution of food. However, the nature of selling food through fast food outlets is vastly different than that of wholesaling food to supermarket chains. Thus by having two major classes of customers, the company has two segments of its business.

.004 Certain disposals would not constitute disposals of a segment of a business because they do not meet the criteria specified in section 2012. For example, the following disposals should not be classified as disposals of a segment of a business:

(5) The sale of a major foreign subsidiary engaged in silver mining by a mining company which represents all of the company's activities in that particular country. Even though the subsidiary being sold may account for a significant percentage of gross revenue of the consolidated group and all of its revenues in the particular country, the fact that the company continues to engage in silver mining activities in other countries would indicate that there was a sale of a part of a line of business.

(6) The sale by a petrochemical company of a 25% interest in a petrochemical plant which is accounted for as an investment in a corporate joint venture under the equity method. Since the remaining activities of the company are in the same line of business as the 25% interest which has been sold, there has not been a sale of a major line of business but rather a sale of part of a line of business.

(7) A manufacturer of children’s wear discontinues all of its operations in Italy which were composed of designing and selling children’s wear for the Italian market. In the context of determining a segment of a business by class of customer, the nationality of customers or slight variations in product lines in order to appeal to particular groups are not determining factors.

(8) A diversified company sells a subsidiary which manufactures furniture. The company has retained its other furniture manufacturing subsidiary. The disposal of the subsidiary, therefore, is not a disposal of a segment of the business but rather a disposal of part of a line of business. As discussed in section 2012.13, such disposals are incident to the evolution of the entity’s business.

(9) The sale of all the assets (including the plant) related to the manufacture of men’s woolen suits by an apparel manufacturer in order to concentrate activities in the manufacture of men’s suits from synthetic products. This would represent a disposal of a product line as distinguished from the disposal of a major line of business.

.005 If it has been determined that the particular event or transaction is not a disposal of a segment of a business, then the criteria for extraordinary items classification should be considered. That is:

Does the event or transaction meet both criteria of unusual nature and infrequency of occurrence?

.006 Discussion—Section 2012.19-.22 discusses the criteria of unusual nature and infrequency of occurrence of events or transactions taking into account the environment
in which the entity operates. Paragraph .23 specifies certain gains or losses which should not be reported as extraordinary unless they are the direct result of a major casualty, an expropriation, or a prohibition under a newly enacted law or regulation that clearly meets both criteria for extraordinary classification. Events or transactions which would meet both criteria in the circumstances described are:

(10) A large portion of a tobacco manufacturer's crops are destroyed by a hail storm. Severe damage from hail storms in the locality where the manufacturer grows tobacco is rare.

(11) A steel fabricating company sells the only land it owns. The land was acquired ten years ago for future expansion, but shortly thereafter the company abandoned all plans for expansion and held the land for appreciation.

(12) A company sells a block of common stock of a publicly traded company. The block of shares, which represents less than 10% of the publicly-held company, is the only security investment the company has ever owned.

(13) An earthquake destroys one of the oil refineries owned by a large multi-national oil company.

The following are illustrative of events or transactions which do not meet both criteria in the circumstances described and thus should not be reported as extraordinary items:

(14) A citrus grower's Florida crop is damaged by frost. Frost damage is normally experienced every three or four years. The criterion of infrequency of occurrence taking into account the environment in which the company operates would not be met since the history of losses caused by frost damage provides evidence that such damage may reasonably be expected to recur in the foreseeable future.

(15) A company which operates a chain of warehouses sells the excess land surrounding one of its warehouses. When the company buys property to establish a new warehouse, it usually buys more land than it expects to use for the warehouse with the expectation
that the land will appreciate in value. In the past five years, there have been two instances in which the company sold such excess land. The criterion of infrequency of occurrence has not been met since past experience indicates that such sales may reasonably be expected to recur in the foreseeable future.

(16) A large diversified company sells a block of shares from its portfolio of securities which it has acquired for investment purposes. This is the first sale from its portfolio of securities. Since the company owns several securities for investment purposes, it should be concluded that sales of such securities are related to its ordinary and typical activities in the environment in which it operates and thus the criterion of unusual nature would not be met.

(17) A textile manufacturer with only one plant moves to another location. It has not relocated a plant in twenty years and has no plans to do so in the foreseeable future. Notwithstanding the infrequency of occurrence of the event as it relates to this particular company, moving from one location to another is an occurrence which is a consequence of customary and continuing business activities, some of which are finding more favorable labor markets, more modern facilities, and proximity to customers or suppliers. Therefore, the criterion of unusual nature has not been met and the moving expenses (and related gains and losses) should not be reported as an extraordinary item. Another example of an event which is a consequence of customary and typical business activities (namely financing) is an unsuccessful public registration, the cost of which should not be reported as an extraordinary item. (For additional examples, see section 2012.23.)

.008 Disposals of part of a line of business, such as examples 5-9 of this Interpretation, should not be classified as extraordinary items. As discussed in section 2012.13, such disposals are incident to the evolution of the entity’s business and therefore the criterion of unusual nature would not be met.

.009 Question—Section 2012.27 states that events and transactions that were reported as extraordinary items in
statements of income for fiscal years ending before October 1, 1973 should not be restated except that a statement of income including operations of discontinued segments of a business that meet the paragraph .13 criteria may be reclassified in comparative statements to conform with the provisions of paragraphs .08 and .09 of section 2012. If a gain or loss on such a disposal in a prior year had been classified as an extraordinary item but was not computed in the manner specified in section 2012.15-.17, may the prior year income statements be reclassified and the gain or loss adjusted to comply with the provisions of section 2012?

.010 Interpretation—Section 2012 specifically uses the term “reclassified” in paragraph .27 and makes direct reference to paragraphs .08 and .09 which describe the manner of reporting disposals of a segment of a business as defined in paragraph .13. While such reclassification is optional under section 2012, there should not be a redetermination (restatement) of net income using the measurement principles specified in paragraphs .15-.17. Since Opinions of the Board are not intended to be retroactive unless otherwise stated, the method of computing of the gain or loss on disposals of a segment should not be retroactively applied if it results in a change in net income of a prior year.

.011 Question—Events or transactions which are not disposals of a segment of a business and are not extraordinary items may nevertheless be required to be reported as a separate component of income from continuing operations under the provisions of section 2012.26. If a company sells a portion of a line of business which does not meet the definition of a segment of a business as defined in section 2012.13, should the gain or loss be calculated using the measurement principles for determination of gain or loss on disposal of a segment of a business as prescribed in section 2012.15-.17 and how should the financial effects of such sale be reported?

.012 Interpretation—The gain or loss on a sale of a portion of a line of business which is not a segment of a business as defined in paragraph .13 should be calculated using the same measurement principles as if it were a segment of a business (section 2012.15-.17). Under the provisions of section 2012.26, the amount of such gain or loss
should be reported as a separate component of income from continuing operations. However, the gain or loss should not be reported on the face of the income statement net of income taxes or in any manner inconsistent with the provisions of paragraphs .08 and .11 of section 2012 which may imply that it is a disposal of a segment of the business. In addition, the earnings per share effect should not be disclosed on the face of the income statement. Revenues and related costs and expenses of the portion of the line of business prior to the measurement date should not be segregated on the face of the income statement but may be disclosed in the notes to the financial statements and such disclosure is encouraged. In addition, the notes to the financial statements should disclose, if known, those items specified in section 2012.18.

.013 The foregoing examples are illustrative. It should be recognized that all attendant circumstances, which can vary from those above, need to be considered in making the judgments required by section 2012.

[Issue Date: November, 1973]
1. Number of Funds Statements Required

.001 Question—Section 2021.07 states that when a balance sheet and an income statement are issued, a “Statement of Changes in Financial Position” (funds statement) should be presented for each period for which an income statement is presented. If comparative income statements for the past five years and only a balance sheet for the end of the five-year period are presented, how many statements of changes in financial position must be presented?

.002 Interpretation — Normally, five statements of changes in financial position would be required by section 2021.07—one for each year for which an income statement is presented. However, the detail of net changes in each element of working capital is required to be presented only for the current year (see section 2021.12).

.003 It should also be noted that section 2021 is effective for fiscal periods ending after September 30, 1971. Therefore, a statement of changes in financial position is not required for any period covered by an income statement ending before that date, although their presentation for earlier years is encouraged.

.004 For example, assume the financial statements described in the question included a balance sheet dated December 31, 1972 and income statements for the calendar years ending December 31, 1972, 1971, 1970, 1969, and 1968. Statements of changes in financial position are required only for the calendar years ended December 31, 1972 and December 31, 1971.

[Issue Date: February, 1972.]

2. Funds Statement for Mutuals and Co-ops

.005 Question—Section 2021.07 requires all “profit-oriented business entities” to present a statement of changes in financial position when financial statements purporting to present both financial position and results of operations
Accounting Interpretations

are issued. Are mutual companies and co-operative organizations considered “profit-oriented business entities” for this purpose?

.006 Interpretation—Yes, for purposes of reporting under section 2021 mutual companies and co-operative organizations are considered to be “profit-oriented.” These entities should therefore include a statement of changes in financial position when issuing both a balance sheet and an income statement.

[Issue Date: February, 1972.]

3. Funds Statements for Mutual Funds and Real Estate Companies

.007 Question—Investment companies carrying their investments at “value” (e.g., mutual funds, many “closed-end” companies, “variable annuity accounts” of life insurance companies and common trust funds) generally include a “statement of changes in net assets” and real estate investment companies may include a “statement of funds generated and disbursed” among their financial statements. The format of these statements may differ somewhat from that described in section 2021.10 for a statement of changes in financial position, but they present the information required by the section. Does such a variation in format comply with the requirements of the section?

.008 Interpretation—A format that varies from that described in section 2021.10 is acceptable in the case of these statements which have been devised as the most appropriate for reporting information which is peculiar in these industries, so long as the statements contain the information required by the section. The section recognizes the need for flexibility in form (paragraph .09) so long as the required information is disclosed in the most useful portrayal of the financing and investing activities and the changes in financial position of the reporting entity (paragraph .11).

.009 It is expected that Audit Guides issued by the AICPA in the future will illustrate the type of statement of changes in financial position that may be appropriate for a particular industry. Companies should, naturally, follow the recommendations of these Guides.

Accounting for Stock Issued to Employees:  
Accounting Interpretations of Section 4062

1. Stock Plans Established by a Principal Stockholder
   
   .001 Question—Accounting for compensatory and non-compensatory stock option, purchase and award plans adopted by a corporation is discussed in sections 4062 and 4061. Should a corporation account for plans or transactions ("plans"), if they have characteristics otherwise similar to compensatory plans adopted by corporations, that are established or financed by a principal stockholder (i.e., one who either owns 10% or more of the corporation's common stock or has the ability, directly or indirectly, to control or influence significantly the corporation)?

   .002 Interpretation—It is difficult to evaluate a principal stockholder's intent when he establishes or finances a plan with characteristics otherwise similar to compensatory plans generally adopted by corporations. A principal stockholder may be satisfying his generous nature, settling a moral obligation, or attempting to increase or maintain the value of his own investment. If a principal stockholder's intention is to enhance or maintain the value of his investment by entering into such an arrangement, the corporation is implicitly benefiting from the plan by retention of, and possibly improved performance by, the employee. In this case, the benefits to a principal stockholder and to the corporation are generally impossible to separate. Similarly, it is virtually impossible to separate a principal stockholder's personal satisfaction from the benefit to the corporation. Section 1025.14, Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises, states that "Financial accounting emphasizes the economic substance of events even though the legal form may differ from the economic substance and suggest different treatment."
.003 The economic substance of this type of plan is substantially the same for the corporation and the employee, whether the plan is adopted by the corporation or a principal stockholder. Consequently, the corporation should account for this type of plan when one is established or financed by a principal stockholder unless (1) the relationship between the stockholder and the corporation's employee is one which would normally result in generosity (i.e., an immediate family relationship), (2) the stockholder has an obligation to the employee which is completely unrelated to the latter's employment (e.g., the stockholder transfers shares to the employee because of personal business relationships in the past, unrelated to the present employment situation), or (3) the corporation clearly does not benefit from the transaction (e.g., the stockholder transfers shares to a minor employee with whom he has had a close relationship over a number of years).

.004 This type of plan should be treated as a contribution to capital by the principal stockholder with the offsetting charge accounted for in the same manner as compensatory plans adopted by corporations.

.005 Compensation cost should be recognized as an expense of one or more periods in accordance with the provisions of section 4062.12-.15.

.006 The corporation should account for tax benefits, if any, from this type of plan in accordance with the provisions of section 4062.16-.18. If the corporation receives no tax benefit from this type of plan, but would have received such benefit had the plan been adopted by the corporation, the absence of such tax benefit is one of the variables in estimating the plan's cost to the corporation (see section 1091.89.).

Accounting For The Cost of Pension Plans: Accounting Interpretations of Section 4063

A DISCUSSION OF THE BACKGROUND AND REQUIREMENTS OF SECTION 4063

By Julius W. Phoenix, Jr., and William D. Bosse

PART I

1. Introduction

.001 Section 4063, issued in November 1966, is both long and comprehensive. It includes 15 separate sections, an appendix briefly describing actuarial techniques, and a glossary devoted principally to the actuarial terms used throughout section 4063. The scope of section 4063 results from the need to consider many interrelated factors affecting estimation of pension cost for accounting purposes. The complexities of estimating pension cost arise primarily from the many uncertainties inherent in the long periods separating the time of estimation from the time of payment of benefits to employees. Underlying the estimates are annuity and compound-interest computations. Mathematical probability factors are used to deal with such uncertainties as employee death or termination and changes in compensation.

.002 The major difficulties in estimating pension cost are in selecting the pertinent data relating to employees as a group, designing the actuarial computation and formulating assumptions regarding such matters as earnings of pension-fund assets. The process usually requires the technical skill, experience and judgment of an actuary. Although significant reliance may be placed on the work of an actuary, the accountant should become familiar with the actuarial concepts and methods so that he can understand the data prepared by the actuary and reach his own conclusions as to whether the provision for pension cost complies with section 4063 (see paragraphs .007-.008 for some key definitions).
All complexities and difficulties notwithstanding, the basic accounting for pension plans recommended in section 4063 is relatively easy to understand.

To begin negatively, provisions for pension cost should not be based on contributions to the pension fund, nor should they be limited to the amounts for which the company has a legal liability. They should not fluctuate widely as a result of pension-fund investment gains and losses or from other causes unrelated to the employee group.

Turning to the positive, the provision for pension cost should be based on an actuarial cost method that gives effect, in a consistent manner, to employee group data, pension benefits, pension-fund earnings, investment gains or losses, and other assumptions regarding future events. The actuarial cost method selected should result in a systematic and rational allocation of the total cost of pensions among the employees’ years of active service. If the actuarial cost method selected includes past service cost as an integral part of normal cost, the provision for pension cost should be normal cost adjusted for the effect on pension-fund earnings of differences between amounts accrued and amounts funded. If the actuarial cost method deals with past service cost separately from normal cost, the provision for pension cost should include normal cost, an amount for past service cost, and an adjustment for the effect on pension-fund earnings of differences between amounts accrued and amounts funded.

As can be seen later, the most controversial issue in developing section 4063 had to do with the amount to be included for past service cost.

2. Some Key Definitions

For convenience, some terms are delineated here. "Normal cost" is the portion of the annual pension cost that, under the actuarial cost method in use, is related to years after the date of an actuarial valuation of the plan. "Past service cost" refers to the portion of the total pension cost that, under the actuarial cost method in use, is identified with periods prior to the adoption of the plan. Similarly, "prior service cost" refers to the portion of the
Accounting for the Cost of Pension Plans

total pension cost that, under the actuarial cost method in use, is identified with all periods prior to the date of an actuarial valuation of the plan. Therefore, "prior service cost" includes, as of the date of its determination, the past service cost, the normal cost for years prior to that date, and increases in pension cost arising when the plan may have been amended to change the benefits or the group of employees covered. Since "prior service cost" is based on present value on the date of determination, it reflects the effect of other factors to that date, such as assumed earnings or interest equivalents, pension benefits paid to date, and gains or losses under the experience to date. Essentially, it is determined at any time in the same way that a past service cost would be determined if the plan were then being put into effect for the first time.

Section 4063 at times makes reference to a specific part of prior service cost, the most usual being "the amounts of any increases or decreases in prior service cost arising on an amendment to the plan." Since such an amount is dealt with like a past service cost, unless otherwise indicated by the context, the term "past service cost" is used in this article to refer to both past service cost arising on the adoption of the plan and the amounts of any increases or decreases in prior service cost arising on amendments of the plan.

3. Previous Pronouncements

Before discussing section 4063 further, it might be well to review briefly the previous official pronouncements of the American Institute of Certified Public Accountants on the subject of pension plans.

The first pronouncement was made in Accounting Research Bulletin No. 36 issued by the committee on accounting procedure in November 1948. It was entitled "Pension Plans—Accounting for Annuity Costs Based on Past Services." Although this Bulletin dealt with only one small segment of the pension accounting problem, it did focus on the most troublesome area, both conceptually and practically, that accountants have had to face in dealing with this complex accounting subject.
ARB No. 36 was included without substantive change as Chapter 13a, "Pension Plans—Annuity Costs Based on Past Service," of ARB No. 43, Restatement and Revision of Accounting Research Bulletins. In ARB No. 43, Chapter 13a, the committee on accounting procedure expressed its belief that "even though the calculation is based on past service, costs of annuities based on such service are incurred in contemplation of present and future services, not necessarily of the individual affected but of the organization as a whole, and therefore should be charged to the present and future periods benefited. This belief is based on the assumption that although the benefits to a company flowing from pension plans are intangible, they are nevertheless real. The element of past service is one of the important considerations in establishing pension plans, and annuity cost measured by such past service contribute to the benefits gained by the adoption of the plan. It is usually expected that such benefits will include better employee morale, the removal of superannuated employees from the payroll, and the attraction and retention of more desirable personnel, all of which should result in improved operations."

The position of the committee on accounting procedure was reaffirmed by a later generation of that committee in Accounting Research Bulletin No. 47, issued in September 1956. Bulletin No. 47, however, was more specific about how past service cost should be treated and also introduced the factor of vested benefits. The committee expressed its preferences that "costs based on current and future services should be systematically accrued during the expected period of active service of the covered employees," and that "costs based on past services should be charged off over some reasonable period, provided the allocation is made on a systematic and rational basis and does not cause distortion of the operating results in any one year." The committee recognized, however, that its preferences were not universally accepted and went on to say that "as a minimum, the accounts and financial statements should reflect accruals which equal the present worth, actuarially calculated, of pension commitments to em-
ployees to the extent that pension rights have vested in the employees, reduced, in the case of the balance sheet, by any accumulated trusteed funds or annuity contracts purchased.” The committee did not explain what it meant by the term “vested” and did not make any recommendation concerning appropriate actuarial cost methods or recognition of actuarial gains and losses. This void is filled by section 4063.

4. Development of Section 4063

.013 When the accounting variations found in practice made it evident that Accounting Research Bulletin No. 47 was not an adequate guide for accounting for the cost of pension plans, the Accounting Principles Board decided that the subject needed further study and authorized an accounting research study to be made. This study was undertaken by Ernest L. Hicks, who performed an outstanding job in putting together the many accounting complexities surrounding pension plans.

.014 The study was completed and published in 1965. A subcommittee of the Accounting Principles Board began its analysis of the subject when preliminary drafts of the research study became available. Early in 1966, after the initial volume of comments on the study subsided, the subcommittee presented to the full Board a discussion outline of suggestions, problem areas and possible opinion content.

.015 During its meetings through June of that year, the Board devoted much time to discussion of the subject. A regular attendant at Board and subcommittee meetings was Frederick P. Sloat, a member of the American Academy of Actuaries, whose assistance and advice were invaluable. Along the way, the subcommittee initiated a series of meetings with representatives of the actuarial societies, the bar association, utility associations and the Financial Executives Institute.

.016 It is important to emphasize the diligence with which the Board sought the views of responsible members of the business community before reaching the point of

---

taking any final votes on the contents of section 4063. It is equally important to emphasize the degree of interest and the spirit of co-operation with which the business community responded to the request of the subcommittee. This dispelled any doubt concerning the business community's genuine interest in what the Accounting Principles Board is doing. It does have views that should be considered by the profession and it does want to help.

.017 The exposure draft was issued in July 1966. The comments received as a result of the exposure were gratifying. Replies were received from over 300 of those on the exposure list, including many of the top executives of leading corporations around the country. All comments were read, analyzed and catalogued. After consideration of these comments and a further meeting of the Board, the exposure draft was converted into the final section 4063 in November 1966.

.018 From the authors' observations, the Board appreciates the efforts expended by companies in commenting on its proposed opinions, especially where the comments are supported by reasons and analysis.

.019 It may be helpful to an understanding of section 4063 to discuss its major objective and what is likely to be its principal accomplishment—the elimination of inappropriate fluctuations.

5. Major Objective of Section 4063

.020 Pension cost is an important cost of doing business. Except in rare cases, when a company commits itself to pay pensions to its employees upon their retirement, the cost of those pensions may be expected to continue as long as the company has employees. Furthermore, and this is important, pension cost year by year should not be greatly out of line with the size or compensation of the employee group. For example, it does not appear reasonable for a company with a stable or growing employee group to have pension cost of $50,000 one year, $100,000 the next and $10,000 the next. Although not usually so extreme, fluctuations of this sort did occur in many cases found in practice.

.021 These fluctuations were due largely to the effect given to three things: (1) actuarial gains and losses,
(2) the funding of pension plans and (3) legal safeguards typically written into the plans. The primary accomplishment of the pension section probably will be to eliminate the fluctuations due to these factors.

.022 A brief comment about each: First, actuarial gains and losses. In recent years, some companies made substantial reductions in their annual provision for pension cost when investment gains were realized by the pension fund, when the estimated future earnings rate of the fund was increased or when accumulated appreciation in pension-fund investments was recognized in the actuarial valuation.

.023 These occurrences represent some examples of what are described in section 4063 as actuarial gains. To eliminate the fluctuations in pension cost caused by these gains, the Board concluded that actuarial gains—and, in like manner, actuarial losses—"should be given effect in the provision for pension cost in a consistent manner that reflects the long-range nature of pension cost." The recommended way for accomplishing this is, with certain exceptions, to "spread" or "average" these actuarial gains and losses over a period of years.

.024 Second, funding. Some companies based their provision for pension cost on the amount funded—that is, the amount paid to the pension fund. The amounts funded frequently varied widely from year to year because of working capital availability, tax considerations and other factors. Section 4063 make it clear that, under accrual accounting, amounts funded are not determinative of pension costs.

.025 Accrual accounting is based on the assignment of costs among years on the basis of the economic benefits derived from the incurrence of the cost. Funding arrangements may not, and often do not, follow the pattern of economic benefits. Funding is a matter of financial management and may be discretionary; it is not a matter of accounting principle, however.

.026 Third, legal safeguards. Somewhat related to funding is the influence of legal safeguards that limit the company's liability for the payment of pensions to the
amount in the pension fund. As a matter of business prudence, most companies include a clause in their pension plan to the effect that the company may, in its discretion, discontinue the plan or discontinue contributions. In these cases, the employees have no rights to any benefits beyond those than can be paid from the assets in the pension fund. Relying on these clauses, some companies took the position that they had no liability for pensions and therefore did not need to record pension cost beyond the amounts contributed to the pension fund. The Board concluded that clauses such as these could not, as a practical matter, be brought into play by a business that expected to continue to operate in today's economy. In short, these clauses should have little effect on the incurrence of pension cost. Except in rare instances, therefore, they should be ignored in determining the amount of pension cost to be provided.

.027 While many other matters are covered in section 4063, the conclusions about actuarial gains and losses, funding and legal safeguards will probably have the most widespread effect on accounting for the cost of pension plans.

.028 These conclusions are essential to eliminating the wide fluctuations in pension cost that were largely responsible for section 4063 being written in the first place.

6. Interest Equivalents

.029 Before proceeding to a discussion of the basic section 4063 recommendations, a peripheral issue should be clarified.

.030 In many places, section 4063 refers to "amounts equivalent to interest" or "interest equivalents." As used in section 4063 and in the actuarial profession, "interest" is a simple way of referring to the earnings, assumed or actual, of a pension fund. The need to take interest equivalents into account in computing the pension-cost provision arises when the actual pension fund differs from a theoretical fund and when the amounts funded differ from the amounts which have been recorded for accounting purposes.

.031 Under the present-worth basis used for pension-cost accounting, it is assumed that amounts equivalent to
prior service cost and normal cost will be contributed to a fund and that the fund will produce earnings (interest) at an assumed rate. If contributions for these amounts are not made, they will not be available to produce earnings, and it becomes necessary to make an additional provision equivalent to what the earnings would have been if the contributions had been made. This assumption is extended to past service cost even though it is known at the outset that the amounts will not be funded until sometime in the future, or not at all.

.032 For this reason, section 4063 calls for the pension-cost provision to include an amount equivalent to interest on unfunded prior service cost. Such interest may be included as a separate component of the provision or it may be included in the amortization of the past service cost (subject to the 10 per cent maximum). Whenever past service cost is being amortized and the prior year pension-cost provisions have not been funded, an amount equivalent to interest on the unfunded provisions should be added to the provision for the year in addition to any amount included in the amortization. Conversely, when the amounts funded exceed the prior year pension-cost provisions, a reduction of the provision for the year is needed to reflect the interest equivalents on the excess amounts funded.

7. What Constitutes Pension Cost?

.033 The preceding discussion is about the recommendations designed to eliminate fluctuations and about the need for interest equivalents. Agreement concerning these matters was reached by the Board with relative ease. Also, there was never any disagreement that pension cost should be accounted for on the accrual basis, and that the entire cost applicable to an accounting period should be provided. There was disagreement about what constitutes the entire cost applicable to an accounting period. The different views are explained in section 4063. For purposes of this article, suffice it to say that one view was that pension cost should “take into account all estimated prospective benefit payments under a plan with respect to the existing employee group” whereas the principal other view was “that pension cost is related to the pension benefits to
Under either view, annual pension cost would include normal cost. The difference between the two views essentially revolved around what to do about past service cost.

The Board agreed, as had the predecessor committee on accounting procedure, that past service cost relates to periods subsequent to the adoption or amendment of a plan and should not be charged against retained earnings as something applicable to the past. Some members of the Board believed this cost should be specifically recognized in annual provisions over a period of years, although there were some differences in views concerning the period to use. Other members of the Board believed it unnecessary to make specific provisions for past service cost if all benefit payments could be met on a continuing basis by annual provisions representing normal cost plus an amount equivalent to interest on unfunded prior service cost.

There was merit in both positions. Although the Board stated a preference for past service cost being amortized, it concluded that it should not at this time rule out either approach as an acceptable measure of cost. Accordingly, in the interest of attaining the substantial improvement in accounting for the cost of pension plans that would result from the other conclusions of section 4063, the Board framed section 4063 in terms of a minimum method based on the normal-cost-plus-interest concept and a maximum method based upon the amortization-of-past-service-cost concept. One result of this conclusion is that any period may be selected for the amortization of past service cost, as long as the total annual provision falls between the minimum and maximum.

Many would term the minimum-maximum approach to be a flaw in section 4063, and it is fair to say that few, if any, of those working with section 4063 felt that it was a completely satisfying answer. If the minimum-maximum approach is a flaw, however, the authors believe that the flaw is more apparent than real because, as section 4063 is written, it allows a company to fit its accounting
for the cost of its pension plan to the facts and circumstances in its particular case and to record the pension cost most realistic for it.

8. Minimum—Maximum

.038 Before discussing the mechanics of the minimum-maximum methods, three general observations should be made.

.039 First, the difference between the two methods is essentially in the extent to which past service cost is included in the pension-cost provision. Under the defined minimum, only interest on unfunded prior service cost (plus any indicated provision for vested benefits) is included. Under the defined maximum, 10 per cent of the past service cost is included. Normal cost is the same under both.

.040 In two frequently used actuarial cost methods, the “individual level premium” and “aggregate” methods, past service cost is not measured separately. That is, past service cost is included in normal cost. Because there is no amount of separately computed past service cost, the defined minimum and maximum are the same under these methods.

.041 On the other hand, in other frequently used actuarial cost methods, such as the “unit-credit” (“accrued benefit”), “entry age normal,” and “attained age normal” methods, past service cost is measured separately. It is only when methods such as these are used that there is a difference between the defined minimum and maximum. Furthermore, if the past service cost has been fully amortized, there is no difference between the defined minimum and maximum.

.042 The second general observation is that section 4063 contemplates that the defined minimum, the defined maximum and the provision for the year will all be computed using the actuarial cost method selected. For example, if the pension-cost provision is based on the unit credit method, the defined maximum should also be based on that method and not on the entry age normal method, which usually would give a greater maximum amount.
043 The third general observation has to do with an apparent misconception about the defined minimum and maximum.

044 There has been some comment to the effect that any pension-cost provision is acceptable under section 4063 so long as it falls between the minimum and the maximum each year. This may be described as a bouncing-ball effect—that is, the pension-cost provision can bounce up and down between the two limits. This view of section 4063 is a mistaken one.

045 Section 4063 contemplates that in all cases the provision for pension cost will be based on an acceptable actuarial cost method, with all variable factors consistently applied. Furthermore, the treatment of actuarial gains and losses, the actuarial assumptions and the like, should conform with the recommendations of section 4063, and should be applied consistently from year to year.

046 As to past service cost, if the vested-benefit provision is not required, section 4063 contemplates that the company will select interest-only or some amortization plan not exceeding 10 per cent and apply whatever it selects consistently. If this is done, pension-cost provisions will not bounce around from year to year, unless caused by such factors as size, composition or compensation of the employee group. If the vested-benefit provision is required, it could cause some variations from year to year. However, as will be seen from the example given later, the effect is not likely to be material.

9. Computing the Defined Maximum

047 In many cases, the maximum defined in section 4063 is the same as the maximum allowed for federal income tax purposes. Generally speaking, the Internal Revenue Service will allow a deduction for the normal cost of a qualified plan plus not more than 10 per cent of the past service cost. This is also the general maximum limitation included in section 4063. Differences between the maximum tax deduction and the maximum pension-cost provision can arise, however, as a result of unrealized appreciation or depreciation, or as a result of the application of the actuarial cost method. Probably the outstanding
example of the latter is where the unit credit actuarial cost method is used for tax purposes. When this method is used, actuarial gains usually reduce the pension-cost deduction in the year they occur or in the following year. In these cases, it may be necessary to make accounting adjustments to effect a spreading or averaging of the gains.

.048 It is important to note that the 10 per cent limitation applies separately to past service cost at the adoption of a plan and to changes in prior service cost that result from amendments of the plan. For example, disregarding interest equivalents, if a company adopts a pension plan with past service cost of $100,000, the maximum accounting provision would be normal cost plus $10,000 (10 per cent of $100,000) of past service cost. If the company later amends the plan to increase benefits and the cost of the increased benefits related to service prior to the amendment is an additional $50,000, the maximum would be normal cost plus $15,000 (10 per cent of the total of $150,000) until such time as the original past service cost has been fully amortized; after that time the maximum becomes normal cost plus $5,000 (10 per cent of the $50,000 increase). This can be significant when there is a series of increases in benefits over a period of time.

.049 As previously indicated, whenever the funding differs from the cost provision, the cost provision must be increased or decreased by interest equivalents on the difference between the amount provided and the amount funded. An illustration may be helpful. When a company adopts a pension plan, it may fund immediately all of the past service cost. It might do this, for example, in order to gain the advantage of the tax-free income from the investment of the funds by the pension trust. Because the pension-cost provision with respect to the past service cost is limited to 10 per cent, there will be a deferral on the balance sheet for the other 90 per cent. Again taking past service cost of $100,000, $10,000 would be included in the pension-cost provision for the year and the other $90,000 would appear as a deferred charge. In this situation, the accrual for the following year would be reduced by the earnings of the $90,000. If the assumed interest rate was 4 per cent, the cost provision for the succeeding year would
be reduced by $3,600. Because of these reductions, the amortization period will be somewhat longer than ten years.

.050 Conversely, if the company decides to make the maximum pension-cost provisions but does not immediately make contributions to the fund or makes contributions in smaller amounts than provided, there will be an accrued pension cost on the balance sheet. The pension-cost provision for subsequent years should include an amount equivalent to interest on whatever amount is shown as an accrual on the balance sheet.

.051 Accounting for pension cost under the defined-maximum method is illustrated by Exhibit A, paragraph .059. The plan used in Exhibit A has the same past service cost, normal cost and benefits as the plan in Exhibit B, paragraph .060, to illustrate the defined-minimum method. The sameness can be seen in the initial data given under “Prior Service Cost,” which is identical in the two exhibits. The pension fund, balance sheet and provision for pension cost are, of course, different. This would be expected to be so in practice. Taken together, the two exhibits illustrate how the defined maximum and minimum might differ for the same plan. Although an attempt was made to make the exhibits realistic, certain liberties were necessary to illustrate different factors in applying the two methods.

.052 Exhibit A would serve to illustrate other amortization methods by substituting the method to be used for the 10 per cent maximum.

10. Computing the Defined Minimum

.053 Under the defined-minimum method, the annual provision for pension cost is the total of normal cost, an amount equivalent to interest on any unfunded prior service cost, and, under certain conditions, a provision for vested benefits. The provision for vested benefits embraces an objective that differs from those generally found in present practice. It warrants some elaboration.

.054 First, it is essential to get a clear understanding of what is meant by “vested benefits.” Vested benefits are defined in section 4063 as “benefits that are not contingent on the employee’s continuing in the service of the em-
ployer.” This is consistent with the assumption of a continuing pension plan for a company with indefinite life. The amount in the pension fund, therefore, has no effect in determining the total amount of vested benefits as contemplated under section 4063. The definition also excludes any escalation in the amount of benefits through plan-termination and similar provisions. Accordingly, “vested benefits” includes benefits that, as of the date of determination, are expected to become payable (a) to employees then retired, (b) to former employees then terminated and (c) to active employees to the extent that the benefits, or any portions thereof, are not contingent on continued employee service. The value of vested benefits is computed on a present-value basis, giving effect to the usual probability assumptions concerning mortality and retirement (and sometimes also to other assumptions), but not to turnover or future changes in levels of compensation.

055 The Board concluded that pension-cost provisions should look forward in an orderly way to the creation of a pension fund or balance-sheet accrual at least equivalent to the actuarially computed value of vested benefits. That is, the employer ultimately should maintain a fund or accrual at least sufficient to allow the payment of all benefits to all its employees who have fulfilled all the service and age requirements to be entitled to such benefits—whether or not the employees stay with the company.

056 When provisions equivalent to the total of normal cost and the interest equivalents are made, the amount of pension cost that will be accumulated (whether funded or not) will vary widely depending on, among other things, the actuarial cost method selected and the relative ages of the employees of the company. The amount of vested benefits will vary widely, depending on the vesting terms of the plan. Some plans do not include any vesting prior to the employee’s retirement. Other plans call for vesting immediately upon entry into the plan. Between these extremes there are many variations. Frequently a plan will call for vesting of a portion of the benefits when the employee has reached the age of 40 years and has ten years of service. Depending on the combination of these various factors existing in any particular case, the pension cost pro-
ning of the period. The method of computation described under (b) is referred to as the "net change method," because a single computation is made at the current tax rates for the net cumulative effect of both originating and reversing differences occurring during a period relating to a particular group of similar timing differences.

.060 For each kind of "similar" differences, a company may choose to compute deferred taxes either on individual transactions or for groups of transactions and in the latter case by either the gross change or net change methods. Once chosen, the same method should be consistently employed for the specific kind of similar differences. If the method of computation is changed, a consistency exception will be required in the auditor's report where the effect is material.

.061 Under all three methods of computation (individual transaction, gross change, or net change) the tax effect is based on a differential calculation. Under either the individual transaction or the gross change methods the reversal of tax effects of timing differences originating prior to the effective date of section 4091 may be recognized only if the applicable deferred taxes had been provided for in accordance with section 4091 either in the prior periods, or retroactively as of the effective date of section 4091. The net change method may be employed only if the deferred taxes applicable to the net cumulative differences of prior periods were provided in those periods or retroactively as of the effective date of section 4091.

.062 The provisions discussed in the preceding paragraphs were included in section 4091 so that a company that was not applying interperiod tax allocation for any particular kind of timing difference prior to the effective date of section 4091 could not use the tax effects of the reversal of that difference to offset deferred taxes required to be recognized for current originating timing differences.

*The calculation should take into consideration all taxes based on income—United States, foreign, state and local. As a practical matter, where companies are subject to a number of jurisdictions which have income taxes, the rates to be used in the calculation are often determined by increasing the United States income tax rate by a percent equivalent to the effect of the taxes imposed by the other jurisdictions.
.063 For example, assume that certain expenditures are capitalized when incurred and amortized in subsequent periods for accounting purposes, but are deducted when incurred for tax purposes, and that no provision has been made in the past for the applicable deferred taxes. After the effective date of section 4091, deferred tax credits (equivalent to the tax benefits received) must be provided by a charge against income with respect to any expenditures which are capitalized for accounting purposes but are claimed as tax deductions in the period of expenditure. However, as these costs which were capitalized prior to the effective date of section 4091 are amortized during periods after the effective date, the tax effects of such reverse timing differences may not be considered as a reduction of the provision for deferred taxes required for differences originating after the effective date.

[As modified, effective for fiscal years beginning on or after January 1, 1975, pursuant to FASB Statement No. 2.]

.064 Illustrations of the procedures followed in computing deferred taxes comparing the gross change method with the net change method are presented in Exhibits I and Ia. They are not intended as typical illustrations but rather to illustrate some of the complications that may be encountered in practice. The illustrations also demonstrate that the current provision for deferred taxes is not necessarily the amount obtained by applying the current statutory tax rate to the amounts of the timing differences.

10. Amortization of Deferred Taxes *

.065 The amortization of deferred taxes upon reversal of nonrecurring timing differences usually presents no special problems. If the entire reverse timing difference occurs during one period subsequent to the period of origination, the entire deferred tax set up at the time of origination is amortized to income tax expense during the period of reversal. If the timing difference reverses over two or more periods, the deferred tax recognized at the time of origination is amortized in each of the subsequent periods of reversal in proportion to the amount of the reverse tim-

*See also FASB Interpretation No. 25 [section 4094-1], Accounting for an Unused Investment Tax Credit, and FASB Interpretation No. 32 [section 4094-2], Application of Percentage Limitations in Recognizing Investment Tax Credit.
ing difference in each period relative to the total original
timing difference.

.066 Sometimes when the gross change method of
computing deferred taxes is employed for recurring timing
differences, it may be possible to associate specific reverse
timing differences with specific originating timing differ­
ence. Under such circumstances, the amortization of de­
ferred taxes is similar to that previously described for
nonrecurring timing differences. There are instances of re­
curring timing differences, however, in which it is not
possible to associate a specific reverse difference with a
specific originating difference. Often in such circumstances
the total deferred tax account applicable to the particular
type of, or group of similar, timing differences has been
accumulated over a number of years at varying rates. It is
appropriate in such circumstances to amortize a portion of
the aggregate deferred tax balance at the beginning of the
period by use of either the first-in, first-out flow assumption
or the average rate assumption.

.067 Under the first-in, first-out assumption, the earli­
est additions to the deferred tax account are amortized
first. Application of the first-in, first-out assumption re­
quires a record of amounts of deferred taxes by year of
addition. Under the average rate assumption, the amount
of deferred tax amortized is determined by applying the
ratio of aggregate deferred taxes to aggregate timing differences at the beginning of the period, to the amount of the reverse timing difference during the period. The practice adopted for amortization of deferred taxes, where specific identification is not possible, should be consistently followed; otherwise, if the effect is material a consistency exception will be required in the auditor's report.

.068 Amortization procedures are different when the net change method of computing deferred taxes is employed. Under the net change method no amortization of deferred taxes is recorded for periods in which the aggregate timing differences increase. In each period in which the aggregate timing differences decrease, deferred taxes are amortized. Such amortization is computed as the difference between income tax on taxable income and income tax on taxable income less the reduction in aggregate timing differences. The amortization of deferred taxes, however, cannot exceed the amounts previously provided. In a period when reversal of all timing differences of a particular type occurs, the entire related deferred tax account should be amortized regardless of the amount determined under the differential computation. For example, a company that has been using the installment method of accounting for gross margin on installment sales for tax purposes may decide to abandon the installment method by selling all installment receivables. The entire amount of deferred tax credits relative to installment sales which was carried over from the preceding period should then be amortized.
**COMPUTATION OF DEFERRED TAXES UNDER ALTERNATIVE APPROACHES FOR TWO KINDS OF TIMING DIFFERENCES**

**Assumptions**
1. All prior deferred taxes are at an average rate of 48%
2. Current period tax rate is 48% less surtax exemption of $6 and plus 10% surcharge
3. Current period investment credit is $0

### Summary of changes in deferred tax credit balance

- **Additions to deferred credits arising from originating differences:**
  - Depreciation ........................................................................ $264
  - Deferred gross margin......................................................... 158
  - Arising from increase in cumulative depreciation differences ........................................................................ $211

- **Amortization of deferred credits arising from reversing differences:**
  - Depreciation—(48% of $100) .......................................... ( 48)
  - Deferred gross margin—(48% of $400) ............................. (192)
  - Net amortization arising from reduction in cumulative deferred gross margin......................................................... ( 53)

- **Net Increase** ................................................................... $182 (b) $158 (b)

### Notes:

- (a) 48% of adjusted taxable income (“without” timing difference), less surtax exemption of $6 and plus 10% surcharge.
- (b) The difference between the net increase in the deferred tax credit balance of $182 under the gross change method and $158 under the net change method, or $24 (in effect 4.8% of $500, the aggregate amount of reversing timing differences) represents the effect of using (1) under the gross change method the current tax rate for originating differences and the effective prior period rates for reversing differences and (2) under the net change method the current tax rate for the cumulative net effect of both originating and reversing differences.

### Notes:

(a) 48% of adjusted taxable income ("without" timing difference), less surtax exemption of $6, plus 10% surcharge and less allowable investment credit of $50.

(b) 48% of adjusted taxable income ("without" timing difference), less surtax exemption of $6, plus 10% surcharge and less maximum investment credit of $36 ($25 plus 50% of the difference between $46 and $25).

(c) The difference between the net increase in the deferred tax credit balance under the net change method of $158 in Exhibit I and $172 in Exhibit Ia, or $14, arises from the influence of the investment credit. It should be noted that under the gross change method the full investment credit of $50 is utilized in all of the computations "with and without inclusion of the transaction creating the difference between taxable income and pretax accounting income." Under the net change method the utilization of the investment credit is limited to $36 in the computation of the tax effects of deferred gross margin timing differences whereas $50 is utilized in the computation of depreciation timing differences. (See section on "Investment Credit Carrybacks and Carryforwards.")
OPERATING LOSSES

.071 Tax benefits are usually available when operating losses are incurred. Such benefits are obtained either (a) from refunds of taxes paid in prior profitable years—by carryback of losses, or (b) as reductions of taxes otherwise payable in future profitable years—by carryforward of losses. The basic accounting concept of matching revenues and expenses suggests that it is appropriate to record the tax benefit from an operating loss in the income statement of the loss year.

11. Loss Carrybacks

.072 Refunds of taxes paid in prior years arising from carrybacks of operating losses should be recognized during the loss year. This is required to achieve proper matching inasmuch as current realization of the refund is assured. The refunds should be reflected in the balance sheet as current assets.

.073 An illustration of the presentation of an operating loss carryback, assuming that pretax accounting income and taxable income are identical, follows.

<table>
<thead>
<tr>
<th>Loss before refundable income taxes</th>
<th>$1,000,000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refund of prior years' income taxes arising from carryback of operating loss</td>
<td>$485,000</td>
</tr>
<tr>
<td>Net loss</td>
<td>$ 515,000</td>
</tr>
</tbody>
</table>

(Note: The refund should be computed at the amount actually refundable regardless of current tax rates.)

.074 A loss carryback may occur at a time when net deferred tax credits exist. Under these circumstances "appropriate adjustments of existing net deferred tax credits may also be necessary in the loss period." The tax effects of the loss carryback included in the income statement should be based on income (loss) reported for accounting purposes rather than for tax purposes, the objective being to reflect in income the carryback refund which would exist if there were no timing differences. The difference between this amount and the amount currently refundable should be added to or deducted from the appropriate balance sheet deferred tax account. This is accomplished by recomput-

Assumptions:
1. 50% tax rate for all years.
2. Surtax exemptions and investment credits ignored.

Notes:
(A) Taxes paid in years 2, 3 and 4 aggregating $7,500 become refundable as a result of the carryback of the loss from year 5. No tax is payable in year 6 because of the loss carryforward from year 5.
(B) For years 2 through 5 cumulative accounting income is $10,000, which at a 50% rate requires a deferred tax credit of $5,000. Accordingly a reduction in deferred tax credits of $10,000 is required. In effect, a loss carryforward has been recognized to that extent. (See section on "Recognition of Carryforwards as Offset to Deferred Tax Credits."
(C) The cumulative deferred tax credit at end of year 5 consists of $5,000 from year 1 plus $5,000 for years 2 through 5.
(D) Represents the tax benefit ($2,500) of the loss carryforward to year 6 previously recognized in year 5.

12. Loss Carryforwards—Conflict of Concepts

The procedures applied to loss carryforwards differ from those applied to loss carrybacks. The existence of a carryforward means that a company has incurred operating losses which exhausted benefits available from carrybacks and which can be realized only as a carryforward. Usually a company in a carryforward position is experiencing financial difficulties so serious that doubt exists as to future realization of the carryforward. In such cases a company may not have shown profits in any recent year—or in its entire history. The recording of the tax benefit of a loss carryforward during the loss year under such circumstances would be contrary to the accounting concept that revenues or gains should not be recognized if realization is doubtful.

AICPA Professional Standards

AC § U 4091.076
.077 Section 4091 takes the position, relative to loss carryforwards, that the realization concept should take precedence over the matching concept. Therefore, loss carryforward benefits usually should be recognized only when realized through subsequent profitable operations. However, section 4091 also states that the future tax benefit of a loss carryforward should be recorded as an asset during the loss year in those cases where realization is assured beyond any reasonable doubt.

.078 In the usual case of a loss carryforward—where realization is not assured beyond any reasonable doubt—tax benefits can be recognized only during subsequent years as they are realized. Thus, even though in a period subsequent to the loss year the future realization of a carryforward becomes assured beyond any reasonable doubt, it is not permissible under section 4091 to recognize the future tax benefit until it is actually realized.

.079 When a loss carryforward is realized and recognized subsequent to the loss period, income statement presentation is a problem. Under the matching concept, the benefit applies to the loss period and not to the period of realization; this suggests retroactive adjustment of the loss period. However the criteria set forth in section 2014, Prior Period Adjustments, greatly restrict prior period adjustments. Therefore, it is not appropriate to adjust the loss period retroactively. [As amended, effective for financial statements for fiscal years beginning after October 15, 1977, by FASB Statement No. 16.] (See section 2014.)

.080 In order to keep within the criteria of section 2012, it is necessary to include the tax benefit from a loss carryforward in the income statement of the year of realization. However, because it seemed illogical to consider such a credit to be a part of ordinary income, the Board decided that such tax benefits should be presented as extraordinary credits in the year of realization. [As amended, effective for events and transactions occurring after September 30, 1973 by APB Opinion No. 30.]
A loss carryforward benefit recognized in the year realized could be presented as shown in Exhibit III.

2. Surtax exemptions and investment credits ignored.

**13. Assurance Beyond Any Reasonable Doubt**

Section 4091 provides that the future tax benefit of a loss carryforward should be recognized as an asset during the loss period if realization is "assured beyond any reasonable doubt." Consequently, the meaning of the phrase "assured beyond any reasonable doubt" is quite important. It was the Board's intention that recognition of future tax benefits of carryforwards should be restricted to unusual cases.

Section 4091 cites, by way of example, circumstances under which carryforwards may be recognized during the loss year as follows:

"Realization of the tax benefit of a loss carryforward would appear to be assured beyond any reasonable doubt when both of the following conditions exist: (a) the loss results from an identifiable, isolated and nonrecurring cause and the company either has been continuously profitable over a long period or has suffered occasional losses which were more than offset by taxable income in subsequent years, and (b) future taxable income is virtually certain to be large enough.
to offset the loss carryforward and will occur soon enough to provide realization during the carryforward period.”

.085 The use of the words “identifiable, isolated, and nonrecurring” in the above quotation was intended to rule out recognition of loss carryforwards resulting from generally unsuccessful business operations of an entity. Thus, operating losses resulting because of depressed economic conditions or because of changes in consumer preferences or in technology do not give rise to a situation where a future tax benefit may be recognized. Loss carryforwards resulting from the introduction of products or services which have not achieved sufficient acceptance to produce profits do not qualify for recognition prior to realization. Such non-recognition of loss carryforwards applies both to companies in existence for many years that have moved into a new area of business and to newly-formed companies in the developmental stage.

.086 Examples of the kinds of situations giving rise to loss carryforwards that may qualify for recognition during the loss period are:

(1) Losses resulting from the expropriation of a foreign subsidiary, or from the abandonment of one of several operations where the continuing operations are and have been profitable and are virtually certain to be profitable enough to offset the loss carryforwards, and

(2) Losses of one or more subsidiaries of a profitable parent company where the carryforward will be made available as an offset against other taxable income by filing a consolidated income tax return, or by claiming a bad debt deduction, or by some other means. On the other hand, it would not be appropriate to record a loss carryforward of a subsidiary company even though the parent and other subsidiaries are profitable if there are no specific plans to obtain the tax benefit from the loss.

.087 In those rare cases where operating loss carryforwards are expected to be realized beyond any reasonable doubt as offsets against future taxable income, the potential tax benefits should be reflected in the balance sheet as
assets, and should be classified as current or noncurrent depending on the extent to which realization is expected to occur within the current operating cycle.

14. Recognition of Carryforwards as Offsets to Deferred Tax Credits

.088 It may happen that an operating loss carryforward arises at a time when net deferred tax credits exist because of prior timing differences. Even though the realization of an operating loss carryforward is not assured beyond any reasonable doubt, it may be necessary if net deferred tax credits exist to recognize a portion or all of the loss carryforward as an offset to such net deferred tax credits. Section 4091 provides that, in such situations:

"net tax credits should be eliminated to the extent of the lower of (a) the tax effect of the loss carryforward, or (b) the amortization of the net deferred tax credits that would otherwise have occurred during the carryforward period. If the loss carryforward is realized in whole or in part in periods subsequent to the loss period, the amounts eliminated from the deferred tax credit accounts should be reinstated (at the then current tax rates) on a cumulative basis as, and to the extent that, the tax benefit of the loss carryforward is realized."

.089 The limiting factor in the amount of loss carryforward that may be recognized by way of offset against net deferred tax credits is indicated in clause (b) of the preceding quotation.

.090 The justification for recognizing loss carryforwards as an offset to deferred tax credits is that it would be unrealistic to require recognition of deferred tax credits while at the same time denying recognition of deferred tax charges, in the form of a loss carryforward. This follows because both the deferred credits and the deferred charges will reverse during the same future accounting periods. However, net deferred credits which will not be amortized until after the expiration of the loss carryforward period cannot be offset by loss carryforwards.

.091 If both current and non-current net deferred tax credits exist when the future benefit of a loss carryforward
is recognized as an offset, such benefit should be allocated between current and non-current deferred tax credits on a proportional basis.

.092 As the loss carryforward benefit is realized, the net deferred credits eliminated to give recognition to the carryforward, as well as credits related to originating timing differences of the loss year, should be reinstated at the then current rates (i.e., at the rates at which the loss carryforward is realized) before recognition is given to the realization of any remaining loss carryforwards. At the same time amortization of such deferred credits that would otherwise have occurred should also be recognized.

.093 The interaction of net deferred tax credits and loss carryforwards is illustrated in Exhibit IV.

*Notes:
- (A) and (B) are deferred taxes.
- (C) is the cumulative net deferred tax credits.
- (D) is the current tax expense.
- (E) is the cumulative net deferred tax credits.*
ADDITIONAL ASSUMPTIONS:
(1) 50% tax rate for all years and surtax exemptions and investment credits ignored.
(2) Equal to amount payable (or refundable) each year.
(3) Loss carryforward of $9,000 on accounting and $49,000 on tax basis is not assured beyond any reasonable doubt.

Notes:
(A) Refund of taxes paid in years 2-4 available because of loss carryback.
(B) Adjustment of deferred credit from timing difference recognized in years 2-4 (carryback period) in accordance with section 4091.43. No deferred credit is required for year 5 since tax refund computed with timing difference is same as refund computed without timing difference.
(C) The tax benefit of the loss carryforward that may be recognized is the lower of (1) the tax effect of carryforward for accounting purposes of $4,500 (computed as 50% of $9,000); or (2) the amortization of remaining deferred tax credits that would otherwise occur during the carryforward period of $2,000 (computed as $20,000—timing difference reversing in years 6-10—divided by $50,000—aggregate timing difference at end of year 5—or 40% applied to $5,000 deferred credit from year 1). The $2,000 limitation prevails.
(D) During each of the years 6 through 10, amortization of deferred tax credits on a cumulative basis of $2,000 is recognized on the basis of 50% of $4,000 reverse timing differences. In each of these years, deferred credits are restored to the extent of realization of the loss carryforward equal to tax that would otherwise be currently payable in year 6 through 9 of $3,000 each year, and in year 10 of $4,500. Full benefit of carryforward is added to deferred credits because aggregate net deferred credits never exceed amounts that would have been recorded if there had been no operating loss.
(E) The accumulated deferred tax at the end of year 10 is $9,500 which must be amortized equally during each of the years 11 through 15 since timing differences reverse in equal annual amounts of $6,000 during those years.
(F) The average rate assumption has been used in the amortization of deferred tax credits upon reversal of the depreciation timing differences. A first-in, first-out assumption could have been applied. (See section on "Amortization of Deferred Taxes.")

15. Deferred Tax Charges Existing When Loss Carryforward Arises

A company may incur operating losses sufficient to put it in a loss carryforward position at the same time that unamortized net deferred tax charges exist. To the extent the deferred charges arose in the three preceding profitable years, they would normally be eliminated through carryback of losses. However, balances prior to that period may still remain. If the realization of the tax benefit of the carryforward is not assured beyond any reasonable doubt, the question arises as to the propriety of continuing to carry the remaining deferred tax charges. In these situations unamortized net deferred tax charges represent the tax effects of additional expenses not recognized for tax purposes but recognized for accounting purposes. Therefore, if it is not appropriate to recognize the effect of the tax loss carryforward in the year of loss, it may not be appropriate to recognize or to continue to carry as deferred charges the tax effects of the additional expenses recognized for accounting purposes. Accordingly, in the situations cited
the net deferred tax charges should be evaluated as to realizability in the same manner as are other assets.

.096 In other situations companies may incur losses which, because of the nature of the timing differences, are larger for accounting purposes than the amounts carried forward for tax purposes and there is no assurance of future realization of the carryforward benefit. No recognition is given to the tax effects (deferred tax charges) of the timing differences (additional accounting loss carryforwards) inasmuch as the tax effects would be zero under the "with" and "without" computations. Therefore, when these timing differences reverse, the tax benefits realized will not be offset by amortization of deferred charges which would otherwise have been provided. Accordingly, in these situations the tax benefits realized from these timing differences (additional accounting loss carryforwards) should be included in the income statement as extraordinary credits (see Exhibit V) in the same manner as benefits obtained upon future realization of tax loss carryforwards (see Exhibit III).

Assumptions:
1. 50% tax rate for all years.
2. Surtax exemptions and investment credits ignored.
16. Loss Carryforward Arising Prior to Quasi-Reorganization

.098 A company which goes through a quasi-reorganization (including for this purpose the application of a deficit in retained earnings to contributed capital) is likely to be in a loss carryforward position. The proper accounting for the future tax benefit of such loss carryforwards poses a question because the losses occurred prior to quasi-reorganization, but the tax benefit from the carryforward is available as an offset against taxable income after quasi-reorganization. Normally, it would be inappropriate to recognize the potential future tax benefits from the carryforward at the date of the quasi-reorganization because realization would not be assured beyond any reasonable doubt. Also, the deficit from operations prior to the quasi-reorganization is written off to contributed capital; in effect a new enterprise is said to have been established.

.099 When a tax benefit is realized from such loss carryforwards, section 4091 provides that such benefits should be added to contributed capital because the benefits are attributable to the loss periods prior to the quasi-reorganization. Thus, the benefits are treated as a part of the capital of the new enterprise.

.100 In some instances, losses may also occur subsequent to the quasi-reorganization and the question may arise as to whether realization of the loss carryforwards applies to losses incurred prior or subsequent to quasi-reorganization. Under the tax law the earliest loss carryforward must be utilized first. For accounting purposes the tax benefits from loss carryforwards should be allocated between losses before and after the quasi-reorganization in the same manner that they are available under the tax laws.

.101 The above requirements apply to the tax effects of loss carryforwards realized after the effective date of section 4091 even though the related quasi-reorganization occurred prior to the effective date.

.102 The concepts described in the preceding paragraphs relative to quasi-reorganizations apply equally to reorganizations under the bankruptcy laws where a deficit is written off to capital.
17. **Purchased Loss Carryforwards**

.103 Occasionally when a corporation acquires another business in a transaction accounted for as a purchase, one of the assets acquired is the future tax benefit of a loss carryforward. Such future tax benefit should be recorded as an asset at the date of purchase only if its realization is assured beyond any reasonable doubt. In the normal case, however, where such assurance does not exist, the tax benefits of such a loss carryforward "... should be recognized only when the tax benefits are actually realized and should be recorded as retroactive adjustments of the purchase transactions ...".

.104 This is based on the concept that accounting for the acquisition of a business as a purchase requires the allocation of the purchase price to the assets acquired. When a loss carryforward exists it may be considered as an important part of the assets acquired. It is likely that in arriving at the purchase price the parties assigned some value to the loss carryforward. Therefore, when the purchase price is being allocated, the future tax benefit of the carryforward should, in theory, be recorded as a receivable. However, inasmuch as it may not be recorded as a receivable unless its recovery is assured beyond any reasonable doubt, the effect of not recognizing it at the date of the purchase may be to increase the goodwill or reduce the "negative goodwill" that would otherwise be recognized.

.105 Therefore, if and when a tax benefit is realized from the purchased loss carryforward, a retroactive adjustment of the purchase transaction is required. This would normally be accomplished by an adjustment of goodwill or "negative goodwill." In some cases adjustment of tangible assets and depreciation may also be required. Such accounting treatment should be applied to tax benefits realized after the effective date of section 4091 even though the related purchase occurred before the effective date.

\>

The next page is 13,335-3. \<
18. Investment Credit: Carrybacks and Carryforwards *

.106 Section 4094.21 states: "The amount of a carryback of unused investment credit may be set up as an asset (a claim for refund of income taxes) and be added to the allowable investment credit in accounting for the effect of the credit in the year in which the property is placed in service. A carryforward of unused investment credit should ordinarily be reflected only in the year in which the amount becomes 'allowable', in which case the unused amount would not appear as an asset." Section 4094 remains in effect without modification by APB Opinion No. 11.

.107 APB Opinion No. 2 required that the "deferral" method should be followed in accounting for investment credits; APB Opinion No. 4 stated that the "flow-through" method was also acceptable. This method is now predominant in practice. Under the "deferral" method investment credits actually realized, including those realized through carryback or carryforward, are deferred and amortized over the productive life of the acquired property.

.108 Under the "flow-through" method investment credits generally are treated as reductions of income tax expense of the year in which the credits are actually realized. Practice does not treat the realization of investment credit carryforwards as extraordinary items in the year of realization, as is required for operating loss carryforwards under section 4091.

.109 As discussed in the section on "Computation of Deferred Taxes," the effect of the investment credit must also be recognized in computing deferred taxes for timing differences originating in the current period. This occurs because deferred taxes are computed as the differential in taxes (giving effect to investment credits) arising from including and excluding the timing difference.

.110 If tax allocation results in net deferred credits the differential calculations will recognize as income for financial accounting purposes, through a reduction in the deferred tax provisions, that portion of available investment credits that would have been allowable had taxes pay-

---

*See also FASB Interpretation No. 25 [section 4094-1], Accounting for an Unused Investment Tax Credit, and FASB Interpretation No. 32 [section 4094-2], Application of Percentage Limitations in Recognizing Investment Tax Credit.
able been based on pretax accounting income. In effect investment credit carryforwards are being recognized as offsets against net deferred tax credits in a manner similar to that followed for operating loss carryforwards. The carryforwards utilized should be limited to the lower of (a) the amount of the carryforward benefit or (b) the amortization of the net deferred credits that would otherwise have occurred during the carryforward period. The total amount of investment credits that may be reflected in these
Computations is limited to the amount actually available (either currently or as a carryforward).

.111 As the investment credit carryforward benefits are realized, reductions of net deferred credits resulting from application of unused investment credits should be reinstated at the then current rates (i.e., at the rates at which the investment credit carryforwards are realized) before recognition is given to the realization of any remaining investment credits. At the same time amortization of such deferred credits that would otherwise have occurred should also be recognized.

.112 If allocation results in a net deferred charge an opposite effect should be obtained—a portion of the investment credit actually realized will be deducted from the deferred charge and omitted from income of the current period for financial accounting purposes.

Deferred taxes:

| Taxable income with timing difference | $ 500 |
| Tax thereon: |
| 52.8% less surtax exemption | $ 257 |
| Investment credits ($25 plus 50% of tax in excess of $25) | 141 |
| Tax payable | $ 116 |
| Taxable income without timing difference | $1,000 |
| Tax thereon: |
| 52.8% less surtax exemption | $ 521 |
| Investment credits ($25 plus 50% of tax in excess of $25) | $ 273 |
| Tax | $ 248 |
| Differential equal to deferred tax credits | $ 132 |

Investment credits:

| Available | $ 400 |
| Realized | 141 |
| Carryforward | $ 259 |

Investment credit benefit received in computation of deferred taxes:

| Deferred taxes without considering investment credits ($521 less $257) | $264 |
| Deferred taxes as computed above | 132 |
| Investment credit carryforward to future years | $ 127 |

Summary:

| Income before income taxes | $1,000 |
| Income tax expense: |
| Currently payable (after giving effect to investment credits realized of $141) | $116 |
| Deferred taxes | 132 |
| Net income | $ 752 |
19. Allocation Within a Period

.115 Section 4091 requires income tax expense for any period to be allocated among income before extraordinary items, extraordinary items, adjustments of prior periods (or of the opening balance of retained earnings), and direct entries to other stockholders' equity accounts. The amount of income tax expense for the period allocated to income before extraordinary items is computed as the amount of income tax expense (after giving effect to related investment credits) that would have been determined by excluding from pretax accounting income all transactions that are not included in the determination of income before extraordinary items. The difference between income tax expense allocated to income before extraordinary items and the total income tax expense for the period (after giving effect to investment credits) is then allocated among the extraordinary items (and to adjustments of prior periods and direct entries to stockholders' equity accounts).

.116 If exclusion of extraordinary losses from a net loss for a period results in income before extraordinary items, an appropriate provision should be made for the income tax expense that would have been applicable to such income. This imputed tax provision should then be reversed by application against the extraordinary loss.

.117 If exclusion of extraordinary items from pretax accounting income results in a loss before extraordinary items, a credit tax provision should be allocated to such loss. The credit would be equivalent to the tax that would be refundable from an operating loss carryback equal to the loss before extraordinary items. The sum of such credit tax provision and total income tax expense for the period should then be allocated among the items excluded from pretax accounting income in the determination of the loss before extraordinary items. Often the income tax expense allocated to the extraordinary items will differ from the tax that normally would be associated with such items, as illustrated in the example on next page.

.118 If there is more than one item of revenue and expense included in extraordinary items, adjustments of
prior periods and direct entries to stockholders’ equity accounts, it is necessary to allocate the total income tax effects applicable to them among the individual items. The tax effect applicable to each individual item should be determined as the differential in income taxes resulting from including and excluding the specific item and should be determined in the same manner as for a timing difference. The amount of income tax expense allocated to all excluded items should then be allocated to the individual items on the basis of the proportion that the tax effect of each item bears to the aggregate tax effects.

Loss before income taxes and extraordinary capital gain ........................................ $ (200,000)
Income tax credit (assuming a 50% rate) ........................................... 100,000

Loss before extraordinary credit ........................................... $ (100,000)
Extraordinary long-term capital gain of $600,000, less applicable income tax of $250,000 350,000

Net income ................................................ $ 250,000

.119 In certain unusual cases, an item recognized in the determination of taxable income may not enter into the reporting of results of operations but, instead, for accounting purposes represents a capital transaction which is reflected by a direct entry in a stockholders’ equity account. In such cases, the tax effect of such an item should be related to the transaction affecting the stockholders’ equity account and not considered to be an increase or decrease of income tax expense for the period. An example of such a direct entry to stockholders’ equity accounts arises in connection with that portion of a loan loss reserve of a bank which is recorded in the accounts and is deducted for tax purposes but is in excess of allowances required for accounting purposes and is, therefore, treated as appropriated surplus.

.120 When a transaction is includable in the determination of taxable income for a period but is treated as a

*The amount of $250,000 represents the sum of 25% of $600,000, or $150,000 (the alternative tax), plus $100,000, the tax credit attributable to the carryback of the loss from operations under the “with” and “without” computations. This $100,000 tax credit is, in effect, lost inasmuch as the alternative tax computation available because of the long-term capital gain does not provide for any recognition of the loss from operations.
prior period adjustment for accounting purposes, the tax
effects should be allocated to such prior periods. When a
change in accounting method is made by retroactive restate­
ment of prior years’ operations, the applicable income tax
expense should be determined on the basis of the applicable
rates for those prior periods.

20. Income Statement Presentation

121 All taxes based on income, including foreign,
state and local, should be reflected in income tax expense
in the income statement.

122 The components of income tax expense for the
period should be disclosed separately. This disclosure of
components may be done either on the income statement
or in a note. The components of income tax expense that
must be disclosed separately for the period, allocated among
income before extraordinary items, extraordinary items,
adjustments of prior periods (or of the opening balance
of retained earnings) and direct entries to other stock­
holders’ equity accounts, are as follows:

(a) Taxes estimated to be payable,
(b) Tax effects of timing differences,
(c) Tax effects of investment credits (whether on
the deferral method or the flow-through method) and
(d) Tax effects of operating losses.

123 An example of income statement presentation of
income tax expense follows:

<table>
<thead>
<tr>
<th></th>
<th>1968</th>
<th>1967</th>
</tr>
</thead>
<tbody>
<tr>
<td>Income before income taxes</td>
<td>$800,000</td>
<td>$700,000</td>
</tr>
<tr>
<td>United States, foreign and state income taxes</td>
<td>300,000</td>
<td>350,000</td>
</tr>
<tr>
<td>(Note A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Net income</td>
<td>$500,000</td>
<td>$350,000</td>
</tr>
</tbody>
</table>

Note A—Income tax expense differs from amounts currently payable because certain
revenues and expenses are reported in the income statement in periods which differ
from those in which they are subject to taxation. The principal differences in timing
between the income statement and taxable income involve (a) depreciation expenses
recorded under the straightline method in the income statement and by accelerated
methods for tax purposes and (b) provision for product warranties recorded in the income
statement as warrantied products are sold but deducted for tax purposes when services
under the warranties are performed. The differences between income tax expense and
taxes currently payable are reflected in deferred tax accounts in the balance sheet.
Income tax expense consists of the following:
Currently payable before giving effect to investment
credits .................................................. $550 $350
Investment credits realized .................................. (175) (50)
Deferred—net .................................................. (75) 50

$300 $350

21. Balance Sheet Presentation

.124 The Opinions of the Board require that income
tax accounts be presented in the balance sheet so as to pro­
vide separate classification of the following elements:

(a) Taxes estimated to be currently payable,

(b) Net amount of current deferred charges and
current deferred credits relating to timing differences,

(c) Net amount of noncurrent deferred charges
and noncurrent deferred credits relating to timing
differences,

(d) Refundable taxes arising from carrybacks of
operating losses, investment credits and similar items,

(e) Future tax benefits of carryforwards of oper­
ating losses and similar items (in those unusual cases
where they have been recognized because realization
is assured beyond any reasonable doubt) and

(f) Deferred investment credits (applicable when
the deferral method of accounting for investment
credits is employed).

.125 The distinction between current and noncurrent
deferred taxes due to timing differences is based on the
classification of the asset or liability related to each specific
timing difference. For example, deferred taxes arising from
timing differences in depreciation expense are classified
with noncurrent liabilities because the related depreciable
assets are noncurrent. On the other hand, if installment
receivables are included in current assets, the deferred tax
credits arising from the use of installment method for tax
purposes are classified with current liabilities.

.126 The Board considered the possibility of present­
ing current deferred tax charges separately from current
deferred tax credits, with similar separation of noncurrent
deferred tax charges from noncurrent deferred tax credits. However, the Board concluded that allowing the netting of deferred charges and credits achieved a simpler presentation while allowing the reader of the financial statement to determine the effect on the balance sheet of interperiod tax allocation. It was considered necessary, however, to separate the net current deferred taxes from the net non-current deferred taxes in order to conform with accepted principles for determining working capital.

22. General Disclosures

.127 In addition to the presentation of components of income tax presented in the income statement and in the balance sheet, section 4091 requires the following general disclosures:

"(a) Amounts of any operating loss carryforwards not recognized in the loss period, together with expiration dates (indicating separately amounts which, upon recognition, would be credited to deferred tax accounts);

(b) Significant amounts of any other unused deductions or credits, together with expiration dates; and

(c) Reasons for significant variations in the customary relationships between income tax expense and pretax accounting income, if they are not otherwise apparent from the financial statements or from the nature of the entity's business.

The Board recommends that the nature of significant differences between pretax accounting income and taxable income be disclosed."

In addition, section 4094 requires disclosure of the method adopted (deferral or flow-through) in accounting for investment credits and the amounts of unused carryforwards, together with expiration dates. These requirements are consistent with the disclosure requirements cited above in section 4091.

23. Transitional Problems

.128 Section 4091 was effective for fiscal periods that began after December 31, 1967. Retroactive application was not mandatory but was encouraged. The obvious advantage of applying section 4091 retroactively was to
achieve complete comparability among all reported periods—both then and in the future.

.129 If a company did not elect to apply section 4091 retroactively, it was nevertheless necessary to make changes in presentation of deferred taxes that related to periods prior to the effective date. For example, a company that was, prior to the effective date, presenting deferred tax accounts as direct reductions of related assets and liabilities—"net of tax" presentation—was required to change the presentation of balance sheets at the end of fiscal periods beginning after December 31, 1967. This was required even though the amounts of deferred taxes carried over from prior years had not been recomputed to conform to the provisions of section 4091.

.130 The net of tax presentation is also prohibited in income statements for periods subject to section 4091. When comparative income statements are presented which include years beginning both before and after the effective date of section 4091, it is not required that "net of tax presentation" be eliminated from the former income statements but it would certainly be highly desirable even though the amounts of deferred taxes are not recomputed.

.131 Deferred tax accounts relating to timing differences may be computed either on the basis of individual transactions or, with respect to similar timing differences, under the "gross change" or "net change" methods. Irrespective of which basis or method is elected, no recognition (beyond systematic amortization of previously recorded deferred taxes) can be given in the computation of the current deferred tax provision to the reversal of tax effects arising from timing differences originating prior to the effective date of section 4091 unless the applicable deferred taxes have been provided for in accordance with section 4091, either during the periods in which the timing differences originated or, retroactively, as of the effective date of section 4091. The method or methods adopted should be consistently applied. If the methods are changed, disclosure of a change in accounting is necessary in accordance with section 1051, Accounting Changes. [As amended, effective for fiscal years beginning after July 31, 1971, by APB Opinion No. 20.]
.132 There are cases in which a company, prior to the effective date of section 4091, did not apply interperiod tax allocation procedures for significant timing differences in accordance with section 4091, but was required to do so subsequent to the effective date. It should be noted that under such circumstances if the provisions of section 4091 were not applied retroactively, there may be a significant lack of comparability among income statements for a number of years. This will occur because it will be necessary to recognize deferred taxes for timing differences that originate subsequent to the effective date of section 4091, whereas it will not be permissible to reflect in the provision for deferred taxes the tax effects of similar timing differences that reverse during the same period. The effect of this procedure will be to place the accounts of the company on a full allocation basis gradually over a period of time. The period of time required for full allocation to be achieved and the significance of the lack of comparability will depend on the “rollover period” of the timing differences involved, and their materiality.

.133 An example of a possible extreme lack of comparability could occur in the case where a company has not been providing deferred taxes relating to provisions for product warranty costs where the warranty period is relatively short, say two or three years. In such a case, during the first few years following the effective date of section 4091, the provision (credit) for deferred taxes in the income statement will vary widely (decreasing in amount) even though there is no change in tax rates or in the ending amount of the warranty reserve. Such lack of comparability, assuming it is significant, requires explanation in a note to the financial statements. It is obvious that under these circumstances retroactive application would be highly desirable.

.134 Some companies adopted tax allocation procedures for depreciation timing differences at the effective date of section 4074 on a prospective basis and did not retroactively provide deferred taxes for accumulated timing differences at that date. Such companies should consider the advisability of providing such deferred taxes retroactively on the basis provided in section 4091.
If a company decides to give retroactive effect to section 4091, the computations of deferred taxes relating to timing differences for prior periods should be based on the provisions of section 4091 and should be applied to all material items of those prior periods. It is unacceptable to compute such deferred taxes under the "liability" approach, which has been rejected in section 4091, even though the liability approach would have been acceptable if it had been followed in prior years. On the other hand, where deferred taxes have been provided in prior years under the liability method, recomputation under the deferred method should be required only when the differences are material.

The Board recognized that it was not practicable to discuss in section 4091 all of the problems that could arise in the application of the principles stated in section 4091. Likewise it was not practicable in this article to indicate or suggest solutions to some existing problems or to anticipate solutions to new problems. Further experience in the implementation of section 4091 will undoubtedly lead to new or different treatments.

24. Franchise Taxes Based on Income

Question—The Ohio corporation franchise/income tax law enacted December 20, 1971 imposes a tax based on the value of a corporation’s issued and outstanding shares of capital stock. The value of the issued and outstanding stock is deemed to be (a) the stockholders’ equity in the corporation (subject to certain adjustments) as of the beginning of the corporation’s annual accounting period that includes the first day of January of the tax year or (b) the corporation’s net income (subject to certain adjustments) for the year, or portion of the year, preceding the commencement of its annual accounting period that includes the first day of January. The amount of the tax payable is the greater of the applicable tax rate applied to stockholders’ equity or net income, but no less than $50, and is first due on January 1, 1972. To what period does the tax charge belong?
.138 Interpretation—A franchise tax unrelated to income is a privilege tax which should be charged as an expense of the year to which the privilege relates. A franchise tax which, in effect, is based solely on income is considered to be an income tax under section 4091. The tax should be accrued in the year the income to which it relates is earned, even though the tax constitutes a fee for the privilege of doing business in a succeeding period and is payable in that period.

.139 The Ohio corporation franchise/income tax is considered to be composed of two elements for accounting purposes, a franchise tax and an income tax. To the extent the tax is based on stockholders' equity, it is a franchise tax which should be accrued in the year to which the privilege relates. If there is additional tax due, based on income, that excess is considered to be an income tax which should be accrued in the year the income was earned.

.140 In many instances corporations will have issued prior to the enactment of the Ohio law their financial statements for years ending in 1971. In such cases the additional tax expense for years ending in 1971 should be treated as a prior period adjustment when the corporation next issues its financial statements.

[Issue Date: March, 1972]

25. "Leveraged" Lease Accounting

[.141—.142] [Superseded, effective January 1, 1977, by FASB Statement No. 13] (see section 4053).
AC Section U4094

Accounting for the Investment Credit: Accounting Interpretations of Section 4094*

1. Tax Credit Disclosure

.001 Question—What disclosure is required in relation to accounting for the investment tax credit?

.002 Interpretation—Section 4094.18 specifies that full disclosure of the method followed and amounts involved, when material, in accounting for the investment credit is essential. For this purpose, materiality should be measured in relation to the income tax provision, net income, and the trend of earnings. Generally, all amounts of investment credit should be revealed unless they are clearly insignificant. (Modified by Interpretation No. 2 below.)

[Issue Date: February, 1972.]

2. Tax Credit Disclosure (Modification)

.003 Accounting Interpretation No. 1, issued in February 1972, stated, “full disclosure of the method followed and amounts involved, when material, in accounting for the investment credit is essential. For this purpose, materiality should be measured in relation to the income tax provision, net income, and the trend of earnings. Generally, all amounts of investment credit should be revealed unless they are clearly insignificant.” That Interpretation is reaffirmed, except for the foregoing references to materiality as it relates to disclosure of the method.

.004 The 1971 Act and the Treasury releases require a taxpayer to disclose in financial reports the method of accounting used for the investment credit but no materiality guideline is given. Accordingly, until such time as a guideline may be issued, the method of accounting for the investment credit should be disclosed in all financial reports for taxable years ending after December 9, 1971 even though

*See also FASB Interpretation No. 25 [section 4094-1], Accounting for an Unused Investment Tax Credit, and FASB Interpretation No. 32 [section 4094-2], Application of Percentage Limitations in Recognizing Investment Tax Credit.
the *amount* is not material and is not disclosed and disclosure would not otherwise be required. If more than one *method* is used (for example, the deferral method for "old" credits and the flow-through method for "new" credits), all *methods* should be disclosed. The amounts may be omitted only if they are clearly insignificant.

[Issue Date: March, 1972]

3. **Acceptable Methods of Accounting for Investment Credits Under 1971 Act**

.005 *Question*—What methods may be used to account for investment credits allowable under the Revenue Act of 1971?

.006 *Interpretation*—In a news release dated January 10, 1972, the Treasury Department interpreted the Act to mean that the flow-through and the deferral methods are the only acceptable methods to account for investment credits allowable under the 1971 Act for taxable years ending after December 9, 1971.

.007 Under the flow-through method, the credit is reflected as a reduction of tax expense in the year it is recognized in the financial statements.

.008 Under the deferral method, the credit is reflected as a reduction of tax expense ratably over the period during which the asset is depreciated and follows the depreciation method used for financial reporting purposes. The amortization period may be the specific life of each asset or the composite life of all depreciable assets. However, amortization over the period the asset must be held to avoid recapture of the credit rather than life of the asset is not acceptable because it is not based on depreciable life.

.009 A financing institution may include the investment credit as part of the proceeds from leased property accounted for by the financing method and include it in determining the yield from the "loan" which is reflected in income over the term of the lease. However, the financing institution may account for the investment credit on property purchased for its own use by either the flow-through or the deferral method.

.010 The investment credit may be passed through to a lessee for leased property. The lessee should account for
the credit by whichever method is used for purchased property. If the deferral method is used and the leased property is not capitalized, the term of the lease, generally including renewal options which are reasonably expected to be exercised, is the period over which the credit should be amortized.

[Issue Date: April, 1972]

4. Change in Method of Accounting for Investment Credit

.011 Question—The Revenue Act of 1971 provides that a taxpayer need not use a particular method of accounting for the investment credit in financial reports subject to the jurisdiction of, or made to, any federal agency. However, once a method is adopted, a taxpayer may not under the Act change to another method unless the Secretary of the Treasury or his delegate consents. (Therefore, a taxpayer has a one-time "free choice" to select a method different from the one used in the past to account for the investment credit under the 1971 Act but must continue to use the method selected.) The Treasury Department issued news releases on December 21, 1971 and January 10, 1972 specifying December 10, 1971 as the effective date for the accounting requirements for the credit under the Act in financial reports issued by taxpayers and describing methods of accounting for it. How do the 1971 Act and the Treasury Department releases affect the application of section 1051, Accounting Changes, by taxpayers who change their method of accounting for the investment credit in financial reports issued to shareholders?

.012 Interpretation—This Accounting Interpretation sets forth our understanding of how section 1051\(^1\) should be applied under the Act and the Treasury releases in accounting and reporting for the investment credit in general purpose financial statements issued by companies subject to the jurisdiction of, or making reports to, federal agencies. These would include, for example, annual reports to shareholders and other investors under the jurisdiction of the SEC, ICC, CAB, SBA, etc. The conclusions of this Interpretation should be applied to all financial statements prepared in accordance with generally accepted accounting

---

\(^1\) Section 1051 is effective for fiscal years beginning after July 31, 1971, but earlier application is encouraged.
principles even though they are issued by companies whose financial reports are not under the jurisdiction of, or who do not report to, a federal agency. (It is our understanding that a tax return is not deemed a financial report to come under the provisions of the 1971 Act discussed in this Interpretation.) If anything in this Interpretation should conflict with any requirement issued by the Treasury, the requirement of the Treasury prevails for those financial statements.

"Old" Investment Credits

.013 Section 1051.16 specifies that the previously adopted method of accounting for a tax credit which is being discontinued or terminated should not be changed. Therefore, the method of accounting used for investment credits previously reported in financial statements covering taxable years ending before December 10, 1971 should be continued for those credits in financial statements issued after December 9, 1971. Thus, an investment credit received in 1968 and accounted for by the deferral method should under section 1051 continue to be amortized on the same basis as before even though the taxpayer elects to use the flow-through method under the one-time "free choice" to account for 1971 Act investment credits. Likewise, a 1968 investment credit which was accounted for by the flow-through method should not be reinstated, either by retroactive restatement or by a "catch-up" accounting change adjustment, even though the taxpayer elects the deferral method under the one-time "free choice" to account for 1971 Act investment credits.

.014 Under section 1051.16, the "old" investment credit in the above examples is considered terminated as of December 9, 1971 in view of the Treasury Department releases. The adoption of a different method to account for 1971 Act investment credits under the one-time "free choice" is, therefore, considered similar to the adoption of a different method of amortization for newly acquired assets as provided by section 1051.24.

"New" Credits Arising Before Cutoff Date

.015 An investment credit arising under the Revenue Act of 1971 but allowable in a taxable year ending before
December 10, 1971 (for example, from property purchased in September 1971 by a taxpayer with a November 30 taxable year) may be accounted for either by the method used in prior years to account for the investment credit or by the method the taxpayer will use under the one-time "free choice." In these circumstances, those taxpayers who use the "old" method may exercise their one-time "free choice" in the following year. Those taxpayers who change to a different method for the 1971 Act credit should continue that method in accounting for investment credits allowable in following taxable years ending after December 9, 1971.

Carrybacks and Carryforwards

Carrybacks and Carryforwards

.016 In practice, the investment credit is recognized in financial statements by including it in the "with and without" computation of the tax effect of a timing difference which is specified by section 4091.35. This practice continues to be appropriate in taxable years ending after December 9, 1971 although the credit is a carryback or a carryforward for income tax purposes. Thus, when different methods are used to account for the credit in different years and carrybacks or carryforwards are involved, the method applicable to a particular credit is the method used for the year in which the credit is recognized in the financial statements.

.017 Therefore, an investment credit arising from an investment made during a taxable year ending after December 9, 1971 but carried back to produce a refund from a taxable year ending prior to December 10, 1971 should be accounted for by the method selected under the one-time "free choice." An investment credit arising under prior Revenue Acts which has not been previously accounted for and which is allowable in a taxable year ending after December 9, 1971 (for example, from property purchased in 1968 for which all or part of the credit was carried forward to calendar 1971) should be accounted for by the method selected under the one-time "free choice."

.018 The Treasury Department releases do not apply to investment credits which have been reported in annual income statements covering taxable years ending before December 10, 1971 even though the credits may be carried

See sections U4091.106-.114, "Investment Credit Carrybacks and Carryforwards" and sections 4091.44-.47 for rationale.
forward to reduce tax liability in years ending after December 9, 1971. Therefore, those investment credit carryforwards realized after that date should be accounted for in the normal manner by crediting the assets set up to recognize the investment credit carryforward or by restoring the deferred tax credit when the carryforward credit is realized.

.019 An investment credit recognized in a carryforward year rather than in the year it arises should be included in the determination of income before extraordinary items in the carryforward year.

Consistency Exception in Auditor’s Report

.020 A change in the method of accounting for the investment credit (either by selection of a different method under the one-time “free choice” or later by permission of the Secretary of the Treasury or his delegate) would call for a consistency exception in an independent auditor’s report if it has a material effect on the financial statements in the current year (see Accounting Interpretation No. 2 on tax credit disclosure). The effect of the change under the one-time “free choice” should be disclosed in the manner specified by section 1051.24. The effect of a Treasury-approved change should be disclosed in the manner specified by section 1051.21.

[Issue Date: April, 1972]

5. Investment Credit Is Prior Period Adjustment

.021 Question—The Revenue Act of 1971 allows an investment credit retroactively to some taxpayers whose fiscal years closed prior to enactment of the Act on December 10, 1971. To what accounting period does this credit belong?

.022 Interpretation—An investment credit arising under the Revenue Act of 1971 and allowable in a taxable year ending before December 10, 1971 is considered to be an event of a fiscal year ending before December 10, 1971. If the financial statements have not yet been issued, they should be adjusted to reflect the credit as a type 1 subsequent event (see AU section 560, Volume 1, AICPA Professional Standards).
If the financial statements have already been issued, the credit should be treated as a prior period adjustment as described by section 2010.17 (see also section 2011.18).

.023 The credit may be accounted for by the method used in prior years to account for the investment credit or by a different method. If a different method is used, that method should be used thereafter to account for investment credits allowable in following taxable years ending after December 9, 1971. (See Accounting Interpretation No. 4 on change in method of accounting for the investment credit.)

[Issue Date: April, 1972]

6. Investment Credit in Consolidation

.024 Question—The Revenue Act of 1971 specifies that a taxpayer shall not be required to use a particular method of accounting for the investment credit in reports subject to the jurisdiction of a federal agency. However, a taxpayer must continue to use the method adopted in all such reports subsequently issued unless consent to change is granted by the Secretary of the Treasury or his delegate. May different methods of accounting for the investment credit be adopted by the various legal entities that file separate income tax returns but are included in consolidated financial statements?

.025 Interpretation—No, a single method of accounting for the investment credit should be adopted under the one-time "free choice" by a parent company and its subsidiaries in consolidated financial statements (including subsidiaries carried on the equity method) and other financial reports subject to the jurisdiction of, or made to, a federal agency.

1. Disclosure of Untaxed Undistributed Earnings
of Subsidiary

.001 Question—Section 4095.14b requires disclosure of
the cumulative amount of undistributed earnings of a sub­
sidiary on which the parent company has not accrued in­
come taxes. Is the amount to be disclosed the total amount
of undistributed earnings on which income taxes have not
been accrued or may an amount that will not be taxed, with
appropriate tax planning under existing statutes, be ex­
cluded?

.002 Interpretation—The amount to be disclosed
under section 4095.14b is the cumulative undistributed
earnings which under existing law would be subject to
income taxes if distributed currently but for which the
parent company has not accrued income taxes. If under
existing law, however, a short-term postponement of the
distribution would permit the earnings to be distributed
tax free to the parent, those earnings need not be included
in the amount disclosed. Thus, for example, the amount
disclosed would include that portion of the undistributed
earnings of a DISC subsidiary on which tax has not been
accrued, the undistributed earnings of a foreign subsidiary
on which tax has not been accrued and the tax would not
be offset by an available foreign tax credit, and the undis­
tributed earnings of a less than 80 percent owned domestic
subsidiary.

.003 The amount disclosed would not include the un­
distributed earnings of an 80 percent or more owned do­
mestic subsidiary that is included in a consolidated income
tax return, or where the parent has elected a single surtax
exemption for all members of an affiliated group which file separate tax returns, since a dividend paid from those earnings would be eligible for the 100 percent dividends received deduction. Likewise, the undistributed earnings of a subsidiary that is expected to be remitted to the parent company in a tax free liquidation would not be included in the amount disclosed.

.004 The undistributed earnings of an 80 percent or more owned domestic subsidiary that files a separate tax return with multiple surtax exemptions for the affiliated group should not be included in the amount disclosed in most situations. Under present law, dividends paid out of earnings accumulated after 1974 will be eligible for the 100 percent dividends received deduction. Income taxes should, however, be accrued for any pre-1975 multiple surtax year accumulated earnings which are not considered to be invested for an indefinite period of time when the tax planning alternatives of filing a consolidated return or a tax free liquidation are not practical. In the unusual situations when pre-1975 accumulated undistributed earnings are considered invested for an indefinite period of time and the consolidated return and tax free liquidation alternatives are not practical, such pre-1975 accumulated undistributed earnings should be included in the amount to be disclosed.

.005 Care should be exercised in drafting the footnote required by section 4095.14b so that readers may be fully apprised of tax implications of unremitted earnings of subsidiaries. The following is illustrative: “It is the policy of the Company to accrue appropriate U. S. and foreign income taxes on earnings of subsidiary companies which are intended to be remitted to the parent company in the near future. Unremitted earnings of subsidiaries which have been, or are intended to be, permanently reinvested [disclosure of purpose], exclusive of those amounts which if remitted in the near future would result in little or no such tax by operation of relevant statutes currently in effect, aggregated $____ at December 31, 1972.”

[Issue Date: March, 1973.]
Interest on Receivables and Payables: Accounting Interpretations of Section 4111

1. Advance Not Requiring Imputation

.001 Question—Section 4111 requires interest to be imputed for some rights to receive or obligations to pay money on fixed or determinable dates. In certain transactions, pipeline companies make advances to encourage exploration. These advances are satisfied by delivery of future production, but there is also a definite obligation to repay if the future production is insufficient to discharge the obligation by a definite date. Does section 4111 apply to such advances?

.002 Interpretation—No, paragraph .03b states that the section is not intended to apply to “amounts which do not require repayment in the future, but rather will be applied to the purchase price of the property, goods, or service involved (e.g., deposits or progress payments on construction contracts, advance payments for acquisition of resources and raw materials, advances to encourage exploration in the extractive industries).” The advance described in the question above is covered by the exclusion in paragraph .03b even though there may be an obligation to repay should the future production prove insufficient to discharge the obligation.

[Issue Date: June, 1972.]
The Equity Method of Accounting for Investments in Common Stock: Accounting Interpretations of Section 5131

1. Intercompany Profit Eliminations Under Equity Method

.001 Question—In applying the equity method of accounting, intercompany profits or losses on assets still remaining with an investor or investee should be eliminated, giving effect to any income taxes on the intercompany transactions. (See section 5131.19a and sections 2051.07 and 2051.16.) Should all of the intercompany profit or loss be eliminated or only that portion related to the investor’s common stock interest in the investee?

.002 Interpretation—Section 5131.19 normally requires an investor’s net income and stockholder’s equity to be the same from application of the equity method as would result from consolidation. Because the equity method is a “one-line” consolidation, however, the details reported in the investor’s financial statements under the equity method will not be the same as would be reported in consolidated financial statements (see section 5131.19c). All intercompany transactions are eliminated in consolidation, but under the equity method intercompany profits or losses are normally eliminated only on assets still remaining on the books of an investor or an investee.

.003 Section 2051.13 provides for complete elimination of intercompany profits or losses in consolidation. It also states that the elimination of intercompany profit or loss may be allocated proportionately between the majority and minority interests. Whether all or a proportionate part of the intercompany profit or loss should be eliminated under the equity method depends largely upon the relationship between the investor and investee.

.004 When an investor controls an investee through majority voting interest and enters into a transaction with an investee which is not on an “arm’s length” basis, none of the intercompany profit or loss from the transaction
should be recognized in income by the investor until it has been realized through transactions with third parties. The same treatment also applies for an investee established with the cooperation of an investor (including an investee established for the financing and operation or leasing of property sold to the investee by the investor) when control is exercised through guarantees of indebtedness, extension of credit and other special arrangements by the investor for the benefit of the investee, or because of ownership by the investor of warrants, convertible securities, etc. issued by the investee.

.005 In other cases, it would be appropriate for the investor to eliminate intercompany profit in relation to the investor's common stock interest in the investee. In these cases, the percentage of intercompany profit to be eliminated would be the same regardless of whether the transaction is "downstream" (i.e., a sale by the investor to the investee) or "upstream" (i.e., a sale by the investee to the investor). The following examples illustrate how these eliminations might be made. The examples assume an investor owns 30 percent of the common stock of an investee, the investment is accounted for under the equity method, and the income tax rate to both the investor and the investee is 40 percent.

.006 Assume an investor sells inventory items to the investee ("downstream"). At the investee's balance sheet date, the investee holds inventory for which the investor has recorded a gross profit of $100,000. The investor's net income would be reduced $18,000 to reflect a $30,000 reduction in gross profit and a $12,000 reduction in income tax expense. The elimination of intercompany profit might be reflected in the investor's balance sheet in various ways; for example, the investor might present $12,000 as a deferred tax charge (this is a "timing" difference under section 4091) and $30,000 as a deferred income credit. The income statement and balance sheet presentations will depend upon what is the most meaningful in the circumstances.

.007 Assume an investee sells inventory items to the investor ("upstream"). At the investor's balance sheet date, the investor holds inventory for which the investee has recorded a gross profit of $100,000. In computing the
Investor’s equity “pickup,” $60,000 ($100,000 less 40% of income tax) would be deducted from the investee’s net income and $18,000 (the investor’s share of the intercompany gross profit after income tax) would thereby be eliminated from the investor’s equity income. Usually, the investor’s investment account would also reflect the $18,000 intercompany profit elimination, but the elimination might also be reflected in various other ways; for example, the investor’s inventory might be reduced $18,000.

[Issue Date: December, 1971.]

2. Investments in Partnerships and Ventures

Question—Do the provisions of section 5131 apply to investments in partnerships and unincorporated joint ventures?

Interpretation—Section 5131 applies only to investments in common stock of corporations and does not cover investments in partnerships and unincorporated joint ventures (also called undivided interests in ventures). Many of the provisions of section 5131 would be appropriate in accounting for investments in these unincorporated entities, however, as discussed below.

Partnership profits and losses accrued by investor-partners are generally reflected in their financial statements as described in sections 5131.19c and 5131.19d. Likewise, most of the other provisions of section 5131.19 would be appropriate in accounting for a partnership interest, such as the elimination of intercompany profits and losses (see section 5131.19a).

Income taxes should be provided on the profits accrued by investor-partners regardless of the tax basis employed in the partnership return. The tax liabilities applicable to partnership interests relate directly to the partners, and the accounting for income taxes generally contemplated by section 4091 is appropriate. [As amended by APB Opinion No. 23, December, 1971.] (See section 4095.)

Generally, the above discussion of partnerships would also apply to unincorporated joint ventures, particularly the elimination of intercompany profits and the accounting for income taxes. However, because the investor-venturer owns an undivided interest in each asset...
and is proportionately liable for its share of each liability, the provisions of section 5131.19c may not apply in some industries. For example, where it is the established industry practice (such as in some oil and gas venture accounting), the investor-venturer may account in its financial statements for its pro rata share of the assets, liabilities, revenues, and expenses of the venture.

[Issue Date: December, 1971.]

3. Early Disclosure of Material Equity Adjustment

013 Question—Section 5131 requires the equity method of accounting to be applied for a qualifying investment in common stock for fiscal periods beginning after December 31, 1971. The Board encouraged earlier adoption of section 5131. If a company owns an investment in 1971 for which it does not adopt the equity method until 1972 when the retroactive application will materially change the originally reported 1971 net income, should the amount of the change be disclosed in the 1971 financial statements when they are first issued?

014 Interpretation—Yes, as a minimum the company should disclose in its 1971 financial statements the effect later retroactive application of the equity method will have on 1971 net income. In fact, the company should consider adopting the equity method in 1971 even though not required to do so.

015 The Board issued section 5131 in March 1971 and provided a relatively long interval before its effective date because of the time required for companies to accumulate information, arrange for audits of investee companies, etc. Extenuating circumstances may therefore exist for not applying the equity method in 1971. However, any material effect of subsequent retroactive application should be disclosed in the 1971 financial statements.

[Issue Date: February, 1972.]
Accounting for Intangible Assets: Accounting Interpretations of Section 5141

1. Intangible Assets

.001 Question—Section 5141 requires that intangible assets acquired after October 31, 1970 be amortized over a period not exceeding 40 years. Does this section encourage the capitalization of identifiable internally developed intangible assets which have been generally charged to expense in the past?

.002 Interpretation—Section 5141 does not change present accounting practice for intangible assets in any way except to require that intangible assets acquired after October 31, 1970 be amortized. Paragraph .06 notes that the costs of some identifiable intangible assets are now capitalized as deferred assets by some companies while other companies record the costs as expenses when incurred. This paragraph also specifies that the question of whether the costs of identifiable internally developed intangible assets are to be capitalized or charged to expense is not covered by the section. Therefore, the section does not encourage capitalizing the costs of a large initial advertising campaign for a new product or capitalizing the costs of training new employees.

[Issue Date: April, 1971.]

2. Goodwill in a Step Acquisition

.003 Question—Goodwill and other intangible assets acquired before November 1, 1970 (the effective date of section 5141) are not required to be amortized until their term of existence becomes limited (see Chapter 5 of ARB No. 43). Section 5141 requires all intangible assets acquired after October 31, 1970 to be amortized. When a company purchases two or more blocks of voting common stock of another company at various dates before and after November 1, 1970 and eventually obtains control or the ability to exercise significant influence over operating and financial
policies of the other company, how should the investor company subsequently account for any "goodwill" related to the investment?

.004 Interpretation—When a company in a series of purchases on a step-by-step basis acquires either a subsidiary which is consolidated or an investment which is accounted for under the equity method, the company should identify the cost of each investment, the fair value of the underlying assets acquired and the goodwill for each step purchase. This process would then identify the goodwill associated with each step purchase made before November 1, 1970 or after October 31, 1970 for each investment.  

.005 Goodwill associated with each step purchase acquired prior to November 1, 1970 should be accounted for in accordance with Chapter 5 of ARB No. 43 as amended by APB Opinion No. 9. Although amortization is not required in the absence of evidence that the goodwill has a limited term of existence, section 5141.35 encourages prospective amortization of such goodwill. Retroactive amortization is prohibited by section 5141.34.

.006 Goodwill associated with each step purchase acquired after October 31, 1970 should be amortized in accordance with section 5141. The period of amortization may not exceed forty years as specified by section 5141.29.

[Issue Date: March, 1973]
Early Extinguishment of Debt:  
Accounting Interpretations  
of Section 5362

1. Debt Tendered to Exercise Warrants
   
   .001 Question—Section 5362 stipulates that gain or loss should be recognized currently in income when any form of debt security is reacquired by the issuer before its scheduled maturity except through conversion by the holder. Does section 5362 apply to debt tendered to exercise warrants which were originally issued with that debt but which were detachable?

   .002 Interpretation—Section 5362 does not apply to debt tendered to exercise detachable warrants which were originally issued with that debt if the debt is permitted to be tendered towards the exercise price of the warrants under the terms of the securities at issuance. The tendering of the debt in such a case would be a conversion "pursuant to the existing conversion privileges of the holder" (see section 5362.02).

   .003 Section 5362 does not apply to a conversion of debt nor does the section specify the accounting for conversion of debt. In practice, however, the carrying amount of the debt, including any unamortized premium or discount, is credited to the capital accounts upon conversion to reflect the stock issued and no gain or loss is recognized.

Purpose and Scope of FASB Technical Bulletins and Procedures for Issuance

.001 The Financial Accounting Standards Board has authorized its staff to issue FASB Technical Bulletins to provide guidance on certain financial accounting and reporting problems on a timely basis. The first Bulletin describes the purpose and scope of FASB Technical Bulletins, the procedures for issuing them, and related background information. Those procedures have been approved by the Board.

Background

.002 The scope of FASB Technical Bulletins and the procedures for issuing them were developed through the solicitation of the public’s views in the Request for Written Comments on an FASB Proposal for Dealing with Industry Accounting Matters and Accounting Questions of Limited Application issued on November 7, 1978 and Information About FASB Technical Bulletins issued August 10, 1979.

- Some respondents suggested that the FASB identify its procedures for issuing FASB Technical Bulletins. That has been done in this Bulletin.

- Some respondents stated that all proposed FASB Technical Bulletins should be exposed to knowledgeable parties for comment. Although most proposed Bulletins will be exposed to knowledgeable parties, such as the FASB’s Screening Committee on Emerging Problems, exposure is not mandated because some problems to which the answers are clear may require immediate resolution, which could not be accomplished with formal exposure requirements.

- Some respondents expressed concerns about guidelines for the kinds of problems that could be addressed in FASB Technical Bulletins. This Bulletin outlines guidelines that indicate that issuance of a Bulletin would be appropriate for resolving a specific financial accounting and reporting problem. However, the Board can at any time address a matter discussed in a Bulletin or proposed Bulletin.

- Some respondents also questioned the level of Board involvement in Technical Bulletins. Even though the Board
does not approve Bulletins, each Board member receives a
copy of proposed Bulletins prior to issuance. Board mem-
bers are thereby provided an opportunity to express con-
cerns about the answer or to decide that the matter should
be addressed in a Board pronouncement.

Purpose and Scope of FASB Technical Bulletins and Procedures for
Issuance

.003 FASB Technical Bulletins provide guidance concerning
the application of FASB Statements or Interpretations, APB
Opinions, or Accounting Research Bulletins. FASB Tech-
nical Bulletins are not Statements of Financial Accounting
Standards or Interpretations as defined 1 in the FASB’s Rules
of Procedure and do-not establish new financial accounting
and reporting standards or amend existing standards.

.004 FASB Technical Bulletins generally address implem en-
tation questions and other matters that have heretofore been
covered by FASB letter communications, summaries of which
have been published in Status Report. The FASB plans to
issue those previous letters of broad interest as the first series
of FASB Technical Bulletins.

.005 An accounting or reporting problem that comes to the
FASB’s attention is analyzed to determ ine whether the prob-
lem might be resolved by issuing an FASB Technical Bul-
letin. Issuance of an FASB Technical Bulletin is generally
viewed as appropriate if the financial accounting and reporting
problem can be resolved within the following guidelines:

• The intent of the underlying standard1 is documented or
otherwise known to the staff and the answer to the prob-
lem in the Bulletin does no more than clarify, explain, or
elaborate upon the underlying standard,

• The answer is not expected to have a significant effect on
either financial reporting in general or most organizations
affected by the underlying standard, and

• The administrative cost that may be involved in imple-
menting the answer is not expected to be significant to
most affected organizations.

If the appropriateness of resolving a problem by issuing an
FASB Technical Bulletin is in doubt, that problem is referred
to the Board for its consideration.

1 Rule 203 [ET section 203.01] of the Rules of Conduct of the AICPA
Code of Professional Ethics applies to FASB Statements of Financial
Accounting Standards and, through the AICPA’s Interpretation 203-2
[ET section 203.03], of the Code, Rule 203 [ET section 203.01], applies
to FASB Interpretations.
.006 FASB Technical Bulletins are not approved by the Board, but Board members are informed of all matters proposed for Bulletins and are provided with copies of all proposed FASB Technical Bulletins prior to issuance. In some cases, Bulletins may be issued for matters that the Board has considered and concluded not to add to its agenda. In such cases, the Board may provide guidance for the preparation of a Bulletin. However, the issues addressed in Bulletins have not necessarily been deliberated by the Board.

.007 In addition to distributing proposed FASB Technical Bulletins to Board members, the Director of Research and Technical Activities may decide to expose proposed Bulletins to the public in general or to selected knowledgeable persons or groups for comment prior to issuance.

.008 The Board monitors the issuance of FASB Technical Bulletins and, if deemed advisable, may modify the above procedures from time to time. Any modifications will be announced publicly.

.009 FASB Technical Bulletins are generally in question-and-answer format and are published with the following legend:

The financial Accounting Standards Board has authorized its staff to issue FASB Technical Bulletins to provide guidance on certain financial accounting and reporting problems on a timely basis. Although Board Members are provided with copies of proposed Bulletins prior to issuance, the Board does not approve them.

[Issue Date: December 28, 1979.]
AC Section B2033

Classification of Short-Term Obligations Expected to Be Refinanced: FASB Technical Bulletins re Section 2033

1. Title: Subjective Acceleration Clauses in Long-Term Debt Agreements

Reference: FASB Statement No. 6 [section 2033], Classification of Short-Term Obligations Expected to Be Refinanced

Question .001 Should long-term debt be classified as a current liability if the long-term debt agreement contains a subjective clause that may accelerate the due date?

Background .002 Statement 6 [section 2033] indicates that a subjective acceleration clause contained in a financing agreement that would otherwise permit a short-term obligation to be refinanced on a long-term basis would preclude that short-term obligation from being classified as long-term. Statement 6 [section 2033] does not address financing agreements other than those related to short-term obligations.

Response .003 In some situations, the circumstances (for example, recurring losses or liquidity problems) would indicate that long-term debt subject to a subjective acceleration clause should be classified as a current liability. Other situations would indicate only disclosure of the existence of such clauses. It would also seem that neither reclassification nor disclosure would be required if the likelihood of the acceleration of the due date were remote, such as when the lender historically has not accelerated due dates of loans containing similar clauses and the financial condition of the borrower is strong and its prospects are bright.

[Issue Date: December 28, 1979.]

Interim Financial Reporting: FASB
Technical Bulletins re Section 2071

1. Title: Accounting in Interim Periods for Changes in Income Tax Rates

Reference: FASB Interpretation No. 18, Accounting for Income Taxes in Interim Periods, paragraph 24 [section 2071-1.24]

Question .001 How should a company with a fiscal year other than a calendar year account during interim periods for the reduction in the corporate tax rate resulting from the Revenue Act of 1978?

Background .002 The Revenue Act of 1978, among other things, reduced the corporate income tax rate from 48 percent to 46 percent.

Response .003 Paragraph 24 of Interpretation 18 [section 2071-1.24] requires that the effect of a change in tax rates be reflected in a revised annual effective tax rate calculation in the same way that the change will be applied to the company's taxable income for the year. The revised annual effective tax rate would then be applied to pretax income for the year-to-date at the end of the current interim period. Paragraph 13 of FASB Statement No. 16 [section 2014.13], Prior Period Adjustments, indicates that previous interim periods of the company's current fiscal year would be restated by prior period adjustment if the effect is material.

[Issue Date: December 28, 1979.]
Financial Reporting for Segments of a Business Enterprise: FASB Technical Bulletins re Section 2081

1. Title: Segment Reporting of Puerto Rican Operations

Question

.001 Are Puerto Rican operations and operations relating to other areas under U. S. sovereignty or some type of American jurisdiction, such as the Virgin Islands and American Samoa, to be considered foreign operations and thus subject to the disclosure requirements of paragraphs 31-38 of Statement 14 [section 2081.031—.038]?

Background

.002 Paragraphs 31-38 of Statement 14 [section 2081.031—.038] require disclosure of information about an enterprise's foreign operations and export sales. Paragraph 31 [section 2081.031] states that "for purposes of this Statement, an enterprise's foreign operations include those revenue-producing operations . . . that (a) are located outside the enterprise's home country (the United States for U. S. enterprises). . . ." (Emphasis added.)

Response

.003 Statement 14 [section 2081] allows judgment (paragraph 83 [section 2081.083]) to distinguish between domestic and foreign operations based on the features of the operation and the facts and circumstances of the enterprise (paragraph 31 [section 2081.031]). Based on those guidelines the degree of interrelationship between the United States and Puerto Rico (as well as non-self-governing U. S. territories such as the Virgin Islands and American Samoa) is such that Puerto Rican operations of U. S. enterprises should be considered domestic operations. Factors such as proximity, economic affinity, and similarities in business environments also indicate this classification for the Puerto Rican operations of U. S.
enterprises. It should be noted that the Statement does not prohibit additional disclosures about Puerto Rican operations that might be useful in analyzing and understanding an enterprise's financial statements.

[Issue Date: December 28, 1979.]

2. Title: Meaning of the Term "Customer" as It Applies to Health Care Facilities under FASB Statement No. 14

Question
.004 Would an insuring entity (such as Blue Cross) be considered a "customer" of a health care facility as that term is defined in paragraph 39 of Statement 14 [section 2081.039]?

Background
.005 Paragraph 39 of Statement 14 [section 2081.039] requires that if 10 percent or more of an enterprise's revenue is derived from sales to any single customer, that fact and the amount of revenue from each such customer should be disclosed. A group of customers under common control is regarded as a single customer for purposes of that requirement.

Response
.006 An insuring entity should not be considered the "customer" of a health care facility as that term is used in Statement 14 [section 2081]. The fact that an insuring entity is a paying agent for the patient does not make the insuring entity the customer of the health care facility because the insuring entity does not decide which services to purchase and from which health care facility to purchase the services. The latter two factors are important in determining the customer.

Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises: FASB Technical Bulletins re Section 2083

1. Title: Applicability of FASB Statements 21 and 33 to Certain Brokers and Dealers in Securities

References: FASB Statement No. 21, Suspension of the Reporting of Earnings per Share and Segment Information by Nonpublic Enterprises, paragraph 13 [section 2083.13]
FASB Statement No. 33, Financial Reporting and Changing Prices, paragraph 22(h) [section 1072.022(h)]

Question

.001 Should closely held brokers or dealers in securities that file financial statements with the Securities and Exchange Commission (SEC) be considered nonpublic enterprises for purposes of applying Statements 21 and 33 [sections 2083 and 1072]?

Background

.003 Statement 33 [section 1072] establishes standards for reporting effects of price changes by certain large, public enterprises.

.004 To be considered a nonpublic enterprise under Statement 21 [section 2083], an enterprise must meet two specific conditions, one of which is that the enterprise is not required to file financial statements with the SEC. Reciprocally, Statement 33 [section 1072] states that an enterprise that is required to file financial statements with the SEC is a public enterprise.
.005 All security brokers and dealers registered with the SEC must file complete sets of financial statements with the SEC for use by the SEC's Division of Market Regulation for regulatory purposes, whether they are closely held or publicly held. Although the statement of financial condition filed by a broker-dealer must be available for public inspection, the income statement and statement of changes in financial position may be treated as "confidential" if so requested by the broker-dealer. A publicly held broker-dealer that is subject to sections 12 and 13 of the Securities Exchange Act of 1934 must, in addition, file a complete set of financial statements and various forms with the SEC in the same manner as is required of other publicly held enterprises subject to those sections of the 1934 Act.

Response

.006 The fact that financial statements are required to be filed for broker-dealer regulatory purposes with the SEC does not make an otherwise "nonpublic" enterprise public for purposes of Statements 21 and 33 [sections 2083 and 1072]. Thus, the Statement 21 [section 2083] suspension applies to, and the Statement 33 [section 1072] definition of a public enterprise excludes, closely held broker-dealers that are required to file financial statements with the SEC only for use by its Division of Market Regulation, principally because the broker-dealer can cause a significant portion of those financial statements (that is, the income statement and statement of changes in financial position) to be unavailable for public inspection by requesting confidential treatment.

[Issue Date: December 28, 1979.]
Accounting for Leases:  
FASB Technical Bulletins re  
Section 4053

1. Title: Fiscal Funding Clauses in Lease Agreements

Reference: FASB Statement No. 13, Accounting for Leases, paragraph 5(f) [section 4053.005(f)]

Question

.001 What effect, if any, should the existence of a fiscal funding clause in a lease agreement have on the classification of the lease under Statement 13 [section 4053]?

Background

.002 A fiscal funding clause is commonly found in a lease agreement in which the lessee is a governmental unit. A fiscal funding clause generally provides that the lease is cancelable if the legislature or other funding authority does not appropriate the funds necessary for the governmental unit to fulfill its obligations under the lease agreement.

Response

.003 Paragraph 5(f) of Statement 13 [section 4053.005(f)] requires that a cancelable lease, such as a lease containing a fiscal funding clause, be evaluated to determine whether the uncertainty of possible lease cancellation is a remote contingency. That paragraph states that “a lease which is cancelable (i) only upon occurrence of some remote contingency . . . shall be considered 'noncancelable' for purposes of this definition” of lease term. (Emphasis added.)

.004 In discussing the likelihood of the occurrence of a future event or events to confirm a loss contingency, paragraph 3 of FASB Statement No. 5 [section 4311.03] Accounting for Contingencies, defines remote as relating to conditions when “the chance of the future event or events occurring is slight.” The evaluation of the uncertainty of possible lease cancellation should be consistent with that definition.

.005 The existence of a fiscal funding clause in a lease agreement would necessitate an assessment of the likelihood of
lease cancellation through exercise of the fiscal funding clause. If the likelihood of exercise of the fiscal funding clause is assessed as being remote, a lease agreement containing such a clause would be considered a noncancelable lease; otherwise, the lease would be considered cancelable and thus classified as an operating lease.

[Issue Date: December 28, 1979.]

2. Title: Effect of a Penalty on the Term of a Lease

Reference: FASB Statement No. 13, Accounting for Leases, paragraph 5(f) [section 4053.005(f)]

Question .006 In determining the lease term under the provisions of Statement 13 [section 4053], does the existence of a penalty that would reasonably assure renewal of a lease need to be stated in the lease agreement?

Background .007 Paragraph 5(f) of Statement 13 [section 4053.005(f)] states that the lease term includes “all periods, if any, for which failure to renew the lease imposes a penalty on the lessee in an amount such that renewal appears, at the inception of the lease, to be reasonably assured.”

Response .008 The “penalty” referred to in paragraph 5(f) of Statement 13 [section 4053.005(f)] is not limited to a penalty imposed by the lease agreement. Accordingly, the lease term would also include any periods for which failure to renew the lease would result in an economic penalty as a result of factors external to the lease so long as (a) the existence of the penalty were known at the inception of the lease and (b) the nature and estimated amount of the penalty at the inception of the lease were such that renewal would appear to be reasonably assured.

[Issue Date: December 28, 1979.]
3. Title: Interest Rate Used in Calculating the Present Value of Minimum Lease Payments

Reference: FASB Statement No. 13, *Accounting for Leases*, paragraphs 5(l) and 7(d) [sections 4053.005(l) and 4053.007(d)]

Question

.009 May a lessee use its secured borrowing rate in calculating the present value of minimum lease payments in applying the provisions of Statement 13 [section 4053]?

Background

.010 Paragraph 7(d) of Statement 13 [section 4053.007(d)] requires the lessee to use its incremental borrowing rate (or the lessor's implicit interest rate in certain circumstances) to calculate the present value of minimum lease payments. The incremental borrowing rate is defined in paragraph 5(l) [section 4053.005(l)] as "the rate that . . . the lessee would have incurred to borrow over a similar term the funds necessary to purchase the leased asset."

Response

.011 Paragraph 5(l) of Statement 13 [section 4053.005(l)] does not proscribe the lessee's use of a secured borrowing rate as its incremental borrowing rate if that rate is determinable, reasonable, and consistent with the financing that would have been used in the particular circumstances.

[Issue Date: December 28, 1979.]

4. Title: Applicability of FASB Statement No. 13 to Current Value Financial Statements

Reference: FASB Statement No. 13, *Accounting for Leases*, paragraphs 7 and 8 [section 4053.007—.008]

Question

.012 Are financial statements prepared on a current value basis exempt from the provisions of Statement 13 [section 4053]?

Response

.013 Statement 13 [section 4053] would not be inapplicable merely because financial statements are prepared on a current value basis. For example, if at its inception a lease involving
property meets one or more of the four criteria of paragraph 7 [section 4053.007] and both of the criteria of paragraph 8 of Statement 13 [section 4053.008], the lessor would classify the lease as a sales-type or direct financing lease, whichever is appropriate. Subsequently, the carrying amount of the recorded investment in the lease payments receivable would be adjusted in accordance with the valuation techniques employed in preparing the financial statements on a current value basis.

[Issue Date: December 28, 1979.]

5. Title: Upward Adjustment of Guaranteed Residual Values

Reference: FASB Statement No. 13, Accounting for Leases, paragraphs 17(d), 18(d), and 46 [sections 4053.017(d), 4053.018(d), and 4053.046]

Question .014 Does the prohibition against upward adjustments of estimated residual values in Statement 13 [section 4053] also apply to upward adjustments that result from renegotiations of the guaranteed portions of residual values?

Background .015 Paragraphs 17(d), 18(d), and 46 of Statement 13 [sections 4053.017(d), 4053.018(d), and 4053.046] require the lessor to review annually the estimated residual value of sales-type leases, direct financing leases, and leveraged leases, respectively. Those paragraphs also contain a provision that prohibits any upward adjustment of the estimated residual value.

Response .016 The prohibitions of paragraphs 17(d), 18(d), and 46 of Statement 13 [sections 4053.017(d), 4053.018(d) and 4053.046] against upward adjustments to the leased property's estimated residual value are equally applicable to the guaranteed portion. If a lease initially transferred substantially all of the benefits and risks incident to the ownership of the leased property, it would not seem appropriate that the lessor could subsequently increase the benefits that were accounted for as having been retained initially.

.017 Recording upward adjustments to the leased property's residual value would, in essence, result in recognizing a sale of
the residual value interest. In this respect, the prohibition of an upward adjustment in the leased property's residual value is similar to the prohibition in paragraph 17 of FASB Statement No. 5 [section 4311.17], Accounting for Contingencies, of recognizing gain contingencies because to do so might be recognizing revenue before realization. Realization of the residual value interest might also be contingent on factors, such as the physical condition of the leased property or the requirements and related costs, if any, relating to remarketing agreements at the end of the lease term.

[Issue Date: December 28, 1979.]

6. Title: Accounting for Loss on a Sublease Not Involving the Disposal of a Segment

References: FASB Statement No. 13, Accounting for Leases, paragraphs 35-39 [section 4053.035—.039]
FASB Interpretation No. 27 [section 4053-6] Accounting for a Loss on a Sublease

Question .018 Should a loss on a sublease not involving the disposal of a segment be recognized and how is it determined?

Response .019 The general principle of recognizing losses on transactions and the applicability of that general principle to contracts that are expected to result in a loss are well established. Accordingly, if costs expected to be incurred under an operating sublease (that is, executory costs and either amortization of the leased asset or rental payments on an operating lease, whichever is applicable) exceed anticipated revenue on the operating sublease, a loss should be recognized by the sublessor. Similarly, a loss should be recognized on a direct financing sublease if the carrying amount of the investment in the sublease exceeds the total of rentals expected to be received and estimated residual value unless the sublessor's tax benefits from the transaction are sufficient to justify that result.

.020 The absence of explicit reference to accounting for these transactions in Statement 13 [section 4053] does not affect the necessity to follow general principles of loss recognition.

[Issue Date: December 28, 1979.]
Effect of a Change in Income Tax Rate on the Accounting for Leveraged Leases

FASB Statement No. 13, Accounting for Leases, paragraph 46 [section 4053.046]

Question
.
.021 What effect, if any, does a change in the income tax rate have on the accounting for leveraged leases under Statement 13 [section 4053]?

Background
.
.022 Paragraph 46 of Statement 13 [section 4053.046] provides that, when an important assumption changes, the rate of return and the allocation of income shall be recalculated from the inception of the lease, and the change in the recalculated balances of net investment shall be recognized as a gain or loss in the year in which the assumption is changed.

Response
.
.023 The lessor's income tax rate is an important assumption in accounting for a leveraged lease. Accordingly, the income effect of a change in the income tax rate should be recognized in the first accounting period ending on or after the date on which the legislation effecting a rate change becomes law.2

.024 If accounting for the effect on leveraged leases of the change in tax rates results in a significant variation from the customary relationship between income tax expense and pretax accounting income and the reason for that variation is not otherwise apparent, paragraph 63 of APB Opinion No. 11 [section 4091.62], Accounting for Income Taxes, requires that the reason for that variation should be disclosed.

[Issue Date: December 28, 1979; Revised: February 29, 1980.]

---

1 FASB Technical Bulletin No. 79-16 addressed the effect of a reduction in the corporate income tax rate from 48 percent to 46 percent. Because the response is applicable to increases as well as decreases in the tax rate, this revised Bulletin has been generalized to address the effect of all income tax changes on the accounting for leveraged leases.

2 Bulletin 79-16 stated "ending on or after the effective date of the rate change." (Emphasis added.) This revised Bulletin clarifies the ambiguity of that phrase.
Accounting for Leases

8. Title: Reporting Cumulative Effect Adjustment from Retroactive Application of FASB Statement No. 13

Reference: FASB Statement No. 13, Accounting for Leases, paragraph 51 [section 4053.051]

Question .025 If a company presents in its annual report five annual income statements that were retroactively restated to apply the provisions of paragraphs 1-47 of Statement 13 [section 4053.001—.047] must the cumulative effect of applying those provisions be included in determining net income of any period presented?

Background .026 Paragraph 49 of Statement 13 [section 4053.049] requires retroactive application of the provisions of that Statement in financial statements for fiscal years beginning after December 31, 1980. Financial statements presented for prior periods are to be restated. Paragraph 51 of that Statement [section 4053.051] requires that the cumulative effect on the retained earnings at the beginning of the earliest period restated shall be included in determining the net income of that period.

Response .027 The cumulative effect of applying the provisions of paragraphs 1-47 of Statement 13 [section 4053.001—.047] would not be included in net income of any period presented unless the year prior to the earliest year presented could not be restated. Paragraph 51 [section 4053.051] does not refer to the earliest period presented but rather refers to the earliest period restated. Thus, if income statements for five years are presented and the next prior year cannot be restated, the cumulative effect would be included in the determination of net income of the first year presented. In that same situation, if a company presented income statements only for the current year and the immediately preceding year, neither income statement would include a cumulative effect adjustment.

[Issue Date: December 28, 1979.]
Question

.028 In applying the transition requirement of the amendments and interpretations of Statement 13 [section 4053], what is meant by the phrase "have published annual financial statements" and what disclosure is required to indicate that Statement 13 [section 4053] had been applied retroactively without restatement of the prior years' financial statements due to immateriality?

Background

.029 The relevant portion of the transition requirement in FASB amendments and interpretations of Statement 13 [section 4053] states:

In addition, except as provided in the next sentence, the provisions of this [Interpretation/Statement] shall be applied retroactively at the same time and in the same manner as the provisions of FASB Statement No. 13 [section 4053] are applied retroactively (see paragraphs 49 and 51 of Statement No. 13 [sections 4053.049 and 4053.051]). Enterprises that have already applied the provisions of Statement No. 13 [section 4053] retroactively and have published annual financial statements based on the retroactively adjusted accounts before the effective date of this [Interpretation/Statement] may, but are not required to, apply the provisions of this [Interpretation/Statement] retroactively. [Emphasis added.]

Response

.030 The phrase "have published annual financial statements" generally refers to those financial statements that a company
normally includes in its annual report to shareholders for its established 12-month reporting period (that is, its fiscal year). Inclusion of the word "published" in the transition requirement emphasizes that the annual financial statements should be those that are distributed to all shareholders. For a publicly held company, those financial statements would normally be accompanied by an independent auditor's opinion.

.031 Although the phrase "have published annual financial statements" generally refers to the financial statements included in a company's annual reports to shareholders, other circumstances, such as in a filing under the requirements of the Federal Securities Act, may necessitate the issuance to all shareholders of complete financial statements for a company's established 12-month reporting period. For example, if a calendar-year company files a registration statement with the Securities and Exchange Commission in October 1978 and subsequently delivers a proxy statement containing complete financial statements for its year ended December 31, 1977 to all shareholders, the 1977 financial statements (which would include all footnotes contained in the annual report to shareholders) that are included in the proxy statement could constitute published annual financial statements as contemplated by the transition requirement of the amendments and interpretations of Statement 13 [section 4053].

.032 On the other hand, the "have published annual financial statements" provision would not be met if the calendar-year company referred to in the above example included its 1977 financial statements, restated to adopt the requirements of Statement 13 [section 4053] retroactively, in the 1978 third quarter interim report to shareholders unless inclusion of its normal fiscal year financial statements is consistent with that company's previously established reporting practices. In addition, the issuance of complete financial statements for a 12-month period that is not the company's established fiscal year would not constitute published annual financial statements for purposes of satisfying the transition requirement in question.

.033 Amendments and interpretations of Statement 13 [section 4053] should be applied retroactively as they become effective unless Statement 13 [section 4053] had been applied retroactively in published annual financial statements to shareholders at an earlier date. The retroactive application of Statement 13 [section 4053] would not necessarily require the recording of an adjustment in a company's accounting records when the effects of applying Statement 13 [section 4053] on
a retroactive basis call for adjustments that are clearly immaterial. However, in those instances, it could be expected that the notes to the published annual financial statements would have included appropriate disclosure to indicate that the company had adopted Statement 13 [section 4053] retroactively and that prior years' financial statements were not restated because the effects of retroactive application were immaterial. The absence of such disclosures would indicate that Statement 13 [section 4053] had not yet been adopted retroactively. Similarly, if the notes to financial statements in an annual report to shareholders include the “as if” disclosures required by paragraph 50 of Statement 13 [section 4053.050] it would also be apparent that a company had not adopted the provisions of Statement 13 [section 4053] on a retroactive basis in those earlier financial statements.

Accounting for Research and Development Costs: FASB Technical Bulletins re Section 4211

1. Title: Computer Software Costs

References:
- FASB Statement No. 2, Accounting for Research and Development Costs, paragraphs 8-10 [section 4211.08—.10]
- FASB Interpretation No. 6 [section 4211-3], Applicability of FASB Statement No. 2 to Computer Software

Question
.001 Are all costs incurred to produce computer software considered “research and development costs” under Statement 2 [section 4211] and Interpretation 6 [section 4211-3]?

Background
.002 Statement 2 [section 4211] requires all research and development costs encompassed by that Statement to be charged to expense as incurred. Interpretation 6 [section 4211-3] clarifies the applicability of Statement 2 [section 4211] to certain costs incurred to obtain or develop computer software.

Response
.003 Statement 2 [section 4211] and Interpretation 6 [section 4211-3] do not require that all computer software production costs be considered research and development costs as defined in paragraph 8 of Statement 2 [section 4211.08]. Statement 2 [section 4211] specifies certain activities that are to be identified as research and development costs for financial accounting and reporting purposes. The activities described in paragraphs 9 and 10 of Statement 2 [section 4211.09—.10] give appropriate recognition to the fact that all costs incurred in producing a given software product or process are not necessarily research and development costs. However, a determination that software production costs are not research and development costs does not necessarily mean that they would be
inventoriable or deferrable to future operations. Those decisions can only be made in light of all of the facts and circumstances surrounding the particular situation.

[Issue Date: December 28, 1979]
Accounting for Certain Marketable Securities: FASB Technical Bulletins re Section 5132

1. Title: Investor's Accounting for Unrealized Losses on Marketable Securities Owned by an Equity Method Investee

References:
- FASB Statement No. 12, Accounting for Certain Marketable Securities, paragraph 9 and footnote 5 [section 5132.09 and footnote 5]
- APB Opinion No. 18, The Equity Method of Accounting for Investments in Common Stock, paragraph 19 [section 5131.19]

Question
.001 How should a parent or investor account for its share of the accumulated changes in the valuation allowance for marketable equity securities included in stockholders’ equity of an investee accounted for under the equity method?

Background
.002 Paragraph 9 of Statement 12 [section 5132.09] specifies in part that “the portfolios of marketable equity securities owned by an entity (subsidiary or investee) that is accounted for by the equity method shall not be combined with the portfolios of marketable equity securities owned by any other entity included in the financial statements. However, such an entity is, itself, subject to the requirements of this Statement.” (Footnote reference omitted.)

.003 Under Statement 12 [section 5132], if the aggregate cost of a portfolio of marketable equity securities exceeds the aggregate market value of the portfolio, the difference is accounted for as a valuation allowance and the securities are thereby carried at market value. For a portfolio of marketable equity securities classified as a noncurrent asset or included in an unclassified balance sheet, an amount equal to the accumu-
lated changes in the valuation allowance is included in the equity section of the investee's balance sheet and shown separately. On the other hand, for a portfolio of marketable equity securities classified as a current asset, an amount equal to the changes in the valuation allowance is included in the determination of net income by the investee and the parent or investor includes its proportionate share of the investee's earnings or losses in income.

.004 Opinion 18 states in paragraph 19 [section 5131.19]:

*Applying the equity method.* The difference between consolidation and the equity method lies in the details reported in the financial statements. Thus, an investor's net income for the period and its stockholders' equity at the end of the period are the same whether an investment in a subsidiary is accounted for under the equity method or the subsidiary is consolidated. . . . A transaction of an investee of a capital nature that affects the investor's share of stockholders' equity of the investee should be accounted for as if the investee were a consolidated subsidiary.

.005 Footnote 5 of Statement 12 [section 5132, footnote 5] recognizes that exclusion of the securities owned by a subsidiary that is accounted for by the equity method from the parent company's portfolio of marketable equity securities may result in income different from that which would have resulted if that subsidiary had been consolidated rather than accounted for by the equity method because portfolios of consolidated subsidiaries are combined while portfolios of entities accounted for by the equity method are not combined. However, that footnote does not describe, as an exception to paragraph 19 of Opinion 18 [section 5131.19], any difference in stockholders' equity from applying the portfolio approach required by Statement 12 [section 5132].

Response

.006 If a subsidiary or other investee that is accounted for by the equity method is required to include accumulated changes in a valuation allowance for a portfolio of marketable equity securities in the stockholders' equity section of its balance sheet pursuant to the provisions of Statement 12 [section 5132], the parent or investor shall reduce its investment in that investee by its proportionate share of the accumulated changes in the valuation allowance and a like
amount shall be included in the stockholders' equity section of its balance sheet.

AC § B5363.003

Accounting by Debtors and Creditors for Troubled Debt Restructurings: FASB Technical Bulletins re Section 5363

1. Title: Valuation Allowances Following Debt Restructuring

Reference: FASB Statement No. 15, Accounting by Debtors and Creditors for Troubled Debt Restructurings, paragraphs 1 and 29 [section 5363.001 and 5363.029]

Question

.001 Must the collectibility of a receivable whose terms have been modified and carrying basis adjusted in a troubled debt restructuring under Statement 15 [section 5363] be evaluated to determine the need for subsequent valuation allowances?

Background

.002 Statement 15 [section 5363] addresses the accounting appropriate at the time that a restructuring occurs but does not specifically address the accounting for allowances for estimated uncollectible amounts.

Response

.003 Statement 15 [section 5363] does not proscribe subsequent provisions for anticipated losses on assets adjusted or acquired in a troubled debt restructuring. Paragraphs 1, 29, 60, 90, and 91 and footnotes 18 and 34 of that Statement [section 5363.001, 5363.029, 5363.060, 5363.090—.091, and footnotes 18 and 34] are relevant in this respect. Furthermore, FASB Statement No. 5 [section 4311], Accounting for Contingencies, requires recognition of anticipated losses whenever they are probable and reasonably estimable. Thus, an assessment of the collectibility of a receivable with modified terms is necessary for a troubled debt restructuring subject to Statement 15 [section 5363].

[Issue Date: December 28, 1979.]
Recoveries of a Previous Writedown under a Troubled Debt Restructuring Involving a Modification of Terms

FASB Statement No. 15, Accounting by Debtors and Creditors for Troubled Debt Restructurings, paragraph 30 and footnote 17 [section 5363.030 and footnote 17]

Question
.004 May a creditor reverse a previous direct writedown of a receivable when, under a restructuring of a troubled loan through a modification of terms, the future cash receipts exceed the recorded investment in the receivable?

Background
.005 Paragraph 30 of Statement 15 [section 5363.030] discusses the accounting by a creditor for a restructuring involving only a modification of terms and states that the recorded investment in the receivable is not changed unless that amount exceeds the total future cash receipts specified by the new terms, in which case the investment is reduced to an amount equal to the total future cash receipts and a loss recognized. If the total future cash receipts exceed the recorded investment in the receivable, the excess is recognized as interest over the remaining term of the loan. Footnote 17 [section 5363, footnote 17] states that the recorded investment in the receivable is the face amount decreased by the amount of any previous direct writedown.

Response
.006 The future cash receipts in excess of the recorded investment in the receivable shall be accounted for as interest income even if a previous direct writedown results in an unusually high effective interest rate on the recorded investment. The amount of the direct writedown should not be reversed.

.007 Paragraph 40(a) of Statement 15 [section 5363.040(a)] does not require disclosures related to a receivable whose terms have been modified if its effective interest rate is equal to or greater than the rate that the creditor was willing to accept for a new receivable with comparable risk; however, disclosure of the amount and source of interest income on such receivables is permitted.
